A

GENERAL HISTORY

OF THE

DICHLAMYDEOUS PLANTS,

COMPRISING COMPLETE

DESCRIPTIONS OF THE DIFFERENT ORDERS;

TOGETHER WITH THE

CHARACTERS OF THE GENERA AND SPECIES, AND AN ENUMERATION OF THE CULTIVATED VARIETIES;

THEIR PLACES OF GROWTH, TIME OF FLOWERING, MODE OF CULTURE, AND

USES IN MEDICINE AND DOMESTIC ECONOMY;

THE SCIENTIFIC NAMES ACCENTUATED, THEIR ETYMOLOGIES EXPLAINED, AND THE CLASSES AND ORDERS

ILLUSTRATED BY ENGRAVINGS,

AND PRECEDED BY INTRODUCTIONS TO THE LINNÆAN AND NATURAL SYSTEMS,

AND A GLOSSARY OF THE TERMS USED:

THE WHOLE

ARRANGED ACCORDING TO THE NATURAL SYSTEM.

BY GEORGE DON, F.L.S.

IN FOUR VOLUMES.

Vol. III.—CALYCFLORE.

LONDON:

PRINTED FOR J. G. AND F. RIVINGTON; J. AND W. T. CLARKE; LONGMAN AND CO.; T. CADELL; J. RICHARDSON; JEFFERY

AND SON; BALDWIN AND CRADOCK; J. BOOKER; J. BOOTH; HARVEY AND DARTON; S. BAGSTER; SHERWOOD AND CO.;

HARDING AND LEPARD; J. F. SETCHEL; WHITTAKER AND CO.; SIMPKIN AND MARSHALL; AND E. HODGSON.

MDCCCXXXIV.
INDEX TO THE THIRD VOLUME,

COMPRISING THE

SYSTEMATIC AND ENGLISH GENERIC NAMES, AND THE ENGLISH AND SYSTEMATIC SYNONYMIES.

* * * In this Index the systematic names used, and the English names in common use, are in Roman letters; the synonyms in Italics; the names of Classes, Sub-classes, and Orders in large capitals; and the names of Sub-orders and Tribes in small capitals.

INDEX TO THE THIRD VOLUME.

Flowers hermaphrodite, monoecious or dioecious (f. 1. b. c. f. 3. b. c.), axillary. Calyx gamosepalous (f. 3. a. b.), 5-toothed, sometimes obsolete. Corolla 5-petalled (f. 2. a. f. 1. c. f. 3. c.), but usually only 5-parted, distinct from the calyx, and sometimes somewhat continuous with it, rising from the margin of the torus, sometimes fringed, constantly yellow, white, or red, very cellular, with strongly marked, reticulated veins. Stamens 5, either distinct, or joined in 3 parcels, and sometimes all together; filaments rarely pilose; anthers 2-celled, very long, sinuous, rarely ovate and short. Style rarely almost wanting, crowned by 3-5 2-lobed stigmas, which are thick and velvety, but rarely fringed. Ovarium 1-celled, with 3 parietal placentas. Fruit fleshy, more or less succulent, crowned by the scar formed by the calyx, 1-celled (f. 3. c. f. 2. b.), with 3 parietal placentas, which are indicated on the outside by nerves. Umbilical funicle timeud towards the seeds. Seeds frequently obovate, flat, fixed to the parietes of the fruit, enveloped in an arillus, which is either juicy, or dry and membranous; testa coriaceous, often thick at the margins; hyolum oblique at the top of the seed. Embryo straight, flat, without albumen. Cotyledons foliaceous, palmately nerved; radicle basilar, directed towards the hylum.—Roots annual or perennial, fibrous or tuberous. Stems herbaceous, climbing by means of tendrils. Leaves palmate, or with palmate ribs, succulent, covered with numerous asperities. Tendrils solitary, lateral, divided or undivided. Flowers solitary, panicked, or in fascicles. Bracteae usually wanting. Branches rising between the leaves and tendrils.

This order is nearly related to Passifloraceae, to which they are so closely allied, as hardly to be distinguishable, except in their monopetalous corolla, sinusous stamens, unisexual flowers, and exalbuninous seeds, the habit of both being nearly the same. There is an affinity between the order and Campanulaceae in the perigynous insertion of the stamens, the inferior ovary, the single style with several stigmas, the quinary division of the flower, connected with the ternary division of the fruit, and some analogy in the nature of the floral envelopes. The small tribe Nhandiröbeae consists of plants having the habit of Cucurbitaceae, but some resemblance in their fruit to that of Lecythidaceae, which, as is well known, border close upon Myrtaeae; but beyond this resemblance of the fruit, which appears altogether to be a structure of analogy rather than that of affinity, there is nothing to confirm the approachment. Cucurbitaceae is one of the most useful orders in the vegetable kingdom, comprehending the melon, the cucumber, the choco, and the various species of gourd and pumpkin, all useful as food for man. A bitter laxative quality perhaps pervades all these, which in the colocynth is so concentrated as to become an active purgative principle. The colocynth of the shops is prepared from the pulp of Cucumis colocynthus; it is of so drastic and irritating a nature, as to be classed by Orfila among his poisons; but, according to Thunberg, this gourd is rendered perfectly mild at the Cape of Good Hope, by being properly pickled, Ainslie 1. p. 85. The bitter resinous matter in which the active principles of colocynth are supposed to exist, is called by chemists colocynthine. A waxy substance is secreted by the fruit of Benincasa cerifera. It is produced in most abundance at the time of its ripening. Delislei descrip. The leaf of Feuillea cordifolia, is asserted by M. Drapiez to be a powerful antidote against vegetable poisons. Edinb. phil. journ. 4. p. 221. The fruit of Trichosanthes palmata, pounded small, and intimately blended with warm cocoa-nut oil, is considered a valuable application in India for cleansing and healing the offensive sores which sometimes take place in the inside of the ears. It is also supposed to be a useful remedy poured up the nostrils in cases of ozema. Ainslie 2. p. 85. The root of Bryonia possesses powerful purgative properties, but is said to be capable of becoming wholesome food, if properly cooked. The perennial roots of all the order appear to contain similar bitter drastic virtues, especially that of Momordica elatifterium or Squirtin...
Cucurbitaceae.

Cucumber. An extremely active poisonous principle, called
eatine, has also been found in the placentas of the fruit of this
plant. It exists in such extremely small quantity, that Dr.
Clutterbuck only obtained 6 grains from 40 fruit. Edinb. phil.
journ. 3. p. 307. An ingenious explanation of the cause of the
singular ejection of the seeds of this plant will be found in
Dutrochet's Nouvelles Recherches sur l'Exosmosis. The root of
Brònia rostrà is prescribed in India internally in febrility
in cases of piles. It is also used as a demulcent, in the form of
powder. That of Brònia cordifòlia is considered cooling, and
to possess virtues in complaints requiring expectorants. Ainslie
2. p. 21. The root of Brònia epìga'a was once supposed to
be the famous colomba-root, to which it approaches very nearly
in quality. The tender shoots and leaves of Brònia scìabra are
aperient, having been previously roasted. Ainslie 2. p. 212. The
seeds of all the species are sweet and oily, and capable of forming
very readily an emulsion. Those of Ampelosicyos scòndens are
as large as chestnuts, and said to be as good as almonds, having
a very agreeable flavour. When pressed they yield an abundant-
ance of oil, equal to that of the finest olives. De Candolle
remarks that the seeds of this family never participate in the
property of the pulp that surrounds them.

Synopsis of the Genera.

Tribe I.

Nhandìróbèe. Tendrils axillary, in the place of peduncles.
Flowers dioecious.

1 Feùlèla. Calyx of the male flowers 5-cleft. Petals 5,
joined at the base. Stamens 5, inserted with the petals, some-
times 10, but 5 of them are sterile. Calyx of the female flowers
5-cleft. Petals 5, distinct. Styles 3; stigmas broad, bifid.
Fruit globose, fleshy.

2 Zànània. Male flowers. Calyx 3-lobed (f. 1. a.). Petals 5,
joined into a 5-parted rotate, spreading corolla (f. 1. b. c.).
Stamens 5, joined at the base; anthers 1-celled. Female flowers.
Calyx with a long turbinate tube, and a 5-lobed limb.
Corolla as in the male flowers. Styles 3, spreading, bifid at the
apex. Fruit long, turbinate, fleshy; seeds winged (f. 1. d. e.).

Tribe II.

Cucùribìs. Tendrils lateral, stipular. Flowers herma-
phrodite, dioecious, or monoecious.

3 Lagènàrià. Calyx campanulate, with subulate or broadish
segments; corolla white; petals obovate. Stamens 5, triad-
phalous. Stigmas 3, thick, 2-lobed. Fruit 3-5-celled. Flowers
dioecious.

4 Cu'cumis. Calyx tubularly-campanulate, with subulate
segments. Petals almost distinct. Stamens 5, in 3 parcels.
Stigmas 3, thick, bipartite. Fruit 3-6-celled. Flowers monoecious
or hermaphrodite, yellow.

5 Lu'fìa. Male flowers panicked; tube of calyx hemisphè-
rical. Petals distinct. Stamens 5, free; anthers very sinuous.
Female flowers solitary; tube of calyx clavate. Stigmas reni-
form. Fruit ovate, 3-celled. Flowers yellow.

6 Benìncà'sa. Flowers polygamous, monoecious, solitary;
Corolla 5-petalled (f. 3. c.); petals oblong, fringed (f. 3. d.). Stamens 5, in 3 packets. Female flowers. Limb of calyx 5-toothed. Corolla as in the male. Stigma capitate, 3-lobed, ex Bojer. Fruit fleshy, 2-3 feet long, and 8 inches thick, elongated, furrowed (f. 3. c.). Flowers purple.

19 **Involucra'ria**. Flowers monoecious. Male ones umbellate, sessile; bracteas reniform, fringe-toothed, involucrum-formed. Tube of calyx obconical; sepals linear, acute. Anthers joined together. Female flowers solitary, on long peduncles.

21 **Argu'ria**. Flowers monoecious. Male flowers. Calyx campanulate, 5-toothed. Corolla joined with the calyx, ventricose, red, 5-parted. Stamens 2. Female flowers with a calyx and corolla as in the males, and 2 sterile stamens. Style semibifid; stigmas bifid. Fruit 2-4-celled, many-seeded, somewhat tetragonal.

† Genera not sufficiently known.

22 **Zu'cca**. Flowers solitary, axillary. Bracteas large, concave, involving a large, coloured, 5-sepal'd calyx, and girded by 5 scales at the base. Stamens 5.

23 **Alla'sia**. Flowers hermaphrodite. Calyx gamosepalous, girded by a short involucrum. Segments 5, acute, pilose. Corolla 4-petalled; petals pilose. Stamens 4, but more probably 8, joined by twos; anthers 2-lobed. Style subulate, crowned by an acute stigma. Berry fleshy, large, oblong, obtuse, 1-celled, many-seeded.

24 **Gron'ovia**. Flowers hermaphrodite. Calyx funnel-shaped, 5-parted; scales 5, linear, petal-formed, pellucid, alternate with the calycine segments. Stamens 5, free, alternating with the scales. Style crowned by a capitata stigma. Berry dry, nearly globose, 1-seeded, crowned by the dry permanent calyx.

**Tribe I.**

**Lin. syst. Diòecia, Pantàndria.** Flowers dioecious. Male flowers. Calyx 5-cleft beyond the middle. Petals 5, rather joined at the base, inserted in the throat of the calyx, and alternating with the sepals. Stamens 5, inserted with the petals, and alternating with them, sometimes 10, but when this is the case, 5 of which are always sterile. (ex Juss.) Anthers 2-celled, didymous. Female flowers. Tube of calyx adnate to the ovarium; limb 5-cleft. Petals 5, distinct, or joined at the base, oblong. Lamellae or abortive stamens 5, sometimes alternating with the petals (ex Juss.). Styles 3. Stigmas broad, bluntly bifid. Fruit globose, fleshy, 3-celled, indehiscent, with solid bark and a large fleshy trigonal central axis; cells many ovulate. Ovula erect from the centre. Seeds compressed, oval. Embryo straight. Cotyledons flat, rather fleshy.—Introtropical American, rather frutescent climbing herbs. Leaves alternate, petiolate, exstipulate, palmately nerved, cordate, glabrous. Tendrils axillary, spirally twisted, in place of peduncles. Peduncles axillary, 1 or many-flowered. Flowers small. Seeds oily, bitter. This genus has a habit emulating *Passiflora*. Fruit in the form of that of *Coussapoa*, a genus of *Leycidiceae*.

1. **Punca'táta** (Poir. dicrt. 4. p. 418.) leaves 3-lobed or ternate, beset with glandular dots on both surfaces along the nerves, but more especially beneath; leaves of lanceolate, rather cut. *C. O. S. Native of St. Domingo. Trichosanthes puncticata, Lin. spec. 1432. amoen. acad. 3. p. 423. exclusive of the country. Feuillea trifolítia, Reich. syst. 4. p. 258.

**Dotted-leaved Feuillea.** Pl. cl. 2

2 F. **Tri'bolá'ta** (Lin. spec. ed. 1. p. 1014.) leaves rather glan'dular on both surfaces, 3-parted or trifid; lower lobes obtuse, upper ones acute. *C. O. S. Native of Brazil. F. scán'dens β, Lin. spec. ed. 2. p. 1457. F. hederácea, Poir. dicrt. 4. p. 419. Chándiróba or Nhandíroba, Margr. bras. 46. lower figure. 3-celled-leaved Feuillea. Pl. cl.

3 F. **Cordifiólla** (Poir. dicrt. 4. p. 418.) leaves glan'dless, cordate, acuminated, or somewhat 3-lobed, and rather serrated. *C. O. S. Native of the West Indies. Plum. ed Burm. t. 209. F. scándens a, Lin. spec. ed. 2. p. 1457. F. hederácea, Turp. in dict. sc. nat. with a figure. The leaves of this species are said to be a powerful antidote against vegetable poisons.

**Heart-leaved Neufillea.** Pl. cl. 4 F. **Javilla** (H. B. et Kunth, nov. gen. amer. 2 p. 124.) leaves glandless, roundish, sinuately cordate, acuminated. *C. O. S. Native of New Granada, in woods near Turbaco, where it is called *Javilla* by the inhabitants. Seeds with subulate margs, hence this species agrees with the genus *Zanonia*.

**Javilla Neufillea.** Pl. cl.

**Cult.** A light rich soil will suit the species of *Feuillea*; and cuttings of them will root readily under a hand-glass, in heat. They are well fitted for training up rafters in stoves.

**Lin. syst. Diòécia, Monàdelphía.** Flowers dioecious. Male. Calyx 3-lobed (f. 1. a.). Petals 5, joined into a 5-parted rotate corolla (f. 1. b. c.). Stamens 5 (f. 1. c.); filaments flat, connected at the base; anthers 1-celled, adnate to the tops of the filaments. Female. Tube of calyx long, turbinate; limb 5-
lobed. Corolla as in the male. Styles 3, spreading, bifid at the apex. Fruit long, turbinate, fleshy, having a circular line at the apex, formed from the vestige of the calyx, opening by 3 valves at the top, 3-celled; the rind solid: central placenta fleshy, large, trigonal; cells bivolute. Seeds ovate, margined by a foliaceous wing (f. i. e. d.), exalbimous. Embryo inverted.—Smooth, climbing, Indian plants. Leaves alternate, petiolate, exstipulate, ovate-lanceolate, coriaceous at the base, acuminate, quite entire. Tendrils axillary. Peduncles also axillary and racemose. This genus, from the general form of the fruit, is like the genus Couratari, but from the characters it is allied to Fœillea. The interior fabric of the seeds is unknown.

Sect. I. Zanonia (see genus for derivation). Blum. 1. c. Cells of fruit 2-seeded. Fruit elongated, somewhat tetragonal.

1. Z. indicæ (Lin. spec. 1157.) leaves elliptic, acute, rather cordate at the base; racemes axillary. ḥ.  ɴ.  S. Native of Malabar, Ceylon, and Java. Blum. 1. c. Penivaralli, Rheed. mal. 8. t. 47 and 48.

Indian Zanonia. Pl. cl.

Sect. II. Alsoximtra (from alos, aloe, a grove, and μερα, mitra, a girdle; the plants grow in groves and entwine round the trees by means of ring-like tendrils.). Blum. 1. c. Cells of ovarium many-seeded. Fruit hemispherical, truncate at the apex, or elongated.

2. Z. macrora (Blum. 1. c.) leaves ovate-elliptic, acute, rounded at the base; racemes axillary. ḥ.  ɴ.  S. Native of Java, on the mountains of Parang.

Large-fruited Zanonia. Pl. cl.

3. Z. sarcophylla (Wall. pl. rar. asiat. 2. p. 28. t. 132.) leaves trifoliolate; leaflets thick, fleshy, ovate, obtuse, quite entire. ḥ.  ɴ.  S. Native of the East Indies, in sterile exposed situations along the banks of the Irawaddi. The plant climbs by means of simple and slender tendrils. The leaves are of a pale glaucous colour. Flowers small, very numerous, forming ample, greenish, nodding panicles. The different sexes are produced in distinct plants.

Fleshy-leaved Zanonia. Shrub cl.

4. Z. clavigera (Wall. 1. c.) smooth; leaves trifoliolate; leaflets oblong, acuminate, quite entire; fruit large, clavate. ḥ.  ɴ.  S. Native of Silhet, where it is called in the Bengalee language Kishnobra. The fruit is 3 inches long, and as thick as a thumb.

Club-bearing Zanonia. Shrub cl.

5. Z. angulata (Wall. 1. c.) smooth; stem angular; leaves simple, somewhat hastately lanceolate, coriaceous at the base; fruit large, clavate. ḥ.  ɴ.  S. Native of Silhet. The fruit is as long as a finger, and very thick.

Angular-stemmed Zanonia. Shrub cl.

6. Z. cissoides (Wall. 1. c.) stem filiform, angular; leaves pedate, with 5 or 7 leaflets; leaflets lanceolate, acuminate at both ends, coarsely and cuspidately serrated; petioles and peduncles pilose. ḥ.  ɴ.  S. Native of Nipaul.

Cissus-like Zanonia. Shrub cl.

7. Z. laxa (Wall. 1. c. p. 29.) stem filiform, much branched, bifariously pilose; leaves trifoliolate; leaflets acuminate, serrated, intermediate one lanceolate, lateral ones half cordate; petioles and peduncles pilose. ḥ.  ɴ.  S. Native of Silhet.

Loose Zanonia. Shrub cl.

8. Z. heterospé̆ma (Wall. 1. c.) stem filiform, very slender; leaves pedate, with 5 leaflets; leaflets lanceolate, acuminate, serrated; capsule clavate, angular, borne on very long capitate peduncles; seeds scabrous from scales.  h.  ɴ.  S. Native of Mount Taong Dong, near Ava. Capsule chartaceous, trigonal, 8 lines long, with a 3-toothed mouth. The scales on the seeds are elegantly imbricated, and girded by a narrow margin.

Variable-seeded Zanonia. Shrub cl.

Cult. See Fœillea, p. 3. for the culture and propagation of the species.

Tribe II.

CUCURBITACEE. (plants agreeing with Cucurbita in important characters.) D. C. prod. 3. p. 299. Tendrils lateral, stipular. Flowers hermaphrodite, dioecious, or monocious.

III. LAGENARIA (from lagena, a bottle; form of fruit of some of the species). Ser. diss. 1. c. D. C. prod. 3. p. 299.—Cucurbita species of authors.

Lin. syst. Diocèia, Polydélphie. Calyx campanulate; segments subulate or broadish, shorter than the tube. Corolla white; petals obvolute, rising from beneath the margin of the calyx. Male. Stamens 5, in 3 parcels, the fifth one free. Female. Style almost wanting; stigmas 3, thick, 2-lobed, granular. Fruit 3-5? celled. Seeds obvolute, compressed, 2-lobed at the apex, with tumid margins. Flowers monocious.

1. L. vulgâris (Ser. mss. ex D. C. prod. 3. p. 299.) plant musky scented, clothed with soft pubescence; stems climbing; tendrils 5-4-eleft; leaves cordate, nearly entire, biglandular at the base, pilose, rather glaucous; flowers monocious, stellate, spreading much, in fascicles; connexives of anthers beset with oblong-ovate, acute papillae; fruit pubescent, but when mature quite smooth; flesh white, edible. ḥ.  ɴ.  H. Native within the tropics. Cucurbita lagenaria, Lin. spec. 1484. Sieb. hist. 1. t. 69.—Rumph. amb. 5. t. 144.—Mor. hist. 2. p. 29. sect. 57. 1. s. 1. 2, 3. Flowers large, white. Fruit shaped like a bottle; when ripe of a pale yellow colour, some near 6 feet long, with a roundish bottom and a neck; the rind becoming hard, and being dried, contains water; it is then of a pale bay colour. The bottle-gourd is called Charrab by the Egyptians. The poor people eat it, boiled with vinegar, or fill the shells with rice and meat, thus making a kind of puddling of it. It grows in all parts of Egypt and Arabia, wherever the mountains are covered with rich soil. In Jamaica and many other places within the tropics, the shells are generally used for holding water or palm wine, and serve as bottles. The pulp of the fruit is often employed in resolutive poultices; it is bitter and purgative, and may be used instead of colocynth.

Var. a, goîrda (Ser. mss. ex D. C. l. c.) fruit unequally biventricose.—Moris. hist. sect. 1. t. 5. f. 1. Dodon. pempt. 688. f. 1. Bottle gourd. Gourde des pélerins.

Var. β, gourdîrda (Ser. l. c.) fruit ventricose at the base, neck oblong.—Rumph. amb. 5. p. 398. t. 144. Braam. icon. chin. t. 17. Commonly called Gougearde.

Var. γ, depresseïa (Ser. l. c.) fruit globosus, depressed.

Var. ζ, turbiníta (Ser. l. c.) fruit somewhat campanulated pear-shaped. Mor. hist. sect. 1. t. 5. f. 2. Dodon. pempt. t. 669. f. 1.

Var. ε, clavíta (Ser. mss.) fruit obovate-oblong, club-shaped.

—Moris. hist. sect. 1. t. 5. f. 3. Dodon. pempt. 669. f. 2. Gourde trompetette, Gourde massue, or Trumpet gourd.

CUCURBITACEÆ. III. LACENARIA. IV. CUCUMIS.

List of Melons.

Var. α, reticulatus (Ser. in D. C. prod. 3. p. 300.) fruit roundish or oblong, with a grey reticulated rind.—Blackw. herb. t. 329. The following sorts of melons belong to this variety:—

1 Beechwood melon. This is an excellent, early, greenish yellow kind, with a netted rind and a greenish-white flesh, of a middle size.

2 Melon maraicher. The flesh of this sort is very thick and watery; hardly sweet-scented.

3 Melon de Honfleur. A late melon, with a thin yellow rind, and pale red sugary flesh. It is of inferior quality but large in size.

4 Melon des Carmes. A well-flavoured large fruit, with a thick orange rind, and juicy sugary pulp.

5 Melon de Langeais. A middle-sized, ribbed fruit, with orange-coloured, sugary, sweet-scented flesh.

6 Melon sucrin de Tours. Fruit large, with firm, sugary, orange-coloured flesh.

7 Sucrin à chair blanche.

8 Sucrin à chasssis.

9 Sucrin vert.

10 Sucrin à petits grains.

11 Sucrala. A late green middle-sized netted melon.

Var. β, Cantaloupe (Ser. in D. C. prod. 3. p. 300.) fruit large, with broadly ribbed, and furrowed, warty, thick rind. The following sorts belong to this variety.

1 Early Cantaloup. A deep-furrowed, early, middle-sized kind, with white, deeply-furrowed, thin skin; and orange-coloured flesh, not very highly flavoured. It sets well, and is a great bearer.

2 Silver cantaloup. Cantaloup argenté. A shallow-furrowed, middle-sized, fruit, and before it is full grown is mixed with silver and green.

3 Large black Holland cantaloup. Cantaloup gros de Hollande. A large fruit, with green, furrowed, thin rind: and red rather coarse flesh.

4 Hybrid cantaloup. A small good early fruit, with a whitish rind and red pulp.

5 Montagu cantaloup. This is a variety produced from the Italian green-fleshed and the smooth scarlet-fleshed cantaloup. A middle-sized, early good fruit, with a thick, yellow, furrowed rind and pale red flesh, which is soft and juicy, and completely melting in the mouth.

6 Netted cantaloup, or White-seeded cantaloup. This is a very juicy, highly-flavoured, small fruit, with a thin, netted, yellow rind.

7 Orange cantaloup. A small, round, pale yellow, netted fruit. The flesh, when just fit for cutting, is orange; but when ripe it is more red. In respect to flavour, it is excelled by none of the melon tribe, being juicy, sugary, and rich. The plant is a free grower, an early setter, and a great bearer.

8 Black rock cantaloup. A large late melon, with a thick dark green rind, and salmon-coloured flesh. It is juicy, but not very highly flavoured.

9 Carobceded rock cantaloup. Very like the black rock, as to colour and flavour, but differs in being cheese-shaped.

There are a small and a large kind of this; the smaller kind is the best.

10 Lee's rock cantaloup. Rather long than round, and more green than black. Much the same in flavour as the preceding.

11 Scarlet-fleshed cantaloup. A middle-sized early good fruit, with a thick yellow rind and red sweet flesh. It is particularly high flavoured.

Ribbed Gourd. Pl. cl.

3 L. ? hispida (Ser. l. c.) greyish, pilose; leaves cordate, 5-angled, acuminate, denticulated, beset with pedicellate glands beneath; stem and petioles densely hispida; flowers densely clothed with ferruginous hairs. O. F. Native of Japan and the East Indies. Cucurbita hispida, Thunb. fl. jap. p. 322. and Willd. spec. 4. p. 608. Walsh of the Indians. Perhaps only a variety of L. vulgaris.

Hispid Gourd. Pl. trailing.

4 L. ? idiota (Ser. l. c.) leaves cordate, cuspidate, absolutely 3-lobed, pubescent, biglandular at the base; lateral lobes very short and cuspidate; fruit pear-shaped. O. F. Native of Guinea and the East Indies. Cucurbita idiota, Willd. spec. 4. p. 607. Blum. bijdr. p. 390. Labu-eeyer and Kukuk of the Hindoos. Perhaps only a variety of L. vulgaris. In India the fruit of this plant is held in great veneration by the Hindoos, in their religious ceremonies.

Worshipped Gourd. Pl. trailing.

Cult. See Cucurbita, p. 41. for culture and propagation.

LIN. SYST. Dioecia, Polypodiphila. Calyx tubularly campanulate; segments subulate, hardly the length of the tube. Petals hardly joined together or to the calyx.—Male. Stamens 5, in 3 parcels.—Female. Stigmas 3, thick, bipartite. Fruit 3-6-celled. Seeds ovate, compressed, not marginate. Flowers monocoeous or hermaphrodite, yellow.

1 C. melo (Lin. spec. 1486.) stem trailing, scabrous, cirsiferous; leaves roundish, angular, petiolate; male flowers having the tube of the calyx rather ventricose at the base, and rather dilated at the apex; stamens inclosed; anthers shorter than their connectives; the hermaphrodite flowers with the anthers as in the males; stigmas 3-4, shortly 2-lobed; fruit ovate or sub-globose, 8-12-furrowed; flesh sugary, yellow, red, or white. O. F. Native of Asia. Called rhetmou by the Hindoos; Melon, Eng. and Fr.; Melone, Germ.; Melleone, Ital.

The melon is a tender annual, producing one of the richest fruits brought to the dessert, and has been cultivated in England since 1570, but the precise time of its introduction is unknown. It was originally brought to this country from Jamaica, and was, till within the last fifty years, called the musk-melon. The fruit, to be grown to perfection, requires the aid of artificial heat and glass throughout every stage of its culture. Its minimum temperature may be estimated at 65°, in which it will germinate and grow; but it requires a heat of from 75° to 80° to ripen its fruit, which, in ordinary cases, it does in 4 months from the time of sowing the seed.

Varieties.—There are numerous varieties, many of which, especially those raised from seeds brought from Italy and Spain, are not worth cultivating. The best sorts are included under the name of Cantaloups, an appellation bestowed on them from a seat of the Pope near Rome, where this variety is supposed to have been originally produced. The general character of the Cantaloups is a roundish form, rough, warty, or netted outer rind; neither very large in fruit or leaves. The Romans, an Italian sort, is next in esteem, are generally oval-shaped, regularly netted; the fruit and leaves middle-sized, and the plants great bearers. Many varieties of both these sorts, however, that were formerly in esteem, are now lost, degenerated, or supplanted by others of Spanish or Persian origin. The following is a descriptive list of the sorts.
12 Italian green-fleshed. A middle-sized early good fruit, with a thick yellow rind and green flesh; in flavour both rich and sweet.
13 Italian green-fleshed cantaloup. A large thin-skinned lemon-coloured and lemon-scented fruit, of excellent flavour, but not a great bearer.
14 Egyptian green-fleshed. A middle-sized early good fruit, with a thin white netted skin and green flesh; in flavour resembling the preceding.
15 Dutch green-fleshed. An indifferent sort.
16 Crimean green-fleshed. A useless late fruit, of middling size, with a thin green skin and pale red flesh.
18 Green-fleshed Masulipatam. A very small and excellent early sort, with green skin and green flesh.
19 Green-fleshed Valparaiso. Not very good.
20 Red-fleshed Valparaiso.
21 Dutch rock. A rather large good fruit, with a thick yellow rind, and orange-coloured flesh.
22 Early rock. A good early fruit.
23 Golden rock. A middle-sized fruit, with a thick yellow rind and pale red flesh, of excellent flavour.
24 Scarlet rock.
25 Silet rock. A large late fruit, with a thick yellow rind, and pale red flesh, which is juicy, sweet, and well-flavoured.
26 Netted scarlet-fleshed. A good sort.
27 Smooth scarlet-fleshed. A middle-sized fruit, of excellent flavour. The rind is thick, smooth, and yellow, and the flesh orange-coloured.
28 Windsor scarlet-fleshed. A rather large, excellent-flavoured, late kind, with thick green rind, and salmon-coloured flesh.
29 Lee's Romana. A middle-sized, longish, shallow-furrowed fruit. Rind hard, partly netted, and pale yellow: the flesh full yellow and pretty high flavoured, but not very juicy.
30 Large netted Romana. The largest of the Romanas, regularly netted all over, and shallow-furrowed, often attaining a large size. Rind hard and pale yellow, the flesh full yellow, but not very juicy: very high-flavoured, if eaten sharp ripe.
31 Fair's Romana. A small oval fruit, the rind greenish yellow when ripe, and the flesh a pale yellow, not very juicy; but well-flavoured and agreeable.
32 Early Polignac. An early rich middle-sized fruit, with a thick yellow rind, and pale red flesh. It is in frequent cultivation.
33 Portugal. There are two varieties of this kind, a small and a large sort; they are noted as good bearers and early.
34 Sweet Italian. A large orange-coloured sort, of moderate quality.
35 Netted succado. A middle-sized late green-skinned sort.
36 Small Levant. A middle-sized sort, with a thick green skin and pale red flesh. Not of good quality.
37 Smooth yellow-fleshed Valparaiso. A middle-sized, late, green, thin-skinned sort; the flesh white, of moderate flavour.
38 Brasilian. An inferior middle-sized sort, with thin green skin and orange-coloured flesh.
39 Melon d'été d'Odesse. A rather large, later, indifferent fruit, with thin orange skin and white flesh.
40 Melon d'Olor. A very small fruit, with yellow skin and white flesh, of good quality.
41 Netted French melon. A rather large late fruit, with a thick yellow rind and yellow flesh, of bad quality.
42 Nutmeg. A late green, thick-skinned sort, with pale flesh.
43 Queen Ann's melon, early queen, or queen's pocket melon. A very small fruit, with ornamental striped thin skin, and white flesh.
44 Carthagenia. A large high-flavoured fruit, with a thick orange-coloured rind and pale red flesh.
45 Cassabar. A large late fruit, with green thin skin, and white flesh.
46 Cephalaria. A large oblong fruit, with thin yellow skin and green flesh, of tolerable flavour.
47 Château. A large fruit of little use; the skin is thick and yellow, and the flesh pale red.
48 Gahoon. A large late fruit, of little value; with yellow skin and yellow flesh.
49 Geree, ostrich egg. A middle-sized late fruit, of excellent flavour: the skin as well as the flesh is green. The plant is rather tender.
50 Groce Prescott fond blanc. A large late fruit, with a thick yellow rind, and orange-coloured flesh.
51 Petit Prescott. Fruit depressed, crowned at the top; ribs warted: flesh delicious.
52 Cantaloup natif d'Allemagne. An early fruit, with a greenish-yellow smoothish rind, but not of good quality.
53 Cantaloup bott de Siam. Fruit very much depressed, with a dark green rind, full of warted ribs.
54 Hardy ridge. A middle-sized late fruit, with a thick yellow rind and red flesh, of good flavour.

A list of melons which are hardly known; but none of them are perhaps worth cultivation.

1 De Andalousie. 2 Cantaloup à chair verte. 3 Cantaloup à fond noir. 5 Cantaloup Galleux. 6 Chili musk. 7 Crimeau. 8 Citron. 9 D'Espagne. 10 Fagis. 11 Fin hatif. 12 Golden egg. 13 Grand Mogul. 14 Green Spanish oval. 15 Gros Galleux à chair verte. 16 Hardy scarlet-fleshed. 17 Highbore. 18 D'Hiver. 19 Large Astrachan. 20 Levant. 21 Melon gris des Carmes. 22 Melon of Honda. 23 Melon of Jaffa. 24 Melon Turc. 25 Madeira. 26 Mendoza. 27 Le Mogul. 28 De Beron. 29 Pine apple or Melon d'Ananas. 30 Musk melon. 31 Carthagenia musk melon. 32 Murray's pine-apple. 33 Noir de Hollande très gros. 34 Turkish melon. 35 Valentin or winter melon. 36 Wynestay. Var. γ, Maltesei (Ser. in D. C. prod. 3. p. 300.) Fruit with a smooth thin rind. This variety is divisible into two parts, as Maltese Melons and Persian Melons.

* Maltese melons.

1 Melon de Malte blanc or Melon de Malte à chair blanche. An early middle-sized ovate-oblong fruit, with white watery sugary flesh.
2 Melon de Malte jaune. Flesh of fruit orange-coloured, sweet-scented.
3 Melon de la Morée ou de Candie, or Melon de Malte d'hiver. This kind is cultivated in various countries bordering on the Mediterranean sea, and particularly in the orange gardens at Hiers, near Toulon, whence its fruit is sent to Paris. The skin is thin; the flesh white, firm, sugary, and juicy; not rich, but pleasant. The shape oval, size about a foot long and eight inches broad; of a dark green colour. This fruit is regularly imported, and may be had in the fruit shops from September to January.

** Persian melons.

1 Darce. A good-sized fruit; skin thin and green; flesh white, high-flavoured. A late fruit.
2 Dampiska melon. An excellent, late, rather large fruit, of nearly a cylindrical form, and netted; rind thin and yellow when ripe; flesh green, quite melting, and of excellent flavour. The fruit will keep, if hung up by its stalk, for some time.
3 Large germek. An excellent early green-skinned sort, of considerable size; flesh green.
CUCURBITACEÆ. IV. CUCUMIS.

4 Small gherkin. This is much smaller than the last-named sort; the skin is yellow and the flesh green.
5 Goongab. A middle-sized late fruit, with yellow rind and white flesh. A useless sort.
6 Green Hoosaine. A middle-sized late sort, of good quality; rind thin, green; flesh white.
7 Striped Hoosaine. A very good late sort, with greenish-yellow rind, and white flesh.
8 Kasan sugar melon. A good sort.
9 Keiseng. This is said to be one of the best Persian melons; the skin is thin, pale yellow, and red, and the flesh white.
10 Kurcheing. A very good sort, of considerable size; the skin is lemon-coloured, and the flesh white.
11 Melon of Erivan.
12 Melon of Gherga. A middle-sized good fruit, with yellow skin and red flesh.
13 Melon of Nukshevan. This is an excellent late kind; the skin is yellow, and the pulp white.
14 Melon of Nussarabad.
15 Melon of Seen. A middle-sized fruit of indifferent quality. It is a late sort, with yellow rind and green flesh.
16 Green Persian. A fruit of indifferent flavour.
17 Oldaker's Persian. A fruit of considerable size but no merit; the rind is orange-coloured, and the flesh green.
18 Sir Gore Ouseley's Persian. A large fruit of good quality; the skin is yellow and the flesh white.
19 Sweet melon of Isphahan. This is said to be one of the very best melons. It grows to a large size; the skin is yellow and the flesh green, crisp, sugary, and rich in taste.
20 Talibee melon.
21 Tehran melon.
22 Salonica. A round fruit, with a gold-coloured rind, and white flesh; improves in flavour and richness till it becomes quite soft; consistence of its pulp nearly that of a water melon, and very sweet.

On the degeneracy of the larger varieties of Persian melons.—Mr. Knight thinks that it would be strange if every large and excellent variety of melon did not degenerate, under our ordinary modes of culture. For every large and excellent variety of melon, must necessarily have been the production of high culture and abundant food; and a continuance of the same measures to it, in its highly improved state, must be necessary to prevent its reverting in successive generations from that state.

Abundant food, it is true, is generally, perhaps always, given by the British gardener to his melon plants: but sufficient light, under the most favourable circumstances, can only be obtained during a part of the year, and a sufficient breadth of foliage to enable the melon plant properly to nourish a fruit of large size and rich saccharine quality, so that it may obtain the highest state of growth and perfection which it is capable of acquiring, has rarely, and probably never, been given in any season of the year, by any British gardener. Mr. Knight has cultivated the Sweet Isphahan melon, and found it a very superior variety. He has cultivated this variety generally in brick pits, surrounded by hollow walls, through which warm atmospheric air at all times enters abundantly; putting each plant in a separate large pot, and suffering it to bear one melon only; but the fruit sets sufficiently well in a common hot-bed. The rind of the Isphahan melon, being very soft and thin, the fruit is apt to sustain injury on the lower side; they should be raised above the ground a little by some means while young, so as the air may pass under them. When seeds of the Isphahan melon are only wanted, it is quite time enough to sow in the beginning of April, so that the fruit may ripen in August. Very valuable varieties of melons may be obtained, for one generation at least, by cross breeding among the smaller and more hardy varieties of green and white-fleshed melons and the large Persian varieties. It is generally supposed that the offspring of cross-bred plants, as of animals, usually present great irregularity and variety of character; but if a male of permanent character and habits, and, of course not cross-bred, be selected, that will completely overrule the disposition to sport irregularly in the cross-bred variety; alike in the animal and vegetable world, the permanent habit always controlling and prevailing over the variable. The finest varieties of melon are usually supposed by gardeners to be fruits of as easy culture as the pine-apple, but experience has led us to draw a contrary conclusion. If the leaves of the melon plant be suddenly exposed to the influence of the sun in a bright day, which has succeeded a few cloudy days, for a short time only, they frequently become irreparably injured. If the air of the bed be kept a little too damp, the stems of the plants often canker, and the leaves and stalks sustain injury in the common hot-bed; and, if the air be too dry, the plants, and consequently the fruit, are injured by the depredations of the red spider.—Loud. gard. mag. vol. 7. pp. 186, 187, 188.

In the cultivation of the melon, Knight observes, "it is a matter of much importance to procure proper seed. Some gardeners are so scrupulous on this point, that they will not sow the seed unless they have seen and tasted the fruit from which they were taken. It is proper, at least, not to trust to seeds which have not been collected by judicious persons. Some make it a rule to preserve always the seeds of those individual specimens which are first ripe, and even to take them from the ripest side of the fruit. A criterion of the goodness and probable fertility is generally sought by throwing them into a vessel containing water; such as sink are considered as good, and likely to prove fertile, and those that float imperfect. It is remarked of seeds brought from the Continent, that they must have more bottom heat, and the young plants less water, than are necessary for seeds ripened in this country, or young plants sprung from these."

The culture of the melon is an object of emulation among gardeners, and the fruit of the best sorts have a peculiarly rich flavour, thought by some to bear some resemblance to that of the pine-apple. "Ripe fruit," Abercrombie observes, "may be had by forcing at any season, but the main crops, raised for the general demand, are seldom cut, at the earliest, before May, and the last succession mostly ceases to yield fruit after October." "To ripen the largest fine kinds," M'Phail observes, "is a great an atmospheric heat, and a bottom heat to its roots also, is required as is sufficient to ripen the pine-apple in this country; but as the melon is produced from an annual plant, the seeds of which must be sown every year, it requires a different mode of culture. Different methods of culture, and various kinds of earth and of manures have been recommended and used successfully in rearing of melons. The great thing, after planting, is to give them plenty of atmospheric heat, and a sufficiency of external air, and water. Those methods which are most simple and the least expensive, and best calculated to assist in making a suitable climate for the melon to grow in and ripen its fruit well, should be preferred." Soil.—Abercrombie says "The melon will succeed in any unexhausted loam, rich in vegetable rudiments, with a mixture of sand, but not too light. The following is a good composs: two-thirds of top-sift earth from a sheep common, adding sharp sand, if the earth contains little or none, till half is sand; one-sixth of vegetable mould; and one-sixth of well-consumed horse-dung. Or, if the earth is not obtained from a pasture, rotted sheep-dung may be substituted for the last. The ingredients should have been incorporated and pulverized by long previous exposure and turning over. The compost should be dried under shelter before it is used, and warmed in the frame.
for potting," M'Phail says, "Melons will grow and produce fruit of a good flavour, if they be planted in any kind of earth, not of too light a texture, whether it be taken from a quarter of the kitchen garden or from a corn-field, mixed well with good rotten dung; but earth of a loamy nature is the best, because it retains moisture longer than lighter earth. Earth, dug from the surface of a common, where sheep and cattle have long been pastured, is excellent for the melon. It should be broken well, and lie a few months before it is used, and if it be exposed to a winter's frost it will do it good. This sort of earth, if it be taken from the surface of the common, will require no manure the first year of using. I would here mention that unless the earth which I used for the melon plants was very strong, I made it a practice, when the melon-beds were wholly earthed up, to tied the surface all over, which makes the earth retain its moisture longer than if it were left loose."

Earth for melons, according to Nicol, "may be thus composed: one-half strong brown loam from a pasture, a quarter light sandy earth, an eighth part vegetable mould of decayed tree leaves, and an eighth part rotten stable-yard dung. The mould for both cucumbers and melons should be well incorporated, should be exposed to frost, and be frequently turned over to ameliorate." It appears from a passage in Morier's second journey into Persia, p. 147., that pigeons' dung has from time immemorial been much sought after for manuring melons. Immense pigeon-houses are built on purpose to collect it, and when there is a dearth, as melons produce the earliest return of food, every one is eager to cultivate them, and that kind of manure, being then in great demand, sells very high. During the famine in Samaria, mentioned in 2 Kings, ch. vi, it is said to have sold for five pieces of silver the cub. A correspondent in the gard. mag. 2, p. 404. on melon compost, and on the influence of soil on Hydrangea Hortensis, has always used for his melons the compost to which the Dutch so strongly adhere, viz. one-third strong hazel loam, one-third scoring of ditches, and one-third rotten dung, exposing the mixture two years to the influence of the summer and winter, to evaporate what noxious qualities may lurk in the earths: for it is well known, that in proportion to the degree of salt of iron, it will be proportionably sterile. He had often observed the leaves of his melon plants turn yellow, occasionally plants died, for which he could not account; he suspected iron, as it pervaded his district, to be the cause; but as a magnet would not take up any of the compost, his attention was diverted from that point. Similar results in future seasons again called his attention to it, and he added lime, to correct the sulphate of iron, if any; but he lost his whole crop, which he fancied by the application of the lime. As during winter a red oxide filtered from the compost heap, he again felt certain of the presence of iron. He submitted the compost to the test of burning, and having by that means got rid of the superabundant carbon, the magnet immediately detected the iron. He changed his soil, and has never lost since any melon plants. The experiment proves that the old test of the loadstone may be defeated by the presence of other adherent matter; for though it was inactive over the cold soil, it acted in full force upon the soil when, by roasting, it had discharged its gas. While a profitable experiment resulted on the one hand, a great amusement occurred on the other, with some greenhouse plants. He mixed the compost fresh from the ditch with water, and found a precipitation of iron. He used the soil and water to Hydrangea Hortensis, a cutting from the common pink variety, and it so altered the pink colour of the flower to purple, as to form a new plant. He applied the same to other plants, in some of which it altered the colour of the flowers, but in others it had no effect.

Estimate of sorts.—Examine the list. The cantaloupes are in the highest estimation for quality and neatness, although not uniformly such great bearers as others in the list.

Time of beginning to force.—" From the time of sowing, ripe fruit may be cut in about fifteen weeks, as an average period; when many short and winter days fall in the course, it may last eighteen weeks; but when the forcing is not commenced until the days are nearly twelve hours long, and continually lengthening, ripe fruit is sometimes cut in ten weeks. The period also depends upon the sort. Little time is gained by beginning excessively early. The early and main crops are commonly originated from the middle of January to the first week of February, the latter or succession crops at the beginning of March; and late crops, intended to fruit at the end of summer, in the middle of April. M'Phail and Nicol sow in January. " The latter says, "I formerly cut melons for three years successively on the 15th, 12th, and 10th of May, and never sowed before the last week of January or 1st of February. In 1788, when at Rainham Hall in Norfolk, I sowed melons on the 12th of March, and cut ripe fruit on the 20th of May. The kind was the Early golden cantaloup. This shows how little is to be gained, or rather how much may be lost by early forcing."

Forming the seed-bed.—The plants may be originated in a cucumber-bed, and this is the general practice; but Abercrombie prefers a separate bed, built a slight degree higher than for the cucumber at the same season, and adapted to a one or two-light frame, according to the quantity to be raised." Nicol raises the melon almost exactly in the same manner as he does the cucumber.

Choice of seed.—" Seed under the age of two years is apt to run too much to vine, and show more male than female blossoms; but new seed may be mellowed by being carried in the pocket a fortnight or more, till the heat of the body has dried and hardened it. Seed 20 years old has been known to grow and make fruitful plants, but seed that has been kept 3 or 4 years is quite old enough, and less likely to fail than older." M'Phail says it is best not to sow melon seed till it be 2 or 3 years old. It cannot be too old if it be sound and grow well. Nicol says, "I have sown melon seeds 20 years old, from which I have raised very healthy and fruitful plants." Kal. p. 396. Miller and Nicol say young melon seeds may be worn in the pocket, near the body, for several months previous to sowing, which has the effect of fully maturing them. " If seeds of the last season," Nicol observes, "be sown without taking this precaution, or something similar, the plants will not be fruitful, but will run much to vine, and show chiefly male blossoms."—Kal. p. 396.

Sowing.—Abercrombie says, "Having moulded the bed, and proved the heat, sow in pans 3 inches or pots 4 inches deep, rather than in the earth of the bed. Sow a second portion in 5 or 7 days, to provide against failure. Do not at once plunge the pots to the rims."—Pr. gard. p. 108.

Treatment till removed to the fruiting-pit.—" As soon as the plants appear, give air cautiously, guarding the aperture with matting at night and on frosty or gloomy days. At favourable opportunities wipe the condensed steam from the glasses. When the seed-leaves are about half an inch broad, prick the plants into small pots, 5 inches in diameter, 3 in each pot, giving a little aired water just to their roots, then plunge the pots into the earth of the hot-bed partially or to the rims, according to the heat. Admit fresh air every day in moderate weather, at the upper end of the lights, raised an inch or two, according to the temperature of the external air, more freely when sunny than cloudy, shutting closer or quite close as the afternoon advances towards the evening, or sooner, if the weather changes cuttingly cold, and cover the glasses every night with mats, and uncover in the morning, as soon as the sun is high enough to reach the
frames. Give occasionally a very light watering, when the earth appears dry. As the plants advance into the first rough leaves, the first runner-bud in the centre should be stopped, by cutting or pinching the top off, close to the first or second joint, an operation which strengthens the plants, and promotes a lateral issue of fruitful runners. Be careful to support a regular tenor of heat in the bed, by laying first an outward casing of straw-litter round the sides, to defend it from the weather; afterwards, if the heat declines, remove the above casing, and apply a moderate lining of hot dung to one or more of the sides. In matting at night, be careful not to drive the rank steam of the linings into the beds, by letting the ends of the mats hang down.”

Fruiting-bed.—Form it as directed for the cucumber-bed, but 6 inches deeper. M’Phail says, “4 feet high, and after it has stood about a week, treat it down, and make it level, and set the frames upon it.”

Moulding the bed.—Abercrombie directs to “mould it by degrees to 8, 10, or 12 inches’ depth, first laying the compost in little hills of that thickness, one under each light, with the intervals earthed only 2 or 3 inches for the present, till the general heat is moderated.” M’Phail lays in, under each light, a small hill of earth about 1 foot high.

Planting.—When the earth of the hills is warmed by the heat of the bed, and the plants have leaves 2 or 3 inches broad, or have begun to push lateral runners, turn them out of the pots, with the ball of earth entire; set a ball containing one plant in the middle of each hill, inserted clean over the ball; or set at most 2 plants under the centre of a large light. After planting, give a gentle watering over the hills and round the roots, avoiding to wet the shanks of the plants; shut down the glasses close, till the heat and steam arise, then give air moderately.

Extend a slight shade over the glasses in the middle part of warm summer days, if the plants shrink or flag their leaves before fully rooted in the hills, which will be in 2, 3, or 4 days after planting.

Temperature.—“The melon requires a minimum heat of about 65° from the time of germination till the fruitification, and the heat of about 75° to fruit in.”—Abercrombie. M’Phail, as appears from the table in his “Gardener’s Remembrances,” kept his melon and cucumber frames at the same temperature; stating, that if any person kept melon or cucumber plants in the same degrees of heat, they will not fail of success. Nicol’s medium heat for melons is 70°. The proper temperature must be kept up by repeated linings, at least till the middle of July.

After that, sun-heat may suffice to ripen the crop. Till this season the greatest care is necessary not to burn or overheat the plants. M’Phail says, “examine daily with your hand the heat of the bed, pushing your fingers into the dung immediately under the hills of earth in which the plants grow; and if you find the heat likely to be too powerful, pour cold water all round the bottom of the hills of earth, to lower the heat of the bed. Remember this must be daily attended to till the heat of the bed be so declined in the middle, that the roots of the plants be in no danger of being hurt by the heat of the dung under them. In case this necessary precaution has been neglected, till the heat immediately under the stems of the plants has become too hot, pour plenty of water at 80° round about the sides of the hills in which the plants grow, and among the stems of the plants, which will bring the earth and dung immediately under the plants to the same degree of heat as the water which is poured into it. When the heat in the middle of the bed becomes so cool that there is no fear of its being too great for the roots of the plants, watering that part of the bed to keep the burning heat down of course must cease, and as the roots of the plants extend, earth may be added to the hills. As soon as the heat of the bed declines, linings must be applied to it, which will set it into a fresh fermentation, and then the surface upon the bed must be examined occasionally, by pushing the hand into it in different parts, and when a burning heat is felt, pour in some water as before directed. In this way you should persevere, still keeping a strong heat in the linings. Remember that the surface of the bed all round about the hills should be left uncovered with earth, and the dung be loosened occasionally, to let the heat rise freely to nourish the plants.” In July, “melons will do without heat in the linings, but I found by experience that they do best by keeping a heat in the linings all the summer. If a heat be kept on constantly in the linings, and the plants watered sufficiently, they will continue to produce fruit till the middle of October.”

Air.—“As long as weak steam is perceived to rise from the bed, leave an aperture, even at night, for it to escape; guarding against the influx of cold air by a curtain of matting. Admit fresh air to the plants by tilting the glasses more or less at the most favourable hours in a dry day. After the bed has come to a sweet heat, shut down close at night. As the fruit enlarges, it becomes more necessary to seize every proper opportunity of admitting air; raising the lights from 1 to 4 inches, according to the season, the heat of the bed, and temperature of the external air, shutting close if that should turn cold, and always timely towards evening. As confirmed summer approaches, admit air still more freely. Nicol says, “air should be freely admitted, though not in such quantity as for the cucumbers, which do not require so high a temperature as melons do. In sunshine, however, the mercury in the thermometer should be kept down, by the admission of air to about 80° or 75°,” M’Phail says, “look into your melon-pits in the morning, and if there is a dew on them, standing like beads round the edges of the young leaves, it is a good sign; but if there is no dew on them, in the form I have described, they are not in a very prosperous condition. The air in the frames is not sweet; they either want water or sprinkling of water, or else the heat of the air in the frames is too great in the night. In hot weather melons are better to have air left at them all night, and in very warm weather to take the glasses entirely off in the evening, and put them on again in the morning; by this means the plants will get refreshment from the dew in the night.”

Water.—“After the plants are placed on the hills, give opportune gentle waterings, increasing them as the season and the growth of the plants advance. Nicol says, “Water circumspectly and sparingly while the fruit is setting and young in growth, as too much moisture would make it decay. Take every proper care for watering before the middle of May; in summer the afternoon or evening. Use soft water warmed to the air of the frame, and let as little as possible fall on the setting or new set young fruit; nor much near the main head of the plants, for fear of rotting that part. Shut down the lights after watering for a short time; and if in the morning part, and a strong sun, spread a mat over, to prevent the sun from injuring the plants by acting on the water lodged on the spray of the leaves. As a strong steam will now arise, remove the mats in an hour or two, and raise the glasses at the top, to give vent to the steam and give air to the plants. As the fruit becomes nearly ripe, lessen the quantity of water given, barely keeping the plant from flagging, and withhold water when the fruit begins to turn colour.”

C

CUCURBITACEÆ. IV. CUCUMIS.
Rem. p. 300. Knight, finding that the leaves of melons sustained great injury from the weight of the water falling from the watering-pot, pours the water on the tiles which cover the surface of the bed. See Training.

Earthing.—Perform this operation as directed for the cucumber, after the heat of the dung has become moderate, earthing up by degrees the intervals between the hills, till the depth of the earth becomes equal. Eight or ten inches' depth of earth M'Phail states to be enough for the roots of the plants to run in, provided the bed or fermenting mass beneath be made of leaves of trees, or of dung well prepared; for if the bed under the earth be in a good state, the roots will grow into it, and draw from thence considerable nourishment to the plants. The roots of the melon do not naturally run deep, they extend horizontally not far from the surface, especially in forcing frames, where the moist warm air is more confined than in the open atmosphere.—Gard. Rem. p. 63. In early forcing, leave unfilled up with earth a space of about 7 or 8 inches wide, against the inside of the frames, immediately adjoining the hot linings.

"By this method the heat of the linings do more powerfully warm the air in the frames, than if the earth was made level home to the sides of the boards of the frames to which the linings adjoin. But if melons be not planted earlier than the month of May, this precaution need not be attended to, unless the weather prove uncommonly cold, and but little sunshine."

Training.—As the plants advance into the first runners, 3 or four joints in length, if no fruit be shown, stop them at the third joint, in order that they may produce fruitful laterals; and as the runners extend, train them over the surface of the bed with neat pegs. Many of these runners, as the plant proceeds, will show embryo fruit at the joints; but a great many barren ones are occasionally produced, and hence it becomes necessary to regulate them. Abercrombie says, "cut out the superabundant, unfruitful, or evidently useless shoots, especially the very weak and most luxuriant, for the middle-sized are the most fertile." Nicol says, "melons should be kept moderately thin of vines, though not so thin as cucumbers (the foliage being smaller), which should never be much lopped at one time, as they are also apt to bleed. All bruised, damped, or decayed leaves should be carefully picked off as they appear, and the plants should be kept clear from weeds, or any rubbish that may be conveyed into the frames by wind or otherwise. M'Phail directs to cut out from the melon-frames all superfluous or decaying shoots. Stop shoots a joint or two before the fruit, and also cut off the ends of the long running shoots immediately before showing fruit, if there is a leading shoot coming out by the side of it; for you ought to remember always in pruning melons, that a fruit will not swell well except there be a growing shoot before it; and this shoot, which is called a leader, because it leads or draws the sap from the roots to and past the fruit, should be stopped before a joint, that will, if the plant is in good health, sprout out again. Do not let your plants get too full of leaves, and cut off the oldest and worst leaves first. This ought to be done at least once or twice a week, by which method they will be nearly always in a medium state of thinness, and the plants and fruit will derive advantages which they would be deprived of were they suffered to become over-crowded with leaves and shoots, and then a great many cut out at one time. If melons are of a large kind, no more than one or two should be left on a plant to swell off at one time; if smaller three or four fruit may be left."—Gard. Rem. p. 278. Knight, in an ingenious and philosophical paper on the culture of the melon, states "that his crops of melons failed, because watering over the foliage, pruning, weeding, &c. had removed the leaves, on the extended branches, from their proper position, and these leaves, being heavy, broad, slender and feeble, on long footstalks, were never able to regain it. In consequence, a large portion of that foliage which preceded or was formed at the same period with the blossoms, and which nature intended to generate sap to feed the fruit, became diseased and sickly, and consequently out of office, before the fruit acquired maturity." To remedy this defect, the plants were placed at greater distances from each other, viz. one plant of the Salonica variety, to each light of 6 feet long by 4 feet wide. The earth was covered with tiles, and the branches trained in all directions, and hooked down over them with pegs. They were thus secured from being disturbed from their first position, the leaves were held erect, and at an equal distance from the glass, and enabled, if slightly moved from their proper position, to regain it. "I, however, still found that the leaves sustained great injury from the weight of the water falling from the watering-pot; and I therefore ordered the water to be poured from a vessel of a proper construction, upon the brick tiles, between the leaves without at all touching them, and thus managed, I had the pleasure to see that the foliage remained erect and healthy. The fruit also grew with very extraordinary rapidity, ripened in an unusually short time, and acquired a degree of perfection which I had never previously seen. As soon as a sufficient quantity of fruit, between 20 and 30 pounds on each plant, is set, I would recommend the further production of foliage to be prevented, by pinching off the lateral shoots as soon as produced, wherever more foliage cannot be exposed to the light. No part of the full grown leaves should ever be destroyed; however distant from the fruit and growing on a distinct branch of the plant, they still contribute to its support; and hence it arises, that when a plant has as great a number of growing fruit upon part of its branches, as it is capable of feeding, the blossoms upon other branches, which extend in an opposite direction, prove abortive."—Loud. encyc. gard. p. 648.

Setting.—"As the fruit bears into blossom, you may assist the setting of the fruit, by impregnating some of the female blossoms with the male flowers, as described for the cucumber. The melon, however, will also set naturally, and produce fertile seeds, if the time of fructification fall at a season when the glasses can be left almost constantly open."—Abercrombie. Nicol says, "he has proved experimentally, that melons not impregnated will not swell off so fair and handsome as impregnated ones, and, therefore, considers it more necessary to attend to this operation in melons than in cucumbers. Therefore let nature be assisted in this work, considering that she is more under restraint here than if the plants grew in the open air, where the wind, insects, and other casualities, might be helped."—Kalend. p. 334.

Care of fruit.—"As the fruit increases to the size of a walnut, place a flat tile or slate under each to protect it from the damp of the earth; the slab thus interposed will also assist the fruit to ripen, by reflecting the rays of the sun."—Abercrombie. M'Phail says, "The fruit should lie upon dry tiles. When the fruit is young, it is better to have a gentle shade of leaves, but when it is fully swelled, it should be entirely exposed to the sun." Nicol advises placing the fruit on bits of slate or glass some time before it begins to ripen, as the flavour might else be tainted, but by no means slate or moss the whole surface of the bed, lest you encourage the red spider. Think on the reflection of the sun upon the slates or tiles, in hot weather particularly, and of his additional force in shining through glass. It is more consonant to the nature of the plants that they be trained on the earth. By mossing the surface, the indolent may find a pretext, as it no doubt, in some measure, lessens the labour of watering. But it is wrong to do so, in so far as it harbours and encourages the breeding of various insects, and as the fruit approaches to maturity, taints it with an unpleasant effluvia."
Time of maturation.—“The interval between the setting of the fruit and perfect maturity is generally from 30 to 40 days; but the plants in the same bed, and the vines on the same plant, often show some difference in the time of reaching maturity.”—Abercrombie.

Cutting the fruit.—“Ripe melons are distinguished by their full size; sometimes by turning yellowish, more constantly by imparting an agreeable odour, often by the base of the footstalk, close to the fruit, cracking in a little circle. On these indications, the fruit should be cut before too mellow or dead ripe, that it may eat with a lively sharp flavour. The morning is the time for cutting.”—Melons, Nicol observes, “if allowed to remain on the plant till they be of a deep yellow colour (which many do) lose much of their flavour. They should, therefore, be cut as soon as they begin to change to a greenish yellow, or rather, as soon as they begin to smell ripe. They may lie in the frame for a day or two, if not immediately wanted, where they will acquire sufficient colour. But if they are let remain many days in the frame, they will become as insipid as if they had been left too long on the plant.”

Saving seed.—“The ordinary mode is to request the seeds of particularly fine fruits, of approved sorts, to be returned from table. The best way, however, is to pick some of the best ripe fruit, take out the seed, clean it from the pulp, and let it be well dried and hardened, and then put it up in paper.”—Abercrombie. Nicol says, “wash it very clean, skimming off the light seeds, as those only that sink in water will grow.”—Kal. p. 396. Great care must be taken that the sorts, from which seeds are saved, are genuine and distinct. When different sorts are planted in the same frame, this cannot be the case.

Second crop from the same plants.—“When the fruit of the first crop is off, a second crop may be obtained from the stools, which often proves more productive than the first. If the first crop is taken before the middle of June, the second will come in at a very good time. For this purpose, as soon as the fruit is cut, prune the plant, shorten the vigorous healthy runners at a promising joint. At the same time take off all decayed leaves, stir the surface of the mould, and renew it partially by 3 inches’ depth of fresh compost. Water the plant copiously, shutting down the glasses for the night. Shade in the middle of hot days, and give but little air until the plants have made new radicles and shoots. Afterwards repeat the course of culture above described, from the stage when the first runners are sent out till the fruit is cut.”—Nicol says, “When all the fruit of the first crop are cut, suppose in 3 or 4 weeks, the plants may be pruned for the production of a second crop, equal and perhaps superior to the first. They should be cut pretty much in, in order to cause them to push plenty of new vines, which will be very fruitful, observing always to cut at a joint of some promise, and to thin out all decayed or unhealthy vines, dead leaves, &c. Observe also to cut an inch or two above the joint you expect to push, and then to bruise the end of the stem so lopped with the thumb and finger, which will, in a great measure, prevent it from bleeding. The plants should be shaded from the mid-day sun for a week or ten days, exposing them to his full rays by degrees. Now, also, let the mould in the frame be well watered, in order to put the roots in a state of active vegetation; point over the surface with a small stick, or little wedge, and cover the whole with about 2 inches of fresh mould. This will greatly encourage the plants, and cause them to make new fibres near the surface. At this period air need not be admitted very freely, especially while the glasses are covered, but rather as it were endeavour to force the plants into new leaves. After they begin to shoot, water, admit air, prune, train, and otherwise manage the plants as before directed. If the season be fine, they may yield you a third crop by a repetition of the above rules, coming in in September, which might be very gratifying. I once had 52 full-sized fruit produced in a 3-light frame, a second crop, and two dozen on a third off the same plants, the early golden cantaloupe. Of the first crop 26 fruit, two were cut the 10th of May. Thus, a 3-light box produced, in one season, 102 full matured melons.”

M’Phail says “if you intend to have melons as long as there is a sufficiency of sun to ripen them tolerably well, you had best put linings of warm dung to some of your beds. These, if applied in time and kept on, will cast fresh heat into the beds, and, with other necessary assistance, the plants will grow as long as you want them.”

Plan of obtaining a second crop of melons.—“When the first crop of fruit is nearly gathered, cuttings are taken from the extremities of the shoots which show the most fruit; these are cut off close under the second advanced joint, or about the fifth leaf from the top; the two largest leaves at the bottom of the cutting are taken off, and thus prepared, are inserted in 24-sized pots, two in each pot, in light rich soil, gently shaken down. After being watered, the pots are placed in a 1-light frame, on a hot-bed previously prepared, and plunged in the moderately dry soil, with which it is covered. The frame is kept close and shaded for a few days, and in a week the cuttings will have struck root. The old melon-plants, with the soil in which they grew, are now all cleared out of the frames, fresh soil to the depth of 12 inches put in, and the beds well lined with fresh dung. In 10 days from the time of inserting the cuttings they will be ready to plant out, which is done in the usual way. When the plants have pushed about 14 inches, the end of each shoot is pinched off, to cause them to produce fresh runners, and the fruit which showed on the cuttings will swell rapidly, and in 3 weeks after replanting the beds, abundance of fine fruit may be expected. This way of getting a second crop is far more certain than either pruning back the old plants, or planting seedlings; because cuttings grow less luxuriantly, are less liable to casualties, and are much more prolific.”—Harrison ex Loud. gard. mag. 2. p. 414.

Cultivation of the Persian varieties of the melon.—T. A. Knight (Hort. reg. no. 6. p. 263.) erected a small forcing-house for the exclusive culture of this fruit, and grew them by means of fire heat. This house consists of a back wall, nearly nine feet high, and a front wall nearly 6 feet, inclosing a horizontal space 9 feet wide and 30 feet long. The fire-place is at the east end and very near the front wall; and the flue passes to the other end of the house, within 4 inches of the front wall, and returns back again, leaving a space of 8 inches only between the advancing and returning course of it, and the smoke escapes at the north-east corner of the building. The front flue is composed of bricks laid flat, in order to give a temperate permanent heat, and the returning one with them standing on their edges, the usual way. The space between the flues is filled with fragments of burnt bricks, which absorb much water, and generally give out moisture to the air of the house. Air is admitted through apertures in the front wall, which are 4 inches wide and nearly 3 in height, and which are situated level with the top of the flues, and are 18 inches distant from each other. The air escapes through similar apertures near the top of the back wall. These are left open, or partially or wholly closed, as circumstances require. Thirty-two pots are placed upon the flues, each being 16 inches wide and 14 inches deep; but they are raised by a piece of stone or brick to prevent their coming in actual contact with the flues. In each of these pots one melon-plant is put, and afterwards trained upon a trellis, placed about 14 inches distant from the glass, and each plant is permitted to bear but one melon only. The height from the ground at which the trellis is placed, is such as can be con-
veniently walked under, to discover the appearance of red spiders or other noxious insects; and by this method two, and even three crops may be obtained in one season. Being so liable to burst, Mr. Knight raised the points of the fruit higher than the stems, and not one failed to ripen in a perfect state; they were found to ripen very well hanging perpendicularly, but the Isfahan grew very deformed.

**Late crop on old hot-beds.**—To ripen melons, not earlier than the month of August, Mr. Philp "generally made beds of dung which had first been used for linings to the early cucumber and melon-beds. For this purpose, this kind of dung is better than new dung, because it does not heat violently, and for a considerable time keeps its heat. Leaves of trees make very good melon-beds, but they do not produce heat enough alone for linings; but of whatever materials melon-beds be made, the air in the frames among the plants should be kept sweet and strong, otherwise the plants will not grow freely. It may be known whether the air be sweet or whether it be not, by putting the head in under the lights and smelling it. But it frequently happens to be difficult to bring dung-beds into a requisite state of kindliness for these delicate plants, for if the dung be by any means get and retain too much water, before its noxious vapours pass off by evaporation, it will stagnate and become sour, and until these pernicious qualities be removed, which requires time and patience, the plants will not grow kindly; and besides this, although corrupted, stinking air hinders the growth of plants of the melon kind, it greatly promotes the health and forwards the breeding of different kinds of insects, which feed upon and otherwise hurt fruits and plants, and esculent vegetables of various kinds."

A method of growing the melon, adopted by Mr. Lovell, (Gard. mag. 7. p. 461.) varies in one or two very essential points from any that he has seen practised; first in well bedding and firmly rooting the plants to support a good crop of fruit; second in early setting and preserving the first fruit, and forcing the whole of the plants luxuriantly through the whole of the period necessary for their maturity. To effect this he prepares his bed with dung well watered and fermented, or tan, not wishing such a strong heat as for cucumbers. He sows his seeds in pots, in which the plants remain until they are turned into the hills, leaving only 3 plants in each pot. These he places in the dung, in order to start them as soon as the bed is made up, unless there should be another bed in use at the same time. As soon as the second rough leaf appears, he puts a hill of good melon soil under each light, composed of good loam, and turf, adding a sixth part of good rotten dung, well mixed with the spade, but not sifted. This he waters if dry, and treads in the hills firmly, making a hole in the centre, and turning out a pot of plants with the ball entire into each hole. Should the weather be very warm, he waters them overhead abundantly, and in the space of a fortnight they will have grown to four or five joints each; he then stops them down to three joints. By this time the heat of the bed will have become reduced to such a temperature as to allow of moulding up the plants, well heading in and watering as you proceed. As the plants will at this time be strongly rooted, and in vigorous growth, in the course of three days they will have pushed a strong shoot from each of the three eyes in a horizontal direction, and they will seldom fail of showing fruit at the first joint; you may rely at least on two out of three of these fruits setting. Before the fruit comes to blossom, the bed must be covered 1½ inch thick with dry sand, but mould will do, and do not water the bed any more for at least 3 weeks. This prevents the newly formed fruit from turning yellow and damping off. All shoots that appear, except the three above mentioned, must be removed. As these shoots will show fruit at the first or second joint, if such fruit be set and taken care of, it will be three parts grown before the vines will have reached the outside of the bed, arriving at perfection in nearly half the time it would have done if the vines had been left in confusion. Particular care must be taken in pruning, never to stop the three shoots that bear the fruit, nor yet the lateral ones produced from the same joint as the fruit. These lateral shoots will show fruit at the first joint, which fruit must be preserved until the other is swelling, then take off this lateral shoot, but do not stop the vine. But should any accident happen to the other fruit, the shoot bearing it must be taken off, and the lateral shoot treated as a main one, when the fruit on it will swell accordingly; and all the laterals that spring from the main shoot must be stopped, leaving one joint and leaf only.

On the cultivation of the melon.—J. Holland (Gard. mag. 7. p. 575.) plants off his seedlings singly in 60-sized pots, and when sufficiently advanced in growth they are stopped so near the seed-leaf, as only to admit of them throwing out 2 lateral shoots, and when these principal leaders extend to 2 or 3 joints, they are finally planted out into frames or pits, having the bottom heat arranged according to the advanced state of the spring months. Five melons were produced by a plant set in the centre of a two-light frame in the beginning of May, upon an old bed that had been previously employed for raising radishes. A dung lining was added to the back and one end of the frame, which was all the artificial heat the plant received, one vine was trained to the back and the other to the front of the frame. His practice is never to stop the vines until they have extended as far as their confinement will permit, and the laterals from the two leading vines, as they advance in growth, are trained to the right and left over the bed with neat pegs, and every fruit blossom, as it expands, is carefully impregnated and placed upon a tile under the shade of a neighbouring leaf. In a day or two, or as soon as he thinks the fruit will set, he stops the vine at the first or second joint beyond it. In this way he proceeds, in setting all the fruit he can, until the surface of the bed is covered with foliage, which is never deranged more than can be avoided. While the fruit is setting, he gives air very freely, sometimes he draws the lights quite off for a few hours on sunny days, and he also, by applying or withholding heat or water, endeavours to keep them in a state between luxuriance and desiccation, for in either extreme they will not set well. Having advanced thus far, he commences swelling them off. He begins this with pinching off all the ends of the lateral shoots that have not already been stopped to assist the young fruit. He now gives no more air than will prevent the sun from scorching their leaves. He looks over them every morning, and takes off all the blossoms as they appear, and stops every young shoot back to one joint above that of the vine which produces it. He watches over them every afternoon in fine weather, and before the sun has quite left the frame, he syringes or waters them all over, leaves, fruit, and all, and shuts down the glasses for the night. He always prefers performing this while the departing rays of the sun have sufficient strength to raise a sweet vaporous heat of about 90°, which serves them to feast upon long after the sun has disappeared. A few days of such treatment will determine which fruit will take the lead in swelling off, out of which he selects 2 or 3 to each plant, according to the sort, and all the rest he cuts away. As the fruit advances in growth, it is necessary at intervals to turn them a little on the tiles, to prevent them from growing flat, and discoloring on one side, and also from rottin. When they have attained as large a size as he thinks the sort will admit, he leaves off watering, and again gives all the air he can, by taking the lights entirely off when the weather is favorable; and if the season is not too far advanced, he leaves them to ripen without any other assist-
ance. For an early crop of melons, he grows the small early cantaloup, 1 plant in a light when the frame is narrow, and 2 if wide, with 2 or 3 fruit on each plant, which in general weigh from 2 to 3 pounds each. He succeeds these with the scarlet and green-flesh, planted and trained as above, the produce of which is from 2 to 6 pounds. His principal crop is, however, from the black rock, which he has grown of all sizes up to 13½ lbs. weight; the plants are much more Hardy than many other sorts, it is a good bearer, the fruit handsome, and the flavor excellent. The sort which he grew so large was originally from France, and in its primeval state was a rock; but it has lately been strongly impregnated with the scarlet flesh, which fruit it now resembles in all its characters, except in growing much larger. The largest melon weighed 24½ lbs. The above is Mr. Holland's general practice of cultivating the melon, which practice he says he will still continue to adhere to unless fully convinced he can adopt a better.

Insects and diseases.—To prevent melon plants from being infested with insects or injured by diseases of any kind, no better method can be adopted than to keep the plants constantly in a healthy, vigorous, growing state; for this purpose, M'Pheil observes, "they must be constantly attended to, giving them plenty of heat and water. In warm weather in the spring and the summer, they should be watered occasionally all over the fruit and leaves, till the earth in which they grow be thoroughly moistened, and a stronger heat than usual be kept in the frames about the plants for a few hours; also the lights should be shut down every afternoon, with a good strong heat among the plants. If there be sufficient moisture in the earth the greatest sun heat in the afternoon will not hurt the plants, but it might scorch the sides of the large fruit, exposed to the sun-beams operating upon the glass, which should be guarded against. The frames and lights should be kept clean and painted over once every year. Melon plants are subject to be infested and hurt by the mildew and by the canker. These diseases come upon them because they are not in a good climate, they have not a sufficient heat, or the dung and earth of the bed is in a stagnated state. Melon plants are liable to be greatly injured by an insect called the red spider, which increases surprisingly in hot dry weather. As I said before, nothing will prevent plants from the inroads of disease and insects but heat, sweet air, and a sufficiency of water, which softens the atmosphere, and makes it healthy for vegetables as well as for animals. And nothing will eradicate disease and insects from melon plants but good management, strong heat, and plenty of water given all over them. Diseased plants, or plants much infested with insects, cannot produce good healthy fruit. The mildew is a most pernicious disease to all sorts of plants. On melons it generally makes its first appearance on the oldest leaves and on the extremities of the young shoots. The cause of it, I apprehend, is unhealthy nourishment comprehended in the elements, or their not harmonising in the promotion of the growth of the plant; for by practitioners it may be observed, that when a dung hot-bed gets into a stagnated sour state, the plants do not grow kindly, the air in the frames is saturated with unhealthy particles, and so also must be the juices drawn into the plants by their roots. These must breed diseases, if preventive means be not applied. It cannot be reasonably supposed that plants of a delicate nature will continue in a healthy state growing upon a heap of stinking dung, and in confined air. When melon plants have become diseased, or much infested with the red spider, they should either be destroyed, or effectual means used to cure them. To destroy the plants is easy; to cure them let the following methods be put in practice: get plenty of horse-dung thrown up in a large heap, turn it over once or twice, shaking and mixing it well, and let it lie till its rankness be somewhat evaporated, and if there be linings at the beds, take them entirely away, examine the dung of the beds, and if it be wet and has a bad smell, take a sharp-pointed stake, and make holes all round in the sides of the beds unto their centre, in such a slanting way that the water may easily run out of them; then make a strong lining of the prepared dung all round the beds, and by occasional augmentations, keep up the linings nearly to a level with the surface of the earth in which the plants grow. As soon as the linings have cast a strong heat into the beds, scatter some flour of sulphur all over the plants, and keep as strong a heat in the frames as the plants can bear; a heat of 120° will not destroy them, if the steam of the linings be prevented from getting in among the plants. Water the plants all over their leaves about once a week, with clean water 100° warm, and if the sun shine keep the lights close shut down all day, and cover them up in the evenings, leaving a little air all night at each light, to prevent a stagnation of air among the plants. Continue this process till the mildew and the insects disappear, and the plants appear to grow freely, and afterwards manage them in the usual way, taking care to keep up a good strong heat in the linings. This method sets the old stagnated bed in a state of fermentation, which makes the moisture run out of it, and dries it so, that water given to the plants has free liberty to pass off. If the linings do not heat the air in the frames sufficiently, let some of the earth in the inside all round the sides of the boards be removed, to let the heat from the linings rise freely in the frame."

Culture of melons in a dung-pit.—"A glazed pit to receive either stable-dung, leaves, or tanners' bark, is calculated to ripen superior fine fruit. The well of the pit may be formed either by a nine-inch wall, or by strong planking, a yard in depth, from 6-8 feet wide, and in length from 10-20 feet or more as required. A low glass-case is to be fitted to it, adapted to the growth of the melon. Having raised the plants in a small seed-bed, as for the frame crop, the plants out into the pit in the usual manner. Give the proper subsequent culture, and when the strength of the fermenting mass begins to decline, add linings outside the pit, if inclosed by boards, but if inclosed by a nine-inch wall, cut away as much of the dung and earth within, and throw it out, as will admit a lining of well-tempered dung."

—Abercrombie.

Culture of melons in a flued-pit.—"One such as that proper for the nursing manury is here understood; and the plants being raised in the usual way, and the bed, whether filled with dung, tan, or leaves, or a mixture of these, being moulded, plant about the end of July. Nicol prefers for such late crops "the early golden cantaloup, the orange cantaloup, and the netted cantaloup, planting a part of the pit with each." A very mild bottom heat is sufficient for the purpose here in view; and if the pit has been occupied in forcing asparagus, French-beans, or straw-berries, on a bark, or a bark and dung, or on a bark and leaf heat, it will require no other preparation than to be stirred up and have a little fresh materials added, keeping the fresh bark, dung, or leaves well down, and finishing the bed with some of the smallest and best reduced. When it has settled a few days, let it be moulded all over to the thickness of 12 or 15 inches; previously laying on a little more of the above small materials, in order to keep the plants well up to the glass, as the bed will fall considerably in the settling. It should be formed, and the mould should be laid on in a sloping manner from back to front, so as in some measure to correspond with the glasses. All being ready for the plants, they may either be planted in a row, in the middle of the pit, at 2 feet apart, or may be planted in 4 rows at 4 feet apart; or, if they have been planted in nursing, 3 in a pot; plant in the centre of each light, as directed for the common hot-bed, in March. Let them have a little water
CUCURBITACE.E. IV. Cucums.

and be shaded from the sun for a few days, exposing them to his rays by degrees. The future management of the plants differ in nothing from that of melons in a hot-bed till September, when it will be proper to apply fire heat."—"About the beginning of September it will be proper to apply fire heat, in order to further the progress of late fruit, and to dry off damps. Let the fires be made very moderate at first, however, and increase their strength as the season becomes more cold and wet. Keep the mercury up to 70° in the night, and in the day by the addition of air keep it down to about 80° or 75°. Very little water will now suffice for the plants, as their roots will be fully established, and be spread over the whole bed; the heat of which will also now have subsided. They should only, therefore, have a little water once in 8 or 10 days, and as the fruit begin to ripen off, entirely withhold it. Keep the plants moderately thin of vines and foliage; be careful to pick off all dampened leaves as they appear; and fully expose the fruit to the sun as it ripens, in the manner directed for melons in the hot-bed. In this manner I have often had melons in October and November fully swelled, and in good, but not of course in high perfection, for want of sun to give them flavour. Any who have a pit of this kind, however, for the forcing of early vegetables, strawberries, flowers, &c. cannot, perhaps, occupy it to a better purpose in the latter part of the season, as the trouble is but little, and the expense not worth mentioning."

Culture of melons in M'Phail's pit.—The inventor of this pit says, "For the purpose of raising melons early, for many years I cultivated them on a brick bed, on the same construction as that which I invented for rearing early cucumbers, excepting only that through the pit of each 3-light box I carried no cross flues. When this bed was first set to work, I had the pits filled level with the surface of the flues, with well fermented dung or with the dung of old linings from the cucumber-bed. In each 3-light division I made the pit about 3 feet 6 inches wide and 10 feet long, and 3 feet deep below the surface of the flues. On the surface of the dung in the pits, I had laid about 10 inches thick of good earth, in a ridge of about 20 inches wide, from one end of the pit to the other. When this was done, I made a lining round the bed, and as soon as the earth became warm, I set the plants into the ridge of the earth, and gave them a little water, and kept a strong heat in the frames, and filled up the pit gradually as the roots and plants extended themselves."—"The dung or leaves of trees in the pit require not to be changed every year, neither need the earth for the plants be removed entirely every season, for by experience I found it to do very well by digging, and mixing with it some fresh earth and manure in winter, and exposing it to the rains, the frost, and the snow."—"In forcing melons early, the surface of the cross flues, as well as the surrounding and outside ones, should be kept bare of mould till the days of the spring get long, which will let the heat of the linings arise freely through the covers of the flues to warm the air among the plants. After the cross flues are covered with earth, those which surround each frame may be left uncovered till the month of May or June."—Gard. rem. p. 64.

The culture in the brick bed is, in other respects, the same as that already given for melons in frames, and cucumbers in brick beds. See the monthly table of temperature under the cucumber.

Culture under hand-glasses.—"A successive or late crop, to fruit in August and September, may be raised on hot-bed ridges under hand-glasses. Sow in a hot-bed from the middle of March to the middle of April. When the plants have been up a few days, while in the seed-leaves, prick some into small pots, two plants in each; water and plunge them into a hot-bed, managing as directed for the young frame plants, till the rough leaves are from 2-4 inches long, and the plants ready to shoot into runners. From the middle of March to the third week of May, when the plants are a month or five weeks old, they will be fit to ridge out under hand-glasses. With well-prepared stable-dung, or, with a mixture of fermented tree-leaves, build the hot-bed four feet wide and 2½ feet thick, the length according to the number of glasses intended, alloting the space of 4 feet to each. In a week or ten days, or when the dung and leaves are brought to a sweet or well-tempered heat, mould the bed 10 or 12 inches thick, then place the glasses along the middle, and keep them close till the bed has warmed the earth. The same, or next day, insert the plants; turn them out from the pots with the ball of earth entire, and alloting plants for each glass, insert the ball into the earth, clean down over the top, closing the mould about the stems. Give a little water and place the glasses over close. From about nine in the morning till three in the afternoon, of the first two or three days, shade the plants till they have taken root, when admit the sun more freely, yet only by degrees from day to day, till they can bear it fully without flagging much. Give air daily, in temperate weather, by tilting the edge of the glasses on the south side, an inch or two; but in the present stage of the plants shut close at night. Cover with mats till morning, constantly keeping the glasses over. Give occasional moderate waterings with aired water. Cover in the day time with mats in bad weather, or heavy or cold rains; and continue the night covering until confirmed summer in July. Meanwhile attend to the heat of the bed; if this be declined, so that the minimum temperature be not 65° at night, with the aid of matting, line the sides with hot dung, covered with a layer of mould. The revived heat from the linings will forward the plants in fruiting, while the earth at top will enlarge the surface for the runners, and the bed for the roots. When the runners have extended considerably and filled the glasses, they must be trained out. Accordingly, at the beginning of June, in favourable settled warm weather, train out the runners, cutting away dwindling and useless crowding shoots; then the glasses must be raised all round, 2 or 3 inches, upon props to remain day and night. Cover with mats in cold nights and bad weather, but first arch the bed over with rods or hoop-bands to support the mats. Apply moderate waterings as necessary in the morning or afternoon. Oiled paper frames, formed either archwise, or with 2 sloping sides, about 2 feet or 2½ feet high, and of the width of the bed, are very serviceable in this stage. Some persons use them from the first, under a deficiency of hand-glasses. But the proper time for having recourse to them, is when the plants have been forwarded in hand-glasses till the runners require training out beyond the limits of the glasses, some time in June; then removing the glasses, substitute the oiled frames, as these paper screens will entirely afford protection from heavy rains or tempests, as well as from nocturnal cold, and also screen the plants from the excessive heat of the sun, while, being pellucid, they admit its influence of light and warmth effectually. Give proper admission of free air below, and occasional watering. With respect, however, to the crop for which no oiled paper frames have been provided, continue the hand-glasses constantly on the bed, over the main head and stem of the plants throughout the season, to defend those capital parts from casual injuries by the weather. Throughout June, and thence to the decline of summer, be careful, if much rain or other unfavourable weather, or cold nights occur, to shelter the beds occasionally, with an awning of mats or canvass, particularly when the plants are in blossom. Likewise turn in some of the best full set exterior fruit under the glasses, or some spare glasses might be put over the outside melons, to forward them without check to maturity. Some will be ready to cut in July, others in August, the more general time, and in September; they being generally, after setting, from 30-40 days..."
in ripening. The crop coming in at the decline of summer will not ripen well, unless guarded from cold at nights, and assisted by linings. The fruit that do not ripen may be used for mangoes.

"Wide ridge, or the fruiting-bed, may be made 6, 7, or 8 feet wide, for the plants to have an ample surface for their extending runners, defended either with a regular frame, and glasses of proportionate dimensions, or a case formed of an inch and a half boarding, ranged connectedly both sides of the bed, without any external cross divisions, other than top cross bars, to stay the sides and support the glasses."

Method of growing crops of melons in the open borders.—The mode of growing cucumbers on ridges of shallow beds of half-spent dung in the open air, is well known to gardeners; and in warm situations melons may be grown in the same manner. The sorts grown by Mr. Greenshields were the black rocks, green-fleshed, netted, and early cantaloup. The seeds of the first crop were sown about the middle of March, in pots in a cucumber-frame, and the bed or ridge was prepared in the first or second week in May, 4 feet wide, and 1 foot higher at the back or north side than in front. Hand-glasses, with 2 or 3 plants in each, are placed, 4 feet apart, along the centre of the bed. Very little air is given till the plants have filled the glasses, but when these appear to get crowded with vines, the glasses are raised up, and the plants allowed to grow up in the manner of ridged cucumbers. If the vines are very thick, a few of the weakest may be pinched off, and the top of each leading shoot or vine removed. No more pruning will be necessary for the season. Setting the fruit at this season of the year is quite necessary. To have handsome fruit, not more than one or two should be left on the plant. They will begin to ripen about the first week in August, and continue to be produced through that month and part of September. To prolong the season, seeds may be sown three weeks later, planted out like the first crop, and when there is appearance of frosty nights, a cucumber-frame and sashes may be placed over them. By this means tolerably good melons may be had till the end of October.—Greenshields, ex Loud. gard. mag. 3. p. 182.

There is another method of cultivating melons in the open air; that is, to raise a bed of old tan, and tramp it well and firmly down, placing some stakes and boards behind to keep up the ten, so that the bed may slope in front; 6 inches of mould should be placed on the tan, and themelon plants planted into it. Grass or leaves may be placed at the back of the bed to keep up the heat. The plants should be reared on a hot-bed.

2 C. DELICIOUS (Roth. cat. 3. p. 307.) angles of leaves blunt; fruit roundish-ovate, pubescent, with white, very fragrant flesh, and a thin rind. O. F. Native of the East Indies, but now cultivated in Spain. Perhaps only a variety of the common melon.

3 C. SATIVUS (Lin. spec. 1437.) stems rough, bearing tendrils; leaves cordate, obscurely 5-lobed, petiolate, terminal lobe the largest; flowers on short peduncles, large, usually by threes; male flowers having the tube of the calyx tubularly-campanulate, and with a spreading deflexed limb; fruit long, somewhat triquetrous, smooth or prickly, and usually shining, having the carpels distinctly separable in the inside. O. F. Native of Tartary and the East Indies.—Blackw. herb. t. 4.—Lob. strp. 363. f. 1. The cucumber is called Kettimou and Timou by the Hindoos. Flowers yellow, as in the rest of the species.

The cucumber is called concombre in French; gurke in German; and Citriulo in Italian; it is a tender annual, a native of the East Indies, and was introduced in 1573. It is a trailing and climbing plant, with large, roundish, rough leaves, furnished with tendrils, and if sown in the open air in May, produces flowers from July to August. The cucumber is of nearly as great antiquity as the vine, for Moses, the earliest Jewish author, mentions it as abounding in Egypt when the children of Israel were there, above 3000 years ago. (Numbers, chap. ii.) In England it is cultivated generally and extensively in forcing frames, and in the open air, and especially near large cities and towns. "Not only gentlemen," as M'Phail observes, "but almost every tradesman who has a garden and dung, have their cucumber-frame." In Hertfordshire, whole fields are annually seen covered with cucumbers, without the aid of dung or glass, and the produce of which is sent to the metropolis for pickling. In March, cucumbers fetch in the London market a guinea a dozen; in August and September a penny a dozen. The village of Sandy, in Bedfordshire, has been known to furnish 10,000 bushels of pickling cucumbers in one week.

Use.—The green fruit is used as salad; it is also salted when half grown; and preserved in vinegar when young and small. In Germany and Poland, barrels of half, and also full grown cucumbers, are preserved from one year to another by immersion in deep wells, where the uniform temperature and exclusion of air seem to be the preserving agents.

Varieties.—The principal of these are as follow:—

List of cucumbers.

1 Early long prickly.—This fruit is from 5-7 inches long, of a green colour, with few prickles. The plant is a good bearer, and upon the whole this is the best cucumber for the general summer crop, the flesh being very crisp and pleasant.

2 Largest green prickly.—From 7-10 inches long; it has a dark green skin, closely set with small prickles. This is a hardy sort, but does not come early.

3 Early short prickly.—Not more than 4 inches long; the skin green and rather smooth, but with a few small black prickles. This is one of the hardiest and earliest sorts, and is often preferred for the first crop.

4 Dutch or white short prickly.—Though not much cultivated, is recommended by some as preferable even to the early long prickly; it has fewer seeds, is evidently different in taste from most other cucumbers, but of agreeable flavour.

5 Cluster cucumber.—A very early sort; the flowers appear in clusters of 3 or 4 together; the fruit is seldom more than 5 inches long; it is at first of a fine green colour, but becomes yellowish as it ripens. The stems of this variety are much inclined to climb by means of their tendrils upon sticks; the leaves are small, and the plant altogether occupies but little room.

6 Smooth green Roman.—An early sort; the fruit becomes large and long, and is quite smooth; the plants grow very strong, and require a good deal of room.

7 White Turkey.—The stalks and leaves are larger than in the other varieties; the fruit also is very long, sometimes from 10-15, or even 20 inches; it is quite straight, and has a smooth skin, destitute of prickles; it is produced sparingly, and late in the season.

8 Long green Turkey.—Sometimes sown for the late crop. Late cucumbers, however, are much less cultivated than the early varieties, most gardeners being of opinion, that those kinds which are best for the early crop, are also best for the late.

9 Nipaul.—Fruit very large, usually weighs upwards of 12 lbs., measures in girth 24 inches, and in length 17 inches; flavour pleasant, and esteemed for standing. It is a native of Nipaul, from whence it was introduced to the botanical garden at Calcutta; but it is not likely that it ever will be much cultivated in this country.

Culture.—The culture of the cucumber, as a table esculent,
is chiefly carried on by artificial heat, and is therefore treated of under that head. For pickling it is chiefly cultivated in the open ground, by what is termed drilling. To have a crop in the natural ground, the seed is sown in warm compartments of rich earth, towards the end of May or beginning of June, when the weather is settled, warm and dry. The plants should mostly remain where sown, to produce late fruit towards the end of July, or more generally in August and September; small for pickling, and in larger growth for ordinary consumption. Sow a portion in a warm border, and the main crop in an open compartment. Dig the ground neatly even. Trace lines with intervals of 5 or 6 feet; and in the lines mark stations 3½ feet distant, then with a trawl at each of these spots, form shallow circular saucer-form cavities in the surface, 10 or 12 inches wide and about an inch deep in the middle. Sow in the middle of each cavity 8 or 10 seeds, half an inch deep. When the plants are come up, and begin to put forth the first leaves in the centre, thin them to 3 or 4 of the strongest in each hole. Earth these up a little between and close round the stems, pressing them a little asunder, and give them some water to settle the earth below and above. In their advancing growth train out the leading runners, supplying them with requisite waterings in dry weather 2 or 3 times a-week, and sometimes every day in very dry hot weather, in July, August, or September. At this season water early in the morning and late in the afternoon towards evening.

**Gathering.**—"The crop comes in sometimes towards the end of July, but more generally not before August in full production; continuing till about the middle or end of September, when the plants decline. Be careful to gather the fruit in a fine state both for pickling and other purposes. They must be quite young for pickling, not exceeding 2 or 3 inches in length."—Abercrombie.

**Forcing cucumbers.**—To produce cucumbers at an early season, is an object of emulation with every gardener; and there is scarcely any person who has not a cucumber-bed in his garden. We shall lay down a systematic view of the practices of the most approved gardeners in the culture of this plant, as has been our usual custom with other garden plants. Cucumbers are forced in hot-beds, pits, and hot-houses, and the heat of fire, and warm water, and steam, and dung, have been applied to their culture; but dung, as the author last quoted observes, is the only thing yet found out, by the heat of which the cucumber may be advantageously cultivated.

**Soil.**—Cucumbers, like every other plant, will grow in any soil, though not with the same degree of vigour, provided they be supplied with a sufficiency of heat, light, water, and air. For early forcing, Abercrombie recommends a mould or compost of the following materials: "One third of rich top-split earth, from an upland pasture, one-third of vegetable mould, and one-sixth of well decomposed horse-dung, with a small quantity of sand." M'Phail used vegetable mould made from a mixture (accidental) of the leaves of elm, lime, beech, sycamore, horse and sweet chestnut, spruce, and Scotch fir, walnut, laurel oak, evergreen oak, ash, &c. and among them withered grass and weeds of various kinds. "This vegetable mould," he says, "without a mixture of any thing besides, is what I used for growing cucumbers in, and by experience I found it preferable to any other moulds, earths, or composts whatever, either in my new method of a brick bed, or in the old method of a bed made of horse-dung." Nicol says, "soil thus composed will produce cucumbers in great abundance: three-fourths light rich black earth from a pasture, an eighth part vegetable mould of decayed tree-leaves, and an eighth part rotten cow-dung." Kal. p. 393. W. T. Aiton gives the following as the compost used in Kew Gardens: "Of light loam a few months from the common, one-third part, the best rotten dung one-third part, leaf-mould and heath-earths of equal parts, making one-third part. The whole well mixed for use." G. Mills states that the soil he uses "is half bog or black mould, got from a dry heathy common, and half leaf-mould: after lying 12 months in a heap, the compost is fit for use."

**Time of beginning to force.**—Abercrombie says, "Managers who have to provide against demands for early cucumbers, must raise the seedlings from 10-12 weeks before the fruit will be required, according to the length of the days in the interval. In proportion as the entire course embraces a greater part of the mid-winter, the liability of failure from obstacles in the weather will be greater. The last fortnight in January, or first week in February, is a good time for beginning to force the earliest crop. In the subsequent months, both main and secondary crops may be started as required, and will come forward more freely. To have a constant succession, seedlings should be raised twice a month. As the course of forcing more coincides with the natural growing season, the length of it will be reduced to 8, 7, or 6 weeks." M'Phail says, "those who are desirous of having cucumbers early, had best sow seeds about the 20th of October; they may be sown at any time of the year, but the spring and autumn are the best seasons. Cucumber plants may be made to bear fruit plentifully from about the middle of March till the middle of September; but from the middle of September till the middle of March their produce will be but scanty. Cucumber-plants, raised from seed in October, will begin to produce fruit in February or March, and will continue to bear till the following month of October, provided they be kept in frames and get plenty of heat and water." Nicol recommends the middle of January. He says "some begin sooner, but it is striving hard against the stream to little purpose. If the dune be prepared and the bed be got ready, so as to sow about the first of February, the success will often be greater than by sowing a month earlier, the growth of the plants being frequently checked by bad weather, and sometimes they are entirely lost." Aiton, in the paper above quoted, sowed on the 12th and 20th of August, with a view to cultivate in stoves, a regular supply of this vegetable being annually required for the royal tables. G. Mills sows on the first of October.

**Sorts.**—Abercrombie recommends the short prickly for very early fruit, and the long prickly kinds for the chief early and main summer crops. Nicol says every gardener has his favourite sort of cucumber, and it is no easy matter to advise. He names as early sorts generally known, the early short prickly as the earliest; the early smooth green, a long fruit, the long green prickly, and the white prickly, a white fruit.

**Choice of seed.**—"It is advisable," Abercrombie observes, "to have that at least from 2-4 years old, in preference to newer seed, which is more apt to run luxuriantly in vine, and the plants from it do not show fruit so soon or so abundantly as those from seed of greater age. But when seed has been kept more than 4 years, it is sometimes found to be too much weakened." **Forming the seed-bed.**—"A one-light frame," Abercrombie says, "will be large enough for ordinary purposes. Choose a dry sheltered part of the melon-ground, and form a bed for a 1-light frame. When high winds are suffered to blow against a cucumber-bed, they have a very powerful effect on it, for in that case the heat will not only be greatly abated, but also forced and driven into the corners of the frames, and, consequently, some parts thereof are rendered too cold, whilst other parts are made too hot, and of course the plants are all equally endangered, retarded in their growth, and perhaps some, if not all of them, totally destroyed. Therefore, when a cucumber-bed is about to be built, the first object of consideration should be, to have it, as well as possible, sheltered from the high winds and
boisterous, stormy weather." Having put on the frame and waited till the bed is fit for moulding, lay in five or six inches' depth of the proper earth or compost. M'Phail "makes up a bed of good dung, four feet high, for a 1-light box." Nicol "builds a bed of dung, carefully fermented, to the height of 5 feet at back, and 4 at front, keeping it a foot larger all round than a 1-light frame, or about five or six feet by three or three and a half. He then covers with turf, and on that lays fine sand, as free of earth as possible, to the depth of about six inches, laying in a sloping manner, corresponding with the glass and within 6 inches of it; over which lay an inch or two of dry light earth." Aiton and Mills also prepare a bed for a 1-light box; the latter forms it on a stratum of wood 1 foot high for drainage, and 8 inches higher in the middle than at the sides, as the sides are liable, from the weight of the frame, to settle faster than in the middle, which causes the piles of earth to crack; by which in fruiting-beds more especially the roots of the plants are greatly injured.

Sowing.—Abercrombie sows some seeds in the layer of the earth, which he spreads over the bed, putting them in half an inch deep. He also sows some seed in 2, 3, or more small pots of the same kind of earth, which may be plunged a little into that of the pot. M'Phail sows in a pot filled with rich earth, covers about 2 inches thick, and sets the pots on the surface of the naked dung on the bed. Nicol sows immediately after the bed is made, without waiting till the heat arises, which he says is losing time, and the opportunity of bringing on vegetation by degrees as the heat rises. He sows in a broad pan 4 inches deep, or in small pots 4 or 5 inches in diameter, and as much in depth. These he fills with "fine light earth" or vegetable mould, and covers the seeds 2 inches. He plunges these to the brim in the back part of the bed (which, it will be recollected contains a stratum of earth 6 inches thick, over one of sand and another of turf), puts on the light, and lets the frame be matted at night, in the ordinary way.

Raising plants from cuttings.—M'Phail says, "Instead of raising cucumber plants from seeds, they may be raised from cuttings, and thus kept on from year to year, in the following manner; the method of sticking them in is this: take a shoot which is just ready for stopping, cut it off just below the joint, behind the joint before which the shoot should have been stopped, then cut smooth the lower end of the shoot or cutting, and stick it in fine leaf or other rich mould, about an inch deep, and give it plenty of heat, and shade it from the rays of the sun till it be fairly struck. By this method, as well as by the method of laying, cucumber plants may readily be propagated." J. Meorns, gardener at Shobden Court, near Leominster, propagates his cucumber-plants for a winter crop in this way, and "finds that the plants raised from cuttings are less succulent, and therefore do not so readily damp off, or suffer from the low temperature, to which they are liable to be exposed in severe weather; that they come into bearing immediately as they have formed roots of sufficient strength to support their fruit, and do not run so much to barren vine as seedlings are apt to do." He takes the cuttings from the tops of the bearing shoots, and plants them in pots 9 inches deep, half filled with mould. He then waters them, covers the tops of the pots with flat pieces of glass, and plunges them into a gentle bottom heat. "The sides of the pot act as a sufficient shade for the cuttings during the time they are striking, and the flat glass, in this and in similar operations, answers all the purposes of bell-glassing. The cuttings form roots, and are ready to pot off in a fortnight.

Temperature of the seed-bed.—Abercrombie says, "The minimum heat for the cucumber is 58° at the coldest time of night, in the day-time 65° is sufficient for the maximum; because air admitted, when the sun has great influence, will do more good

than a higher heat. M'Phail says, "If it were possible to keep the heat in the frames always to 80°, with the concurrence of proper air and moisture, I am of opinion that that would be a sufficient heat for the production of the cucumber." Nicol keeps the air in the bed to about 65° in the night, allowing a few degrees of a rise in sunshine. Aiton rears and fruits his plants in a stove. Miller says, "The heat I wish to have in the seed-frame is from 65° to 75°."

Treatment of the plants until removed to the fruiting-bed.—After sowing, Abercrombie "continues the glasses on the frame, giving occasional vent above for the steam to evaporate, that the bed may keep a moderate heat, and not become too violent. The plants will be up in a few days, when it will be proper to admit air daily, but more gradually, at the upper end of the light, which may be raised from half an inch to an inch or two, according to the temperature of the weather, that the plants may not draw up weak, or be injured by the steam. In frosty weather hang part of a mat over the aperture. When the plants are a little advanced, with the seed-leaves about half an inch broad, strike them up, and prick them in small pots of light earth, previously warmed by the bed. Put 3 plants in each pot, and insert them a little slopingly, quite to the seed-leaves. Plunge the pots into the earth, and you may prick some plants also into the earth of the bed. Give a very little water just to the roots; the water should be previously warmed to the temperature of the bed. Draw on the glasses; but admit air daily to promote the growth of the plants, as well as to give vent to the steam rising in the bed, by tilting the lights behind, from half an inch to an inch or two high, in proportion to the heat of the bed and temperature of the weather. Cover the glasses every night with garden-mats, and remove them timely in the morning. Give twice a-week, once in two days, or daily, according to the season, a very light watering; keep up a moderate lively heat in the bed by requisite linings of hot dung to the sides." M'Phail, having sown, and placed the pots on the naked bed, says, "the plants will come up in a few days, and when they have fully expanded their seed-leaves, transplant them into small pots, 3 plants in each pot. Set them on the surface of the dung in the bed, and let a little air be left at the light day and night, to let the steam pass off freely." When the seedlings plants have one or two joints, stop them, after which they generally put forth 2 shoots, each of which let run till they have made 1 or 2 clear joints, and then stop them, and afterwards continue throughout the season to stop the plants at every joint." Nicol directs to guard the seed from mice, which generally swarm about hot-beds, by laying a pane of glass over the pot or pot till they come up; and afterwards at night by covering with a pot of equal size, till the seed-leaves have expanded and the husks have dropped; for until then the plants are liable to be destroyed. The cover, however, should always be removed by sunrise, and be replaced in the evening. It is at night these vermin generally commit their depredations. No air need be admitted till the heat begins to rise, and steam begins to appear; but after that the lights should be tilted a little every day, in whatever state the weather may be, until the plants break ground. Air must then be admitted with more care, and if frosty or very chill, the end of a mat should be hung over the opening, that the air may sift through it, and not immediately strike the plants. A little aired water may be given once a day, from the time the seeds begin to chip; and if a very strong heat rise, the pots should be raised a little to prevent the roots from being injured. They should be frequently examined on this account, and if the heat be violent, should be set loosely on the sand, or be placed entirely on the surface. The air of the bed should be kept to about 65° in the night, allowing a few degrees of a rise in the sunshine. If the weather be severe, the mats must be doubled.
or tripled, and if mild perhaps a single one will suffice. But
unless in very bad weather they should always be removed by
sunrise, in order to admit all the sun and light possible to
the plants, which are very essential to their welfare. When the plants
are about an inch and a half high, they are then fit to be pricked
out into nursing pots. These pots should be about 5\(\frac{1}{2}\) or 6
inches in diameter at top, and as much in depth. The mould
to be used should be the same as that in which the seeds are
sown, and should be laid in the frame a few hours previous to
potting, in order to bring it to a proper degree of warmth, that
the tender fibres be not chilled by it. Let the pots be filled
about one half with the earth, turn the plants carefully out of
the seed-pot; place three in each, against the side of the pot,
and so as their leaves may be just above its margin; then cover
the roots with the mould, rubbing it fine between the fingers,
and filling the pots nearly to the brim. Work over the sand in
the frame to its full depth, plunge the pots to within an inch of
their rims, and cover the whole surface with a little dry earth as
at first, making it level with the tops of the pots. Then give a little
aired water, in order to settle the earth to the roots of the plants.
The plants will now require due attention. Let air be admitted
to them as freely as the state of the weather will allow, and
supply them moderately with water once in 2 or 3 days. Exa-
mine the pots frequently, if the heat be violent, lest the roots
be scorched, setting them loosely or pulling them up in that
case, or if thought necessary, placing them entirely on the sur-
fase. If much steam abound in the bed at this time, it may be
proper to leave the light tilted half an inch in the night,
observing to hang the lap of a single mat 2 or 3 inches over
the tilt. But if the bed was carefully turfed over, as directed at
making up, this will seldom be necessary, never but in thick
hazy weather. Mat up carefully at night, but make a point to
admit all the sun and light possible to the plants; therefore,
uncover always by sun-rise; and frequently wash and wipe the
glasses clean, inside and outside, as they are often clogged by a
mixture of steam and dust. Also, occasionally stir the surface
of the sand or earth in the frame with the point of a stick, in
order to expiritate vapour, that hovers on the surface, and so
purify the internal air of the bed. If the heat begin to decrease,
and particularly if the weather be severe, it may be necessary
to line one or more sides of the bed, that the plants may receive
no check in their growth. If it be a 1-light box, both back and
front may be lined at the same time, and, if necessary, in 10 or
12 days, the two sides; and if much steam arise from the
linings after they come into heat, be careful in matting at night,
tuck up the edges of the mat, lest it be thrown into the bed.
Mills, as soon as the seed-leaves of the plants are fully ex-
paned, transplants them singly into pots of 4\(\frac{1}{4}\)th size, gives a
little water and air night and day. His temperature for seed-
lings, as already stated, is from 65° to 75°. With this heat and
water, as the earth in the pots becomes dry, and a little air night
and day, so as to keep the internal air in the frame sweet, and
fluctuating between the degrees of heat above mentioned, the
plants will be fit for finally transplanting out in a month, that is,
by the 14th of November, into the fruiting-frames.

Forming the fruiting bed.—Abercrombie directs, "When the
plants are advanced in some tolerable stocky growth, that is,
when the first rough leaves are 2 or 3 inches broad, or when the
plants have been raised about five weeks, transplant them to
the larger hot-bed, with a 2-light or 3-light frame, sometimes
called the ridging-out-bed." Form the bed on general prin-
ciples, of superficial extent, according to the frame it is to sup-
port, leaving from 4 to 6 inches all round, and fixing the height
according to the season. Thus in January, Abercrombie directs
"the bed to be 3 feet 9 inches high in front, 4 feet 6 inches at the
back, and 6 inches larger than the frame all round. In February,
3 feet 3 inches high at the front, 4 feet at the back, and 4 inches
to spare round the frame. In March, 3 feet high in front, 3 feet
6 inches at back, and 4 inches beyond the frame every way." "Put
on the frame and glasses presently after the body of the
dung is built up, to defend it from the weather. At the same
time raise the glasses a little at the upper end, in order both
to draw up the heat sooner, and to give vent to the rising steam,
until the bed is reduced to a regular temperature. In con-
nection with the thermometer, the cultivator may be assisted to form
a judgment of this by trying sticks, that is, 2 or more sharp-
pointed smooth sticks, thrust down in different parts of the bed,
which at intervals may be drawn up, and felt by a quick grasp of
the hand. The smell of the vapour is also a criterion; it
should not be strong and fetid, but mild and sweet. While
taking care that the heat is not so intense as to burn the mould
when applied as below, let it not be suffered to evaporate un-
necessarily by delay. If the temperature appear to be not suffi-
ciently high, take off the frame, and add another course of dung."
M'Phail, when he fruits the cucumber on dung beds, begins to
make preparation for the fruiting-bed, about 3 weeks before the
plants are ready to be planted for good. The dung collected,
after being well worked, is "made up into a bed of about 4 or
5 feet high, and the frames and lights set upon it. It is after-
wards suffered to stand for a few days to settle, and until its
violent heat be somewhat abated; and when it is thought to be
in a fit state for the plants to grow in, its surface is made level,
and a bill of mould laid in just under the middle of each light,
and when the mould gets warm the plants are ridged out in it.
After this, if the bed has become perfectly sweet, and there be
heat enough in it, and the weather prove fine, the plants will
grow freely." Nicol builds his fruiting-bed about 4 feet high in
front, keeping it fully a foot broader than the frame all round.
He turns it, and lays on sand as in forming the seed-bed, if the
dung has not been well fermented. "But otherwise, placing a
thick round turf, a yard over, in the middle of each light, so as
that its centre may be exactly under the plants, will generally
be found sufficiently safe." The frames are now put on, and
the beds matted up at night to make the heat rise the sooner.
Mills says, "Well preparing the dung is of the greatest im-
portance in forcing the cucumber, and if not done before it is
made into a bed, it cannot be done after, as it requires turning
and watering to cause it to ferment freely and sweetly; fresh
dung from the stable will require at least 6 weeks' preparation
before it will be fit to receive the plants. A month before it is
made up into a bed, it should be laid up into a heap, turned three
times and well shaken to pieces with a fork; and the outsides
of the heap turned into the middle and the middle to the outsides,
that the whole may have a regular fermentation; and if any ap-
ppear dry, it should be made wet, keeping always between the
two extremes of wet and dry. A dry spot of ground should be
chosen to prepare the dung on, that the water may drain away
from the bottom of the heap. The dung having been a month
in heap, I make the bed as follows: I form a stratum one foot
high of wood of any kind, but if larger the better (old roots of
trees or any other of little value will do). This is to drain the
water from the bottom of the bed, for after a month's prepara-
tion, with every care, it will frequently heat itself dry, and re-
quire water in large quantities, which, if not allowed to pass off
freely, will cause an unwholesome steam to rise, in which the
cucumber plant will not grow freely. On this bottom of wood,
I make the bed 4 feet high with dung, gently beating it down
with a fork. This is done about the 1st of November, and by
the month of February the 4 feet of dung will not be more than
2 feet thick, which, with a foot of wood, at the bottom, will
make the bed 3 feet high. This I consider a good height; for
if lower, it cannot be so well heated by linings, which is the
only method of warming it in the months of February and March, as by that time the first heat of the bed will have quite declined. Having made the bed, I put on the frames and lights, which I shut close till the heat rises. I then give air night and day, sufficient to allow the steam to pass off, and once in 2 days I fork the surface over, about 9 inches deep, to sweeten it, and if in the operation I find any part dry, I carefully wet it. The bed being quite sweet, I prepare it for the mould, by making the middle about 8 inches lower than the sides, as the sides are liable from the weight of the frames to settle farther than the middle, which often causes the hills of earth to crack, by which the roots of the plants are greatly injured."—Mills in Loud. encycl. gard. p. 562.

Moulding.—"As soon," Abercrombie observes, "as you deem the bed to have a lively, safe, well-tempered heat, which may be in a week or 10 days after building, proceed to mould it. Earth the middle of each light, laying the mould so as to form a little hill from 6 to 10 inches in height, according as seed is to be sown, or plants from the seed-bed inserted. Then earth over the intervals between the hills, and the sides of the frame only, from 2 to 4 inches, as a temporary measure, until the heat is ascertained to be within safe limits. After the whole bed has been for some time covered, examine the mould; if no traces of a burning effect appear discoverable by the mould turning of a whitish colour, and caking, it will be fit to receive the plants. But if the earth appears burnt, such part should be replaced by fresh, and vacuities made to give vent to the steam, by drawing every part of the hills from the centre. When the bed is in fit order, level the mould to 6 inches deep to receive the seeds; but to receive plants in pots the hills of earth should be kept 10 inches deep or more. If there be any motive for haste, while an excess of heat is to be suspected, the danger from burning may be obviated by leaving vacancies in the top of the mould; by placing patches of fresh cow-dung or decayed bark to receive the pots of seeds or plants; and by boring holes in the bed with a round pole, sharpened at the end, which holes should be filled up with hay or dung when the heat is sufficiently reduced. Some persons place a layer of turf with the sward downwards between the dung and the mould; but this, if ever expedient, is only in late forcing; for in winter the full effect of a sweet well-tempered heat is wanted, much of which, by being confined at the top, may be forced out at the sides." M'Phail, in moulding common hot-beds, also raises hills in the centre of each light in the usual way. Gard. rem. p. 51. Nicol gathers up from the surface of the beds a sufficient quantity of earth to raise hills whereon to plant; one exactly in the middle of each light, about a foot broad at top, and to within 6 inches of the glass. If the frames be a proper depth, they should be 12 or 15 inches high above the turf. Kal. p. 365. Mills puts under the centre of each light one solid foot of earth, the top of which is hardly within 9 inches of the glass, and the top of the plants when planted in it will be within 3 inches of the glass.

Planted out.—Abercrombie, when the temperature is ascertained to be right, brings the plants in their pots; turns over the hills of mould, forming them again properly, and then proceeds to planting. "Turn those in pots clean out, one pot at a time, with the ball of earth whole about the roots, and thus insert one patch of three plants which have grown together, with the ball of earth entire, into the middle of each hill, earthing them neatly round the stems. Also any not in pots, having been pricked into the earth of the bed if required for planting, may be taken up with a small ball of earth, and planted similarly. With water warmed to the air of the bed, give a very light watering about the roots, and shut down the glasses for the present, or till next morning. Shade the plants a little from the mid-day sun a few days till they have taken root in the hills, and cover the glasses every evening with large mats." Nicol, before planting, if the beds have settled anywise unequally, rectifies and sets level the frames, by placing boards, slates, or bricks under the low corners, so as to make them correct. He then makes up the outside of the bed with dung a few inches higher than the bottoms of the frame, over which he lays some dry litter or fern fronds, and planks at top to walk on. He then takes the pots of plants, each of which is supposed to have got two or three rough leaves, and making a hole in each hill, full large enough to receive the plants, turns them out of the pots as entire as possible, placing them level with the surface of the hill, firming the earth round their sides, and settling all with a little water. In the case of planting older plants than the above, at a farther advanced period of the season, or such as have quite filled the pots with their roots, the balls may be reduced a little, and the fibres should be singled out, if anywise matted. But the above plants are supposed to have barely filled the pots with roots, and then the balls should be kept entire, that they may not receive a check in transplanting.

Temperature for fructifying plants.—Abercrombie's minimum is 55°, and maximum in the day time 65°, the same as for the seed-bed. M'Phail says, "It appears that during the winter and spring months the medium heat of the air in the frames should be 75°, and the maximum heat 80°. But when the sun shines the heat of the air in the frames is increased to a much higher degree; so that reckoning this heat, the medium for that of the air in the frames may be 80°." Gard. rememb. p. 59. Nicol's medium heat for cucumbers is 60°; in sunshine he admits as much air as will keep down the thermometer to 65°. Kal. p. 366. Mills, in the fructifying frames, wishes "to have at all times from 70 to 80 degrees of heat, which I regularly keep up by applying linings of hot dung, prepared one month previously, in the same manner as that for the beds. For the first month I cover the glass with a single mat only; and as the nights become cold, I increase the covering, using hay, which I put on the glass, and cover that with a single mat. I regulate the heat at night by the warmth of the glass under the hay, for when the glass is warm, which should be in two hours after covering up, a little air is required. When the glass and hay covering are warm, which is easily known by putting the hand under the hay on the glass light, the internal heat of the bed will be about 78 degrees, in which degree of heat the cucumbers have grown in length in 16 hours one inch and a quarter. I give a little water round the insides of the frames, as often as I find them dry, which causes a fine steam to rise, and I think it better than watering the mould, for if this latter practice is often repeated in winter, when the sun's power is insufficient to absorb the moisture, and the glasses can be but little open to allow the damp to pass off; the earth in a few weeks will lose its vigour, and the roots of the plants will perish. Great care should also be taken, at this season, not to injure the roots by too much heat, which is not less detrimental than too much moisture: they can only be secured by keeping up a regular warmth, just sufficient to expel the damp, which arises in the night from the fermenting dung." Linings.—The requisite degree of heat, Abercrombie is careful to support in the bed when declining, "by timely linings of hot fresh dung, which may be applied to the sides 15 or 18 inches in width, and as high as the dung of the bed. Generally line the back part first, and the other in a week, or from 10 days to a fortnight after, as may seem necessary by the degree of heat in the bed. Sometimes if the heat has fallen abruptly below the minimum degree, it may be proper to line both sides moderately, at once to recover the temperature sooner, and with better effect; but be particularly careful never to over line, which would cause a too violently renewed heat, and steam in the bed. The dung for linings must be fermented, as in first

d 2
building a bed." When the heat decreases, Nicol cuts away the old dung perpendicularly by the frame, and adds new linings, (generally beginning with the back first,) 2 feet broad to the height of 6 inches about the bottom of the bed frame. As it will sink considerably in heating, he adds to it in a few days. Mills applies linings of hot dung prepared a month previously.

Covering.—This must be nightly performed till June, proportioning the warmth of the cover to the heat of the air in the bed, and that of the external air. Mats are laid next the glass; on these a layer of hay, and over these mats, made fast by boards, but not hanging over the linings, is the usual mode, early in the season. M'Phail says, "My method of covering up was as follows: in the first place I laid clean single mats on the light in length and breadth, just or nearly to cover the sashes, taking care not to suffer any part of the mats to hang over the sashes, on or above the linings, for that would be the means of drawing the steam into the frames in the night time. On these mats was spread equally a covering of soft hay, and on the hay was laid another covering of single mats, upon which were laid two, or sometimes three or four rows of boards, to prevent the covering from being blown off by the wind. The mats laid on next to the glass are merely to keep the seeds and dust, which may happen to be in the hay, from getting into the frames among the plants. If the bed be high, in covering up steps or short ladders must be used by those whose office it is to cover and uncover; and great care must be taken not to break or injure the glass."

Air.—Abercrombie directs to "admit air every day when the weather is moderate, without much wind; and always more freely on sunny days, than when cloudy or cold and frosty. Open the lights behind, only a little at first, sooner or later in the day, according to the temperature of the season; increasing the opening from about half an inch to 1, 2, or 3 inches, or very little more (decrease the opening occasionally, if the weather in the early part of the season changes very cold); and shut close in the same gradual order towards afternoon, generally shutting close in the evening, unless in the early state of the bed, a considerable heat and steam continues. In this case you may occasionally leave open about half an inch, hanging the end of the mat before each opening." M'Phail says, "A cucumber plant delights in a strong heat, and in sweet wholesome air; but if the air in which it grows be contaminated, unhealthy, or impure, the plant will not continue long in a healthy flourishing condition. Whatever is disagreeable to the smell becomes in time hurtful to the cucumber plant; therefore whoever would wish to know if the air in a cucumber frame be in a healthy nature for the plants, should smell to it." He adds, in giving and taking away the air, do it gradually, that is, by little and little at a time, which without doubt is the best way: for sudden changes are always attended with unpleasant consequences. A due proportion and continual supply of fresh air is at all times necessary, and more or less is required according to the heat of the linings, the temperature of the weather, and the thickness of the coverings put on at nights. Gard. rememb. p. 42. Nicol admits air regularly in as large portions as the state of the weather will allow, being careful to let off rank steam, if it abound, by leaving a tilt, even in the night. Mills says, "My usual time of giving fresh air to the frames, and permitting the fowl to escape, in the winter months, (that is, from the middle of November to the middle of February,) is as follows: between 8 and 9 in the morning I raise the lights, and let the confined air pass off, shutting them again; about 10 I give a little air; at 11 more; at one I lower the lights a little, and between 3 and 4 I close them entirely. About two hours after the covering of hay has been put on, I give a little air for the night. Should the weather be changeable, the lights must be raised or lowered more or less, as circumstances may require; but some air about the times of the day above mentioned is absolutely necessary to keep the plants in a free growing state."

Water.—"Give necessary waterings with water warmed to the air of the bed, mostly in the forenoon of a mild day, in early forcing; and in the morning or afternoon in the advanced season of hot sunny weather."—Abercrombie. M'Phail says, "The quantity of water requisite to be given to the plants depends upon the heat of the bed, the strength and age of the plants, and also on the temperature of the weather. When the weather is cold, wet, and gloomy, and the air moist, they require less water than when the weather is clear, and the air more dry. If too much water be given, or if water be given too often, it will hinder the fruit from setting and swelling kindly; and if too little water be given, the plants will grow weak, and the fruit hollow. I seldom watered the plants with water warmer than 85°, nor colder than 65°; although in general I tried by the thermometer the warmth of the water I used, yet it is not necessary so to do. A good way to know if the water be of a proper temperature is to take a mouthful of it, and when it feels neither hot nor cold, then it is in a fit state for accelerating the growth of the plants, or for making them grow fast. I made a constant rule never to water the plants but with clean sweet water; and if the water be clean and sweet, I am of opinion it makes little or no difference whether it be pump water, spring water, rain water, or river water. However, it is a good quality in water to bear soap, and make a lather therewith, which rain and river water readily do; but the pump and spring waters are found too hard to do it, yet this may easily be remedied in them, by letting them stand a few days in the open air, and sun's rays. With regard to the time of the day in which the watering ought to be performed, I think it is not material, nor did I ever make any rule with respect to the time, but gave them water at any hour of the day, when I saw they stood in need of it, and when it best suited my convenience. Those who have hot-houses may get their water warmed there, and those who have no hot-houses may get some from the house, or from some other place where water is frequently heated. One gallon of hot water will properly water several gallons of cold water." Tate says "in spring and in the summer months the water may be warmed by exposure to the rays of the sun." Nicol airs his water "by some means or other," waters once or two or three days after planting, and liberally from the rose of the watering pot as the plants advance. The time chosen is the afternoon about 4 or 5 o'clock, in order not to scorch the plants, which, he says, often happens, when, after morning waterings, the sun's rays suddenly dart on the plants. Kal. p. 366—365. J. Mearns, already mentioned, uses water impregnated with sheep's dung, as does Mr. Knight. Mearns tried this water first "on some cucumber plants in the pine stove, which had been planted in January, but which in consequence of dull weather had become weak, and of a pale green colour; he applied the liquor to the roots, and in a few days a great change in the appearance of the plants was produced; the foliage assumed a hardy green, the shoots acquired an unusual degree of strength, with short joints, and although the stove had scarcely any air given to it, yet the fruit swelled rapidly, and attained a large size." These plants continued in bearing till May, and were then cut back to within 6 inches of the root, when they started again with vigour. "No water was ever given over the leaves, but a continued supply of the liquid pigeon-dung manure to the roots." Mearns. ex Loud. ency. Gard. p. 635. For Mills's practice as to watering see his process under temperature.

Earthing.—"Observe," says Abercrombie, "in proper time when the first heat of the bed is moderate, to begin adding more earth between the hills, as the extending roots require to be
covered, or the runners to be supported with mould; raising it by degrees equal with the tops of the hills, all in level order from 8 to 10 inches thick," Pract. Gard. p. 72. Nicol, "by the time the plants have sent out runners, and the roots spread quite over the hills, enlarges them; beginning by stirring up the earth in the other parts of the frame to its full depth with a hand-fork or weeding-iron, breaking it fine if anywise caked by the heat. To this add fresh mould, sifted or finely broken, and in a dry state, so as to raise the surface nearly to the level of the hills; laying it in a sloping manner from back to front. Previously he rectifies the position and level of the frames, and raises them so that the glass may be eight or nine inches above the mould in the centre." Kal. p. 367.

Training.—To force the cucumber into early fruit, Abercrombie directs to "stop the runners as soon as the plants have made two rough leaves; as the bud that produces the runner is disclosed at the base of the second rough leaf, it may be cut off or picked out, or if the runner has already started it may be pinched off close. This is called stopping at the first joint, and is necessary for a stronger steady growth, and an emission of fruitful laterals; and from these other prolific runners will be successively produced. The vines, without the process of stopping, would generally be both weaker, and so deficient of fertile runners, that they would sometimes extend 2 or 3 feet without showing fruit. When plants which have been once stopped have extended the first runners to three joints without showing fruit, they are to be again stopped for the purpose of strengthening the plant, and disposing it for bearing. As fertile runners extend, train them out regularly along the surface, fastening them down neatly with pegs." M'Phail stops his plants when they have two joints; and "when the plants shoot forth again after the second stopping, they seldom miss to show fruit at every joint, and also a tendril; and between the tendril and the showing fruit, may clearly be seen the rudiment of another shoot, and when the leading shoot has extended itself fairly past the showing fruit; so that in pinching off the tendril and the shoot, the showing fruit is not injured. This stopping the leading shoot stops the juices of the plant, and is the means of enabling the next shoot (the rudiment of which was apparent when the leading shoot was stopped,) to push vigorously, and the fruit thereby also receives benefit. When the plants are come into bearing, if the vines are suffered to make two joints before they are stopped, at the first of these joints, as I before said, will be seen showing fruit, a tendril, and the rudiment of a shoot; but at the second joint there is seldom to be seen either showing fruit or the rudiment of a shoot; but only a tendril, and the rudiments of male blossoms. It is therefore evident, and but reasonable, that the shoot should be stopped at the first of these joints; for were the shoot to be let run past the first joint, and stopped before the second, perhaps no shoot would ever spring forth at the said second joint, but only a cluster of male blossoms or leaves, which would serve for no good purpose, but would rather exhaust the juices of the plant, which ought to be thrown into the productive parts of it. If the plants are suffered to bear too many fruit, that will weaken them, and in such case some of the shoots will lose their leaders, that is, the rudiments of some of the shoots will not break forth, the numbers of fruit having deprived them of their proper share of the vegetative juices. The rudiments of some of the shoots may also be injured by accident, which sometimes prevents their pushing; but from whatever cause this happens it matters not, for by the losing of its leader the shoot is rendered unfruitful, and therefore should be cut entirely off. In the course of the spring and summer months, several shoots break forth here and there from the old ones. When too many break out, cut off the weakest of them close to the old shoots, and those which remain, with regard to stopping, serve nearly in the same manner as young plants. If the old shoot from which the new one bursts forth lie close to the moulds, it sometimes sends forth roots from the same joint from which the young shoot proceeded, by which the young shoot is much invigorated, and the old plant in some measure renovated. When this young plant is fairly formed on the old shoot, it somewhat resembles a young plant formed and struck root on a strawberry runner; and if the shoot were to be cut off on each side of the newly formed plant, and no part of the plant left in the frame but itself, by proper treatment it would soon extend itself all over the frame. In winter, when the plants are young, and before they come into bearing, it sometimes happens that they send forth too many shoots; in that case, cut the weakest of them off; not suffering them to become crowded and thick of vines, for that would weaken, and prevent the plants from bearing so early as they ought to do. Keep the leaves of the plants always regularly thin. The oldest and worst of them cut off first, and cut off close to the shoot on which they grow. This is necessary and right, for if any part of the stalk of the leaf were to be left, it would soon putrefy and rot, and perhaps destroy by damp the main branch from which it proceeded." Nicol, "Cucumber plants will put out runners or vines, whether the heart-buds be picked out or not, which is a matter of trivial concern, although much insisted on by some, as being necessary to their doing so at all. For my own part I never could discover any difference, and I have repeatedly made the comparison in the same bed, which otherwise of course could not be fair. When the vines have grown to the length of 4 or 5 joints, and if fruit appear on them, they may be stopped at one joint above the fruit; but otherwise, they may be allowed to run the length of 7 or 8 joints, and may then be stopped, which will generally cause them to push fertile shoots. These should be regularly spread out, and be trained at the distance of 8 or 10 inches apart."

Pruning and training cucumber plants.—W. P. Vaughan, (Gard. mag. 7. p. 462.) considers the productiveness of cucumber plants as depending principally on pruning, and the age of the seed; his system of management is therefore as follows. As he saves a few seeds annually he has always some three years old; these he sows in shallow pans in a dung heat not under 70°, and by the time the plants have spread their seminal leaves, he has soil and 22-sized pots ready dried in the frames, and plants them so as they will just reach over the rim of the pot when planted 3 or 4 in each pot, making them form a triangle or square; he then fits the pot to within half an inch of the top, waters them, and keeps them in a brisk heat of from 65° to 75°. And as soon as they have spread their first rough leaves, he picks out the leading bud from each plant close to the second leaf, and in a few days afterwards each plant will put forth two shoots, and they are ready for plunging in the hills without breaking the balls of earth, that is, one potful in each hill. When the lateral shoots have made two joints, they must be stopped at the second as before, and pegged down with a piece of straight stick, 6 inches long, broken half through in two places, so as to form a square. Each shoot will now produce two more, which never fail to show fruit at the first joint, and must be stopped at the second, which operation must be done to all as they make two joints. Picking off the male blossoms and setting the fruit, as they open, should be done in the morning just before the sun comes strong on the frames, until the weather will admit of the lights being open a great part of the day; watering should also be performed at the same time, shutting the frame close for a few minutes after. Cuttings taken from the tops of the shoots about 4 inches long, and planted in a pot deep enough to admit a flat pane of glass on the top, will strike freely, and these plants so produced will come into bearing.
sooner than those raised from seeds, but they are not of so long duration.

Upright training.—"Cucumber plants being climbers by means of their tendrils, some branchy sticks being placed to any advancing runners, they will ascend and produce fruit at a distance from the ground, in a clean growth, free from spots, and well flavoured."

Setting the fruit.—"The cucumber," Abercrombie observes, "bears male and female blossoms distinctly on the same plant. The latter only produce the fruit, which appears first in miniature, close under the base, even before the flower expands. There is never any in the males; but these are placed in the vicinity of the female blossoms: the fruit of which will not otherwise swell to its full size, and the seeds will be abortive. The early plants under glass, not having the full current of the natural air, nor the assistance of bees and other winged insects, to convey the farina, the artificial aid of the cultivator is necessary to effect the impregnation. At the time of fructification watch the plants daily; and as soon as a female flower, and some male blossoms are sufficiently expanded, proceed to set the fruit the same day, or next morning at farthest. Take off the male blossom, detaching it with part of the foot-stalk. Hold this between the finger and the thumb; pull away the flower leaf close to the stamens and anthers, which apply close to the stigma of the female flower, twisting it a little about, to discharge thereon some particles of pollen or fertilizing powder. Proceed thus to set every fruit, as the flowers of both sexes open, while of a lively full expansion, and generally perform it in the early part of the day, using a fresh male if possible for each impregnation, as the males are usually more abundant than the female blossoms. In consequence the young fruit will soon be observed to swell freely. Cucumbers attain the proper size for gathering in about 15, 18, or 20 days from the time of setting, and often in succession for 2 or 3 months or more in the same bed by good culture. The above artificial operation will be found both necessary and effectual in forcing the cucumber, between the decline of autumn and May, while the plants are mostly shut under glass. In plants more fully exposed to the free air, in the increasing warmth of spring, and in having the full open air in summer, from June and July till September, the impregnation is effected mostly or wholly by nature. The male flowers being by some ignorantly denominated false blossoms, are often plucked entirely off as useless, under the notion of strengthening the plant; but this should not be generally done. Where crowded too thick in clusters, some may be thinned out moderately; but their agency being absolutely necessary in fertilizing the females, they should only be displaced as they begin to decay, except where they are superabundant."—"It is the female blossoms of flowers," M'Phail observes, "that bear the fruit; but if they were not to be impregnated by the male flowers they would prove barren and unfruitful. The female blossoms are easily to be distinguished from the male ones, for the rudiment of the fruit is apparent at the bottom of the female flower, and the flowers have no stamens, but have three small pointed filaments, without summits; whereas the male blossoms have not any rudiment of fruit about them, but in the centre of the flower are three short stamens, which are inserted in the corolla. When the female or fruit blossoms are in full blow, take the male blossom which is in full blow, and holding it in one hand, with the other split and tear off the corolla, taking care not to part the stamens or male parts. Then hold the male blossom thus prepared between the finger and thumb of the right hand, and with the left hand gently lay hold of the female blossom, and holding it between the two fingers, put the prepared male blossom into the centre of the female blossom, and there the farina or pollen of the anthers clings or sticks to the stigmas, and thus the impregnation of the fruit is effectuated, and the plants are thereby rendered fruitful, which, being in frames in a climate by art made for them, would otherwise in a great degree be rendered barren and unproductive; and which I have frequently known to have been the case, even when at the same time the plants were in a vigorous flourishing state. Generally leave the prepared part of the male blossom sticking in the centre of the female one, and take a fresh male blossom to every female blossom. But if the male blossoms run scarce, which seldom or never happens, make one male blossom do for two or three females." Nicol states, that cucumbers will grow and will arrive at full size without the female flowers being impregnated: the seeds, however, will prove abortive. The directions he gives for impregnating are in substance the same as those of M'Phail. The fruit being set and swelling, some lay fragments of glass or slate beneath it in order to keep it clean, and to admit as much air and light as possible to the under side, so as to cause its approach in greenness to the upper.

On keeping a fine bloom on cucumbers.—"The art of producing and keeping a fine natural bloom on cucumbers, either for a gentleman's table for show, or for the market, merits great attention, both as to the perfect appearance of the fruit, and also to the general culture of the plant, after the fruit is set. From that time a strong bottom heat should be given with dung linings; or, if late in the spring, short grass laid round the frame on the dung, will cause a very strong heat. Water ought then to be given plentifully, always at the back part of the frame; and at no time should the plants be watered over their leaves, when the fruit is wanted for its fine delicate bloom and long regular shape. A fine foliage over all the bed is likewise a very essential point; and leaves should never be picked off near the fruit, as it thereby deranges the juices of the plant, and consequent the fruit does not swell off finely. Air also should be given very sparingly in the middle of the day, even in bright sunshine, and generally there should be a little left in the night, when the bottom heat is very strong, as by that means the air in the frame is kept sweet. When the fruit is fit to eat, for any of the above purposes, great care should be taken to pack it in narrow wooden boxes, in the largest nettle-leaves that can be got, filling up the interstices with well-beaten moss, and covering over with soft leaves of any kind. It may then be sent to a great distance with a fine bloom, and, upon the whole, in a perfect state.—Geo. Fulton, ex Loud. gard. mag. 6. p. 709.

Gathering the crop.—"Cucumbers are used green and unripe, and before they have attained their full size. They are cut and gathered when 4, 5, 6, or 8 inches long, according to the kinds. To this size they attain in 10 days or a fortnight in the best part of the season.

To save seed.—"Select some best summer fruit, from good productive plants, which permit to continue in full growth till they become yellow. Then cut them from the vine, and place them upright on end in the full sun for 2 or 3 weeks, when they may be cut open, and the seed being washed out from the pulp, spread it to dry and harden; then put it up in papers and bags for future sowing. It will remain good many years; and seed of 3 or 4 years' keeping is preferable for early frame crops."

On forcing cucumbers.—"In growing cucumbers under lights, "the most obvious defects," according to Mr. Allen, "are compost of too light a quality," and "dung not sufficiently worked before it is earthed over." Mr. Allen has been in the habit of growing early cucumbers under frames, on common dung-beds, for twenty years, always producing abundance of fruit from March till October. In 1823 he worked 70 lights for the London market, the produce of which was 3360 cucumbers, or 4 dozen to a light, "a greater product than is usually obtained
CUCURBITACEÆ. IV. Cucumis.

23

by any of the ordinary methods of treatment." The beds are made in December or January, the hot horse-dung having been previously turned and watered 5 or 6 times. Before earthing it, round flat mats, about 15 inches in diameter, formed by colling up a band of straw, 1 inch in diameter, and 10 feet long, are to be prepared and placed on the dung, under the centre of each light. Rye straw is preferred for these mats, as it does not encourage mice. A bushel of compost, consisting of loam and rotten dung, is placed on each mat, and 1 plant in preference to more, on the top of each hillock; the top of the plant should be left about 3 inches from the glass; the mould should then be dressed up around the hillock, and be pressed close to the roots, and within 1 inch of the seed-leaves of the plant; these, at no time of earthing, should not be covered, for this is very apt to cause canker. The earth should be kept within the bounds of the straw mat, and not be suffered to mix with the dung, as that would cause a burning, which is not only troublesome, but in many instances fatal to the prosperity of the plant; because if the earth is once burnt, its vegetative quality is destroyed, and water will have no effect on it. The only remedy in such a case is to remove the mould, fork up and water the dung, lay on a little rye straw, and replace the earth. After ridging out, from one quarter to one inch of air is given in the day, and about one quarter during the night. The covering must be very slight for the first 3 or 4 weeks, and must not hang over the sides. "The heat must be kept up by augmenting the linings once a-week, turning over and watering them when they heat so as to become dry. The bed inside the frame will require forking up about 9 inches deep, 3 times a-week; the hillocks at the same time should be examined, and a round pointed stick, of about an inch in diameter and 18 inches long, must be thrust about 12 inches in the dung, under the straw mat, making 5 or 6 perforations under each hillock. Into each of the holes so formed, pour from the spout of a watering-pot as much water as the state of the bed seems to require; this may be ascertained from the facility with which the perforator goes into the bed. If the bed is husky or burning, the stick will go in with difficulty, and then a large pot of water is required to a hillock; on the contrary, if the bed is in a free state of working, the perforator will go into it very easily, and then a sprinkling from the rose of the pot will be sufficient." A great object of Mr. Allen seems to be to sweeten, rot, and moisten the dung under the frame for the roots of the plants, while the heat is principally supplied by the linings. "The dung," he says, "from the continued forking and watering, will become in a fine state to receive the roots of the plants; these, after passing through the proper depth of compost, placed over the dung, which is about 8 inches, will readily strike into the dung, and bear a productive crop of cucumbers throughout the summer, without their leaves flagging or requiring any shade. For ascertaining the proper periods to make additions to the earth, the best criterion is the appearance of the roots through the sides of the hillock. This should be earthed over about 3 inches, each time forking out the dung 2 inches below the mat, to give a greater depth of earth each time of performing the operation. The last time this is done, the depth of mould at the back of the frame should be 20 inches. It will be necessary to raise the frame and lights as the plants advance in growth." Water should be given plentifully 3 times a-week, without wetting the leaves or fruit, "pouring it against the back of the frame, for the mould will dry faster against the back than the front, in consequence of the heat being there greater, and the air being admitted there." "In pruning, the runners should not be cut or thinned out, the tops only should be pinched, and at every joint, beginning where the plant has 2 rough leaves, and the second rough leaf is about an inch in diameter. That will cause the plant to produce fruit and a fresh runner in succession at every joint; it will likewise add to the strength of the plant." Pinch off the tendrils and male blossoms, and fecundate artificially in the early part of the season. The sort of cucumber which Mr. Allen finds most productive is the Southgate, and he prefers seed 3 or 4 years old to new seed.—Loud. gard. mag. vol. 1. p. 416. 417.

Insects and diseases.—The thrips sometimes attack early cucumbers, and are to be destroyed by fumigation. The red spider rarely makes its appearance; when it does water must have been improperly withheld. Some soils produce canker in the shoots, especially where they branch from the main stem. When this is the case, the only resource is to renew the soil and the plants.

Growing the cucumber under hand-glasses.—The following method is given by M'Phail as that generally practised: "The seeds are sown some time about the middle of April in a cucumber or melon-bed, and when they come up, they are potted out into small pots, 2 or 3 plants in each pot, and are kept properly watered, and stopped at the first and second joints. About the middle of May, a warm situation, where the mould is very rich is pitched on, and a trench is dug out about 2 feet deep, 3 feet broad, and the length is proportioned according to the number of glasses it is intended for. This trench is filled with good warm dung, and when the dung has come to its full heat, it is covered over with 8, 10, or 12 inches' depth of rich mould. The glasses are then set upon it about 3 feet distant from each other, and when the mould gets warm under them, the plants are turned out of the pots with their balls whole, and plunged into the mould under the glasses, and a little water given them to settle the mould about their roots, the glasses set over them, and after they have made roots, and begin to grow, in fine days the glasses raised a little on one side, to let the plants have the free air; and as the weather gets warmer and warmer, air is given more plentifully to harden the plants, so that they may be able to bear the open air and run from under the glasses. When the plants begin to fill the glasses, they are trained out horizontally, and the glasses are set upon bricks or such like, to bear them from the plants. After this the plants require nothing more but to be supplied with water when the summer showers are not sufficient, and to stop them when they run too thin of branches, and thin them of leaves or branches when they are likely to become over-crowded. In warm summers and in warm situations, by this mode of management, the plants will bear plentifully for about 2 months, provided they be not attacked by insects or weakened by diseases." Abercrombie describes the practice somewhat different, but with his usual detail and order. He says, "To have a general summer crop, to fruit in hot-bed ridges under hand-glasses, sow some seed of the long prickly kind in a hot-bed, under a frame or hand-glass, or in any cucumber hot-bed in cultivation, about the middle of March, or thence till the middle of April. When the plants have been up 3, 4, or 5 days, prick some in the same or another hot-bed, 3 or 4 inches asunder. A portion may be put in small pots, 3 plants in each, and plunged in a bed. Give water, and shade from the sun till they take root; and manage as for the frame crop. In 3 or 4 weeks, when advanced in the first rough leaves, about 2 inches broad, and stopped at the first joint as directed in the early crop, the plants should be ridged out, that is, transplanted into hot-bed ridges, under hand-glasses, to remain for fruiting. The period for this may fluctuate from the middle of April to the beginning of May. Having a sufficient quantity of prepared dung, make a hot-bed on the level ground, 3½ or 4 feet wide, and 2½ feet high, the length as required, according to the number of hand-glasses intended. Earth it at top 6 or 8 inches thick, and place the hand-glasses along the
middle at 3½ feet distance. Sometimes the bed is made in a
moderate trench, 12 or 15 inches deep, in some good soil in the
kitchen-garden, in order to have the excavated earth of the
trench ready at hand for mourning the bed. When the earth
under the glasses is warm, proceed to put in the plants, remov-
ing them from the nursery-bed, with as much earth as will
adhere about the roots. If you have any plants in small pots,
turn them out with the ball entire, and plant 3 plants under each
glass. Give a light watering; put down the glasses, and shade
the plants from the sun, till they have taken root, after which
let them enjoy the sun and light fully, only covering the glasses
and bed every night with mats till June, or commencement of
warm weather. Admit air every mild day, by propping up the
southward side of the glasses 1 or 2 inches; moderate waterings
will be necessary twice a-week or oftener. As the plants push
runners of considerable length, train them regularly. When
extended to the limits of the glasses, and when the weather is
settled warm, about the beginning or middle of June, they
should be raised upon 3 props 2 or 3 inches high, and the runners
trained out in regular order, but cover them on cold nights with
mats, for the first week or two. Continue the glasses, and cir-
sumspectly water in dry weather, as may be necessary; the
plants will produce fruit in June, July, August, &c. in plentiful
succession. To obtain a crop from hot-bed ridges, under hand-
glasses, you may, in default of plants raised in a previous nur-
sery-bed for transplanting, sow seed under the glasses in April
or May, inserting several seeds in the central part under each
glass. When the plants have been up a few days or a week,
them to 3 or 4 of the strongest in each patch, managing
them afterwards as the others. They will come into bearing
towards the end of June or July, and thence to September.
(Should there be a scarcity of dung to make a regular bed,) in
the last week of April, or in May, you may dig circular holes
2 feet wide, a spade deep, and 4 or 5 feet asunder; fill them
with hot dung, trodden down moderately firm, and earthed over
6 inches. In these put either plants or seed, and place on the
glasses; the plants will produce fruit in June or July till Septem-
ber. (In default of hand-glasses,) make a hot-bed, or holes of
dung, as above, in May; put in plants or seed, and defend
with oiled paper frames, to remain constantly, day and night,
till settled warm weather in June or July. Give the additional
protection of mats over the paper frame in cold nights and bad
weather. In the culture of all the crops, give proper supplies
of water in dry warm weather, 2 or 3 times a-week, or every
day in the hottest season of June, July, and August. In the
hot-bed ridges, made above ground in April or May, if in 3 or
4 weeks or more after making, the heat be much declined, and
the nights or general season remain cold, let a moderate lining
of hot dung be applied to the sides, which will both throw in a
reviving heat, and widen the bed for the roots and runners of the
plants to extend."

Cultivation of the cucumber in a flued pit.—Nicol says, "Those
who would have cucumbers on the table at Christmas (a thing
sometimes attempted), will find it more practicable, and less
troublesome, if the plants be grown in a flued pit, in the manner
of late melons, than if they be grown in a common hot-bed.
In this case the cucumbers should take place of the melons
planted in this compartment in July, and which will, by the
middle or end of the month, have ripened off all their fruit of
any consequence. The seeds of some of the early sorts (those
best for early being also best for late) should be sown in small
pots about the first of the month, and should be placed in the
pit along with the melons, or under a hand-glass, on a slow dung
heat; where let the plants be nursed, and be prepared for plant-
ing about the second or third week in the month, as hinted at
above. Observe to sow old seeds, not those saved this season,
which would run more to vine than to fruit. Let the pit be
prepared for their reception, by trenching up the bark or dung,
and by adding fresh materials, in so far as to produce a mo-
derate growing heat; observing the directions given for pre-
paring the pit for the melons in July, and moulding it (however
with proper cucumbers earth) all over to the depth of a foot or
14 inches. The plants may be placed closer in planting them
out than is necessary in a spring hot-bed. They may be planted
at the distance of a yard from each other, and 2 rows lengthwise
in the pit, as they will not grow very vigorously at this late
season. They should be moderately supplied with water once
in 4 or 5 days, and should always be watered over the foliage,
more especially when strong fire-heat becomes necessary, as
cucumbers naturally like a moist rather than a dry heat.
The temperature should be kept up to about 70° or 80° in the
night, by the side of the flues, and by matting, or otherwise cov-
ering the pit. Air should be as freely admitted as the state of
the weather will allow, and so as to keep the mercury down, in
sunshine to about 70°. The plants will require little other pruning
than to stop the vines, as they show fruit at the joint or two
above it; for they will not push many superfluous shoots. Ob-
serve to pick off all damp leaves as they appear; and other-
wise carefully attend to them, as above directed, while they
continue to flourish, or to do any good worthy of such attend-
ance."

Cultivation of the cucumber in M'Phail's brick-bed pit.—
"When I used," observes M'Phail, "to cultivate cucumbers on
a dung-bed, the fruit were sometimes watery and ill-tasted; but
after I began to cultivate them on a brick-bed, the fruit were
constantly firm and well-flavoured, which is certainly occasioned
by the goodness and wholesomeness of the food with which the
plants are fed or nourished." M'Phail's pit has many advantages
over a common hot-bed: there is no chance of burning the roots
of the plants in it, the linings being placed all on the outside,
without any dung underneath the plants. "All the materials of
my newly-invented bed are clean and sweet; and the flues being
made perfectly close, no tainted or bad-smelling air can get
through them into the bed; so that it is of little or no concern
whether the dung of the linings be sweet or otherwise, or whe-
ther the linings be made of dung or of any thing else, provided
there be a sufficient heat kept in them, and no pernicious steam
be drawn in among the plants by the current of air." A shel-
ered dry situation is of the first consequence for this pit. The
bed being built, "when the frame is about to be set upon it, a
layer of mortar is spread all round upon the upper course of
brick-work, on which the bottoms of the frames are to rest.
Thus the frames are set in mortar on the bricks; and the flues
are, with a bricklayer's brush, well washed, and rubbed with a
thick grout, made of lime and water, which stops every crack
or hole, and prevents the steam of the linings from getting into
the frames. This washing of the flues I had done once a-year,
for no crack or hole must ever be suffered to remain unstop-
pered in the flues. I found little or no trouble in keeping the flues
perfectly close, nor is it indeed likely that they should become
troublesome, if the bed stands on a sound foundation, for the
heat of the dung has not that powerful effect on the flues, as
fire-heat has on the flues of the hot-house; because the heat of
dung is more steady and not so violent as the heat of the fire,
and, besides, the flues of a cucumber-bed are almost always in
a moist state, which is a preventive in them against cracking
or rending. When the bed is first built, the pits are about 3
feet in depth below the surface of the flues. The pits I had
filled up about a foot high, some of them with rough chalk,
some of them with small stones, and some of them with brick-
bases; this is to let the wet drain off freely from the mould
of the beds. After this filling up with chalk, stones, and broken
bricks, there is a vacancy in the pits, about 4 feet deep below the surface of the flues; this vacancy I had filled to a level with the surface of the flues, with vegetable or leaf mould; and in putting it in, it was gently pressed, to prevent it from sinking too much afterwards. On the surface of the mould with which the pits were filled, under the middle of each light, and which is just in the centre of the mould in each pit, make hills of mould, in the same form as is commonly done on a dung-bed. These hills are to set the plants in, and are to be raised at first nearly close to or within a few inches of the glass. Raising the mould at first very pith the glass is necessary, on account of the sinking of it; for as the frames are set on bricks, they cannot sink; but mould newly put in is sure to settle, and the measure of the settlement will ever depend upon the lightness and texture of the mould with which the pits are filled. Therefore, these and such-like matters must be left to the discretion of those who are intrusted with the direction and management of the frames. When the bed is thus finished, and ready for the reception of the plants, if the flues be strewed over with mould, so that their surface be just covered, to a stranger it is altogether a deception, for in every respect it has the appearance of a dung-bed. The ashes of the frames which I used were glazed in lead; but if any person who rears early cucumbers has lights which are not glazed in lead, but are state-glazed, the vacancies between the glass had best be filled up close with putty, to prevent too much air from getting into the frames in the cold days of winter. The frames under my management were constantly kept in good repair, and painted over once every year. This method, I am clearly of opinion, is more profitable than if the frames were neglected for 2 or 3 years, and then have a thorough repair, with 2 or 3 coats of paint. When frames are newly painted, they should be suffered to lie and sweeten for some time, at least for 2 or 3 weeks, or until the disagreeable smell of the paint is somewhat lessened. Although the frames I used were of a very good size, yet if they were a little smaller or larger, they would answer the purpose very well. Therefore those who intend to build a bed after my plan, have no occasion to make new frames merely for the purpose, but they may get the bed built to fit the frames they are already in possession of. The linings are to be applied to the bed a few days before the plants are ready for finally placing, but in order that the mould and every thing in the frames may be properly warmed for their reception. The dung, of which the linings are to be made, may either be cast together into a heap, to bring it to a heat before it be laid round the bed, or it may be laid round the bed as it is brought from the dung-yard; but whichever of these methods be taken, when the linings are making up, the dung should be well shaken, and laid up lightly, so that the heat of it may come up freely. As it takes some days before the linings are able to warm the earth in the bed sufficiently for the reception of the plants, the rank steam of the new dung linings is evaporated, unless the dung came immediately from the stables, which seldom is the case. The linings are to be made nearly 3 feet broad in their foundation, and tapered up to about 30 inches at the top, by which they will retain their heat long, and in sinking will keep close to the bed, which is what should at all times be paid proper attention to. In the winter and spring months, the linings should be trodden upon as little as possible, for treading on them would be the means of stagnating the heat. But should it at any time, in managing the plants, be found necessary to stand or kneel upon them, boards should be laid on their tops for that purpose; which will prevent the weight of a person from taking that effect on them which it otherwise would do. As the linings sink they are to be raised with fresh dung, but they should seldom be raised higher than the level of the mould in the frames on which the plants grow, especially when there is a strong heat in them; for when there is a great heat in them, if they are kept higher than the level of the mould, the heat dries the air in the frames too much. Nor should they be suffered to sink much below the level of the mould in the frames, for that, on the contrary, would cause too much moisture in the frames, especially in the winter and spring months. When the heat begins to be too little, notwithstanding the linings being kept to their proper height, the fresh unexhausted dung underneath should be taken away, and that which was laid aside put in the foundation, and fresh dung laid above it, in lieu of that which was carried away. Both the side linings may be raised at one time, but both of them should never be renewed together; for if both were to be renewed at the same time, it would for a time cool the frames too much, and when the heat of both came to their full strength, it would probably be too powerful to the roots of the plants when extended to the flues. I seldom or never renew the end linings, because I found the heat of the side ones fully sufficient; for as there are flues or vacuities in every part of the bed, the steam being fluid, circulates in and warms every part thereof. And for the very same reason there is no occasion for having a strong heat in both the side linings at one and the same time, except in very cold weather. In making up and pulling down the linings, care should be taken not to injure the brick-work. The covering the lights in the winter and spring is absolutely necessary; for, notwithstanding the heat of the linings, it would be impossible to keep up a proper degree of heat in the frames for the plants without covering. Therefore, the covering up in the evenings and uncovering in the mornings must be particularly attended to, and more or less put on according to the heat of the linings and temperature of the weather. After the bed is set to work, heat and sweet moisture are the two principal agents required for promoting the growth and vigour of the plants; therefore if there be a heat kept in the linings, strong enough to keep the heat in the centre of the pits of mould fluctuating between 80° and 90°, cold water may be poured on the flues twice or thrice a week. There is no danger of creating damp or impure air in the frames by watering the flues; for the water is no sooner poured on them, than it runs down their sides, and passes clear off through the drains of the bed; consequently, water being poured upon the flues, gives only a momentary check to the heat of the frames; for the flues being at all times full of hot steam, when the watering is finished, the heat quickly resumes its former vivacity, and raises a warm vapour in the frames, well adapted for promoting vegetation, and for increasing the growth, and invigorating the plant in all its parts. The mould round about the sides of the pits close against the inner sides of the flues, should be kept nearly on a level with the surface of the flues, and as it is the mould that joins to the flues which receives the first and greatest heat from the linings, it should be continually kept in a moist state; for if the mould against the flues be suffered to become dry and husky, air will be generated in the frames disagreeable to the plants. In all other respects, the culture of cucumber or melon, on M'Phail's brick-bed, corresponds with the culture of these fruits on common dung-beds. M'Phail has, in his "Gardeners' Remembrancer," as well as in his "Treatise on the Cucumber," given the temperature of one of his beds for every day in the year, of which the following table shows the extremes for every month:

CUCURBITACEÆ. IV. Cucumis.

By the heat described in these tables, and plenty of water, the cucumber plants, if sown on the 22d day of October, were maintained in a healthy fruit-bearing state in the brick frame of my inventing, from the month of January to the beginning of December. The melon plants in the management of the author, were kept in about the same degree of heat which he has given for the culture of the cucumber, in the forcing frames; and he ventures to predict that if any person keep melon or cucumber plants in nearly the same degrees of heat, as is set down in the foregoing plant tables, and manage the plants well in other respects, the way to do which he thinks he has clearly pointed out in this treatise, he is persuaded they will not fail in having success. He adds, that notwithstanding the objections of some who have not been successful in making trial of his bed, "it is now generally approved of, and in practice by numbers of the best gentlemen's gardeners in the kingdom, and by various market gardeners in the neighbourhood of London." West's pit, however, seems superior to McPhail's, as requiring much less dung, presenting a much more neat and orderly appearance, and giving a greater command of temperature.

Cultivation of the cucumber in a common pit without flues.—Some form a narrow dung-bed along the middle of each pit, leaving room for adding a lining on each side when the heat declines. The method succeeds very well late in the season; but at an early period the sinking of the bed from the glass leaves the plants at a great distance from the light.

Cultivation of the cucumber in houses.—"Cucumber plants," McPhail observes, "will grow in a hot-house, where the pineapple is cultivated; but they will not be very long lived there, for that is not a healthy climate for them." In August sow the seeds in boxes filled with vegetable or other light earth, and place them on shelves on the back side of the hot-house, where the sun may not be interrupted from shining on them in the short days. They may perhaps produce a few fruit in the month of December or January." Gard. rememb. p. 301. Abercrombie says, "some gardeners, ambitious of early fruit, try a sowing in the stove under the disadvantages of December. Fruiting this plant in the house in narrow boxes 3 feet long, and full 20 inches deep, may be found more commodious than pots. The boxes may stand upon the crib-trellising over the flues, or be suspended near the back wall, 18 inches from the upper tier of lights, so as not to shade the regular house plants: this is the best situation for a very early crop. The plants may be originated in small pots, plunged into the bark-bed, in order to be transplanted with a half ball of earth into the borders. Those who aim to have fruit at Christmas introduce seedlings about the middle of August." "The chief deviation from the course of the hot-bed is, that the plants must be trained in the house upright, for which purpose form a light temporary trellis of laths. Give water every other day at least." Pract. Gard. p. 618.

We have already quoted the particulars of Aiton's method of raising cucumber plants in August, with a view to their being reared in the stove through the winter. We now subjoin the remainder of that paper. "The plants being raised on a well prepared one light hot-bed, when the cotyledons or seed-leaves became nearly of full growth, the plants were potted out, two into each pot, known to gardeners about London by the name of upright thirty-twos. When these pots became filled with roots, the plants were again shifted into larger ones, called sixteens, and removed from the seed-bed into a three light frame, with a sufficient bottom heat to allow a considerable portion of air being given day and night, both in the front and back of the frame. About the middle of September, the plants having again filled their pots with roots, and become stocky, were taken from the frame to the stove, and after a few days received the last shifting into larger pots of the following dimensions: at top 14 inches over, the bottom 10 inches across, and 12 inches deep, all inside measure; each pot at equal distances apart, having three side drain holes near the bottom, and a larger one in the centre of the bottom, and containing about three pecks of solid earth. The cucumber plants were fruited this season in a pinery. On the front edge of the back flue of this stove, a fascia-boarding, 6 inches deep, was affixed the whole length of the building, forming all along a trough or inclosure for a reserve of compost, after the exhaustion of the mould in the pots had taken place. The pots were now placed in regular order upon the mould-trough over the flue at 3 feet apart, and remained in this station for good, for success in 3. A setting of the second sowing was placed upon the end flues of the house; under each pot were set an upright circular garden pan, 6 inches deep, and 14 inches in diameter, which being filled with earth, the pots were plunged therein about 2 inches deep, and the drain holes being sufficiently covered with mould, served as outlets to the roots. From this time the fire heat of the stove was kept day and night at 60° or 65° of Fahrenheit's thermometer, varying only a few degrees when the sudden influences of the sun or steam produced an additional glow of climate. The plants being now established and vigorous, required stopping the laterals and fruit; and these second and third lateral shoots in their turn were stopped also, and the blossoms from time to time set, as usual, for succession of supply. Waterings were necessary only when the surface of the earth was evidently dry, and light sprinklings of soft water, tempered in the stove, were occasionally given over the leaves of the plants and path with good effect. Steam from a well regulated flue was considered always favorable to the cultivation, but applied sparingly on account of its scalding effect upon the leaves, when the vapour proved overheated. For the mildew, flower of brimstone, coloured leaf-green by a little soot, has been applied with the best success in all stages of the disease, and copious fumigations of tobacco were used for the destruction of the several species of the aphid tribe. Under this simple practice winter cucumbers have been produced abundantly in the months of October, November, December, and part of January, in all the royal gardens of His Majesty during a series of years." Aiton ex encycl. gard. p. 642, 643.

Cultivation of the cucumber in Week's patent frame.—Only two instances in which this ingenious invention has been tried are known to us, both of which are mentioned at the end of "Week's Forcer's Assistant." The chief objection to it is, that the bed or stratum of earth in which the plants are grown, being but of moderate depth, and surrounded by air above and below, is extremely difficult to retain an equable moisture. There are several other structures for growing cucumbers and melons in besides those mentioned above; but none of them appear to us to be of much importance.

On a mode of producing a crop of cucumbers during winter.—James Reed, (Gard. mag. 3. p. 23.) places his winter cucumber bed in a vineyard. In this vineyard the air could be admitted both by the front and top lights. About the 20th of September the cucumber seeds were sown on a moderate hot-bed in the open air, and heated in the usual manner until they were ready to ridge out. This generally happened about the beginning of
November, at which time the shoots of the vines were withdrawn from the house, and a dung-bed formed in the floor of the

in the usual way. After placing the frame and mould on the bed, it may be left without the lights until the rank steam has passed off. After this, the plants being placed in the hills, and the sashes put on, the following are the leading features of management during the winter. Make fires in the evening, so as to warm the air of the house to from 30° to 60°, and in very severe frosts it may be raised to 70°. In the mornings of the coldest weather, and shortest days, make a strong fire, so as to raise the heat to nearly 70° when the house is shut up. About 8 o'clock, and from that time to half past 9, give plenty of fresh air, by opening the front sashes and top lights, after which, and during the remainder of the day, give plenty of air to the cucumbers, by tilting the sashes in the usual way. In mild weather, and during sunshine, the lights may be taken entirely off the cucumbers for some hours each day; and immediately after forming new linings, the top lights may be left open a little all night to permit the escape of rank steam. The advantage of this mode of growing cucumbers during winter is, the comparative certainty of an early and good crop at one-third of the trouble and expense of the common method out of doors. By this practice fruit may be cut in January. The vines may be introduced in the beginning of March, and will break beautifully and regularly in consequence of the genial steam of the dung. In April the shade of the vine leaves will have rendered the house too dark for the culture of the cucumber, and as by this time cucumbers are plentiful in the common hot-beds out of doors, the bed in the vineyard may be cleared away, and the vines treated in the usual way till the following November.

4 C. flexuosus (Lin. spec. 1437.) stems trailing, scabrous, flexuous, cirrhiferous; leaves cordate-ovate, somewhat lobed, denticulated, stalked; flowers in fascicles in the axils of the leaves; calyx very pilose; fruit long, cylindrically-ovate, furrowed, flexuous, replicate, white or yellow. ©. F. Native of the East Indies.—Lob. stirp. p. 353. f. 2. Dodon. pempt. p. 66. f. 2. Ger. herb. p. 763. f. 3. Fruit the size of a large pear, eatable, and delicious. It is cultivated about Nagasaki and elsewhere in Japan; is ripe in June, and is called by the Dutch Banket Melon.

F. var. b. rhedescus (Ser. mss.) leaves angularly-lobed. C. ré- flexus, Zieh.

5 C. Junitaukës (Bert. ex Spreng. syst. 3. p. 46.) leaves cordate, 3-lobed, quintuple-nerved, glabrous, quite entire, beset with seborous dots beneath; lobes acuminate; fruit nearly globose. ©. F. Native of Jamaica.

6 C. Macracra (Wenderoth ex Mart. reis. bras. ex Linna. 5. p. 39.) leaves cordate, rather angular, acutish, sharply-denticulated, seborous from hairs; fruit oblong, oblongo-scapular, and spotted; remotely tuberculated. ©. F. Native of Brazil.

Long-fruited Cucumber. Pl. trailing.

7 C. Chiate (Lin. spec. 1437.) plant very villous; stems trailing, bluntly pentalocular, flexuous; leaves petiolate, roundish, bluntly angled, denticulated; flowers small, on short peduncles; fruit pilose, elliptic, tapering to both ends. ©. F. Native of Egypt and Arabia.—Alp. exot. aggr. p. 54. t. 40.—Bauh. hist. 2. p. 248. f. 3. The fruit is rather watery; the flesh almost of the same substance with the melon; the taste somewhat sweet, and cool as the water-melon. The grandees and Europeans in Egypt eat it as the most pleasant fruit they have, and that from which they have least to apprehend. With us it is very indifferent. It is most common in the fertile soil around Cairo, after the inundation of the Nile. Chate is the Egyptian name of the plant.

8 C. Doni (Lin. spec. 1437.) plant hispid; lower leaves roundish, upper ones somewhat 5-lobed, cordate at the base, denticulated; tendrils simple; petals ovate-roundish; male flowers having the calyx rounded at the base, the throat dilated, and with the connectives longer than the anthers; hermaphro- dite flowers having the tube of the calyx ovate and pilose; stigma 4-6; fruit globose, smooth, variegated, rarely variegated; with white sweet-scented, but insipid flesh. ©. F. Native of Persia. And. bot. rep. t. 548. C. odoratissimus, Mench. med. 565.—Dill. hist. elth. 223. t. 177. f. 218.—Walth. hist. p. 136. t. 21. The fruit is variegated with green and orange, and oblong unequal green spots; when full ripe becoming yellow, and at length whitish. It has a very fragrant vinous musky smell, and a whitish, flaccid, insipid pulp. Doni is the Hebrew name of the fruit, rendered mandrake in Scripture, which is perhaps C. propheletaum.

9 C. Anzômon (Thunb. jap. p. 324.) plant rather pilose; stem trailing, striated; leaves cordate, somewhat lobed, stalked, rather pilose; flowers small; fruit oblong, glabrous, 6-10-furrowed; flesh firm. ©. F. Native of Japan. Fruit larger than a man's head. Flowers aggregate, on rather hispid stalks. This plant is cultivated every where in Japan for the sake of its fruit, which, when preserved, is sold under the name of Con- mon, and is a common food among the Japanese. It is also frequently eaten by the Dutch at Batavia, and is sometimes brought to Holland.

Common or Melon. Fl. trailing.

10 C. Seônum (Meyer, prim. eseq. p. 278.) leaves cordate-ovate, somewhat 5-lobed; fruit oval, pilose, acuminate at both ends. ©. F. Native of Guiana, in the island of Wac- hanana. C. anguria, Raesuch, but not of Lin. ex Steud. nom. It differs from our C. anguria in the leaves being subpalmate, with angular recesses, and in the fruit being globosely-elliptic.

Hedge Melon. Pl. trailing.

11 C. Linnæus (Boiv. journ. hist. nat. 2. p. 251. t. 87.) stem climbing, pentagonal; tendrils trifid, longer than the leaves; leaves cordate, palmate, acutish, serrulato; petioles short; flowers usually twin, almost sessile; female ones having an oblong-ovate calyx, and lanceolate segments; petals ovate, retuse; fruit ovate-oblong, lined with green, 10-ribbed. ©. F. Native of Cayenne.

12 C. Propheetaum (Lin. spec. 1436. aman. acad. 4. p. 295.) stem trailing, striated; leaves cordate, 5-lobed, denticulated; lobes obtuse; flowers axillary, 2-5-together, stalked; male ones with a campanulate calyx, and obovate petals; calyx of the female flowers globose at the base, 12-striped, and hispid; limb campanulate, crowned by teeth; fruit globose, echinatate, variegated, size of a cherry. ©. F. Native of Arabia. Jacq. herb. vend. 1. t. 9.—Blackw. herb. 589. C. grossularioides, Hort. The plant has a nauseous odour. The fruit equals the Colocynth in bitterness.

14 C. Anzôria (Lin. spec. 1436, but not of Raesuch. ex Steud. e 2
CUCURBITACEÆ. IV. Cucumis. V. Luffa.

nom.) stems rather filiform, cincinniferous; leaves palmately-sinu-nated, ciliate at the base, scabrous; flowers usually solitary, size of those of Brûnânia dioica; fruit globose, echinated, white. © F. Native of Jamaica. C. echinâts, Mâenâch, meth. p. 654.—Mill. icon. t. 33.—Plúk. phyt. t. 170. f. 3. Very like C. propectârum. The fruit of this kind of cucumber is eaten when green by the inhabitants of the West India Islands; but these are far inferior to our common cucumber. The fruit seldom grows so large as a pullet's egg, and is shaped like it; and the rind is closely beset with blunt prickles. It is frequently used in the sugar islands with other herbs in soups, and is esteemed an agreeable and wholesome ingredient in them. 

Var. a, Pastâcea (Ser. 1. c.) flesh of fruit firm, yellow, but not very watery. This is the Yellow-flushed Water Melon of the English, and the Pastoge of the French. 

Var. b, Jace (Ser. 1. c.) flesh very watery, reddish. This is the Red-flushed Water Melon of the English, Melon d'eau of the French, and the Jace of the Brazilians.

The water-melon is called wasser-melon in Germany, and cocomo in Italy. The plant serves both for food, drink, and physic to the Egyptians. The fruit is eaten in abundance during the season, which is from the beginning of May until the flowering of the Nile, that is, to the end of July. It is the only medicine the common people use in ardent fevers: when it is ripe or almost putrid, they collect the juice, and mix it with rose-water and a little sugar. The fruit should be eaten cautiously by Europeans, especially when taken in the heat of the day; but it is much used within the tropics, and in Italy. The fruit is large, green externally, white fleshed, reddish towards the centre, juicy, and refreshing, but not highly flavoured. It is generally considered the melon of the Jews, mentioned in various parts of the Bible. It requires nearly the same treatment as the common melon, but a larger frame to admit its more extended shoots to spread themselves.

Citral or Water Melon. Fl. May, Sep. Clt. 1597. Pl. tr. 16 C. muricâ'tus (Willd. spec. 4. p. 613.) leaves ciliate and angular, rather hoary; angles rounded; fruit cylindrical, muricated; male flowers aggregate, nearly sessile; female ones solitary. © F. Native of Tranquebar.

Watered Cucumber. Fl. June, Aug. Clt. 1817. Pl. tr. 17 C. megâcâ'rus; leaves palmate; fruit long, ovate, very full of anastomosing fibres, which look like net-work when the fruit is dried up. © F. Native of Sierra Leone.

Large-fruited Cucumber. Pl. tr. 18 C. fübé'scens (Willd. l. c. p. 614.) leaves ciliate, rather angular, acutish, sharply toothed, scabrous; fruit, elliptic, obtuse, pubescent, green, painted with more obscure narrow stripes. © F. Native country unknown. Fruit 3 inches long, elliptic, and an inch thick, obtuse at both ends, covered with fine down.

Downy Cucumber. Fl. July, Sep. Clt. 1815. Pl. tr. 19 C. maculâ'tus (Willd. spec. 4. p. 614.) leaves ciliate, obsolescetly angular, roundly obtuse, denticulated, scabrous; fruit elliptic, narrow at the base, glabrous, when young painted with broad green stripes; but when mature, white, variegated with green spots; connects much longer than the anthers. © F. Native of Guinea. Fruit smooth. Ser. diss. l. c. t. 3.

Spotted Cucumber. Fl. June, Aug. Clt. 1820. Pl. tr. 20 C. colócy'ntus (Lin. spec. 1435.) stems trailing, rather hispid; leaves ciliate-ovate, multifidly lobed, covered with white pili beneath; lobes obtuse; petals equalling the limb of the leaf; tendrils short; flowers axillary, solitary, pedunculate; female ones having the tube of the calyx globose, and rather hispid, crowned by a spreading campanulate limb, and narrow segments; petals small; fruit globose, glabrous, yellowish at maturity, with a thin solid rind, and very bitter flesh. © F. Native of Japan and Turkey.—Blackw. herb. t. 441.—Sabb. hort. t. 70.—Mor. hist. sect. 1. t. 6. f. 1. Fruit about the size of an orange. The colocynth is a native of Turkey. The fruit is about the size of an orange; its medullary part, freed from the rind and seeds, is alone made use of in medicine; this is very light, white, spongy, composed of membranous plates, of an extremely bitter, nauseous, acrimonious taste. The fruit is gathered in autumn, when it begins to turn yellow, and is then peeled and dried quickly, either in a stove or in the sun. Newmann got from 7600 parts, 1680 alcoholic extract, and then 2160 watery; and inversely 3600 watery and 224 alcoholic. 

The seeds are perfectly bland, and highly nutritious; and we learn from Captain Lydon, that they constitute an important article of food in Northern Africa. The extract of colocynth is one of the most powerful and useful of cathartics, but there is no more efficacious way of lessening its violence than by reducing its dose.

Colocynth or Bitter Cucumber. Fl. May, Aug. Clt. 1551. Pl. tr. 21 C. campechâ'aus (H. B. et Kunth, nov. gen. amer. 2. p. 125.) stem cincinniferous; leaves ciliate-roundish, minutely 5-lobed, toothed; lobes rounded, intermediate one the largest; male flowers racemose, few; tube of calyx villous; fruit unknown. © F. Native on the shores about Campeachy. Perhaps a variety of C. propectârum, according to Spreng. syst. 3. p. 47.

Campeachy Cucumber. Pl. tr. 22 C. paré'nnis (E. James, exped. rock. mount. 2. p. 345. and in isis. 1824. p. 235.) leaves triangularly ciliate, with undulated margins; tendrils trichotomous; lobes of calyx subulate; fruit orbicular, smooth, usually 4-celled; seeds ovate, gibbous, with an acute margin. 4. F. Native of cultivated in North America. Flowers about the size of those of Cucurbita Pépo. Fruit nearly sessile.

Parthenial Cucumber. Pl. tr. Cult. See culture of the Cucumber and Melon in the open air in the proper place, for the culture of the rest of the species.

1 L. furâ'vida (Cv. icon. 1. p. 7. t. 9.) stem furrowed; leaves cordate, 5-7-angled, scabrous; the angles acute and serrated; tendrils umbellate; fruit mucronate, not crowned by the limb of the calyx. © F. Native of the East Indies, the islands of Bourbon and France, as well as in many places on the western
CUCURBITACEÆ. V. LUFFA. VI. BENINCASA. VII. ERYTHROPALUM.

coast of Africa, in fields, hedges, and among bushes. Sims, bot. mag. 1638. *Oqjong Bulustru* is its Hindoo name.

1 L. **cordifolia** (Blume, bijdr. p. 929.) leaves cordate, acuminate, sharply toothed, scabrous; flowers dioecious; male ones rather umbellate; female ones solitary; fruit furrowed and wrinkled. © F. Native of Java, on the mountains, where it is called the natives *Aroy kajorajjan, Aroy Kalayar burriet*, but *Timuk* by the Hindoos.

**Heart-leaved Luffa.** Pl. tr.

2 L. **acuta** var. (Ser. in D. C. prod. 3. p. 302.) stem twisted; leaves cordate, somewhat 5-lobed, acutely toothed; tendrils undivided, or 2-3-cleft; fruit clavate, 10-angled, crowned by the linear calyce segments; the rind hard; seeds flat, roundish-oblong, black and shining at maturity. © F. Native of China, and plentiful in India near the habitations of the Indians. *Cucumis acutangulus*, Lin. spec. 1436. Jacq. Hort. vind. 3. p. 75, 74. ex Lam. dict. p. 27.—Rheed. Mal. 8. t. 7.—Rumph. Amb. 5. p. 408. t. 149. *Dringi* is the Hindoo name of the plant. Leaves like those of *Tussilago Petaétes* or *Vitis*, with the scent of *Datura stramonium*. Male flowers umbellate, female solitarious. Fruit insipid, but is eaten by the natives of India boiled or pickled.

3 L. **PLUKENETIA** var. (Ser. mss. in D. C. prod. 3. p. 302.) leaves cordate, doubly toothed; tendrils 2-3-cleft; fruit ovate, crowned by the marcescent limb of the calyx. © F. Native of the East Indies. *Cucumis acutangulus*, Lam. dict. 2. p. 74.—Pluk. phyt. t. 175. f. 1.

**Plukener’s Luffa.** Pl. tr.

5 L. **CAP'TU-PIECHA** var. (Ser. mss. in D. C. prod. 3. p. 303.) stem tetragonal; leaves cordate, roundish, somewhat 5-lobed, angular; sepals broadly ovate, acuminate; fruit oblong-elliptic, mucronate, lined with warts, and crowned by the calycine segments; seeds ovate. © F. Native of Malabar.—*Cattu-piecha*, Rheed. Mal. 8. p. 15. t. 8. Leaves nearly the size and form of those of *Althaea rosa*. Male flowers size of those of *Pétunia tenifolia*.

**Cattu-piecha Luffa.** Pl. tr.

6 L. **ÉÉVULU** (Mill. dict.) leaves roundish-cordate, lobed; lobes angular, cut at the base, with incumbent margins; tendrils simple; fruit obovate-clavate, 10-angled, crowned by the segments of the calyx. © F. Native of Arabia. *Momordica Luffa*, Lin. spec. 1433. L. *Arabam*, Alp. pl. *agap*. p. 190. t. 58.—Mor. hist. 2. p. 35. sect. 1. t. 1. f. 1.—Sabb. Hort. 1. t. 62. The Arabians call the plant *Liff* or *Lôvif*; they cultivate it, and it climbs upon the palm-trees, covering, and elegantly adorning their trunks. It is also cultivated largely in China and Cochín-china, if Lourier’s plant be the same (Coch. p. 590.). The fruit when young is made into a pickle, like the mango, but it has a disagreeable taste, and is not accounted very wholesome.

7 L. **PE'TOLA** var. (Ser. mss. in D. C. prov. 3. p. 303.) stems terete; leaves cordate, 5-7-lobed; lobes acute, serrated, middle one very long; tendrils bifid; segments of the calyx oblong and bluntish; petals obcordate, toothed, shorter than the calycine segments; fruit obovate-clavate, mucronate, woolly, afterwards furrowed, green, spotted with white, with watery flesh. © F. Native of the East Indies.—*Pétola*, Rumph. ampl. 5. p. 405. t. 147.

**Pétola Luffa.** Pl. tr.

8 L. **PENTANDRA** (Wall. cat. no. 6751.) leaves cordate, downy, 5-7-lobed, mucronately denticulated; middle lobe the longest; female peduncles 1-flowered, solitary; male ones umbellate? © F. Native of the East Indies, in Rungpur and Mangneri.

**Pentandrous Luffa.** Pl. tr.

9 L. **GRAVEOLENS** (Roxb. ex Wall. cat. no. 6752.) downy; leaves cordate, obsoletely lobed, and mucronately denticulated; flowers axillary, 2-4-together, on very short peduncles; fruit muricated. © F. Native of the East Indies, in Munikapur.

**Strong-scented Luffa.** Pl. tr.

10 L. **AMA-RA** (Wall. cat. no. 6754.) scabrous; leaves cordate, 5-7-lobed, middle lobe the longest, all acute; female peduncles 1-flowered, solitary; male ones racemose; fruit long, downy. © F. Native of the East Indies, in Rungpur and Gualpara.

**Bitter Luffa.** Pl. tr.

11 L. **HEDERAEA** var. (Wall. cat. no. 6755.) leaves cordate, palmately 5-lobed, mucronately denticulated; female peduncles 1-flowered, solitary; male ones racemose; fruit oblong. © F. Native of the Burman Empire, at Amerher, and below Melnoon.

**Ivy-like Luffa.** Pl. tr.

12 L. **ECHINATA** (Roxb. ex Wall. cat. no. 6756.) scabrous; leaves cordate, 5-lobed; lobes rounded, mucronately denticulated; female peduncles 1-flowered, solitary; male ones unumbellately racemose; fruit roundish, echinated by spinous. © F. Native of the East Indies, in Bandil, Deyra, and Dhooon.

**Echinated-fruited Luffa.** Pl. tr.

13 L. **SATPATI** (Hamilt. ex Wall. cat. no. 6757.) scabrous; leaves cordate, angularly toothed; peduncles racemose. © F. Native of the East Indies, in Nathpur, where it is called *Satpatia*.

**Satpatia Luffa.** Pl. tr.

14 L. **PA'VULA** (Hamilt. ex Wall. cat. no. 6758.) roughish; leaves 5-7-lobed; lobes acuminate, mucronately denticulated; female peduncles 1-flowered, solitary; fruit long, downy when young. © H. Native of the East Indies, in Puraniya.

**Small Luffa.** Pl. tr.

Cult. Sow the seeds in a hot-bed, and afterwards treat the plants as recommended for ridging out cucumbers.

**Lin. syst.** Polygámia, Monocéia. Flowers polygamous, monoecious, or solitary, yellow. Segments of the calyx short, broad, with undulated, toothed margins. Stamens in 3 bundles in the male flowers, divaricate. Petals obovate-roundish, curved, and undulated; anthers very irregular, with distant convolutions. Female flowers with the stamens as in the males, but usually nearly abortive. Stigmas very thick and irregular. Seeds with thickish margins.

1 B. cerífera (Savi, l. c.) plant very hairy, with a musky scent; leaves cordate, somewhat 5-lobed; lobes acutish and crenated; tendrils simple; fruit ovate-cylindrical, woolly, pen dulous, green. © F. Native of the East Indies. *Cucúbita cerífera*, Fisch. catt. hort. *Gorenk* ex *Savi*, l. c. B. *cylindrica*, Hortul. *Cumbulam*, Rheed. Mal. 8. p. 5. t. 3. The fruit is either short or long, but always covered with numerous fragrant hairs, and clothed with glaucous, glittering bloom. Flowers sometimes hermaphrodite.

Cult. Sow the seeds on a hot-bed in spring; and afterwards treat the plants as in ridging out cucumbers.

VII. ERYTHRÓPALUM (from *erythros, erythros*, red, and *palos*, palos, a shaking; application not evident). Blum. bijdr. p. 921. D. C. prod. 3. p. 303.

**Lin. syst.** Monocóia, Pentándria. Flowers monoecious, perhaps only from abortion. Limb of calyx obsoletely 5-toothed. Petals 5, ovate, alternating with the teeth of the
CUCURBITACEÆ. VIII. TURIA. IX. BRYONIA.

calyx, bicallous at the base inside. Stamens 5, opposite the petals, borne at the margin of the tube; filaments short; anthers erect, dehiscing at the side. Style short. Fruit clavate, 1-celled, 3-valved; valves fleshy, partition into two. Seed one coated.

1 E. scændens (Blum. bijdr. p. 922.) shrub climbing; leaves stalked, rather peltate, oblong, acuminate, quite entire, glabrous; peduncles branched, axillary; pedicels rather umbellate. Θ. Native of the East India Islands, on the mountains, particularly in Java, where it is called Aroy mut Ban kong by the natives.

Climbing Erythralpum. Shrub cl.

Cult. A mixture of loam, peat, and sand, or vegetable mould, will suit this plant; and cuttings will grow freely in the same kind of soil, if placed in heat.

VIII. TURIA (Arabic name of one of the species). Forsk. fl. egypt. p. 165. no. 35. Lam. dict. 8. p. 139. D. C. prod. 3. p. 303.

1 T. cylindrica (Forsk. l. c.) stems twining, 5-angled, scabrous; leaves palmate; lobes toothed; tendrils trifid; fruit terete, attenuated at both ends, villous, crowned by the style and calyx.—Native of Arabia Felix. Gmel. syst. nat. 1. p. 403. ex Lam. dict. 8. p. 140. Flowers yellow.

Cylindrical-fruited Turia. PIl. tw.

2 T. Lejôa (Forsk. l. c. p. 165.) stem striated, mealy; leaves 3-lobe, cordate at the base; lobes angular, middle one longest, but not lobed; fruit conical, glabrous; seeds size of a small pea. Θ. F. Native of Arabia. Gmel. syst. nat. 1. p. 403. ex Lam. dict. 8. p. 140. Lejôa is the Arabic name of the plant. Flowers green.

Lejôa Turia. Pil. tw.

3 T. Cordà (Lam. dict. 8. p. 140.) leaves cordate, angular, ciliated, 2 inches long.—Native of Arabia Felix. The fruit, when mature, opens at top by a lid, and ejects its seeds with force. Forsk. fl. egypt. p. 166.

Cordate-leaved Turia. Pl. trailing.

4 T. Gîjef (Forsk. l. c. p. 166.) stem 6-angled, scabrous; leaves 3-lobe, denticulated, scabrous on both surfaces; fruit ovate, 10-furrowed, glabrous.—Native of Arabia. Flowers small, green. Fruit smaller than a nut, greyish at maturity, dehiscing, with revolute valves. Gîjef is the Arabic name of the plant.

Gîjef Turia. Pl. trailing.

5 T. Môghadd (Forsk. egypt. l. c.) stem terete, smooth; leaves 3-lobe, quite entire; lateral lobes somewhat 3-lobe; fruit oval-oblong, quite glabrous.—Native of Arabia Felix. Flowers large, white. Immature fruit green, spotted with white, but when mature yellow and edible. Môghadd is the Arabic name of the species.

Môghadd Turia. Pl. trailing.

Cult. See Cucurbita, p. 41. for culture and propagation.

Lin. syst. Monœcia, Polygaládpîpha. Flowers monoecious or dioecious. Petals joined at the base. Male flowers with a 5-toothed calyx. Stamens in 3 bundles; anthers flexuous. Female flowers with a trifid style. Fruit ovate or globose, smooth; perhaps always few-seeded. Seeds ovate, hardly compressed, more or less marginated. Tendrils simple, rarely forked.

* Leaves angular.

1 B. rostráta (Rottl. nov. act. berol. 4. p. 212. and Wild. spec. 4. p. 616.) stem filiform, furrowed; leaves cordate, obtuse, denticulated, scabrous; peduncles axillary, solitary; fruit ovate, angular, acuminate. Ω. F. Native of Tranquebar. Fruit the size of a pea. Plant scabrous, but when cultivated it becomes smooth in every part. The root of this species is prescribed in India internally in electuary, in cases of piles.

Rostrate-fruited Bryonia. Pl. cl.

2 B. Perrotetta (Ser. miss. in D. C. prod. 3. p. 304.) tendrils simple, capillary; leaves broadly cordate, unguulate, sessile, villous, scabrous, with undulated margins; male flowers twin, on pilose peduncles; female flowers sessile; fruit ending in a long taper point, sessile, clothed with very long and very numerous hairs; seeds compressed, bay-coloured, granularly edged, and covered with adpressed hairs. Ω. S. Native of Senegal. Flowers white.

Perrotetis Bryonia. Pl. cl.

3 B. mucronáta (Blume, bijdr. p. 923.) leaves cordate-ovate, mucronate, rather angular, and repandly denticulated, scabrous from dots above, and smooth beneath; flowers in fascicles, dioecious; berry oval. Ω. S. Native of the East Indies, on the mountains, where it is called Parihangie by the natives.

Var. β, denticulata (Ser. in D. C. prod. 3. p. 304.) leaves all undivided, obsoletely denticulated; fruit usually contracted in the middle. Ω. S. Growing among bushes about Buitenzorg in Java.

Mucronate-leavedd Bryonia. Pl. cl.

4 B. scabra (Thunb. prod. 13.) leaves cordate, angular, toothed, beset with callous dots above and with pili beneath, therefore scabrous on both surfaces; flowers umbellate; fruit globose; seeds smooth. Ω. G. Native of the Cape of Good Hope. The tender shoots of this plant are aperient, having been previously roasted.

5 B. verrúcosa (Ait. hort. kew. ed. 1. vol. 3. p. 285. ed. 2. vol. 5. p. 246.) leaves cordate, angular, beset with callous dots above as well as on the veins above; tendrils usually simple; fruit globose, nearly sessile. Ω. G. Native of the Canary Islands. Wild. spec. 4. p. 616. Fruit the size of a sloe.

6 B. scabráta (Blum. bijdr. p. 923.) leaves cordate, cuspidate, undivided, and somewhat angular, denticulated, scabrous above, rough on the veins beneath; flowers monoecious; umbels on short peduncles; fruit globose.—Native of the East Indies, on the mountains, particularly in Java. Cucurbita scabra, Blum. cat. hort. built. no. 105. Aroy korreg hottock of the Javanese. Allied to B. scabra and B. Japonica.

Rough Bryonia. Pl. cl.

7 B. punctáta (Thunb. prod. 13.) leaves cordate, angular, callous above, and pilose beneath; peduncles 1-flowered. Ω. G. Native of the Cape of Good Hope.

Dotted-leaved Bryonia. Pl. cl.

8 B. repanda (Blum. bijdr. p. 923.) leaves cordate, cuspidate, repandly denticulated, scabrous above and puberulous beneath; umbels peduncled; flowers dioecious; berries globose.

Dotted-leaved Bryonia. Pl. cl.
Y. S. Native of Java, in the higher mountain woods of Bureangrang.

Reapand-leaved Bryony. Pl. cl.

9 B. cordata (Thunb. in Hoffm. phyt. blatt. 5. ex Pers. ench. 2. p. 594.) leaves cordate, scabrous, dentilicated; flowers axillary, twin. Y. S. Native country unknown. B. Thunbergiana, Dietr. ex Steud. nom.

Heart-leaved Bryony. Pl. cl.

10 B. angulata (Thunb. prod. 13.) leaves 5-angled, scabrous on both surfaces; flowers umbellate. Y. G. Native of the Cape of Good Hope.

Angular-leaved Bryony. Pl. cl.

11 B. leucocarpa (Blume, bijdr. p. 924.) leaves ovate-oblong, acuminate, deeply cordate at the base, somewhat repandly dentilicated, beset with rough dots above, paler beneath; peduncles usually thin, few-flowered; flowers monocious; berries globose. Y. S. Native of Java, at the foot of Mount Salak.

White-fruited Bryony. Pl. cl.

12 B. acutangula (Thunb. prod. 13.) leaves angular, entire, smooth, glabrous. Y. G. Native of the Cape of Good Hope.

Acute-angled-leaved Bryony. Pl. cl.

13 B. grandis (Lin. mant. p. 126.) leaves cordate, lobed, beset with callous dots above and glandular at the base beneath: terminal lobe obtuse; tendrils simple; fruit oblong, prickly at the base; prickles few, reflexed (ex icon. Burm.) reddish. Y. S. Native of the East Indies. Lour. coch. 595.—Rumph. am. 5. t. 166. f. 1. Peduncles 1-flowered. Flowers large, white, androgynous. Berries red.

14 B. Moimoi (Ser. mss. in D. C. prod. 3. p. 305.) leaves cordate, 5-angled, acutely dentilicated; terminal angle elongated and acute; tendrils simple; fruit prickly at the base; prickles few, reflexed; fruit red. Y. S. Native of Ceylon and of Senegal, in hedges, in which last place it is called Moimoi, according to Adanson. Seneg. p. 159. Burm. zeyl. t. 19. f. 1. Flowers large, white.

Moimoi Bryony. Pl. cl.

15 B. geminata (Blume, bijdr. p. 924.) leaves ovate-cordate, or somewhat hastate, blumish, obsoletely dentilicated, scabrous from dots; flowers pedunculate, twin, monocious; berries oval. Y. S. Native of Java, about Linga-jattie at the foot of Mount Tjiemei, where it is called Wawalalan by the natives.

Twine-flowered Bryony. Pl. cl.

16 B. Cochinchinesis (Lour. coch. 595.) leaves 5-angled, rough; flowers monocious, large, axillary, solitary, on long peduncles; fruit ovate, acutish at both ends, 10-angled, red, smooth; seeds oblong-ovate, compressed, smooth. Y. G. Native of Cochinchina, in hedges. Flowers white.

Cochin-china Bryony. Pl. cl.

17 B. Abyssinica (Lam. dict. 1. p. 497.) stem villous at the apex; tendrils simple; leaves cordate, toothed, large, soft, nearly glabrous; upper ones angurally-lobed; petioles and peduncles very villous; flowers yellow, fruit unknown. Y. G. Native of Abyssinia and neighbouring parts of Africa.

Abyssinian Bryony. Pl. cl.

18 B. Japonica (Thunb. jap. p. 525.) leaves cordate, undivided, and angular, toothed, green above, and beset with very minute hairs; pale beneath, and beset with scaly dots. Y. G. Native of Japan, near Nagasaki.

Japan Bryony. Pl. cl.

19 B. sagittata (Blume, bijdr. p. 925.) leaves on short petioles, sagittate, glaucous beneath; male peduncles subumbellate, female ones 1-flowered. Y. S. Native of Java, about Batavia, in humid bushy places. Allied to B. heterophylla and B. umbellata.

Sagittate-leaved Bryony. Pl. cl.

20 B. Bluemei (Ser. mss. in D. C. prod. 3. p. 305.) leaves ovate-cordate, or cordately-sagittate, acuminate, repandly dentilicated, scabrous; flowers monocious, male ones umbellate, female ones solitary; berries oblong. Y. S. Native of Java, near Batavia, among bushes. B. heterophylla, Blum. bijdr. p. 923., but not of Steud. Allied to B. marginata.

Blume's Bryony. Pl. cl.

21 B. marginata (Blum. bijdr. p. 924.) leaves cordate-ovate, acuminate, rather angular at the base, obsoletely dentilicated, margined, rough; umbels on long peduncles; berries oblong. Y. S. Native of Java, about Rompoin, where it is called Korreronteng Kambyen by the natives.

Margined-leaved Bryony. Pl. cl.

22 B. umbellata (Klein. ex Wildl. spec. 4. p. 618.) leaves oblong-cordate, glabrous on both surfaces, dotted above, remotely dentilicated, rather angular at the base: upper ones hastately 2-lobed; peduncles axillary, umbellate; fruit unknown. Y. S. Native of the East Indies. Flowers white. Berries red.

Umbellate-flowered Bryony. Pl. cl.

23 B. amplexicaulis (Lam. dict. 1. p. 496.) stem angular, glabrous; leaves smooth, cordate, rather angular, stem-clasping, dotted, and glaucous beneath; upper leaves generally narrowly 3-lobed; flowers small, solitary, axillary, pedunculate; fruit solitary, acuminate, smooth. Y. S. Native of the East Indies. Flowers white.

Stem-clasping-leaved Bryony. Pl. cl.

24 B.? heterophylla (Stead. nom. p. 123.) lower leaves cordate, upper ones cordate or dentilicated; tendrils solitary; flowers solitary, pedunculate, hermaphrodite; fruit scarlet; seeds blackish. Y. S. Native of Cochinchina and China. Solena heterophylla, Lour. coch. p. 514. Flowers pale.

Variable-leaved Bryony. Pl. cl.

25 B. pubescens (Poir. dict. suppl. 1. p. 731.) stem pilose; leaves cordate, somewhat 5-lobed; lobes acute, with spiny teeth; petioles villous; tendrils long, much branched; flowers small, white, downy, umbellate. Y. G. Native of the Levant. Flowers whitish.

Downy Bryony. Pl. cl.

26 B. Madaraspatana (Berg. pl. cap. p. 351.) stem angular, cirrhose, glabrous; leaves cordate, oblong, acuminate, toothed, scabrous from small callous dots above, hairy beneath; stipulas awl-shaped, solitary; flowers twin, axillary. Y. S. Native of the East Indies. Cucumis Madaraspatan, Lin. spec. 1438.—Plnt. alm. t. 170. f. 2.

Madras Bryony. Pl. cl.

27 B. hederifolia (Jacq. fragm. 73. no. 230. t. 113.) dioecious; root thick, fleshy; stem terete, glabrous, with the internodes distant; tendrils very long, simple; leaves cordate, somewhat 5-angled, quite entire, rather wrinkled above, and hispid beneath; racemes simple, many-flowered; calyce segments of the male flowers lanceolate and acute; lobes of the corolla ovate, acute, yellowish. Y. S. Native of Tenerife. Flowers yellowish.

Tender-leaved Bryony. Pl. cl.

28 B. Altheoides (Ser. mss. in D. C. prod. 3. p. 306.) stem silifrom, furrowed, rough, with the internodes longer than the leaves; tendrils simple, narrow, and spirally twisted; leaves cordate, lanceolate, on short petioles, somewhat 5-angled, bluntly toothed, clothed with a kind of roughomentum beneath; terminal lobe elongated; fruit thin, glbose, sessile, smooth; seeds wrinkled from dots, girded by a slender zone. Y. S. Native of the island of Timor. Flowers white.

Altheo-like Bryony. Pl. cl.

29 B.? pedunculosa (Ser. mss. in D. C. prod. 3. p. 306.)
CUCURBITACEÆ. IX. Bryonia.

plant pilose; stem filiform, striated, having distant internodes; tendrils bifid; leaves on long petioles, cordate, long-acuminate, crenately toothed, beset with long, distant hairs; flowers large, in loose racemes; peduncles longer than the leaves; pedicels long, pilose; fruit unknown. 2. G. Native of Nipaul.

Long-peduncled Bryonia. Pl. cl.

30 B. Rue'Èdri (Blum. bijdr. p. 925.) leaves on short petioles, oblong, cordate, rather angular at the base, remotely dentilucent, smoothish, dotted above, glaucous beneath; upper leaves hastately 3-lobed; male pedicels disposed in dense racemes, 1-flowered, bearing one bractea in the middle of each, female pedicels solitary, 1-flowered. 2. S. Native of Java and Malabar, on the mountains. Rheed. mal. 8. t. 26. The plant is called Aroy-hui-Walleh by the natives of Java.

Rheedie's Bryonia. Pl. cl.

* * Leaves lobed.

31 B. effige'À (Rottl. in nov. act. berol. 4. p. 223.) stem furrowed, glabrous; leaves coriaceous, somewhat cordately 3-lobed, rather obtusely dentilucent, rough: lateral lobes somewhat 2-lobed, intermediate one elongated, acuminate; flowers monoecious, male ones umbellate, female ones solitary; berries globose. 2. S. Native of Java, about Rimpin, in corn fields. Willd. spec. 4. p. 610.—Blum. bijdr. p. 955. Coro-konloeng of the natives of Java. The root of this species was once supposed to be the famous colomba-root, to which it approaches very nearly in quality.

32 B. scabre'Èll (Lin. suppl. 424.) stem mucrinated, hispid; leaves 3-lobed, toothed, callously hispid on both surfaces: lateral lobes dilated, angular, intermediate one elongated, petiolo hispid; flowers axillary, nearly sessile, numerous; fruit nearly globose, beset with a few obverse stripes; seeds mucrinated. O. F. Native of the East Indies. Willd. spec. 4. p. 619. Baboon tengang of the Hindoos. Flowers yellow. Habit of Melothria.

Var. a. leaves smaller, seeds tuberculated. Blume, l. c.

Var. b. leaves coarsely toothed, as in the preceding variety, and beset with setaceous stripe; berries elliptic-globose. Blume, l. c.

33 B. latebra'sa (Ait. hort. kew. ed. 1. vol. 3. p. 384. ed. 2. vol. 5. p. 347.) leaves somewhat 3-lobed, pilose, attenuated at the base, hardly cordate, running down the petiole on one side only. 2. G. Native of the Canary Islands. Flowers whitish.

34 B. triloba'â (Thunb. prod. 13. but not of Lour.) leaves 3-lobed, smooth above, and scabrous beneath. 2. G. Native of the Cape of Good Hope.

Three-lobed-leaved Bryonia. Pl. cl.

35 B. stipula'ceâ (Wild. spec. 4. p. 630.) stem shrubby? furrowed; tendrils trifid; leaves cordate, 3-lobed, toothed, glabrous, smooth on both surfaces; stipules roundish, concave, serrated; flowers monoecious, solitary; fruit ovate, acutish, glabrous, yellow, 5-celled, many-seeded. 2. G. Native of Cochinchina. B. triloba, Lour. coch. p. 595. but not of Thunb. B. agréatis, Rausch. ex Steud. nom. phan. p. 123. Flowers white.

Var. b. perpusilla (Blum. bijdr. p. 926.) leaves membranous, deeply cordate, 3-lobed, oblong, deeply dentilucent, scabrous from dots above, smooth beneath: lateral lobes rather angular, intermediate one elongated, acuminate; flowers of umbel, monoeocious; fruit pea-formed. 2. S. Cucúrbita perpusilla, Blum. cat. hort. biiit. p. 105. Native of Java, in the shady parts of mountains. The plant is called Hampsru Bogor, and Korres koda by the Javanese.

Large-stippled Bryonia. Pl. cl.

36 B. America'À (Lam. dict. 1. p. 498.) root thick; stem angular; leaves cordate, 3-lobed, angular, wrinkled, with spine-

formed teeth; lobes of corolla narrow, white inside; fruit ovate, red, few-seeded; seeds compressed. 2. S. Native of the Antilles.—Plum. spec. 3. icon. p. 66. ex Willd. spec. 4. p. 629.

American Bryonia. Pl. cl.

37 B. Gine'Èe'ss (Linn. spec. p. 1438.) leaves cordate, obl., 5-lobed, toothed, scabrous, bidentate at the top of the petiole. 2. C. S. Native of Sierra Leone. Flowers red.

Guinea Bryonia. Pl. tw.

38 B. cordifòlia (Lin. spec. p. 1438.) leaves cordate, obl., 5-lobed, toothed, scabrous, bidentate at the top of the petiole. 2. S. Native of Ceylon. Flowers white. The root of this plant is considered cooling, and to possess virtues in complaints requiring expectorants.

Heart-leaved Bryonia. Pl. cl.

39 B. a'Àba (Lin. spec. p. 624.) stem climbing; leaves cordate, 5-lobed, toothed, scabrous from callous dots; terminal lobe hardly longer than the rest; tendrils twin; flowers racemose, monoecious; stamens distinct; fruit globose, black; seeds unknown. 2. H. Native of Europe, in woods and hedges, as in Sweden, Denmark, and Carniola. Lam. ill. t. 769. Fl. dan. t. 813. Flowers whitish or yellowish.

40 B. dio'Èca (Jacq. fl. austr. t. 199.) stem climbing; leaves cordate, palmately 5-lobed, toothed, scabrous from callous points; terminal lobe the longest and very dissimilar, perhaps always; tendrils simple; flowers racemose, dioecious; filaments pilose at the base; fruit globose, red; seeds obovate-globose, rather compressed, grey, variegated with black. 2. H. Native of Europe, in hedges; plentiful in England, particularly in calcareous counties. Smith, engl. bot. t. 439. Mill. fig. t. 71.—Blackw. herb. t. 37. B. alba, Hud. 437. Wood. med. bot. t. 189. Flowers white, with elegant green ribs and veins. The root grows sometimes to an immense size; it is a famous hydrogogue, and highly purgative and acrid, a drachm of it in substance, or half an ounce of it infused in wine, is said to be a full dose; others give 2 draçhms in dropsical cases. As a purgative it has great effect on some, while on others it has hardly any; but it frequently becomes diuretic and diaphoretic. A cold infusion in water is used externally in sciatic pains. A cataplasm of it is a most powerful discutient. The best season to take up the roots for use in is autumn. It is called in English, white wild vine, wild hops, white Bryony, wild nettle, Tetter-berry.

Var. b. fàte (Ser. miss. in D. C. prod. 1.) leaves deeply lobed; lateral lobes nearly linear, terminal one lanceolate, bidentate laterally; fruit and seeds yellow. 2. H. Native of Auvergne, in hedges and woods.

41 B. xifïda (Link. enum. 2. p. 404.) leaves cordate, 5-lobed, apiculated, scabrous from hairs; peduncles umbelliferous. 2. H. Native country unknown.

42 B. Car'Èree (Lin. spec. 1439.) root fleshy; stems climbing; leaves cordate, 5-lobed, quite entire, ciliated, mucrinated on both surfaces; terminal lobe the largest; tendrils simple, spiral; flowers dioecious; female ones axillary, twin; fruit globose, red; seeds smooth, obovate. O. H. Native of Candia. Desf. coroll. p. 91. t. 7. ann. mus. 12. t. 17. Flowers pale.

43 B. quinque'èlora (Thunb. prod. 13.) flowers dioecious; leaves 5-lobed, scabrous above; lobes very blunt, mucronately toothed, auricled behind; tendrils simple; peduncles of male flowers 1-flowered, twin; calyx broadly campanulate, and acutely toothed; corolla campanulate, half 5-cleft; fruit unknown. 2. G. Native of the Cape of Good Hope. Ker, bot. reg. 82. Sims, bot. mag. 1820. Flowers brown.

**C. Sicyos** (from sicyos, sicyos, the Greek name for the cucumber; resemblance and affinity). Lin. gen. no. 1481. Juss. gen. no. 394. Gärn. fruct. 2. p. 45. t. 88. f. 1. Sicyoides, Tourn. inst. 103. t. 28.
CUCURBITACEÆ. X. SCIYOS. XI. ELATERIUM.

LIN. SYST. Monécia, Polyadélphus. Flowers monocious; male ones with a 5-toothed calyx, and a 5-parted corolla; teeth of calyx subulate. Filaments 3? or more probably 5, in 3 bundles. Female flowers with a trifid style, and a thickish trifid stigma. Fruit 1-seeded from abortion, usually beset with spines. Seed obovate. Male and female peduncles many-flowered, usually rising together from the same axil.

1 S. angulatus (Lin. spec. 1438.) leaves cordate, angular, denticulated, scarious; lobes 3-5, acuminate; tendrils umbellate; male flowers in corymbose heads, each head on a long common peduncle; female flowers sessile, in bundles at the tops of the peduncles; fruit ovate, spinaceous, and tomentose; seeds truncate at the base, and very blunt at the apex. O. F. Native of North America. Lam. ill. t. 796. f. 2.—Dill. elth. 58. t. 51. f. 59. P. 1710. Scindia 1832. Pl. tr.

2 S. Bryonyfólia (Moris. hor. taur. sem. 1831.) leaves cordate and angular, denticulated, hispid below; teeth of calyx obsolete; capsule clamy and warted. O. S. Native country unknown. This species differs from S. angulatus and S. parviflorus in the stem being hardly pilose about the joints, the rest smooth; in the peduncles being short, the flowers umbellate; male ones 5-8 pedicellate, female ones almost sessile.

3 S. parviflorus (Wilds. spec. 4. p. 626.) branches glabrous; leaves cordate, rather angular, denticulated, roughish; tendrils triad; male flowers racemose, on long pedicels: female ones in sessile capitule umbels; fruit crowned by the permanent calyx, size of an orange; seeds unknown. O. F. Native in the temperate parts of mountains about Quito, near Chillo, at the height of 4000 feet. Not of Mexico, H. & B. et Kunth, nov. gen. amer. 2. p. 119. Flowers whitish. Fruit rarely solitary.

4 S. Baderóa (Hook. et Arn. in bot. misc. 3. p. 234.) leaves cordate, angular, minutely denticulated, glabrous on both surfaces; angles acuminate; lobes at the base of the leaf lying over each other; tendrils triad; flowers few, capitate in both sexes; female peduncles one-half shorter than the male ones; fruit ovate while young. Y. & G. Native about Valparaíso. Baderón Bryoniéfólia, Bertero.

5 S. Pentanórdus (Wall. cat. no. 6682.) leaves cordate, denticulated; flowers racemose; racemes numerous, sometimes aggregated, and branched. Y. & S. Native of the East Indies.

Pentandrous Single-seeded Cucumber. Shrub cl.

6 S. De'pet; leaves broadly cordate, 5-lobed; lobes acuminate, middle lobe the longest; margins acutely denticulated, rough on both surfaces from conical hairs; male racemes elongated; fruit glomerate, ovate, nearly glabrous, but beset with strong retrograde prickles. O. S. Native of Mexico, near Jalapa. Flowers smaller than those of S. angulatus, but larger than those of S. parviflorus. Sicyos, nov. spec. Schlecht. et Cham. in Linnaea. vol. 5. p. 88. Seeds the size of those of Citrus médica.

Deppe's Single-seeded Cucumber. Fl. tr.

7 S. Acuus (Rafin. fl. lud. p. 113.) climbing; leaves lobed; fruit glomerate, ovate, acute, bristly; bristles echinate, interwoven. O. F. Native of Louisiana.

8 S. Microphyllum (H. B. et Kunth, gen. et spec. amer. 2. p. 119.) branches roughish; leaves sinuately-cordate, 7-lobed, denticulated, roughish; tendrils smoothish, trifid; male flowers on long peduncles and pedicels; female flowers in crowded, nearly sessile heads; fruit echinated from bristle-formed hairs, size of an apple seed; seeds unknown. O. F. Native of Mexico, on the burning Mount Jorullo, at the height of 1620 feet. Small-flowered Single-seeded Cucumber. Fl. July, Sep. Cpt. 1833. Pl. tr.

9 S. Pachyca'rus (Hook. et Arnott, in Beech. bot. p. 83.) branches glabrous; leaves cordate, 5-7 lobed, denticulated, glabrous above and papillosé, scarous beneath; tendrils glabrous, trifid; male flowers in panicles; female ones in crowded heads; fruit ovate, rostrate, unarmored. O. F. Native of the Island of Oahu, on the Diamond Hill among the volcanic rocks. Allied to S. microphylus.

Thick-fruited Single-seeded Cucumber. Fl. prostrate.

10 S. vitifólius (Wild. spec. 4. p. 626.) the whole plant clothed with very fine clanny down; leaves cordate, with a roundish recess, 5-lobed, toothed. O. F. Native country unknown. Flowers yellow, twice the size of those of S. angulatus.

11 S. Lactanótaus (Lin. spec. 1459.) stem glabrous; leaves cordate, palmate, glabrous above, but echinated from stiff hairs beneath; lobes lobulate; petals short; tendrils triad; male flowers somewhat panicked; female ones glomerate, sessile; peduncles short; fruit very spiny. O. F. Native of South America.—Plum. ed. Burm. pl. amer. t. 243. Flowers yellow.

12 S. Triqueter (Moc. et Sesse, fl. mex. ined. ex D. C. prod. 3. p. 309.) stem bluntly furrowed; leaves cordate, 5-lobed; lobes broad, obtuse, somewhat denticulated; tendrils much branched; calycine and corolline lobes 3? male flowers racemose, pedunculate, aggregated subverticillate; female flowers subumbellate;fruit elongated, unarmored, triquetrous; seed oblong-cylindrical. O. F. Native of Mexico, in Chilapp. Flowers yellow. Fruit 6 lines long, acuminate, somewhat 5-winged.

Cul. Sow the seeds in the hot-bed in spring, and treat the plants as directed for Gourds, p. 42. Not worth growing except for curiosity.

LIN. SYST. Monécia, Monádiophës. Flowers monocious, white or yellow; male ones disposed in racemes or corymbs; calyx petaloid, campanulate, with hardly conspicuous teeth, and with the corolla hardly gamopetalous. Female flowers solitary, or rising from the same axis with the males. Calyx elongated, petaloid, echinated at the base, and girding the carpels; neck filiform, more or less elongated, at length dilated, and bearing the corolla and stamens. Style thick; stigma capitate. Capsule coriaceous, reniform, echinated, 1-seeded, 2-3-valved, many-seeded, opening elastically, and ejecting the seeds.

1 S. Geméllum (D. C. prod. 3. p. 310.) leaves cordate narrowly sub-sagittate, somewhat 3-angled, with the middle angle acuminate; tendrils bifid; male flowers in long racemes; neck of calyx long, campanulate; petals ovate, acutish; fruit curved, 3-celled; prickles distant. O. F. Native of Mexico. Moc. et Sess. fl. mex. icon. ined.

Twin-tendrilled Squirtng Cucumber. Pl. cl.

2 E. Carthagéne'sse (Lin. spec. 1375.) leaves cordate, angular, denticulated, petaloid, roughish above; flowers white, sweet-scented; male ones in panicles; female ones solitary; tube of calyx terete above the ovarium, not dilated at the apex; petals linear-lanceolate, acute; fruit kidney-shaped, hispid;
seeds winged? flat, tridentate at the base, ex Kunth. ○ F. Native of South America, in the hot regions of the province of Caracas, on the shore of Lake Tacarigua, in Lagunade Valencia; and in the Island of Cura, at the height of 690 feet. Lam. ill. t. 745. Jacq. amer. 241. t. 154. icon. pict. p. 118. t. 232. Corolla yellow. Fruit size of an olive.

3 E. TANMOIDES (Willd. unnum. p. 950. leaves cordate, acum- 

inated, remotely serrated, smoothish above, and hairy beneath; flowers yellowish; female flowers having the tube of the calyx campanulate above the ovary; petals 4-7, ovate; style very short; stigma large, flat; fruit 2-valved, few-seeded; seeds unknown. ○ F. Native of Mexico. E. hastatum, Brouss. but not of H. B. et Kunth.

4 E. HASTATUM (H. B. et Kunth, nov. gen. amer. 2. p. 120.) leaves cordately sinuate, triangularly hastate, acuminate, den- 

ticulated, rather searous above, and glabrous beneath; tendrils simple or bifid; male flowers racemose, pedicellate, minute; fruit oblong, reniform, muricated, 2-valved, size of an olive; seeds 6, roundish, compressed, tridentate at the base. ○ F. Native of Mexico, on the declivities of the burning Mount Jorullo, and the temperate regions near Patzcuara, at the height of 1620 or 3390 feet. Habit of Melothria pendula, according to Kunth.

Hastate-leaved Squirtin Cucumber. Pl. tr.

5 E. QUADRIFIDUM (D. C. prod. 3. p. 310.) stem, peduncles, petioles, and tendrils downy; leaves cordate, orbicular, 7-angled; tendrils bifid, pilose; male flowers umbellate; calyx long, tubular, articulated towards the base, and dilated at the apex, with the limb hardly evident; petals 4, linear-lanceolate, acute; female flowers hardly pedunculate, like the male ones; style fili- 

corn, crowned by an ovate stigma; fruit very pilose. ○ F. Native of Mexico. Moc. et Sesse, fl. mex. icon. ined. Flowers white.

Quadridid Squirtin Cucumber. Pl. tr.

6 E. BRACHYSTACHYUM (D. C. prod. 3. p. 310.) leaves 3- 

lobed, quite entire, ciliate; middle lobe oblong, acuminate; flowers cream-coloured; male ones in spikes; tube of calyx campanulate at the apex; female flowers with a very gibbous hispid calyx, and a short neck, which is campanulate at the apex; capsule oblique, incurved, echninated with 8-10 long soft prickle, 2-3-valved, larger than those of the other species. ○ F. Native of Mexico.

Short-spiked Squirtin Cucumber. Pl. tr.

7 E. TORSIVATUM (D. C. prod. 3. p. 310.) leaves somewhat peltately cordate, 5-lobed, denticulate; terminal lobe the longest, and acuminate; tendrils trifid; flowers greenish-white; male ones in racemes: female ones solitary, echninated at the base, with the neck long and bell-shaped at the apex; petals oblong, bluntest; capsule oblong, 2-valved, acuminate, echninated, with soft prickles. ○ F. Native of Virginia. Fl. mex. icon. ined.

Collared Squirtin Cucumber. Pl. tr.

8 E. TRIFOLIATUM (Spreng. syst. 3. p. 47.) leaves ternate, cut. ○ F. Native of Virginia.

Trifoliate-leaved Squirtin Cucumber. Pl. tr.

Cult. Sow the seeds in a hot-bed in spring, and put the plants out as directed for Gourds, p. 42.

Lin. syst. Monoc'ia, Polygadélphia. Flowers monoeocious, white or yellow, on filiform unibracteate peduncles, perhaps always. Male flowers with a 5-cleft calyx, and a very short tube. Corolla 5-parted. Stamens in 3 bundles; anthers con- 

nate. Female flowers with 3 sterile filaments, or probably 5, joined in 3 bundles, a trifid style, and a 3-celled ovary. Fruit usu- 

ally muricated, (perhaps always) opening elastically at maturity, and expelling the seeds. Seeds compressed, reticulated, perhaps always.

1 M. BALSA'AMICA (Lin. spec. 1453.) leaves palmately 5-lobed, 

toothed, glabrous, shining; fruit roundish-ovate, attenuated at both ends, angular, tuberculated, orange-coloured, splitting ir- 

regularly and laterally; bracteae cordate, toothed, in the middle of the peduncle; aril red. ○ F. Native of the East Indies. Lam. ill. t. 794. f. 1. Charantia, Lob. pemp. t. 670.—Ludvo. ect. t. 127.—Blackw. herb. 6. t. 539. a. b. Flowers yellow. This plant is famous in Syria for curing wounds. They cut open the unripe fruit, and infuse it in sweet oil, and expose it to the sun for some days until the oil becomes red. It is applied to a fresh wound on cotton. The Syrians esteem this next to balsam of Mecca. The plant is also used to form injuries or plasters.

2 M. MURICA'TA (Willd. spec. 4. p. 602.) leaves somewhat palmately 7-lobed, cordate at the base; lobes remotely toothed, acuminate; tendrils almost simple; fruit ovate, muricated; bracteae cordate, quite entire. ○ F. Native of the East Indies. Pavel, Rhed. mal. 8. t. 10.

3 M. CHARANTIA (Lin. spec. 1438.) leaves somewhat pal- 

mately 7-lobed, dentate, rather hairy; tendrils downy; fruit ob- 

long, acuminate, angular, tuberculated, copper-coloured or red; pulp yellow and soft; bracteae cordate, quite entire, below the middle of the pedicle; seeds oblong, tuberculated (ex Rumph). Arillus of a reddish blood-colour. ○ F. Native of the East Indies. Sims, bot. mag. t. 2455.—Rheed. mal. 8. p. 17. t. 9.

Papareh of the Hindoos. Corolla yellow. Seeds wrinkled very irregularly, yellow bay-coloured, and irregularly tubercu- 

lated towards the margin. Allied to the preceding species, but very distinct.

Var. β, abbreviata (Ser. in D. C. prod. 3. p. 311.) fruit shorter than that of the species, very venticose, beset with acute tubercles. M. Zeylánica, Mill. dict. 3. ex Lam. dict. 4. p. 239.

4 M. ROXBURGH'ANA; downy; leaves cordate, palmately 7-9-lobed, and lobately toothed; tendrils simple; peduncles 1- 

5 M. SENEGAL'ENSIS (Lam. dict. 4. p. 239.) leaves deeply palmate, somewhat serrated, pale and villous beneath; fruit ovate, mucronate, tuberculate, orange-coloured or red. ○ F. Native of Senegal.

6 M. CYLINDRICA (Lin. spec. 1433.) stem 5-angled; leaves cordate, somewhat lobate, angular, toothed; flowers yellow; fruit cylindrical, very long, rather villous, reticulated; bractea quite entire at the base of the pedicle; seeds black. ○ F. Native of Ceylon and China. Willd. spec. 4. p. 605. The fruit of the species, according to Rumphius, does not open elastically, being composed of so many reticulated tough fibres.

Cylindrical-fruitated Momordica. Pl. tr.
7 M. HEYNE'ANA (Wall. cat. no. 6744) leaves 3-lobed, mucronately denticulated; peduncles 1-flowered, solitary, furnished each with a large bractea under the flower, which encloses it before expansion; tendrils simple. ○ F. Native of the East Indies. Flowers large.

Heyne's Momordica. Pl. tr.

8 M. subanu'gula'ta (Blum. bjr. p. 928) leaves deeply cordate, acuminate, rather angular, mucronately denticulated, scabrous above; flowers dioecious; bracteae cordate, quite entire at the top of the peduncle. ○ F. Native of Java, on Mount Salak, where it is called by the natives Aroy Gambas. Allied to M. cylindrica and M. dioica. The inflorescence of this plant agrees with the figure in Rumph. 5. t. 150. ex Blume. Fruit fibrous.

Angular-leaved Momordica. Pl. cl.

9 M. PA'NA (Hamilt. ex Wall. cat. no. 6742) leaves cordate, triangular or hastate, sometimes lobed at the base, acuminate at the apex, coarsely toothed; tendrils simple; female peduncles 1-flowered, solitary; male ones racemose; racemes aggregate; fruit round, beset with a few scattered prickles. ○ F. Native of the East Indies, in Goyalpara.

Paina Momordica. Pl. tr.

10 M. tubi'flowers (Roxb. ex Wall. cat. no. 6749) plant white from down; leaves round, angularly and roundly lobed, cordate at the base; tendrils simple; fruit oblong, acuminated, ribbed; peduncles 1-flowered, solitary, bracteate. ○ F. Native of the East Indies.

Tube-flowered Momordica. Pl. tr.

11 M.PUR'ANS (Mart. reise. bras. ex Linnæa. vol. 5. p. 40) stems angular, climbing, clothed with resinous farina at top; leaves ovate-oblongular, acuminated, with a roundish recess, cordate, oblongely 5-lobed, denticulated; male corymbs erect, axillary; female flowers solitary, axillary, drooping; fruit oblong, crested longitudinally from warts. ○ F. Native of Brazil.

Purging Momordica. Pl. cl.

12 M. operculata (Lin. spec. 1433) leaves 5-lobed, toothed; fruit elliptic, angular, tuberculated, operculared by a deciduous bead. ○ F. Native of America. Comm. rar. 22. t. 32, ex Lin. and Willd. spec. 4. p. 603. This plant is probably referable to the genus Luffa. The top falling off from the fruit when it is green.

13 M. elate'rium (Lin. spec. 1434) plant scabrous, hispid, and glaucensed; stems dwarf, without tendrils; leaves cordate, somewhat lobed, crenate-toothed, very rugged, on long petioles; fruit ovate, obtuse, hispid, and scabrous, on long peduncles; seeds bay-coloured. 2 F. or O. H. Native of the south of Europe. Sims, bot. mag. t. 1914.—Blackw. herb. t. 108. Woodv. med. bot. t. 43. Elatérium cordifólium, Mœnch. meth. p. 563. Ecballium L. C. Rich. Root thick. Flowers yellow. Fruit green, expelling the seeds when ripe. Perhaps a proper genus. Dr. Clutterbuck has lately ascertained that the active principle of wild cucumber is contained almost exclusively in the juice around the seeds, and that genuine elaterium is the matter which subsides spontaneously from the juice obtained without pressure. He found that the eighth part of a grain thus prepared seldom failed to purge violently, and of this according to Dr. Barry, from 55 to 64 per cent., only were soluble in alcohol of 0809. The bitter principle found in it is not in itself purgative, but quickens the action of elatin when combined with it. Elatin is a new principle obtained by Dr. Barry of a green colour; it is purgative in very minute quantities. In medicine a few grains of elatérium operates as a drastic purgative, and was sometimes used in dropsies. It is high priced, and seldom used, though recommended by Dr. Ferriar.

14 M. lamberti'ana (Ser. in D. C. prod. 3. p. 311) hispid; stems prostrate, flexuous; tendrils nearly simple; leaves cordate-roundish, 5-lobed, denticulated, scabrous; petioles short; flowers? fruit solitary, elliptic, pilose; peduncles short, hispid. ○ F. Native of the East Indies. Ecballium L. C. Rich. Allied to M. elatérium, but distinct.

Lambert's Momordica. Pl. tr.

15 M. echina'ta (Muhl. ex Willd. spec. 4. p. 605) leaves cordate, with 5 lobed angles; lobes acuminated, quite entire, glabrous; tendrils multifid; fruit roundish, 4-seeded, eellinated by bristles. ○ H. Native of the western parts of Pennsylvania, near the river Ohio. Siccyos lobatá, Michx. amer. 2. p. 217. Fruit roundish, size of a gooseberry, beset with long subulate bristles, very like those of Sicius, but 4-seeded. Flowers yellow.

Echinated-fruited Momordica. Pl. tr.

16 M. dioica (Roxb. ex Willd. spec. 4. p. 605) stems angular, climbing; leaves cordate, acuminated, toothed, glabrous on both surfaces; tendrils filiform; flowers dioecious; female ones solitary; fruit elliptic, muricarated. ○ F. Native of the East Indies.

Dioecious-flowered Momordica. Pl. tr.

17 M. renigera (Wall. cat. no. 6743) leaves cordate, dentate or distantly and mucronately denticulated; peduncles long, 1-flowered, solitary, furnished each with a kidney-shaped hooded bractea, just below the flower; tendrils simple. 2 H. Native of the Burman Empire, about Prome.

Kidney-bearing Momordica. Pl. cl.

18 M. Hamiltoniana (Wall. cat. no. 6748) leaves cordate, toothed, crenated, acuminated; bractea toothed; peduncles 1-flowered, solitary; tendrils simple; fruit hispid. 2 F. Native of the East Indies, in Goyapara and Gongachora. Flowers large.

Hamilton's Momordica. Pl. cl.

19 M. bicolor (Blum. bjr. p. 928) leaves deeply cordate, somewhat 5-angled, bluntish, glabrous, mucronately denticulated, with rather strigose margins (when dry dotted above), glandular beneath; flowers dioecious, pedunculate, axillary, usually 3-together; fruit oblong, glabrous, variegated with red. ○ F. Native of Java, in calcareous soil near Kuripan, where it is called Aroy Pupassang by the natives. Nearly allied to M. dioica.

Var. a; base of leaves deeply cordate. Native of the Moluccas.

Var. β; leaves cordately 3-lobed; lateral lobes angular. Native of Java, on Mount Parang.

Two-coloured-fruited Momordica. Pl. tr. or cl.

20 M. acquile'ata (Poir. dict. suppl. 3. p. 723.) stem slender, climbing; leaves palmately pedate, with 5-7 dentately lobed segments, having white scattered dots above, but with the nerves and petioles beset with short prickles beneath; petioles and middle nerves clothed with rough reflexed hairs; male flowers racemose, on long peduncles; female flowers solitary, hardly pedunculate; fruit subglobose, glabrous, size of a pea. ○ F. Native country unknown.

Prickly Momordica. Pl. cl.

21 M. my'strix (Gill. mss. ex Hook. et Arn. in bot. misc. 3. p. 234.) leaves 5-lobed, glabrous, smooth, somewhat cuneated at the base; lobes mucronate, denticulated, middle lobe the longest; tendrils simple; male and female flowers rising from the same axis: male ones disposed in racemes: female ones solitary, pedunculate; fruit oblique, ovate, echinated with strong bristles. ○ F. Native of Buenos Ayres.

Porcupine Momordica. Pl. tr.

CUCURBITACEE. XII. Momordica.
22. M. Lava'ta (Thunb. prod. 13.) leaves ternately pinna-
tat'd, scabrous; fruit woolly. O. F. Native of the Cape of
Good Hope.

Woolly-fruit'd Momordica. Pl. cl.

23. M. 5. syicoides (Ser. in D. C. prod. 3. p. 312.) stems twining,
tere; tendril's simple; leaves triangularly cordate, some-
what 5-lobed, serrulat'd; female flowers pedunculate, solitary;
calyx ovate, pilose, with narrow linear segments; fruit ovate
mature, very pilose, of a yellowish orange-colour at matur-
ity; seeds subglobose. O. F. Native of China —Braam. icon.
chin. t. 12.

Sicyos-like Momordica. Pl. tw.

24. M. spicata (Lin. ms. ex Smith in Rees' cyci. vol. 23.)
 stems furrowed, rugged; leaves cordate, 3-5-lobed, undulated,
rugged from tubercles; male flowers racemose; racemes on long
peduncles; tube of calyx very long; bracteas dilated, toothed,
scabrous; female flowers solitary, on short peduncles; seeds
elliptic, furrowed, hispid. O. F. Native country unknown.

Sicyos-flowered Momordica. Pl. cl.

Cult. M. Elatium and M. Lambertiata being hardy, their
seeds should be sown in the open border. The seeds of the
rest of the species should be sown on a hot bed in spring, and
the plants planted out afterwards as directed for Gourds, p. 42.

XIII. NEUROPSERMA (from νευρος, neuron, a nerve, and
σπερμα, sperma, a seed; in reference to the seeds, which are
reticulated with anastomosing nerves). Rafin. in Journ. phys.
prod. 3. p. 312.

Lin. syst. Mono'c'ia, Monadoph'la. Flowers monoeocious.
Male flowers with a 5-parted calyx; and a 5-parted corolla,
having an undulated erose margin. Stamens 5, diadephous,
having a gland alternating with each fascicle; one of the fas-
cicles bearing 2 anthers, the other trigonal, and bearing 3 an-
thers. Anthers sessile, stellate. Female flowers with a parted
ovary and calyx. Ovarium inferior, beset with 8 series of warts.
Style trifid, girded by 3 glands at the base; stigmas 2-lobed.
Fruit fleshy, 3-celled, but when mature 1-celled, 3-9-seeded.
Seeds girded by mucilaginous red aril, flat, nerv'd, with anasto-
mosing veins, and a rugged edge. Perhaps a proper genus.

1 N. Cuspi'data (Rafin. l. c.) Native of Kentucky, North
America. Perhaps the same as Monória'd balsàmen?

Cuspidate Neuroserma. Pl. tr.

Cult. See Sicyos p. 34. for culture and propagation.

XIV. S'ECHIU'M (from στεκτος, sokiso, to fatten; given to

Lin. syst. Mono'c'ia, Monadoph'la. Flowers monoeocious,
yellow. Male flowers with a somewhat 5-toothed calyx, exca-
vated into 10 hollows, and with the corolla joined on the calyx.
Stamens 4-5, monadephous, free at the apex, diverging; anthers
cordate, distant. Female flowers with a calyx and corolla, as
in the male, but without stamens. Style thick; stigma sub-
capitate, 3-5-cleft. Fruit obcordate, 1-seeded. Seed ovate,
flat, compressed.

1 S. edule (Swartz, fl. ind. occid. 2. p. 1150.) stems terete,
striated, smooth; leaves cordate, angular, rugged beneath; lobes
conning at the base, tooth'd; terminal angle long and acut-
ated; tendrils 4-5 cleft; male flowers racemose; female
flowers solitary, rising from the same axils as the males; fruit
large, obovate, 5-furrowed, gibbous at the apex, echinated by
stiff hairs. O. F. Native of the West Indies, common.
amer. p. 258. t. 163. Chayota edulis, Jacc. amer. 2. t. 245.
This plant is known in South America under the name of cho'ko
and cha'tote. The fruit is green, shining on the outside, whitish,
and fleshy within, differing in size and singular in structure,
containing one seed each, which is sometimes an inch long, and placed
at the very top of the fruit; when it is ripe it protrudes itself a
little, and puts forth many fibres at its extremity. In many of the
West Indies the inhabitants put the fruit into soups or puddings,
or boil it and eat it with their meat as a substitute for turnips
or greens, in which state it is generally looked upon as wholesome
and refreshing, but it is too insipid to be much liked. The
fruit serves to fatten hogs in the mountains and inland parts of
Jamaica, where the plant is much cultivated. The natives of
Cuba notice this variety; one which is most common they
call simply chayote: it is best with harmless pickles, some-
times in great abundance, and sometimes with very few, and
is about 4 inches in length; the other, less frequent, called chayote
francis, is for the most part entirely destitute of pickles, and is
about the size of a hen's egg.

2 S. America'num (Lam. dict. 7. p. 50.) leaves cordate,
angular; flowers racemose; fruit glabrous, a little compressed,
size of a pigeon's egg; seed oval-elliptic. O. F. Native of
Jamaica. Fruit edible like the last. This is perhaps the
chayote francis mentioned above.

American Choko. Pl. cl.

3 S. Palma'tum (Ser. in D. C. prod. 3. p. 313.) stems terete,
bluntly furrowed; tendril's umbellate; leaves palmately lobed,
scabrous; stipula or bractea sessile, cordate, deeply 3-lobed;
males flowers racemose; common peduncle short, many-flowered;
filaments monadephous at the base, and divericate towards the
 apex; female flowers twin, nearly sessile; fruit prickly, green,
size of a fift. O. F. Native of Mexico, in Acahualtempa.
S. palmátum, Moc. et Sesse, fl. mex. icon. ined.

Palmate-leaved Choko. Pl. cl.

Cult. See Cucúribita, p. 42. for culture and propagation.

XV. MELO'OTRIA (μελος of Theophrastus, supposed to be
3. p. 313.—Trichosanthes species of Jacq.

Lin. syst. Mono'c'ia, Polyda'phla. Flowers monoeocious.
Male flowers with a 5-toothed calyx and a campanulate corolla;
petals ciliated or tooth'd, not fringed. Filaments 5, in 3 parcels.
Female flowers. Style 1; stigmas 3, fringed. Fruit 3-celled,
many-seeded. Seeds unknown.

1 M. pendula (Lin. spec. p. 49.) leaves cordate, 5-lobed,
tooth'd; tendril's simple; female flowers solitary, on long ped-
duncles; corolla rather pilose, dentilicate; fruit ovate, nearly
globose, pendulou. 4. S. Native of South America, and the
southern parts of North America. Lam. ill. t. 28. f. 3.—Pluk.
alm. t. 85. f. 5.—Sloan. junc. t. 272. f. 142; f. 2. Plum. spec.
t. 66. f. 2. Stems rooting at every joint. Flowers small,
pale yellow. Fruit about the size of a pea, changing to black
when ripe. In the West Indies these are pickled when green by
the inhabitants.

2 M. fré'tida (Desr. in Lam. dict. 4. p. 87.) root fleshy,
turn'ip-formed; leaves cordate, a little tooth'd, pilose, almost sessi-
el; tendril's simple; male flowers racemose; peduncles short,
short-flowered; female flowers solitary, sessile along the males;
fruit ovate, mariculated, mucronate, pilose, of a dirty yellow-
colour; seeds obovate, compressed. 4. S. Native of Guinée.

Trichosánthes forútsianna, Jacq. coll. 2. p. 341. icon. rar. 3. t.
624. Flowers yellow. Herb fedid when bruised.

3 M. ? Indica (Lour. coch. p. 35.) stems angular; leaves
triangular, denticulated, rough, small, on long pedioles; flowers
usually solitary, pedunculate, white; fruit ovate-oblung, smooth,
small, whitish green. 2. S. Native of Cochín-china. In hedges.
—Rumph. amb. 5. t. 171. f. 2. ex Lour. l. c. Flowers white.
Indian Melothria. Pl. tr.

Cult. See Sieyos, p. 34 for culture and propagation. The plants will exist through winter if kept in a stove.

Lin. syst. Monoc'cia, Monodelphia. Flowers monoeious, white. Male flowers. Calyx rather club-shaped, 5-parted; lobes appendiculated, furnished with 5 teeth on the outside, which alternate with the lobes. Corolla 5-parted, ciliated; filaments 5, but probably 5, joined by twos; anthers joined, with very flexuous cells. Female flowers. Calyx 5-toothed. Corolla 5-parted (f. 2. a.), ciliately jagged. Style trifid (f. 2. d.). Stigmas oblongly subulate. Fruit oblong, 1? or 3-9-celled (f. 2. c.). Seeds compressed, tunicated, blunt, very much deformed?

1. T. ANGUINA (Lin. spec. 1482.) stem pentagonal; leaves cordate, 3-lobed, rarely toothed, ciliate, puberulous; tendrils trifid, very long; male flowers race-mose; racemes on long peduncles; calyces lobes very short, tooth-formed; lobes of corolla ovate, ciliately jagged; fruit terete-oblong, ending in a long beak, hispid, splitting. O. F. Native of China. Lam. ill. t. 794. Sims, bot. mag. 472.—Mills. fig. t. 32.—Mich. gen. 12. t. 9. Cucumis anguinaus, Lin. spec. 1487. ex Lam. dict. 2. p. 75.—Rumph. emb. 5, t. 407. t. 135. Kukubjangan of the Hindoos. Flowers white. Fruit near a foot long.

2. T. COSTATA (Blum. bijdr. p. 933.) leaves cordate, 3-lobed, denticulated, scabrous; lateral lobes somewhat 2-lobed; male flowers race-mose, bracteate; female ones solitary; fruit ovate, oblong-ribbed. O. F. Native of Java, about Batavia and the western provinces, on the margins of rivers, where it is called lopan by the natives.

Ribbed-fruited Snake-Gourd. Pl. tr.

3. T. CULUBRINA (Jacq. fil. eclog. t. 128.) stems furrowed, thickish; tendrils bifid; leaves roundish, cordate, 3-5-lobed; lobes short, broad, toothed; male flowers in panicles; common peduncles very long; female flowers sessile, solitary or in the same axis with the males; calyx very long, with a reflexed limb; fruit nearly terete, very long, lined; seeds ovobovate, red. O. F. Native country unknown.

Fiper Snake-Gourd. Pl. tr.

4. T. SERRVIDOLA (Lin. spec. 1439.) stem slender; leaves cordate, 3-nerved, toothed; petiole short; tendrils bifid; male flowers race-mose; racemes on long peduncles; lobes of corolla oblong, ciliately jagged; female flowers solitary; fruit ovate, acutish, green, lined with white, about the size of a hen's egg. O. F. Native of the East Indies. Rheed. hort. mal. 8. t. 17. Nerve-leaved Snake-Gourd. Pl. tr.

5. T. OFFICINALIS (Hamilt. ex Wall. cat. no. 6694, scabrous; leaves cordate, denticulated; petioles hispid; female peduncles 1-flowered, solitary; fruit round, smooth. O. F. Native of the East Indies, in Chilnari.

6. T. SCABRA (Lour. coch. p. 589.) branches woody, furrowed; leaves cordate, roundish, wrinkled, scabrous; tendrils bifid; flowers monoeious; corolla shortly ciliated; fruit roundish, red, 10-angled, 5-celled; seeds flat, oblong. h. G. Native of Cochin-China. Flowers white. Fruit small. Scabrous Snake-Gourd. Shrub cl.

7. T. cuspidata (Lam. dict. 1. p. 188.) stem twining; leaves cordate, oblong, acute, toothed; tendrils simple; male flowers unknown; female flowers nearly sessile, on short peduncles; calyx long, tubular, with nearly linear, acute, stalked, ciliately fringed segments; fruit ovate, ending in a long point. O. F. Native of the East Indies.—Rheed. mal. 8. t. 16. T. coudata, Wilds. spec. 4. p. 600.

Cuspidate-fruited Snake-Gourd. Pl. tw.

8. T. angulata (Lam. dict. 1. p. 190.) stems angular, very slender, villous; leaves cordate, roundish, small, angular; tendrils forked, longer than the leaves; male flowers panicked; common peduncles much longer than the leaves; female flowers solitary, pedunculate. O. F. Native of the East Indies. Petals fringed.

Angular-stemmed Snake-Gourd. Pl. tr.

9. T. villosa (Blum. bijdr. p. 934.) leaves cordate, tricuspidate, obsoletely denticulated, villous; peduncles 1-flowered; fruit nearly globose, striated with white. O. F. Native of Java, about Rompient and Buitenzorg, where it is called Badujut by the natives. Fruit indehiscent.

Villous Snake-Gourd. Pl. tr.

10. T. ovigera (Blume, l. c.) leaves deeply cordate, mucronate, sometimes sinuated, mucronately denticulated, shining above, and rough beneath: female peduncles 1-flowered; fruit ovate, vittate. O. F. Native of Java, on Mount Salak, where the plant is called Twuk by the natives.

Egg-bearing Snake-Gourd. Pl. tr.

11. T. grandiflora (Blum. l. c. p. 935.) leaves large, quintuple-nerved, ovate, sometimes tricuspidate, quite entire, coriaceous, quite glabrous; flowers bracteate, disposed in dense spikes. O. F. Native of Java, in humid places on the mountains, where the plant is called by the inhabitants Kalayor Badak.

Great-flowered Snake-Gourd. Pl. tr.

12. T. coriacea (Blum. l. c. p. 935.) leaves somewhat quintuple-nerved, cordate, acuminate, quite entire, coriaceous, reticulated above and glabrous, but paler and rough beneath; male flowers bracteolate, in loose racemes, on elongated peduncles. O. F. Native of Java, on Mount Salak, where the plant is called by the inhabitants Piet-tjum-tjelling. Allied to T. grandiflora.

Coriaceous-leaved Snake-Gourd. Pl. tr.

13. T. heteroblasta (Roxb. ex Wall. cat. 6684.) leaves smooth, coriaceous, 3-lobed, seldom 5-lobed; lobes acuminate, entire; peduncles racemose; tube of calyx long. h. G. S. Native of the East Indies, in Goyalpara.

Variable-hollowed Snake-Gourd. Shrub cl.

14. T. cucumisina (Lin. spec. 1432.) fetid; stems tetragonal, rather pilose; leaves cordate, angular, rather villous, petiolate, with white nerves, and muricated petioles; tendrils bifurcate; male flowers disposed in something like umbels; female flowers solitary, on short peduncles; calyces lobes ovate; petals fringed at the apex; fruit ovate, mucronate, smooth, green, lined with white, but at last becoming orange-coloured; seeds with sinuated margins. O. F. Native of Java, in the province of Bantam. Blum. bijdr. p. 934.—Rheed. mal. 8. t. 15. Flowers white. The seeds are sometimes used in disorders of the stomach and bowels, and the plant is celebrated for its virtues in Hortus Malabaricus.

15. T. amaeba (Lin. spec. 1432.) stems terete, glabrous; tendrils simple; leaves cordate, triangular, sinuated, scabrous from dots, stalked; female flowers solitary; peduncles longer than the leaves; calyx long, tubular, with lanceolate, acute segments; petals roundish-ovate, fringed; fruit obovate-oblung, 9-celled, green, striped with longitudinal white lines; flesh white and
bitter; seeds oblong, narrow. O. F. Native of St. Domingo.

—Plum. descr. pl. amer. t. 100.

Bitter-fruited Snake-Gourd. Pl. tr.

16 T. hexasperma (Blum. bijdr. p. 935) leaves 3-nerved, ovate, tricuspidate, quite entire, coriaceous, glabrous; male flowers bracteate, disposed in racemes: female flowers solitary; fruit globose, 6-seeded. O.? F. Native of Java, at the foot of Mount Salak, where it is called Arroy-pitjung-Tjelleng by the natives.

Six-seeded Snake-Gourd. Pl. tr.

17 T. Russelliana (Wall. cat. no. 6696.) smoothish; leaves cordate, hastily 3-lobed, nearly entire; tendrils simple; peduncles 1-flowered. O. & S. Native of the East Indies.

Russell’s Snake-Gourd. Shrub cl.

18 T. macrocarpa (Blum. l. c.) leaves cordate, orbicular, 5-lobed, but sometimes 3-lobed, coriaceous, glabrous; lobes ovate, acuminate, quite entire: lateral lobes rather bifid; fruit large, globose; stem suffruticos. O. & S. Native of Java, on the mountains.

Long-fruited Snake-Gourd. Shrub cl.

19 T. triuspidata (Lour. coch. 589.) stems shrubby; tendrils trifid; leaves cordate, tricuspidate, denticulated, glabrous, many-nerved; stipulas roundish, thick, crenated; flowers spicate, or perhaps panicked; bracteas large, toothed; fruit yellow, small, ovate, 2-celled, 2-seeded. O. F. Native of Cochín-china; and among bushes and on the margins of rivers in Java. Flowers white.

Tricuspidate-leaved Snake-Gourd. Pl. cl.

20 T. filosus (Lour. coch. p. 588.) stems suffruticos, very long, furrowed; bifid leaves; large cordate, denticulated, pilose on the veins, lower ones palmate, upper ones 3-lobed; male flowers? in spikes; bracteas large, lanceolate, ciliated; fruit ovate, acute, scarlet, 1-celled; seeds rhomboid, compressed, lobed, brown. O. & S. Native of Cochín-china. Flowers white as in the rest of the species, fringed with curling hairs.

Pilo-se Snake-Gourd. Shrub cl.

21 T. laciniosa (Klein, ex Willd. spec. 4. p. 601.) stems filiform, angular, glabrous; leaves deeply cordate, palmately 5-7-lobed, remotely toothed, glabrous on both surfaces; male flowers disposed 4 or 6 in a corymb: petals ovate, toothed; female flowers solitary: petals ciliately fringed. O.? F. Native of the East Indies.

Jagged-leaved Snake-Gourd. Pl. tr.

23 T. Chikènes (Ser. in D. C. prod. 3. p. 315.) leaves cordate, triangular, bluntish, rather angular; petioles short; tendrils simple; male flowers solitary; calyx long, elate, rather pilose; petals obovate, with fringed margins; female flowers solitary, almost sessile; tube of calyx ovate, acuminate, pilose: petals not fringed; fruit ovate, striated, ending in a long point.

China Snake-Gourd. Pl. tr.

24 T. tambinioia (Poir. dict. suppl. l. p. 386.) stems glabrous, striated; tendrils simple; leaves ovate-roundish, rather lobed, or entire, scabrous above; male flowers small, in loose racemes; petals villous? reflexed; fruit ovate, mucronate, glabrous.—Native of Porto Rico.

Tamus-leaved Snake-Gourd. Pl. tr.

25 T. fubera (Blum. bijdr. p. 936.) leaves deeply cordate, tricuspidate, denticulated, rather tomentose beneath; female flowers solitary: fruit ovate, acute.—Native of Java, on the mountains, where the plant is called by the natives Arroy-kalayar-burrum.

Downy Snake-Gourd. Pl. tr.

26 T. globosa (Blum. bijdr. p. 936.) leaves palmately 3 or 5-lobed, quite entire, glabrous; lobes linear, acute; male flowers bracteate, disposed in dense spikes, on thick peduncles; female flowers solitary; fruit globose.—Native of Java, on Mount Salak, where the plant is called Arroy-jantang by the natives.

Globose-fruited Snake-Gourd. Pl. cl.

27 T. palmata (Roxb. ex Wall. cat. 6688.) puberulous; leaves cordate, 5-lobed; lobes denticulated; peduncles racemose; corolla fringed. O. & S. Native of the East Indies. Bracteas toothed.

Palmate-leaved Snake-Gourd. Shrub cl.

28 T. trifoliata (Blum. l. c.) leaves ternate; leaflets denti
culated, scabrous: lateral ones gibbous at the base; male flowers bracteate, disposed in something like racemes; female flowers solitary; fruit ovate, muciracet (ex Rumphi); seeds complanate, denticulated?—Native of Java, in the province of Krawang, near Tjiradjas. Mammórica trifiliata, Lin. spec. 1434. Amara sylvestris, Rump. amb. t. 152. f. 2.

Trifoliolate-leaved Snake-Gourd. Pl. cl.

Cult. Sow the seeds in a hot-bed in spring, and afterwards treat the plants as if they were cucumbers. The shrubby and perennial species should be cold from the frost and cold by placing them in the stove in winter: cuttings will root readily.

XVII. AMPELOSICYOS (from ampleros, ampeles, a vine, and sygos, sigos, a cucumber; intermediate habit.) Pet. Th. veg. d’Afr. p. 68. t. 22.—Telafairia, Hook, bot. mag. no. 2751. and 2752. (July 1827.) Feuillae’s, spec. Smith, in bot. mag. t. 2681. Jollifica, Bojer in litt. (1826.) and Delill. mem. soc. hist. par. vol. 3. p. 314. (July 1827.)

LIN. SYST. Diocèsa, Monadelphia. Flowers dioecious. Male flowers. Calyx turbinate (f. 3. a.), 5-cleft; segments acutely denticulated (f. 3. b.). Corolla 5-petalled (f. 3. c.); petals oblong, fringed. Stamens 5, disposed in 3 bundles. Female flowers. Limb of calyx almost wanting, 5-toothed (ex Smith). Corolla as in the male. Stigma capitate, 3-lobed (ex Bojer), 5-lobed (ex Smith). Fruit fleshy (f. 3. c.), 2-3 feet long, and 8 inches thick, elongated and furrowed, divided into 3 twin cells (ex Bojer), into 5 (ex Smith). Seeds compressed, nearly orbicular, reticulated on the outside. Cotyledons thick, oily. A climbing plant, with pedate leaves and showy purple flowers.

1 A. scandens (Pet. Th. l. c.) 4. S. Native of the southeastern coast of Africa, on the shores of Zanzibar. It has also been gathered in the Mauritius, where it is called by the negroes Koumé. Feuillae’s pedata, Smith, l. c. t. 2681. a female plant. Telafairia pedata, Hook, bot. mag. t. 2751 and 2752. with male flowers and fruit. Jol-
CUCURBITACEÆ.

Cucurbita maxima (Duch. in Lam. Dict. 2. p. 151.) seeds cardate, very rugged; petioles hispid; tube of calyx obovate, ending in a short neck; fruit globose, somewhat depressed, yellow, red, or green. ♀ ♂ Native country unknown. Tourn. Inst. p. 106. no. 2. t. 34. Lob. Icon. 641. f. 2. Cucurbita Potiro, Pers. ench. 2. p. 593.

Var. α, Potiro (Ser in D. C. Prod. 3. p. 316.) stems very long, climbing; tendrils strong; fruit large, yellow, or orange-coloured, hollow at maturity. Common yellow gourd, potiron jaune commun, gourge de the French. The shells of the fruits are generally used for holding water.

Var. β, viridis (Ser. in D. C. Prod. 3. p. 316.) stems very long, climbing; fruit green, large, hollow at maturity. Large green gourd. Gros potiron vert of the French. The shells of the fruit of this sort are also used as calabashes.

Var. γ, Goiterro (Ser. diss. in mem. soc. gen. vol. 3. pt. 2. t. 1.) stems assurgent, dwarf; nodes close; tendrils abortive; leaves ovate, cordate, 3-lobed, somewhat coarctate; lobes narrow; fruit small, green, or yellow, full at maturity. Gourgeron or petit potiron vert.

Large Hollow Gourd. Fl. Jul. Aug. Clt.? Pl. cl. or tr. 2 C. melopepo (Lin. spec. 1435.) leaves cardate, obtuse, somewhat 5-lobed, denticulate; tendrils usually transformed into very imperfect leaves; calyx hemispherically campanulate, short, having the throat much dilated; fruit depressed; carpels irregular, rising beyond the throat of the calyx; flesh dry, spongy, white; cells 4-5. ♀ ♂ Native country unknown. Wild. spec. 4. p. 610. C. polymorpha Melopepo, Duch. in Lam. Dict. 1. p. 157.—Bauh. Hist. 2. p. 254. with a figure. Pêpo maximus clypeatus, Mor. Hist. 1. sect. 1. t. 8. Fruit flattened at both ends. It is of great use in long voyages, for it can be kept several months in a fresh state, and is commonly made into pies, like the pumpkin, or boiled and eaten with meat instead of turnips or potatoes. Bonnet d'electeur, bonnet de prétre, and pâtissé of the French.

XVIII. Cucurbita.

Musky Gourd. Fl. June, Aug. Clt.? Pl. tr. 4 C. cerásteeæ (Mart. reas. in bras. ex Linnæa. 5. p. 39.) leaves cardate, nearly orbicular, blantly somewhat 5-lobed, denticulate; fruit large, oblong-pear-shaped, or cylindrical, lined longitudinally, glabrous; flesh subgranular. ♂ ♂ Native of Brazil.

Horned-fruited Cucurbita. Pl. tr. 5 C. villôsa (Blume. bidgr. p. 931.) leaves roundish, cardate, 5-lobed, sabellous; lobes acute, minutely denticulate; peduncles 1-flowered, of the male longer than those of the female flowers; fruit oblong, villous. ♂ ♂ Gathered in the gardens in the East Indies. By the Javanese it is called Baligo.

Villous Gourd. Pl. tr. 6 C. pefo (Lin. spec. 1435.) leaves cardate, obtuse, somewhat 5-lobed, denticulate; calyx ending in a neck beneath the limb; fruit roundish or oblong, smooth. ♂ ♂ Native of the Levant. C. polymorpha oblonga, Duch. in Lam. Dict. 2. p. 155. This species is called Pumpkin and pomion, in English; Giramou, Citrouille trougasse, gourge de Saint Jean in French; Popone in Italian. There are several varieties of pomion, but the most striking are the two following:

Var. a, subrotundâ, (Wildl. spec. 4. p. 609.) fruit roundish. C. major subrotundâ, &c. Bauh. pin. 213.

Var. b, oblonga, (Wildl. l. c.) fruit oblongus. Pêpo oblongus, Bauh. pin. 311.

The pumpkin is the melon or millon of our early horticulturists, the true melon being formerly distinguished by the name of musk melon. Though commonly cultivated in gardens for curiosity, yet in some country villages in England, the inhabitants grow it on dunghills, and train the shoots to a great length on the grass. When the fruit is ripe, they cut a hole on one side, and having taken out the seeds, fill the void space with sliced apples, adding a little sugar and spice, and then have baked the whole, eat it with butter. On the Continent, as well as in many other parts of the world, the fruit is a good deal used in soups, and also stewed or fried in oil or butter. Pumpkin-pie is also very common in many parts of the world.

Modes of dressing some varieties of the gourd.—Mr. Crichton (Cal. mem. vol. 4.) prefers the cheese-gourd, some of which have weighed with him 1 cwt., and the vegetable marrow; but he very judiciously attaches much more importance to the kind of cooking than to the variety cultivated. He therefore subjoins two receipts for the use of the cheese-gourd, and one for vegetable marrow.

To make soup of cheese-gourd.—Take the fleshy part of the gourd when ripe, and cut it into small pieces; put it into a pan with a small bit of butter, set upon a slow fire until it melt down to a purée; then add milk, in the proportion of half a gallon to 4 lbs. of gourd, let it boil a short time with a little salt and sugar, enough to make it taste a little sweet; then cut some slices of bread very thin, toast them very well, and cut them into small dice, put them in a dish, and pour the purée over them, and serve it up.

Cheese-gourd dressed in the Spanish way.—When ripe cut the fleshy part into slices about half an inch, score it across into small dice about half an inch through on one side of the slices; scrape a little of the fat of bacon, and put it into a saucepan, with a little parsley, shallots, and mushrooms chopped very small, adding a little salt and pepper; put them on a slow fire to fry a little, and place this seasoning upon the cut sides of the gourd slices. Put the whole into a quick oven, with a little butter or olive oil, and when baked a little serve up in a dish.

Pumpkin or Pomion. Fl. June, Aug. Clt. 1570. Pl. tr. 7 C. farinosa (Blume, bidgr. p. 931.) leaves roundish, cardate, rather angularly 7-lobed, a little stigmatic; lobes acuminate, toothed; peduncles 1-flowered; fruit oblong, large, covered with a kind of glaucous mealliness. ♂ ♂ Native of Java, in
fields and in gardens, where the plant is called *Dahigo* by the natives. Allied to *C. Pêpo*. Compare Rumph. amb. 6. t. 143.

Mealy-fruit led Gourd. Pl. tr.

8 C. verrucósa (Lin. spec. 1435.) leaves cordate, deeply 5-loved, denticulated; middle lobe narrow at the base; fruit roundish-elliptic, warty. O. F. Native country unknown.—Bauh. hist. 2. p. 222. with a figure. C. polymôphra verrucósa, Duch. in Lam. dict. 2. p. 155. The plant, flowers, and seed &e. are like those of *C. Pêpo*, but the fruit is smaller, with a harder, almost woody rind. Called *Barbarine*, and *Barberisque* in French. The warted gourd is common in most parts of America, where it is cultivated as a culinary fruit. It varies in form and size, being round, flat, shaped like a bottle, or oblong; the rind is white when the fruit is ripe, and covered with large protuberances or warts. It is commonly gathered when half grown, and boiled by the inhabitants of America, to eat as a sauce to their meat. In England it is only cultivated as a curiosity.

9 C. subverrucósa (Willd. spec. 4. p. 609.) leaves cordate, deeply 5-loved, denticulated; middle lobe narrow at the base; fruit clavately-elliptic, rather warty. O. F. Native country unknown. Perhaps a hybrid from *C. verrucósa*, but the fruit is very different.

10 C. aurasécia (Willd. l. c. p. 667.) plant very scabrous; leaves subcordate, 3-loved, cuspidate, sharply denticulated; fruit globose, smooth, having the appearance and colour of an orange. O. F. Native country unknown. The orange-gourd is rather more tender than the other sorts. It has been hitherto chiefly cultivated for curiosity, and when trained spirally round a pole, or against a wall, and loaded with its yellow fruit, it is very ornamental. The fruit should be used like those of other sorts of pumpkin or gourd.

*Var. a, orándìna* (Ser. in D. C. prod. 3. p. 317.) fruit globose, 3-celled; pulp fibry, yellow, nearly dry, with a solid dark green rind, which at length becomes orange-coloured.—*Orangina* or *Fausse orange in French*; *orange-gourd* in English.

*Var. β, cloëjecthoïdes* (Ser. in D. C. prod. 3. p. 317.) rind of fruit thinner and variegated; pulp dry. Called *Coloquinelle* or *Fausse coqouine* in French, and *False cloquing* in English.

11 C. cocíiscëa; fruit round, scarlet, about the size of an orange. O. F. Native of Sierra Leone.

Scarlet-fruitled Gourd. Pl. tr.

12 C. ovépera (Lin. mant. p. 126.) leaves cordate, angular, 5-loved, denticulated, pubescent; calyx obovate, ending in a short neck, and cut round after flowering to the neck. O. F. Native of Astrakan. C. polymôphra pyriûdâris, Duch. in Lam. dict. 2. p. 134.—J. Bauh. hist. 2. p. 222 and 223. f. 1. C. sylvestris, Dod. pempt. 670. f. 1. C. pyrïmôris, Lob. hist. 367. f. 2. Herb and flowers very like those of *C. Pêpo*, but less scabrous. Fruit obovate or ovate, smooth, greenish or yellow, figure of an egg. Called in French *Gingourdette*, and *Vegetable marrow*, in English.

*Var. a, pyrïmôris* (Ser. diss. l. c. t. 1.) leaves 5-loved with undulated margins; lobes oblong-obovate, denticulated, rarely lobulate; fruit pear-shaped, green, or yellow, lined longitudinally with white.

*Var. β, subglomerà* (Ser. in D. C. prod. 3. p. 318.) leaves bluntly lobed; lobes broad, short; fruit obovate, globose, green lined with white; flesh red.

*Var. γ, grîsica* (Ser. l. c.) leaves 3-5-loved, narrow; middle lobe trapeziform, usually lobulate; fruit larger, greenish grey, spotted with white, hardly lined.

*Var. č, ovîàta*; fruit large, ova&ate, whitish when ripe.

The first kind of vegetable marrow was introduced to Britain from Persia within the last few years, where it is called *Cicader*. The fruit of this sort is of a uniform pale yellow or light sulphur colour: when full grown it is about 9 inches in length, 4 inches in diameter, of an elliptic shape, the surface being rendered slightly uneven by irregular longitudinal ribs, the terminations of which uniting form a projecting apex at the end of the fruit, which is very unusual in the gourd or pompon tribe. It is useful for culinary purposes in every stage of its growth; when very young, it is good if fried with butter; when large, or about half grown, it is excellent either plain boiled or stewed with rich sauce; for either of these purposes it should be cut in slices. The flesh has a peculiar tenderness or softness, from which circumstance it has received its name, much resembling the buttery quality of the *bouurre-pear*, and this property remains with it until it is full grown, when it is used for pies. It is, however, in its intermediate state of growth that it is likely to be most approved. There are now several kinds of vegetable marrow in cultivation.

To dress vegetable marrow.—Take the fruit when about half grown; cut it lengthwise through the middle (if large cut it into 3 or 4 slices); take off the outer skin, cut it into small dice, about half through one side of the slices, then scrape a little of the fat of bacon, and put it into a saucepan, with a little parsley, shallots, and mushrooms, chopped very small, and let them fry a little; then add about a table spoonful of flour, with a little salt and pepper, mixed all together; then put the slices of the vegetable marrow into a stewpan with a cover, and put the fried seasoning over the slices, and let them stew a little on a slow fire, with a little fire on the cover. When enough done, serve up.*—Crichton, Cal. mem. vol. 4. The Caledonian Horticultural Society's silver medal was given to Mr. Chrichton for this receipt, and the other two upon the cheese-gourd. We think it ought to have been given to the cook.

13 C. fedìedissima (H. B. et Kunth. nov. gen. amer. 2. p. 125.) leaves deeply cordate, ova&ate, sinutately angular, narrowed above, toothed, strigose above, but white and villous beneath; female flowers axillary, solitary, pedunculate; calyx campanulate, funnel-shaped below, with ova&ate-oblong, acute segments. O. F. Native of Mexico, near Guanaxuato, at the height of 3400 feet.

Very fedìed Gourd. Pl. cl. or tr.

14 C. ûmbellàta (Klein, ex Willd. spec. p. 608.) stem furrowed, glabrous; leaves cordate, with 5 narrow, denticulated scarous lobes; male flowers in umbels, female ones solitary, pedunculate; fruit elliptic, tomentose. O. F. Native of the East Indies.

Umbelate-flowered Gourd. Pl. tr.

15 C. asperàta (Gill. mss. ex Hook et Arn. in bot. misc. 3. p. 234.) flowers dioecious; stems glabrous; leaves palmately 5-parted, rough from calous dots on both surfaces, which are more numerous beneath; segments sinutately pinnatifid; tendrils simple; male flowers in capitate racemes, on short peduncles, female ones pedunculate, solitary; fruit nearly globose, few-seeded. O. F. Native of Chili, in the province of Mendóza, in uncultivated places, where it is called by the natives *Sandillo del campos*. This plant agrees in many respects with the *C. mammeàta*, Mol. but that species is from Chili.

Rough Gourd. Pl. tr.

16 C. cixèrâria (Molina, Chili ed germ. p. 316.) leaves roundish, angular, tomentose; fruit woody, globose. O. F. Native of Chili.

CUCURBITACEÆ. XVIII. Cucurbita. XIX. Involucraria. XX. Muricia. XXI. Anguria.

17 C. mammea'ta (Molina, l. c.) leaves many-parted; fruit spherical, beset with protuberances. O. F. Native of Chili.

*Teated Gourd. Pl. tr.*

18 C. lion'sa (Mill. dict.) leaves rough, lobed; fruit woody. O. F. Native of South America. This is a large gourd, and is cultivated for the sake of the shell of the fruit, which will frequently contain between 2 and 3 quarts. Where aloes is manufactured in any quantity, it is commonly preserved in these shells; but in Jamaica they are used to hold water, and small grain.

19 C. multiflora (Forst. ex Spreng. syst. 5. p. 45.) leaves broadly cordate, 3-lobed, acute, denticulated, glabrous; flowers minute, crowded in cymes. O. F. Native of the Society Islands.

*Many-flowered Gourd. Pl. tr.*

*Cult.* The species of Cucurbita are propagated from seeds, which are large, and require to be covered nearly an inch. Sow in April in a hot-bed, under a frame or hand-glass, to raise plants for transferring to the open garden at the end of May, under a warm aspect, or for planting out in the middle of May on a trench of hot dung under a hand-glass or half shelter; otherwise sow at the beginning of May, under a hand-glass, without bottom heat, for transplanting into a favorable situation; or sow 3 weeks later (after the 20th) at once in the open garden, under a south wall, for the plants to remain. The smaller fruited kinds do best trained to an upright pole or trellis. From time to time earth up the stems of the plants. As the shoots extend 5 feet or more, peg down at a joint, and they will take root. Water copiously whenever warm weather without showers makes the ground arid. Mr. Gray (Gard. mag. vol. 1. p. 150.) plants in paths between asparagus beds, and lets the vines of the gourds run over them; and he considers that their large leaves do good to the asparagus roots, by protecting them from the sun, while the tall stems of the asparagus afford a shelter to the leaves of the gourds. In very dry seasons they are an excellent substitute for cabbages and turnips, when the drought is apt to burn up these vegetables. Mr. Gray therefore recommends, especially where the soil is liable to be burnt up in summer, planting the vegetable marrow and other cucurbitaceous plants as a reserve crop. The tender tops of all the edible species of Cucurbitaceæ, boiled as greens or spinach, are a fully more delicate vegetable than the fruit. It must be worth something to gardeners and cooks to know that either or both may be used for this purpose when scarcely any thing else can be got.

1 A. integrifolia (Nees et Mart. in nov. act. bonn. 12. p. 9.) leaves ovate, denticulated, 3-nerved, glabrous; peduncles 4-6-flowered, bracteal; female flowers unknown.—Native of Brazil, at the river Ilheos. Flowers red.

Intire-leaved Anguria. Pl. cl.

2 A. triloba (Lin. spec. 1376.) root bitter; stems slender; leaves deeply 3-lobed, or somewhat 5-lobed, veiny; lobes a little toothed; tendrils simple; male flowers large, in racemes, female ones solitary, almost sessile; fruit ovate-oblong, umbilicate green, spotted with white; seeds oblong, fulvous. 2, 3. S. Native of Martinico.—Plum. ed. Burm. pl. amer. t. 22. Jacq. amer. p. 243. t. 156. ed. pict. p. 119. t. 234. Flowers vermilion coloured.

3 A. pedate'sta (Nees et Mart. in nov. act. bonn. 12. p. 10.) leaves pedately 5-parted; lobes quite entire; tendril subumbellate; corymbs many-flowered; flowers triandrous? fruit oblong, striated, attenuated both at the base and apex; pulp white, spongy, rather acid: aril black. O. ?. Native of Peru. Momordica pedisecta, Lin. spec. 1434. Lam. dict. 4. p. 241.—Feuell. per. 1. p. 754. t. 41. Flowers white. Two outer segments of leaves lobed. The Peruvians use the fruit in soups.

Pedate-cut-leaved Anguria. Pl. cl.

A. Rôséa (H. B. et Kunth, nov. gener. amer. 2, p. 122.) branches glabrous; leaves truncate ciliate at the base, quite entire, 3-lobed at the apex, glabrous, membranous; tendrils undivided, glabrous; male flowers disposed in racemes; calyx cylindrically campanulate, ventricose at the base, with a 5-parted rose-coloured limb, having the segments roundish and longer than the tube; stamens 2, sessile. **Z.** Native of New Granada, in temperate places near Turbaco, at the height of 6000 feet. Flowers rose-coloured.

**Rose-coloured-flowered Anguria.** Pl. cl. 

6 A. Úmbrosa (H. B. et Kunth, l. c. p. 121.) leaves pedately 5-parted, sinuate ciliate; lobes quite entire, ovate-lanceolate, outer ones much the shortest and divergicate; flowers panicked; peduncles very long; calyx roughish, having the tube ventricose at the base, of a vermilion colour; stamens 2, free; anthers linear; female flowers unknown. **Z.** Native of the temperate provinces of New Andalusia, near Bordones and Cumanacoa.

7 A. *Trifoliata* (Lin. spec. 1576.) stems thickish, terete, rugged; tendrils simple; leaves palmately ternate; leaflets entire: lateral ones unequal-sided; male flowers in racemes purple; tube of calyx long and ventricose; peduncles short; fruit irregularly ovate-oblong, bluntly mucronate, 4-celled, green, lined with white; flesh of fruit red, and sweet. **Z.** Native of St. Domingo.—Plum. Amer. t. 99. 

**Trifoliate Anguria.** Fl. June, July. Pl. cl.

Cult. The species of this genus delight in a light rich soil, and may be propagated either from seeds or cuttings.

† *Genera allied to Cucurbitaceae, but are not sufficiently known.*

**Lin. syst.** unknown. Flowers solitary, axillary. Bractea large, concave, involving a large, coloured, 5-sepal'd calyx, and girded by 5 scales at the base. Stamens 5.—A doubtful genus, said to be related to the order *Passifloraceae*; but according to St. Hilaire (mem. mus. 9. p. 190) it belongs to *Cucurbitaceae*, from the lateral situation of the tendrils.

1 Z. *Commerstonia* (Ser. in D. C. prod. 3. p. 319.) Native country unknown. 

**Commerstonia's Zucca.** Pl. cl. 

Cult. See Anguria for culture and propagation.

**Lin. syst.** *Tetradnia*, Monogynia. Flowers hermaphrodite. Calyx gamosepalous, girded by a short involucreum; segments 5, acutish, hairy. Corolla 4-petalled; petals roundish, very hairy, small. Stamens 4 or perhaps 8 joined by two; anthers 2-lobed? Style subulate; stigma acute. Berry fleshy, large, oblong, obtuse, pendulous, 1-celled. Seeds imbedded in the pulp, ovate, compressed, turned. 

1 A. *Papo's* (Lour. l. c.) a tree, with spreading unarmed branches; opposite digitate leaves; the lobes 5, oval, quite entire and pilose; flowers nearly terminal, pale; peduncles many-flowered. **S.** Native of the eastern coast of Africa, on the shores of Mozambique. *Jaraçá* Brasiliána, Pison, bras. p. 160. ex Lour. l. c. Flowers pale. Fruit brownish-red. 

**Papo's Allasia.** Tree.

Cult. A light rich soil will suit this tree, and cuttings will strike root in the same kind of soil under a hand-glass in heat.

**Lin. syst.** Pentandria, Monogynia. Flowers hermaphrodite. Calyx funnel-shaped, 5-parted, coloured. Scales 5, linear, petal-formed, pellucid, alternating with the calyxine segments. Stamens 5, free, alternating with the scales. Ovarium inferior. Style 1, crowned by a subcapitate stigma. Berry dry, nearly globose, 1-seeded, crowned by the dry permanent calyx.—Climbing herbs, adhering by tendrils, with leaves like those of *Bryonia*. Peduncules opposite, rather umbellate. Flowers disposed in unilateral spikes, cymose, sessile, bracteate.

Cult. Being a tender annual plant, the seeds of it require to be sown on a hot-bed; and after the plants have grown a sufficient size in the seed-pot, they should be potted off singly into other pots, and after a time placed in the stove, and trained upon sticks.

**XXV. Kolibia** (this genus is dedicated to Peter Kolbe or Kolben, a German traveller, who published a description of the Cape of Good Hope). Beav. fl. d'ou. 2. p. 91 t. 120. D. C. prod. 3. p. 320.

**Lin. syst.** Dioica, Monophylla. Flowers dioecious. Male flowers with a gamosepalous calyx, composed of 5 joined sepals, having a crenulated margin; the corolla is gamopetalous, and 5-lobed; lobes lanceolate, with glandular edges. Nectarium? 5-leaved, having lanceolate lobes, which taper to the base, with their edges plumously ciliated. Stamens 5, monadelphous; filaments short; anthers long, conniving. Pistillum unknown.

1 K. *Elegans* (Beauv. l. c.) stem sarmentose, bearing tendrils; leaves glabrous, petiolate, cordate; peduncles 4-flowered. **S.** Native of the western coast of Africa, in the kingdom of Benin. Flowers red. Nectarium blue.

**Elegant Kolibia.** Pl. cl.

Cult. A light rich soil will suit this elegant plant, and cuttings will root in the same kind of mould under a hand-glass in heat.

**ORDER CIV. Papayaæ.** (this order contains only the Papaw trees). Martius, 1829.—Papaya, Agardh. 1824.—Caricée, Turp. in atl. du dict. des se. nat.

Flowers unisexual. Calyx inferior, minute, 5-toothed. Corolla monopetalous; in the male tubular, with 5 lobes and 10 stamens, all arising from the same line, and of those that are opposite the lobes are sessile, the others on short filaments; anthers adnate, 2-celled, bursting longitudinally; in the female divided nearly to the base into 5 segments. Ovarium superior, 1-celled, with 5 parietal polyspermy placenta. Stigma sessile, 5-lobed, lacerated. Fruit succulent, indehiscent, 1-celled, with 5 polyspermy parietal placenta. Seeds enveloped in a loose mucous coat, with a brittle pitted testa. Embryo in the axis of the fleshy albumen, with flat cotyledons, and a terete radicle, turned towards the hilum.—Trees, without branches, yielding an acid milky juice. Leaves alternate, palmately lobed, standing on long terete petioles.

It was the opinion of Jussieu that the genus upon which this
order is founded, held a sort of middle station between Urticaceae and Cucurbitaceae. Augustine St. Hilaire has, however, well remarked upon this subject, that the only relation that it has with Urticaceae consists in the separation of the sexes, its milky juice, its habit, which is like that of some species of Ficus or Fig, its foliage, which is not very different from the Cecropia, and the position of its stigma; and to these he wisely attaches very little importance. Its fruit brings it near Cucurbitaceae; but its true place is probably nearer to Passifloraceae, with which it altogether agrees in the appearance of its tests, in its unilocular fruit, with parietal polyspermous placentas, and its having a calyx and corolla present, differing, however, widely in its habit, and monopetalous flowers.

The fruit of the Papaw is eaten when cooked, and is esteemed by some persons; but it appears to have little to recommend it. Its great peculiarities are, that the juice of the unripe fruit is a most powerful and most efficient vermifuge; the powder of the seed even answers the same purpose; and that a principal constituent of this juice is febrine, a principle otherwise supposed peculiar to the animal kingdom, and to fungi. The tree has moreover, the singular property of rendering the toughest animal substances tender, by causing a separation of the muscular fibre; its very vapour even does this.

I. CA'RICA. (erroneously supposed to be a native of Caria). Lin. gen. no. 1157. Schreb. 1536.—Papayá, Tourn. 441. Juss. 399.

LIN. SYST. Dia'c'ia, Decândria. Character the same as the order.

1. C. PAPA'YA (Lin. spec. 1466.) leaves palmately 7-lobed; segments deeply lobed, oblong, acute; male flowers corymbose. Ñ.S. Native of both Indies.—Rumph. amb. t. 1. t. 50, 51.—Merian, Surin. t. 40. Rhed. mal. t. 1. t. 15. f. 1. Hook. bot. mag. 2898. Ker. bot. reg. 459. The papaw tree is a native of South America and the West Indies, whence it was brought by the Spaniards and Portuguese to the Philippines and the Moluccas; and from these Islands, it being of very quick growth, it spread to all the other countries of India. In three years from seed a papaw tree will be 20 feet high, and loaded with flowers and fruit; and for the sake of this fruit the plant is generally cultivated; it has a pleasant sweetish taste, and is much liked by many people; when young it is generally used for sauce; and when boiled and mixed with lime-juice and sugar, is not unlike, or much inferior to, that made of real apples, for which it is commonly substituted. But Sloane says, the fruit is not in general gathered before it is ripe; cut into slices, soaked in water till the milky juice is out, and then boiled and eaten as turnips, or baked as apples. The juice of the pulp, according to Descourtis, in the "Flore Medicale des Antilles," is used as a cosmetic to remove freckles on the skin, caused by the sun; and the negroes in the French colonies employ the leaves to wash their linen instead of soap. As a medicinal plant the papaw tree is particularly deserving of notice. Hernandez long ago spoke of the milky juice of the unripe fruit as a powerful vermifuge; which has been confirmed by M. Charpentier-Cossigny, as mentioned in the Asiatic Researches by Dr. Heming (vol. 2. p. 162.). A single dose, that gentleman says, is sufficient to cure the disease, however abundant the worms may be. Another writer (Poupee Desports) recommends the use of the powder of the seed instead of the juice. But the most extraordinary property of the papaw tree, is that which is related first, I believe by Browne, in his natural history of Jamaica, namely, that "water impregnated with the milky juice of this tree is thought to make all sorts of meat washed in it tender: but 8 or 10 minutes' steeping, it is said, will make it so soft that it will drop in pieces from the spit before it is well roasted, or turn soon to rags in the boiling." This circumstance has been repeatedly confirmed, and moreover, that old hogs and old poultry which are fed upon the leaves and fruit, however tough the meat they afford might otherwise be, is thus rendered perfectly tender, and good if eaten as soon as killed, but that the flesh passes very soon into a state of putridity. In the third volume of the Wernerian Society's Memoirs there is a highly interesting paper on the properties of the juice of the papaw tree, by Dr. Holder, who has witnessed its effects in the Island of Barbadoes, and speaks of them as known to all the inhabitants. The juice causes a separation of the muscular fibres. Nay, the very vapour of the tree serves this purpose; hence many people suspend the joints of meat, fowls, &c. in the upper part of the tree in order to prepare them for the table. Such is the effect upon hogs that feed upon the fruit, that the good housewives reject the flesh of such it be destined for salting, well knowing that it is not sufficiently firm for the purpose. It is not known whether the power of hastening the decay of meat be attributable to the animal matter or febrine contained in the juice of the Papaw. Two specimens of the juice were brought from the Isle of France; in the one the juice had been evaporated to dryness, and in the other the juice was preserved by being mixed with equal bulk of rum. "Both were subjected to analysis by Vauquelin. The first was of a yellowish white-colour, and semitransparent; its taste was sweetish, and it had no smell, and was pretty solid; but attracted moisture when kept in a damp place. The second was reddish brown, and had the smell and taste of boiled beef. When the first specimen was macerated in water, the greatest part of it dissolved; the solution frothed with soap. The addition of nitric acid coagulated it, and rendered it white; and when boiled, it threw down abundance of white flakes. When the juice of the papaw tree is heated with water, the greatest part dissolves; but there remains a substance insoluble, which has a greasy appearance. It softens in the air, and becomes viscous, brown, and semitransparent. When thrown on burning coals it melted, let drops of grease exude, emitted the noise of meat roasting, and produced a smoke which had the odour of fat volatilized. It left behind it no residue. The substance was febrine. The resemblance between the juice of the papaw tree and animal matter is so close, that one would be tempted to suspect some imposition, were not the evidence that it is really the juice of the tree quite unquestionable. Thomson's System of Chemistry, extracted from the Annales de Chimie, vol. 43. p. 267. Febrine had been previously supposed to belong exclusively to the animal kingdom; but it has since been found in other vegetables, especially in Fieschi. The name papaw is abridged from papua-marum, its name in Mabulbar.

2. C. corymbo'us (Jacq. fil. ex Spreng. syst. 8. p. 905.) leaves palmately 7-cleft; segments oblong, acute, middle one trifid; fruit oval, smooth. Ñ.S. Native of Peru, about Lima. Flowers yellow. Fruit the shape and size of an orange, edible like the rest.

Citron-formed Papaw. Ct. 1820. Tree 10 to 20 feet.

3. C. pyriformis (Willd. spec. 4. p. 815.) leaves cordate, 3-lobed; lobes angular; angles acute; flowers corymbose; fruit pear-shaped. Ñ.S. Native of Peru, and Chili, on rocky cliffs along the shore of Valparaíso. Feuille, per. 2. p. 52. t. 39. f. 1. C. Prosopósa, Lin. spec. 1466. ? Flowers rose-coloured. Fruit
yellow, pear-shaped. A doubtful species of the genus, from its small size and branched stem.

**Pear-shaped Papaw.** Clt. 1823. Shrub 3 to 6 feet.

4. **C. caulisflora** (Jacq. schenbr. 3. p. 33. t. 311.) leaves palmately 5-lobed; intermediate lobe sinate; segments lanceolate, acuminate; male peduncles usually 5-flowered, rising from tubercles on the trunk. ≠. S. Native of South America, in the province of Caraccas and of Trinidad. Flowers yellowish.

**Stem-flowered Papaw.** Clt. 1806. Tree 10 to 20 feet.

5. **C. microcarpa** (Jacq. schenbr. 3. p. 32. t. 309 and 310.) leaves 3 or 5-lobed; intermediate lobe 3-lobed; male flowers corymbose. ≠. S. Native of Caraccas and Chili. Flowers yellowish. Fruit the size of a cherry.

**Var. b. monoleca** (Desf. in Ann. Mus. 1. p. 273.) lower leaves entire (smaller), caudine ones 3-lobed, upper ones 5-lobed; lobes somewhat pinnatifid; flowers monocious, subracemose, erect. ≠. S. Native country unknown. Petioles channelled.

**Small-flowered Papaw.** Tree 10 to 12 feet.

**Spiny Papaw.** Clt. 1821. Tree 20 to 30 feet.

**Cult.** These trees grow well in any light rich soil. They may be brought into a fruit bearing state in our stoves, by planting them in large pots, or in tubs made for the purpose.

**Calyx** of 5 (f. 5. a.) or 10 sepals (f. 4. a. f. 6. a. f. 7. a.), combined into a short or elongated tube (f. 7. c.), free at the apex, disposed in 1 or 2 series; outer lobes large, foliaceous; inner ones alternating with the outer ones, and more petal-like than them, sometimes these last are wanting altogether; the sides or throat are lined by filamentous (f. 4. a.) or annular (f. 5. b. f. 6. c.) or membranous coloured processes, which are disposed in one or more series, having the bottom usually closed by a lid-formed appendage. Petals 5 in the tribe Paropsisææ, but wanting altogether in the tribe Passifloreæ. Stamens 5 (f. 4. b. f. 5. d. f. 7. c.), but indefinite in the genus *Smaethannia*. Filaments opposite the exterior lobes of the calyx, joined into a long tube which sheaths the stipe of the ovarium; anthers fixed by the back, peltate (f. 4. b. f. 5. c.), reflexed, turned outwards, but reversed they are turned inwards, 2-celled, bursting lengthwise. Torus elongated into a long cylindrical stipe. Ovary seated on the stipe, ovate, free. Styles 3, rising from the same point (f. 6. c. f. 5. d. f. 4. d.), crowned by a stigma each, which is somewhat 2-lobed. Fruit naked (f. 7. g.), or surrounded by the calyx (f. 8. a.), stalked, 1-celled, 3-valved, having a polyspermy parietal placenta in the middle of each valve; the valves sometimes dry and dehiscing, sometimes fleshy and indehiscent. Seeds attached in several rows to the placentas, usually clothed with a large pulpy aril, compressed, and generally scrobiculate. Embryo straight, in the centre of the fleshy thin albumen, having a terete radicle, which is turned towards the hylum; cotyledons flat and foliaceous.—Herbs or shrubs for the most part climbing. Leaves of many forms, alternate, stipulate, usually bearing glands on the limb or petiole. Peduncles axillary, some of which are changed into tendrils from abortion, others are simple, and bear 1 flower each, very rarely branched and many-flowered; however, all the peduncles are florisiferous in the upright species, or those that do not climb: always articulated under the flower, and generally furnished with a 3-leaved involucrum at the articulation.

The real nature of the floral envelopes of this remarkable order, is a question upon which botanists entertain very different opinions, and their ideas of its affinities are consequently much at variance. According to Jussieu (Dict. scienc. vol. 38. p. 49.) the "parts taken for petals are nothing but inner divisions of the calyx, usually in a coloured state, and wanting in several species;" and therefore, in the judgment of this venerable botanist, the order is apetalous, or monochlamydeous. De Candolle adopts the same view of the nature of the floral envelopes as Jussieu; but he nevertheless considers, we think with propriety, the order polypetalous. Other botanists consider the outer series of the floral envelopes as the calyx, and the inner as the corolla; the one is green and the other coloured. The nature of the filamentous appendages, or rays as they are called, which proceed from the orifice of the tube, and of the membranous or fleshy, entire or lobed, flat or plaited annular processes, which lie between the petals and the stamens, are ambiguous, but are probably abortive stamens. With regard to the affinity of *Passiflora*, Jussieu, swayed by the opinion he entertains of their being apetalous, and De Candolle, who partly agrees and partly disagrees with Jussieu in his view of their structure, both assign the order a place near *Cucurbitaceæ*; but when we consider the stipitate fruit, occasionally valvular, the parietal placentas, the sometimes irregular flowers, the stipulate leaves, and the climbing habit of these plants, it is not difficult to admit their affinity with *Capparidææ* and *Violaridææ*, the dilated disk of the former of which is probably analogous to the innermost of the annular processes of *Passifloreæ*.

The plants composing the *Passiflora*, are the produce of South America and the West Indies, where the woods are filled with their species, which climb about from tree to tree, bearing at one time flowers of the most striking beauty, and of so singular an appearance, that the zealous Catholics who discovered them adapted Christian traditions to these inhabitants of the South American wildernesses, and at other times fruit tempting to the eye and refreshing to the palate. Several are found in Africa, and a few in the East Indies, of which the greater part belong to the genus *Modæcæ*.

Nothing is known of the properties of this order, further than that the succulent fruit and pulp that surround the seeds are fragrant, juicy, cooling, and pleasant in several species.

**Synopsis of the genera.**

**Tribe I.**

**Paropsisææ.** Petals 5. Ovarium sessile. Upright shrubs without tendrils.

1. **Smaethannia.** Nectarium 1-leaved, urceolate, surrounding the base of the stamens. Stamens indefinite; anthers incumbent. Stigmas 5, peltate. Capsule inflated, papery, 4-5-valved.
2 Paropsis. Capillary threads simple, disposed in 5 bundles, rising from the base of the calyx. Stamens 5; anthers erect. Capsule bladdery, 3-valved.

Tribe II.

3 Passiflora. Tube of calyx very short, having the throat ornamented with a filamentous crown (f. 4. a.). Berry usually pulpy, rarely membranous.

I. Dise'mma. Tube of calyx short, furrowed below, having a double crown in the throat; the outer crown composed of distinct threads, the inner one with the threads joined into an entire or toothed membrane. The rest as in Passiflora.

5 Tac'sonia. Tube of calyx long (f. 7. c.); limb 5-lobed. Petals 5. Throat of calyx furnished with a scaly membrane.

6 Murucu'ia. Tube of calyx furrowed below; crown of throat simple, erect, tubular, truncate (f. 5. b. f. 6. c.). Habit of Passiflora.

9 Deid'amia. Calyx 5-8-parted; lobes petaloid; filamentous crown simple, rising from the outer part of the calyx. Stamens the same number as the lobes of the calyx; filaments joined into a column at the base. Styles 3-4. Capsule pedicellate, 3-4-valved.

10 Vare'ca. Flowers unknown. Berry 1-celled; pulp divided for the seeds in many partial cells. Placentas 3, parietal, polyspermous.

Tribe I.

1 S. Fure'scens (Sol. in herb. Bank. ex R. Br. in Lin. trans. vol. 13. p. 221.) branches downy; leaves oblong-ovate; top of nectarium bearded. f. S. Native of Sierra Leone, in the low lands.

Downy Smeathmannia. Fl. Mar. Shrub 6 to 8 feet.

2 S. Leviga'ta (Sol. l. c. ex R. Br. l. c.) branches glabrous; leaves oblong, acute at the base, shining; nectarium cut, beardless. f. S. Native of Sierra Leone, in the mountains, where we have seen it growing in great plenty, and where it forms beautiful upright bushes, loaded with delicate white flowers.

3 S. Me'dia (R. Br. in Lin. trans. 13. p. 221.) branches glabrous; leaves obovate-oblong, obtuse at the base, glabrous, rather opaque. f. S. Native of Sierra Leone. Flowers white. Intermediate Smeathmannia. Shrub 6 to 8 feet.

Cult. These elegant shrubs grow best in a mixture of loam, peat, and sand; and young cuttings of them strike root freely in the same kind of soil under a bell-glass, in heat.

II. Parop'sia (from paropsis, paropsis, a dish of meat; the seeds are inclosed in a fleshy arillus, of an agreeable sweet taste, much esteemed by the natives of Madagascar, as well as by Europeans). Du Pet. Th. pl. afr. 2. p. 59. t. 19. D. C. prod. 3. p. 322.

Edible Paropsis. Shrub 5 to 6 feet.

Cult. For culture and propagation see Smeathmannia.

Tribe II.

Passiflo'ree-veriæ (true passion-flowers). Calyx with a 5-parted limb. Petals 5 or wanting. Stamens 5 in all, except one plant, which has only 4. Ovarium pedicellate. Some of the pedicels changed into tendrils. Stems generally climbing.

Linn. syst. Monadelphia, Pentandria. Tube of calyx very short, having the throat ornamented with a multiple filamentous crown (f. 4. a.). Berry generally pulpy, rarely somewhat membranous.

1 P. Glau'ca (Humb. et Bonpl. pl. equin. l. t. 22.) arboreous; leaves obovate-oblong, glaucous beneath, and bearing glands in the axis of the veins; petioles glandless; peduncles dichotomous, 3-5-flowered. f. S. Native of South America, on Mount Quindiu. P. amethystina, Mikan. P. arborea, Spreng. syst. 3. p. 42. Flowers white. Crown tipped with yellow.

Glaucous Passion-flower. Tree 20 to 30 feet.

2 P. Emarginata (Humb. et Bonpl. l. c. t. 23.) arborescent; leaves obovate-lanceolate, acuminated, or emarginate, pubescent, and biglandular at the base; petioles glandless; peduncles dichotomous, 3-5-flowered. f. S. Native of Peru, on the Andes. Flowers white?

Emarginate-leaved Passion-flower. Shrub 10 to 16 feet.

3 P. Ovata (Martin. ined. D. C. prod. l. c.) arborescent; leaves oval, obtuse at both ends, somewhat cuneated at the base, glabrous, glandless beneath; petioles biglandular at the apex; peduncles 2-flowered. f. S. Native of French Guiana.

Ovate-leaved Passion-flower. Shrub.
Sect. II. Polyantēma (from τον, many, and ἀνϑος, a flower; in reference to the peduncles bearing many flowers). D. C. mem. soc. gen. 1. pt. 2. p. 455. prod. 3. p. 322. Peduncles many-flowered, sometimes twin, with a tendril in the middle, sometimes solitary, and branched, the middle ending in a tendril. Involucrum wanting or very small. Limb of calyx 5-lobed. Petals 5. Stems climbing.

4 P. cripitifīla (Juss. in ann. mus. 6. t. 41. f. 1.) leaves pedate; glandular; petiole branched, biglandular above the base; leaflets 7, ovate, with 1 tooth on each side at the base; peduncles bearing flowers and tendrils. h. S. Native of French Guiana, in woods. Form of leaves like those of P. pedata. Crown variegated with white, yellow, and red.

Tendril-flowered Passion-flower. Shrub cl. 5 P. septera'da (D. C. prod. 3. p. 322.) leaves pedate; petioles branched, glandless; leaflets oblong, having 1 tooth on each side at the base; tendrils simple, distinct from the peduncles. h. S. Native country as well as the flowers unknown.

Septenata-leaved Passion-flower. Shrub cl. 6 P. holoserica (Lin. amèn. 1. p. 226. f. 15.) clothed with soft velvety down; leaves ovate, somewhat 3-lobed, arisately toothed at the base; petioles biglandular. h. S. Native of Vera Cruz. Sims, bot. mag. t. 2015. Ker. bot. reg. t. 59. Flowers white, spotted with red. Rays variegated with purple and white.

Whole-silky Passion-flower. Fl. May, Aug. Clt. 1733. Sh. cl. 7 P. sexflora (Juss. l. c. t. 87. f. 1.) clothed with soft velvety down; leaves at the base, very broad, truncate at the apex, 3-lobed; petioles glandless. h. S. Native of St. Domingo and Jamaica.

Six-flowered Passion-flower. Shrub cl. 8 P. geminiflora (D. C. prod. 3. p. 322.) pubescent; leaves cuneated at the base, very broad, truncate, sinuateally 3-lobed at the apex, glandular beneath and shining above; petioles glandless. h. S. Native of Brazil.

Twin-flowered Passion-flower. Shrub cl. 9 P. Molluc'ca (Reinw. in Blum. bijdr. p. 938.) leaves oblong, mucronate, somewhat emarginate at the base, quite entire; petioles biglandular; cymes bifid, many-flowered. h. S. Native of the Moluccas.

Mollucca Passion-flower. Shrub cl.

10 P. tetrandra (Banks, herb. ex D. C. prod. 3. p. 323.) glabrous; leaves oval-oblong, acuminate, quite entire, glansless. h. S. Native of New Zealand. Flowers small, greenish.

Tetrandrous Passion-flower. Shrub cl.

11 P. pa'lida (Lin. amèn. 1. p. 218. t. 10. f. 2. exclusive of the synonyms) leaves glabrous, ovate, acuminate, 3-nerved; petioles biglandular above the middle; pedicels 1-3 together. h. S. Native of St. Domingo and Brazil.—Plum. amer. p. 73. t. 83. Ker. bot. mag. t. 660. Flowers small, yellowish-green.

Pale-flowered Passion-flower. Fl. Aug. Sept. Clt. ? Sh. cl. 12 P. c'u'pra (Lin. amèn. 1. p. 219. t. 10. f. 3.) leaves glabrous, ovate, glandular beneath, between the axes; petals glandless; pedicels solitary. h. S. Native of the islands of Providence and Bahama, Jacq. ian. rar. 3. t. 606. Flowers blood-coloured, an inch and a half in diameter. Berries purplish.

Cavanilles's Passion-flower. Clt. 1822. Shrub cl. 14 P. Multifi'ora (Lin. amèn. 1. p. 221. t. 10. f. 7.) leaves ovate-oblong, entire, clothed with velvety down beneath; petals very short, biglandular at the apex; pedicels numerous in the axils of the leaves. h. S. Native of St. Domingo, Cav. diss. 10. t. 272. There are varieties with the leaves either glandular or downy above. Plum. amer. t. 90. Flowers greenish. Style purplish.

Many-flowered Passion-flower. Fl. June, Sept. Clt. 1731. Shrub cl. 15 P. auriculatu'a (H. B. et Kunth, nov. genera. 2. p. 131.) leaves glabrous, ovate, rounded at the base, glandular beneath; pedicels auricled by 2 glands beneath the middle; pedicels 1 or 2 together. h. S. Native of the banks of the Orinoco, in shady places, at the cataract of Maypure. Flowers whitish, but the calyx is greenish on the outside.

Auricled-leaved Passion-flower. Fl. June, Aug. Clt. 1820. Shrub cl. 16 P. Nipa'ul'ensis (Wall. tent. t. 11.) smooth; leaves coriaceo-acute, quite entire, 3-nerved, glandular beneath and on the petals; pedicules bracteate, aggregate; crown triple, exceeding the calyx. h. S. Native of Nipaul, on woody hills in the great valley. Leaves glaucous, furnished with 2 glands underneath at the insertion of the nerves, and 2 in the middle of the petals. Peduncles 2-3-flowered. Flowers small, white, with an greenish crown. Berry yellow, about the size of a small cherry.

Nipaul Passion-flower. Shrub cl. 17 P. littora'alis (H. B. et Kunth, l. c. p. 138.) leaves beset with silky hairs on both surfaces, hastately 3-lobed, and nearly entire; petals bearing 2 stipitate glands above; pedicels 2-3 together. h. S. Native of Peru, on the sea-shore near Patibela, and in the valley of Lima. Flowers with a green calyx.

Sea-shore Passion-flower. Shrub cl. 18 P. glab'ra (H. B. et Kunth, l. c. p. 135.) leaves glabrous, shining, glandular beneath, half orbicular, truncate 2-lobed; lobes very short, spreading; pedicels glandless; pedicels solitary, or twin. h. S. Native of New Granada, near Turbaco. Related to Murucija accellati. Flowers small, white; crown yellow.

Smooth Passion-flower. Shrub cl. 19 P. rude'scens (H. B. et Kunth, l. c. p. 132.) leaves semi-ornicular at the base, lunately 2-lobed; lobes ovate-oblong, acute, divaricate, with an awn in the recess between the lobes, and are as well as the petals downy and glandless; pedicels solitary. h. S. Native of South America, in shady places of the province of Caraccas. P. Lockhartsii, G. Don, in Loud. hort. brtt. p. 269. Flowers small, greenish white.

Downy Passion-flower. Shrub cl. 20 P. biloba (Juss. ann. mus. 6. p. 107. t. 37. f. 2.) leaves smooth, 2-lobed, rounded at the base, 3-nerved, glandless; lobes
obtuse, emarginate, rather diverging; pedioles short, glandless; pedicels twin. 3. S. Native of St. Domingo. Taezonia biloba, Spreng. syn. 3. p. 44. Flowers very small, greenish?

**Two-lobed-leaved Passion-flower.** Shrub cl.

21. **P. Mexicana** (Juss. l. c. p. 108. t. 38. f. 2.) leaves glabrous, 2-lobed, rounded at the base, 3-nerved; lobes oblong, diverging a little, glabrous beneath; pedioles short, glandless; pedicels twin. 3. S. Native of Mexico, about Acapulco. Flowers small, whitish.

**Mexican Passion-flower.** Clt. 1820. Shrub cl.

22. **P. Dictaemo** (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 3. p. 324.) leaves glabrous, 2-lobed, somewhat emarginate at the base, 3-nerved, glandless beneath; lobes oblong, divericate; pedioles glandless; pedicels twin. 3. S. Native of New Spain, where it is called Dictamo.

** Dictamo Passion-flower.** Shrub cl.

23. **P. Normaiis** (Lin. amen. 5. p. 408.) leaves glabrous, 3-nerved at the base, somewhat cordate, glandular beneath, somewhat 3-lobed; middle lobe small; lateral ones so much divericate as to form a straight angle; pedioles very short, glandless. 3. S. Native of Jamaica. Brown, jam. 3. p. 328. Flowers small, pale colored. Fruit purple, downy.

**Normal Passion-flower.** Fl. May, June. Clt. 1771. Sh. cl.

24. **P. Bauhinifolia** (H. B. et Kunth. l. c. p. 132.) leaves downy beneath, and rather glandular, elliptic, rounded at the base, 2-lobed at the apex; lobes obtuse; pedioles glandless, downy; pedicels solitary or twin, downy. 3. S. Native of Quito, in temperate places. Flowers small, whitish.

**Bauhni-leaved Passion-flower.** Shrub cl.

25. **P. Triesthoma** (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 3. p. 324.) leaves glabrous, glandular beneath, ovate, 3-nerved, equally 3-lobed at the apex; lobes mucronated by a bristle each; pedioles glandless; pedicels twin. 3. S. Native of Mexico.

**Three-bristled Passion-flower.** Shrub cl.

26. **P. Miserum** (H. B. et Kunth. nov. gen. amer. 2. p. 136.) leaves glabrous, reticulately 3-nerved, cordate, 3-lobed; lobes obtuse, emarginate, and are, as well as the pedioles, glandless; pedicels solitary. 3. S. Native of South America, between Turbaco and Carthagena, in very hot places. Flowers small, with a greenish calyx, and violaceous crown.

**Miserable Passion-flower.** Shrub cl.

27. **P. Coricine** (Juss. in ann. mus. 6. p. 109. t. 39. f. 2.) leaves smooth, coriaceous, glandular beneath, peltate, 3-lobed; middle lobe obtuse; lateral ones acuminate, 2-nerved; pedioles biglandular in the middle; pedicels twin. 3. S. Native of South America, near Hodua; and perhaps also in Mexico, according to icon. fl. mex. ined. Flowers small, greenish.

**Coricaceous-leaved Passion-flower.** Shrub cl.

28. **P. Diffrigurum** (H. B. et Kunth. l. c. p. 136.) leaves glabrous, coriaceous, glandular beneath, peltate, somewhat 3-lobed, transversely lanceolate; pedioles biglandular in the middle; pedicels solitary. 3. S. Native of New Granada, in temperate places on the Andes. Allied to *P. coricine*.

Perhaps the same as the figure in Herrn. mex. p. 455. upper figure. Flowers with a greenish calyx, and violaceous crown tipped with yellow.

**Deformed Passion-flower.** Shrub cl.

29. **P. Augustifolia** (Swartz. prod. p. 97.) leaves glabrous, glandless, somewhat peltate; lower ones ovate, the rest lanceolate, 2 or 3-lobed; pedioles short, biglandular above the middle; pedicels solitary or twin. 3. S. Native of the Caribbean Islands. Ker. bot. reg. t. 180. P. heterophylla, Jacq. hort. schaenbr. t. 181. Cièca heterophylla, Mænch. P. longifolia, Lam. dict. 3. p. 40. Flowers yellowish, with the rays purple at the base.

30. **P. Maculata** (Scan. cat. hort. bon. et Coll. hort. rip. p. 101.) leaves glabrous, deeply 3-lobed, painted with white on the upper surface; lobes nearly equal, oblong, acute; upper ones bluntly trifid, intermediate one rather larger than the others; pedioles glandless; pedicels solitary or twin, rather pilose. 3. S. Native of Curassao. Pluk. t. 210. f. 3. Perhaps the same as P. minima of Lin. Flowers greenish.

31. **P. Graecis** (Link, enum. hort. berol. 2. p. 182.) leaves subcordate, glabrous, 3-lobed; lobes roundish, beset with 2-4 glands; pedioles biglandular; peduncles axillary, solitary; fruit egg-shaped. 3. S. Native country unknown. Lindl. bot. reg. t. 870. Flowers whitish. Rays blue and white.

32. **P. Lupea** (Lin. amen. 1. p. 224. t. no. 13.) leaves almost glabrous, cordate, trifid; lobes ovate, mucronate by a bristle, and are, as well as the pedioles, glandless; pedicels twin. 3. S. Native of Virginia and Florida, and of the West Indies. Jacq. icon. rar. 3. t. 607. Ker. bot. reg. t. 79. Flowers pale yellow.

33. **P. Minima** (Jacq. hort. vind. t. 20.) leaves glabrous, glandless, 5-nerved, trifid; lobes ovate, middle one drawn out most; pedioles biglandular at the apex; pedicels twin. 3. S. Native of South America. Sowerby in Lin. trans. 2. p. 27. t. 5. f. 6. Ker. bot. reg. t. 144. P. hederaeace, Lam. Flowers greenish yellow, with white rays. Nectarium fourfold, inner one with an entire brown rim, the outer plaited, of a dusky purple colour, the other ciliated, with capillary black hairs, with yellow tips; outlet one having the filamentous appendices twice as long as the others, dark purple at the base, and yellow from the middle to the tip.

34. **P. Hirsuta** (Lin. amen. 1. p. 227. t. 10. f. 16. exclusive of the synonyms of Herrn. and Pluk.) leaves rather hairy beneath, glandless, somewhat 5-nerved, 3 cleft; lobes ovate, middle one much the largest; pedioles biglandular above the middle; pedicels twin. 3. S. Native of the West Indies. Plum. amer. t. 88. A.-B. P. parvifolia, Swartz. prod. p. 97. Flowers whitish.

35. **P. Suberosea** (Lin. l. c. p. 226. t. 10. f. 14.) leaves glabrous, somewhat ciliated, 5-nerved at the base, ovate, somewhat cordate, usually 3-lobed; lobes ovate, acute; middle one larger than the rest; pedioles biglandular above the middle; pedicels twin. 3. S. Native of the West Indies and South America. Smith, exot. bot. 1. t. 28. Plum. amer. t. 84. Jacq. schaenbr. 2. t. 163. Flowers of a greenish yellow colour; crown purple at the bottom. Fruit purple when ripe.

36. **P. Pelta** (Cay. diss. 10. p. 447. t. 275.) leaves pubescent above, glandless, 3-nerved, rather peltate, 3-lobed beyond the middle; lobes lanceolate, divaricate; pedioles biglandular in the middle; pedicels solitary. 3. S. Native of the Antilles, in hedges, as well as in Virginia. Ker. bot. reg. 505. —Plum. amer. t. 85. Flowers greenish.

37. **P. Hederaecea** (Jacq. l. c. p. 448.) leaves somewhat puberulous, glandless, 3-nerved, trifid; lobes ovate, obtuse; pedioles biglandular in the middle; pedicels solitary. 3. S.
Native of the Antilles, in hedges. Plum. amer. t. 54. Flowers whitish?

37 P. fannos (Smith in Rees' cyclo. no. 28.) leaves clothed with velvety hairs on both surfaces, glandless, cordate, unequally 3-lobed, rarely 2-lobed; lobes obtuse; petioles velvety; pedicels bearing 3 bracteoles each. h. S. Native of the West Indies. Allied to P. rubra. Flowers small, greenish.

Cloth-leaved Passion-flower. Shrub cl.

39 P. Berti eriana (Balb. in litt. ex D. C. prod. 3. p. 325.) leaves glabrous, glandless, divided into 3 parts even to the base; leaflets petiole, trifid, attenuated at the base, and very blunt at the apex; pedicels solitary or twin. h. S. Native of St. Domingo.

Berti eria's Passion-flower. Shrub cl.

50 P. perfoliata (Linn. l. c. p. 222. t. 10. f. 8.) leaves glabrous, cordate at the base, glandular beneath, somewhat 3-lobed; middle lobe very short; petiole glandless, very short; petioles solitary or twin, rather downy. h. S. Native of Jamaica, in hedges on the mountains. Ker. bot. reg. t. 78. Murucoucha perfoliata, Spreng. syst. 3. p. 43.—Sloan, jam. 1. p. 230. t. 142. f. 3. 4. Flowers crimson or scarlet; rays fleshy, green, with blunt scarlet tips.

41 P. xeront (Linn. acmen. 1. p. 222. t. 10. f. 9.) leaves velvety, cordate at the base, 2-lobed, with an awn in the recess between the lobes, glandless beneath, and on the petioles; pedicels solitary; ovary hairy, subglobose. h. S. Native of the West Indies and the adjacent continent. Plum. americ. t. 55. Ker. bot. reg. t. 95. Stem reddish, hairy. Flowers of a greenish yellow colour; crown red. Berry red.

42 P. capsularis (Linn. l. c. p. 234.) leaves downy, cordate at the base, 2-lobed, with an awn in the recess between the lobes, and are, as well as the petioles, glandless; pedicels solitary; ovary elliptic-oblong, and is, as well as the fruit, acutely hexagonal, glabrous. h. S. Native of the West Indies. Plum. icon. amer. t. 138. f. 2. The flowers are reddish according to Plummer, but according to other authors they are whitish. Fruit small, purple when ripe.

Var. ß, acutiloba (D. C. prod. 3. p. 325.) leaves deeply 2-lobed, hardly pubescent above, painted with white. h. S. Native of Brazil.

Var. γ, geminifolia (D. C. l. c. 1.) leaves glabrous, hardly cordate at the base; branches triangular; pedicels twin. h. S. Native of Jamaica. P. capsularis, Smith in Rees' cyclo. no. 22.

43 P. bi flora (Lam. dict. 1. no. 56.) leaves glabrous, glandular beneath, cordate at the base, 3-nerve, truncate, somewhat 2 or 3-lobed; petioles short, glandless; pedicels twin. h. S. Native of the West Indies and South America. P. lumata, Smith, icon. pict. t. 1. Ker. bot. reg. 577. P. Vesperil, Lowr. pass. t. 8. Flowers white; rays of crown yellow. The Mexican plant differs in the leaves being roundly euneate at the base, not cordate, and in the lobes being less divaricate.

VOL. III.

44 P. Leschenaulti (D. C. prod. 3. p. 326.) leaves semi-orbicular at the base, somewhat truncate at the apex, tricuspidate, pubescent on the nerves beneath, glandless; petioles biglandular in the middle; peduncles twin, 1-flowered. h. S. Native of the East Indies, among the Neegishee Mountains, where it is called by the inhabitants coxamkou. Bryonia tricuspidata, Lesch. Herb. Flowers unknown.

Leschenault's Passion-flower. Shrub cl.

45 P. Andersonii (D. C. l. c.) leaves glabrous, glandular beneath, cuneately-rounded at the base, 3-nerve, truncate at the base; subulate; petioles long, glandless; pedicels twin, hardly longer than the pedicels. h. S. Native of the Island of St. Lucia. Flowers party-coloured.

46 P. Rojhui (D. C. l. c.) leaves nearly glabrous, ovate, somewhat truncate at the base, 3-nerve, blunt and somewhat 3-lobed at the apex; petioles biglandular, rather velvety; pedicels solitary. h. S. Native of Cayenne, or Barbadoes. Rohr's Passion-flower. Shrub cl.

47 P. penduliflora (Bert. in herb. Balb. ex D. C. l. c.) leaves glabrous, roundly obovate, 3-nerve, glandular beneath; nerves extending beyond the border of the leaf; petioles glandless; pedicels solitary or twin, much longer than the pedicels, pendulous, bracteolate beneath the middle. h. S. Native of Jamaica, on the mountains. Flowers pale; threads of crown few and glabular.

Pendulous-flowered Passion-flower. Shrub cl.

48 P. hemicyclia (Meyer, prim. esseq. p. 225.) leaves glabrous, glaucous and glandular beneath, 3-nerve, cuneate, somewhat 3-lobed at the apex; petioles pubescent, glandless; pedicels twin, shorter than the pedicels. h. S. Native of Guiana, about Essequibo; and of Trinidad. Flowers white.

49 P. vespertilio (Linn. amen. 1. p. 223. t. 10. f. 11.) leaves glabrous, glandular beneath, 1-nerve, cuneate at the base, roundly 2-lobed, rarely somewhat 3-lobed; petioles very short, glandless; pedicels solitary. h. S. Native of South America.—Dill. hort. elth. t. 137. f. 164. Flowers white, small.

50 P. retusa (Hook. et Arnott, in bot. misc. 3. p. 235.) leaves smoothish, biglandular beneath, cuneate at the base, or rounded, 3-nerved, 3-lobed; lobes mucronulate, middle one truncate, lateral ones divaricate, prolonged; petioles glandless; peduncles solitary, exceeding the pedicels. h. S. Native of Brazil, on the banks of the Uruguay; and at Santa Bora. Closely allied to P. vespertilio.

Retuse-leaved Passion-flower. Shrub cl.

51 P. Maximiliana (Bory, ann. gen. 1819. vol. 2. p. 149. t. 24.) leaves glabrous, divergently 2-lobed, drawn out a little in the middle, somewhat cordate at the base, red and biglandular beneath; petioles glandless; pedicels solitary or twin, longer than the pedicels. h. S. Native of Brazil. P. discolor, Link et Otto, abh. 1. p. 13. t. 5. Lodg. bot. cab. t. 565. P. vespertilio, Ker, bot. reg. t. 597. This plant differs from P. vespertilio in the leaves being cordate at the base, not cuneate, blood-coloured beneath; and in the pedicels being three or four times longer. Flowers greenish; crown white.

52 P. Artabrous (H. B. et Kunth, nov. gen. amer. 2. p. 133.) leaves glabrous, glandular beneath, semi-orbicular at the base, 3-nerve, truncate at the apex, 2-lobed; petioles puberu-
ous and glandless; pedicels twin.  h.  w.  S. Native of Mexico, on the burning Mount Jurullo. Flowers greenish?

_Jorullo_ Passion-flower. Shrub cl.

53 P. _sicyoides_ (Schlecht. et Cham. in Linnae. vol. 5, p. 88,) leaves cordate, 3-lobed, sharply subdentate or quite entire, glaucous beneath, hairy, biglandular in the recesses, smoothest above; lobes triangularly acuminate, middle lobe the longest; petioles hairy, biglandular in the middle; glands large, elevate; stipules half ovate, cuspidately acuminate; peduncles twin; bracteas filiform, small, approximating the flower.  h.  w.  S. Native of Mexico, in woods near Jalapa. Flowers pale. Habit of _Bryonia._

_Sicyos-like_ Passion-flower. Shrub cl.

54 P. _elongata_ (Swartz. prod. p. 97,) leaves glabrous, glandular beneath, oblong, rounded at the base, 3-nerved, 3-lobed at the apex; petioles glandless; pedicels solitary.  h.  w.  S. Native of Jamaica, among bushes. _P. elongata_, Poir. suppl. 2. p. 839.

55 P. _lycrefolia_ (Tuss. ant. t. 4,) leaves glabrous, glandular beneath, ovate at the base, 3-nerved, 3-lobed at the apex; lobes straight, acuminate, middle lobe small; petioles glandless; pedicels solitary or twin.  h.  w.  S. Native of Jamaica, on Mount St. George. Probably sufficiently distinct from the preceding and following species.

56 P. _tuberosa_ (Jacq. hort. schembr. t. 496,) leaves glabrous, glandular beneath, rounded at the base, 3-nerved, 3-lobed at the apex; lobes oblong, acute, middle lobe very small; petioles glandless; pedicels twin; branches of root tuberous.  h.  w.  S. Native of South America. Ker. bot. reg. t. 492. _P. punctata_, Lodd. bot. cab. t. 110. Lower leaves usually painted with white on the upper surface. Flowers greenish white; outer crown green at the base, tipped with purple and white. Style purple.

Shrub cl.

57 P. _rotundifolia_ (Lin. l. c. p. 235,) leaves rather glandular, velvety beneath, nearly orbicular, 3-nerved, 3-lobed; pedioles glandless; pedicels twin; berries globose, hairy.  h.  w.  S. Native of the Antilles. Plam. icon. amer. t. 138. f. 1. Cav. diss. t. 290. Flowers whitish.

_Var. β, Jacquinii_ (D. C. l. c,) leaves glabrous beneath; pedicels solitary; leaflets of involucrum ovate.  h.  w.  S. Native of Carthagena, in the woods. _P. rotundifolia_, Jacq. obs. t. 46. f. 1. Petals whitish; rays of crown yellow.

_Var. γ, Swartzii_ (D. C. prod. 3. p. 327,) leaves glabrous beneath; berry ovate, glabrous.  h.  w.  S. Native of the south of Jamaica. _P. rotundifolia_, Swartz, obs. p. 337. Flowers greenish.

58 P. _alnifolia_ (H. B. et Kunth, nov. gen. amer. 2. p. 136,) leaves puberulous beneath, glandular, ovate, rounded truncate at the base, 3-nerved, roundly 3-lobed at the apex; middle lobe emarginate; petioles glandless, and are, as well as the pedicels, downy, and twin; berries spherical, glabrous.  h.  w.  S. Native of South America, on Mount Quindiu, at the river Cuello. Flowers large.

_Alder-leaved_ Passion-flower. Shrub cl.

59 P. _obscura_; leaves 3-lobed, somewhat cordate, truncate, velvety: lateral lobes divaricate; intermediate one obsolete, emarginate; petals emarginate, shorter than the calyx; tube of calyx rotate, depressed; inner crown pubescent, plicate, lying on the base of the stipe, in the disc, outer crown radiate; ovary vil-

ous.  h.  w.  S. Native of the north-eastern coast of South America, but in what place we gathered it is now forgotten. Flowers small, pale green, with a downy pedicel: the inner crown is downy and purple: the outer crown has its lower half purple, and its upper white. This species seems to come nearest to _P. alnifolia_ of Bonpland.

60 P. _moellis_ (H. B. et Kunth, 1. c. p. 127,) leaves canescent beneath, glandular, ovate-cordate at the base, 3-nerved, 3-lobed at the apex: lateral lobes very small; petioles glandless, and are, as well as the pedicels, pubescent; pedicels twin; berries glabrous, puberulous.  h.  w.  S. Native of South America, on Mount Quindiu. Flowers not seen.

_Soft_ Passion-flower. Shrub cl.

61 P. _punctata_ (Lin. amoen. 1. p. 224. t. 10. f. 12,) leaves glabrous, transversely oval, glandular beneath, 3-nerved at the base, and emarginately cordate, very bluntly 3-lobed at the apex; petioles glandless; pedicels solitary, longer than the petiole.  h.  w.  G. Native of Peru. Feuill. per. 2. t. 11. Flowers with whitish petals: and violet rays, tipped with yellow.

_Dotted-leaved_ Passion-flower. Shrub cl.

62 P. _bryonyoides_ (H. B. et Kunth, l. c. p. 140,) leaves hispid, cordate at the base, 5-nerved, palmately 5-lobed, sharply-toothed; pedioles biglandular at the apex, hairy; pedicels hairy, twin; berries ellipitic, glabrous.  h.  w.  S. Native of Mexico, near Santa Rosa. Flowers greenish.

_Bryony-like_ Passion-flower. Shrub cl.

_SECT. VI. GRANADILLA_ (Granadilla or Granadille is the French name of some Passion-flowers, so called from the resemblance of the fruit, in size and colour, to a pomegranate, with this difference, that it is not crowned by the calyx.) D. C. in mem. soc. gen. 1. pt. 2. p. 405. prod. 3. p. 327. — Anthactinia, Bory, ann. gen. 2. p. 138. Involucrum 3-lobed under the flower; leaflets entire or toothed, never jagged. Calyx 10-lobed; the 5 inner lobes are probably petals. Pedicels 1-flowered, rising from the same axis as the tendrils, which are simple.

* Leaves entire.*

63 P. _serratifolia_ (Lin. amoen. 1. p. 217. t. 10. f. 1,) leaves pubescent beneath, ovate-lanceolate, acute, serrated, feather-nerved; petioles bearing 4 glands, and are, as well as the pedicels, pubescent.  h.  w.  S. Native of South America. Cav. diss. t. 279. Sims. bot. mag. t. 63. Jacq. hort. schembr. 1. p. 4. t. 10. Mart. dec. 4. t. 36. Flowers with purple petals, and the filaments of the crown pale purple at the base, and from thence bluish.

64 P. _niftida_ (H. B. et Kunth, l. c. p. 130,) leaves glabrous, oblong-elliptic, acuminate, serrated, feather-nerved; pedioles biglandular.  h.  w.  S. Native in woods about the Orinoco. Very nearly allied to the preceding species. Flowers about the size of those of _P. corideae_, with a reddish calyx: crown with blue filaments, ringed with white.

_Shining-leaved_ Passion-flower. Shrub cl.

65 P. _guazumefolia_ (Juss. ann. mus. 6. t. 39. f. 1,) leaves glabrous, ovate-oblong, acuminate, denticated; pedioles biglandular; crown one-half shorter than the calycine lobes.  h.  w.  S. Native of New Granada, in very hot places. Flowers large, with a whitish calyx.

66 P. _ceci'nea_ (Aubl. guian. 2. t. 324,) leaves glabrous, ovate, coarsely toothed, acutish; petioles bearing 4-6 glands; bracteas ovate, sub serrated, velvety.  h.  w.  S. Native of Guiana, where it is also cultivated; and Maranham, in Brazil. Cav. diss. t. 280. Flowers scarlet, with orange-coloured rays. Fruit full of juicy sweet edible pulp.
Scarlet-flowered Passion-flower or Granadilla. Fl. June, Nov. 
Clt. 1820. Shrub cl. 
67 P. Volutina (D. C. prod. 3. p. 327.) young leaves pubescent, at length glabrous, cordate, acutish, sinuately lobed, serrated; petioles biglandular; bracteas glandularly serrated. h. c. S. Native of Brazil. Allied to P. coccinea. Flowers perhaps red or scarlet. 

Velvet Passion-flower. Shrub cl. 
68 P. Glândulosa (Cav. diss. t. 281.) leaves glabrous, ovate, coarsely toothed, acutish; petioles biglandular; bracteas entire, biglandulosa at the base. h. c. S. Native of Cayenne. Tacsonia glandulosa, Spreng. syst. 3. p. 43. Fruit the size of a hen's egg. 

Glandular Passion-flower. Shrub cl. 
69 P. Macronata (Lam. dict. 3. p. 33.) leaves glabrous, ovate-cordate, obtuse, entire; petioles biglandular; stipulas broad-ovate, awned; bracteas oblong, serrate-crenated. h. c. S. Native of Brazil, at Rio Janeiro. Cav. diss. t. 288. 

70 P. Maliformis (Linn. amem. 1. p. 220. t. 10. f. 5.) leaves glabrous, ovate, somewhat cordate at the base, acuminate, entire; petioles biglandular; bracteas ovate, acute, joined at the base, larger than the flower. h. c. S. Native of St. Domingo, Porto-Rico, &c. Plum. icon. amer. t. 82. Ker, bot. reg. t. 94. Leaves long and broad. Flowers large, sweet-scented, and beautiful, of various shades; the petals white, and the rays blue; the outer divisions of flowers are red. This species is called the apple-fruited Granadilla or sweet calabash. The fruit round, smooth, about 2 inches in diameter, of a dingy yellow-colour when ripe; the coat is hard and stringy, nearly a quarter of an inch in thickness, full of very agreeable gelatinous pale yellow pulp, which is eaten with wine and sugar. 

71 P. Tillefolia (Linn. amem. 1. p. 219. t. 10. f. 4.) leaves glabrous, cordate, entire, acute; petioles glandless; stipulas and bracteas entire, ovate, acuminate. h. c. G. Native of Peru. Freuil. per. 2. t. 12. Flowers red; rays crimson, with a white line. Fruit globose, variegated with red and yellow, containing a sweet watery pulp. (f. 4.) 

72 P. Serratistipula (Moc. et Sesse, fl. mex. icon. med. ex D. C. prod. 3. p. 328.) leaves glabrous, cordate, acute, entire; petioles bearing 4 glands; stipulas and bracteas ovate, acute, serrated. h. c. S. Native of Mexico. Fruit edible. 

Serratistipula-leaved Passion-flower. Shrub cl. 
73 P. Ligulata (Juss. ann. mus. 6. t. 40.) leaves glabrous, cordate, acuminate, entire; petioles bearing 4-6 cylindrical glands; stipulas ovate-lanceolate, acuminate; bracteas ovate, entire. h. c. S. Native of Peru. Flowers party-coloured. 

74 P. Quadrangularis (Linn. spec. 1356.) leaves glabrous, cordate at the base, ovate, acuminate; petioles bearing 4-6 glands; stipulas ovate, and are, as well as the bracteas, entire; branches tetragonally winged. h. c. S. Native of Jamaica and South America. Ker, bot. reg. t. 14.—Jacq. amer. t. 143. pict. 218. Flowers highly odoriferous; calyceae lobes white within; petals of the same shape, red within, and white outside. Crown 5-fold; outer rays in a double row, longer than the petals, round, white, and variegated with violet. The common granadilla or granadilla vine bears large fruit, of an oblong shape, about 6 inches in diameter, and 15 inches in circumference. It is externally of a greenish yellow, when ripe soft and leathery to the touch, and quite smooth; the rind is very thick, and contains a succulent pulp of a purple colour, which is the edible part. Wine and sugar are commonly added to it. The flavour is sweet and slightly acid, and is very grateful to the taste, and cooling in a hot climate. It has been successfully cultivated for its fruit in a few places in this country. 

Var. &. sulcata (D. C. prod. 3. p. 328.) fruit furrowed transversely. 

Cultivation of Granadilla (P. quadrangularis). Mr. Mitchel 

son keeps a plant in a box 18 inches square, fixed on a level 

with the curb in one corner of a tan-pit. The sides of the 

box are perforated, to admit the roots to run among the 

and the shoots are trained like vines, under the rafters. 

In autumn the shoots are pruned back to within two or three 

of the old wood; and in March following, or just before the 

plant begins to break, it is taken out of the box, the root 

and ball reduced, and repotted in fresh compost. 

Abundance of water in the flowering season enables the 

plant to set its fruit without artificial impregnation. A 

strong plant will produce 40 fruits in a season in regular 

succession, from the end of June till Christmas. Half that 

number will grow to a larger size. Gard. mag. 2. p. 203. 

The Pass. laurifolia and Pass. edulis may be cultivated 

in the same way for their fruit. 

Quadrantral-stemmed Passion-flower or Granadilla. Fl. 
75 P. Mauritiana (Pet. Th. ann. mus. 6. p. 65.) leaves glabrous, cordate at the base, ovate, acuminate; petioles bearing 4-6 glands; bracteas lanceolate, acuminate, denticulated. h. c. S. Native of the Mauritius. 

Mauritian Passion-flower. Shrub cl. 
76 P. Alata (Ait. Hort. kew. 3. p. 306.) leaves glabrous, somewhat cordate, ovate, acute; petioles bearing 4 glands; stipulas lanceolate, falcate, somewhat serrated; pedicels terete; branches tetragonally winged; bracteas a little toothed. h. c. S. Native of Peru. Sims. bot. mag. t. 66. Sowerby in Lin.TRANS. 2. p. 23. t. 3. f. 6. Flowers very sweet-scented, the upper side of the calyx and petals deep crimson; rays variegated with purple, white, and crimson. 

Shrub cl. 
77 P. Latifolia (D. C. prod. 5. p. 328.) leaves glabrous, broadly cordate, acuminate; lateral nerves approximate at the middle of the base; petiolis glandular; stipulas and bracteas oval-oblong, entire; branches terete. h. c. S. Native of Peru. Flowers pale red. 

Broad-leaved Passion-flower. Shrub cl. 
78 P. Albeida (Ker, bot. reg. 677.) leaves glabrous, roundish-cordate, entire; petioles biglandular in the middle; stipulas ovate-lanceolate, setosely apiculate; bracteas approximating the flowers, soon falling off; pedicels twice the length of the leaves. h. c. S. Native of Brazil, near Rio Janeiro. Flowers white, not pale red as in the preceding. Column inclined. Stamina secund. Crown yellowish. 

Shrub cl. 
79 P. Orna (H. B. et Kunth, nov. gen. amer. 2. p. 129.) leaves glabrous, ovate-elliptic, acute, crenulato; petioles bi-
glandular; axils glandular; bracteas ovate, large, entire.  

Native of New Granada, in temperate places. Flowers white, with blue rays mingled with white.

Plumed Passion-flower. Shrub cl.

80. P. longipes (Juss. ann. mus. 6. t. 33. f. 1.) leaves glabrous, oval-lanceolate, somewhat cordate at the base, entire; pedicels biglandular at the apex; stipulas biglandular; calyx glandular, petals twice the length of the leaves.  

Native of New Granada, on Mount Quindin. Flowers about the size of those of P. coriacea, pale red.

Long-stalked Passion-flower. Shrub cl.

81. P. laurifolia (Lin. l. c. p. 220. t. 10. f. 6.) leaves glabrous, ovate-oblong, entire; pedicels biglandular at the apex; stipulas setaceous, length of pedicles; bracteas obovate, glandularly serrated at the apex.  

Native of the West Indies and South America. 

Long-stalked Passion-flower. Shrub cl.

82. P. Tinifolia (Juss. l. c. p. 41. f. 2.) leaves glabrous, oval-oblong, entire; pedicels biglandular in the middle; stipulas setaceous; bracteas oblong, hardly crenated.  

Native of Cayenne, and about Essequibo. Very like P. laurifolia.

83. P. acuminata (D. C. prod. 3. p. 328.) leaves glabrous, ovate-lanceolate, acuminate, entire; pedicels biglandular at the apex; bracteas oblong, obtuse, entire.  

Native of Brazil.

Acuminated-leaved Passion-flower. Shrub cl.

** Leaves lobed, parted, or cut to the base.

84. P. indecora (H. B. et Kunth, l. c. p. 131.) leaves puberulous beneath, rather glandular, semi-orbicular, lunate, subcordate; lobes ovate, divaricate; petioles glandless, pubescent; stipulas linear, pubescent; bracteas ovate.  

Native of New Granada, in temperate places. Perhaps belonging to the section Decaloba.

Indecorous Passion-flower. Shrub cl.

85. P. fulchellula (H. B. et Kunth, l. c.) leaves glabrous, somewhat glandular, semi-orbicular, truncate 2 or 3-lobed; petioles glandless; stipulas linear-subulate; bracteas oblong, large, entire.  

Native of South America, in the province of Caraccas. Flowers white, with yellow rays mingled with blue.

Neat Passion-flower. Shrub cl.

86. P. racemososa (Brot. in Lin. trans. 12. t. 6.) leaves quite glabrous, rather peltate, glaucous beneath, for the most part 3-lobed; petioles usually bearing 4 glands; pedicels twin, forming terminal racemes, in consequence of the upper leaves being abrortive.  

Native of Brazil. Sims, bot. mag. 2001. P. princeps, Lodd. bot. cab. t. 84. Flowers of a deep red or scarlet colour. Racemes pendulous. There is a variety having the outer ray of the crown white.

87. P. sangiinea (Colla. mem. acad. taur. ined. hort. ripul. append. t. 6.) leaves glabrous, cordate, glaucous beneath, 3-5-parted; oblong, entire; petals bearing 5 glands; stipulas auriculately falcate, apiculated, somewhat serrated; pedicels axillary, solitary, 1-flowered.  

Native country unknown. Probably a hybrid between P. racemososa and P. alata. Flowers large, of a deep scarlet or blood-red colour.

88. P. cereum—racemosora (Sabin. in hort. trans. 4. p. 758. t. 9.) leaves quite glabrous, rather coriaceous, 3-5 lobed; lobes undulated, somewhat toothed at the base; petals bearing 4 glands; pedicels axillary, solitary, 1-flowered.  

A hybrid raised from the seed of P. racemosora, impregnated by the pollen of P. coriacea. Like the male parent, it will live throughout the winter in the open ground, with a little protection in severe weather. Lodd. bot. cab. t. 573. Flowers purple.

89. P. alato—coriacea (Lindl. bot. reg. t. 848.) leaves glabrous, oval, 3-lobed; petals quite entire, ovate-lanceolate; petals bearing 4 glands; pedicels axillary, solitary, 1-flowered.  

Native of California, and about Essequibo. Very like P. laurifolia.

90. P. stipulata (Aubl. guian. 2. p. 325.) leaves glabrous, ovate-oblong, entire; pedicels biglandular in the middle; stipulas ovate-oblong, somewhat auricled, mucronate, and are as well as the bracteas entire; pedicels about equal in length to the peduncles.  

Native of Cayenne and Brazil; and of Mexico, near Jalapa. P. glauca, Ker. bot. reg. t. 88, but not of Humb. Flowers white; crown variegated with purple and white.

91. P. raddiiana (D. C. prod. 3. p. 329.) leaves glabrous, somewhat cordate at the base, 5-nerved, trident; lobes ovate, glandularly serrated at the base; petals bearing 2 glands in the middle; stipulas ovate, dimidiate, awned; pedicels 4 times longer than the petals.  

Native of Brazil, where it was detected by Raddi.

Raddi's Passion-flower. Shrub cl.

92. P. atra (Link et Otto. abh. t. 33.) leaves glabrous, glaucous beneath, somewhat cordate at the base, 5-nerved, 3-lobed; lobes ovate, somewhat glandularly serrated at the base; petals biglandular in the middle; stipulas cordate; superior pedicels longer than the petals.  

Native of Brazil. Flowers white. Very nearly allied to P. Raddiiana.

White-flowered Passion-flower. Shrub cl.

93. P. setacea (D. C. l. c.) leaves velvety beneath, 3-nerved at the base, somewhat cordate, trident; lobes ovate-oblong, acute, serrulated; pedicels velvety, biglandular at the base; bracteas ovate, acuminate, ciliately serrated.  

Native of Brazil, near Rio Janeiro.

Velvety-bracteal Passion-flower. Shrub cl.

94. P. menispermifolia (H. B. et Kunth, nov. gen. amer. 2. p. 137.) leaves hairy beneath, pubescent above, roundish-cordate, angularly 3-lobed, sharply toothed; petals hairy, usually bearing 4 glands; stipulas large, dimidiate subcordate, awned,
hence toothed on one side. 97. S. Native of South America, near Jan de Bracamoras. Flowers unknown.

**Moon-seed-leaved Passion-flower.** Shrub cl. 95 P. suspetta (Burt. dec. 6. p. 78.) leaves glabrous, cor- date, 3-lobed; lobes serrated; middle lobe more extended than the side ones; petioles bearing 2-4 glands in the middle; sti- pulas semi-cordate, mucronate; bracteas cordate. 97. S. Native of New Spain.

**Subpetalate-leaved Passion-flower.** Shrub cl. 96 P. fusica (Ruiz et Pav. ined. ex D. C. prod. 3. p. 329.) leaves velvety beneath, rather scabrous above, 5-nerved, broadly subcordate, trifid; lobes sharply serrated, acute; petioles velvety, glandless; stipulas setaceous; bracteas oval, serrated. 97. S. Native of South America, probably of Peru. Flowers scarlet. Agreeing in habit with *Tasconia.*

**Scarlet-leaved Passion-flower.** Shrub cl. 97 P. incarnata (Lin. amoen. 1. p. 230. t. 10. f. 19. a. c.) leaves glabrous, somewhat cuneate at the base, 5-nerved, deeply trifid; lobes lanceolate, serrated; petioles biglandular at the apex; stipulas small; bracteas glandularly serrated; ovumil brillious. 97. S. Native of South America and Virginia. Ald. hort. farn. t. 50. 52. 58. Morr. ox. 2. p. 6. sect. 1. t. 1. f. 9. Calyceis lobes pale green. Petals white; crown with a double circle of purple rays. The *Flows-coloured Granadilla, or May-apple,* is a perennial, sending up annually a number of herbaceous shoots. The flowers are sweet-scented, variegated with purple. The fruit, when ripe, is about the size of an apple, orange-coloured, with a sweetish yellow pulp.

**Flesh-coloured-flowered Passion-flower or Granadilla.** Fl. July, Aug. Clt. 1629. Pl. cl. 98 P. edulis (Sims, bot. mag. t. 1989.) leaves glabrous, 3-lobed, serrated; petioles biglandular at the apex; bracteas glandularly serrated; crown about equal in length to the calyx lobes; ovumil brillious. 97. S. Native of Brazil. Flowers white. Fruit purple, edible. *Purple-fruited Passion-flower;* Shrub cl. 100 P. cuneifolia (Cav. diss. 10. t. 292.) leaves glabrous, 3-lobed, serrated; lobes ovate, acuminate; petioles biglandular; bracteas large, ovate, entire; crown 3 times longer than the calyx. 97. S. Native of South America.

**Serrulate-leaved Passion-flower.** Shrub cl. 102 P. vitifolia (H. B. et Kunth, nov. amer. 2. p. 138.) leaves downy beneath, cordinate, deeply 3-lobed; lobes ovate, acuminate, sharply toothed, with the sinuses biglandular; petioles biglandular at the base, pubescent; bracteas glandularly toothed. 97. S. Native of South America, on the banks of the rivers Magdalena and Casiquiare. Flowers yellowish; outer crown orange-coloured; inner crown white.

**Fine-leaved Passion-flower.** Clt. 1823. Shrub cl. 103 P. pitosa (Ruiz et Pav. ined. ex D. C. prod. 5. p. 330.) plant hispid from rigid hairs; leaves cuneate at the base and cordinate, 3-lobed; lobes coarsely toothed, ovate-lanceolate; petioles biglandular; stipulas ovate-cordate; bracteas oblong, ciliate. 97. S. Native of Mexico. (V. s. in herb. Lamb.)

**Pilose Passion-flower.** Shrub cl. 104 P. adesmoboda (Moc. et Sesse, fl. Mex. Icon. ined. ex D. C. prod. 3. p. 330.) leaves glabrous, cordinate at the base, 5- nerved, 5-lobed; lobes ovate, acuminate, somewhat serrated; petioles bearing 2 pedicellate glands; bracteas deeply serrated. 97. S. Native of Mexico.

**Stalked-glanded Passion-flower.** Shrub cl. 105 P. filamentosa (Cav. diss. 10. t. 294.) leaves glabrous, 5-parted; serrated; petioles biglandular in the middle; bracteas serrated; crown longer than the calyx or nearly equal to it. 97. S. Native of South America. Sims, bot. mag. 2023. Flowers with whitish petals and blue crown, coloured very like those of *P. coriacea.*

**Filamentous Passion-flower.** Fl. Ju. Oct. Clt. 1817. Sh. cl. 106 P. palmata (Lod. bot. cab. no. 37. Link, enum. 2. p. 133.) leaves glabrous, palmately 5-parted, somewhat serru- rated; serratures glandular; crown a little shorter than the calyx. 97. S. Native of Brazil. P. filamentosa, Ker. bot. reg. 584. Flowers the size of those of the following species, bluish; crown variegated with blue, purple, and white.

**Palmate-leaved Passion-flower.** Fl. Ju. Oct. Clt. 1817. Sh. cl. 107 P. cordifolia (Lin. amoen. 1. p. 231. t. 10. f. 20.) leaves glabrous, 5-parted; lobes oblong, quite entire; petioles bearing 4 glands at the apex; stipulas falcate; bracteas ovate, entire; crown shorter than the calyx. 97. S. Native of Brazil and Peru. Curt. bot. mag. t. 28. Herb. amat. t. 102. Sow- erby in Lin. trans. 2. p. 25. t. 4. f. 4. Calyceis segments pal- greenish white; the petals are nearly of the same shape and size. Styles purplish. Rays of the crown in two circles, pur- ple at bottom, white in the middle, and blue at the ends. Fruit egg-shaped, size of a Mogul plum, yellow when ripe. The flowers have a faint scent, and continue but one day, like many other species of this genus. This is the only kind which can be considered truly hardy.

**Var. *augustinifolia*;** leaves of leaves narrow; plant flowering later than the species. A hybrid.

**Var. *glaucophylla;* leaves glaucous beneath.**

**Var. c. Coleillei (Sweet, fl. gard. t. 152.) leaves of leaves ob- long-lanceolate, serrulated; petioles biglandular at the apex; stipulas rather lunate, serrately ciliated; bracteas ovate, ob- tuse, serrulated; threads of crown rather shorter than the corolla. 97. H. A hybrid. Flowers whitish; petals tinged with blue; outer crown variegated with purple, white, and blue.

109 P. LOURENÇI; leaves glabrous, 5-parted; lobes quite entire; petioles biglandular.  h. w. F. Native of China and Cochín-china. P. cãerülea, Lour. coch. p. 527. but not of Lin. P. Chémenis, Sweet? Flowers greenish yellow, with a blue crown.

110 P. PEDATA (Linn. amoen. 1. p. 233. t. 10. f. 22.) leaves pedate, in consequence of the petiole being branched at the top; petiole biglandular; segments of leaves ovate, acuminated, serrated; bracteas dentately fringed. t. w. S. Native of St. Domingo and Trinidad. Plum. amer. t. 81. Calycine segments pale green, with abundance of little red spots on the upper surface. Petals or inner calycine segments blue. The rays of the crown are very close, deep red, with 2 or 3 white rings, very slender, violet at the ends; they are twisted so as to resemble the serpents about Medusa's head. Fruit the size of a middling apple, green, and dotted.

Sect. VII. TACSONIIODIES (plants resembling Tascónia in habit). D.C. prod. 3. p. 330. Tube of calyx rather elongated, nevertheless much shorter than the limb. The rest as in section Granadilla. Leaves 3-lobed, with the recesses and petioles glandular. An intermediate section between the genus Papi-flora and Tascónia.

111 P. REFLEXIFLORA (Cav. icon. 5. t. 425.) glabrous; leaves subpetiulate, 3-lobed; lobes obtuse, quite entire, recesses and petioles bearing 6 glands; calycine lobes reflexed; crown very short or almost wanting. t. w. S. Native of Paumâmaide, and near Bodega, in South America. Tascónia reflexiflora, Juss. ann. mus. 6. p. 593. Flowers scarlet.

Reflexed-leaved Passion-flower. Shrub cl.

112 P. PICTURATA (Ker. bot. reg. t. 673.) glabrous; leaves subpetiulate, reddish beneath, 3-lobed; lobes quite entire, mucronate by a bristle; recesses and petioles bearing 4 glands; calycine lobes reflexed, twice the length of the filamentous crown. t. w. S. Native of Brazil. P. picturata, Lodd. bot. cab. t. 1050. differs in the lobes of the leaves being glandless. Flowers red; outer crown beautifully variegated with blue and white.

Sect. VIII. Dysómia (from δυσόμια, dysodes, fled, and ομέ, osme, a smell; the species contained in this section have a bad smell). D. C. in mem. soc. gen. 1. pt. 2. p. 436. prod. 3. p. 331. Involucrum 3-leaved, under the flower; leaflets divided into many setaceous lobes, which are tipped with glands. Calyx 10-lobed, or the 5 inner ones are petals. Pedicels solitary. Fruit subcapsular.—Perhaps this section will form a proper genus.

113 P. HIBISCIFOLIA (Lam. dict. 3. p. 39.) stem, petioles, and leaves clothed with soft velvety down on both surfaces; leaves truncate at the base, 5-nerved, trifid; lobes ovato-acuminated, somewhat dentate. t. w. S. Native of the West India Islands. P. fe'ída, var. a, Linn. amoen. 1. p. 228. t. 10. f. 17. Plum. amer. t. 86. P. gossypifólia, Desv. in Ham. prod. p. 48. t.—Giseck, icon. fasc. 1. t. 20. Flowers whitish. Plant petid when bruised.

114 P. PUI'TIDA (Cav. diss. 10. t. 289.) stems and petioles hispid; leaves villous on both surfaces, 5-nerved, cordate at the base, 5-lobed; lobes nearly entire, lateral ones very short, middle one acuminated. t. or w. w. S. Native of the Caribbee Islands and South America. Sims, bot. mag. 2619. Ker. bot. reg. 321. P. fe'ída, var. β, Linn. amoen. P. variegáta, Mill. P. hierüta, Lodd. bot. cab. 138. P. hierina, Sweet. hort. brit. Flowers whitish; crown variegated with purple and blue. Plant petid when bruised.

115 P. ACRIFOLIA (Schlecht. et Cham. in Linneza. 5. p. 89.) the whole plant scabrous from hairs; leaves deeply cordate, pedately 5-7-nerved, cuneated within the recesses, 5 and sometimes 7-lobed; paler and glandless beneath; lobes acuminated, sub serrated; teeth mucronate; petioles biglandular at the apex; glands stipitmate, recurved at the apex; stipulas semicircular, sinutately toothed; teeth subulate; peduncules twin, involucrated in the middle; involucrum multifidly jagged, hardly glandular. t. w. S. Native of Mexico, in woods near Jalapa. Flowers a little larger than those of P. fe'ída.

Sycomore-leaved Passion-flower. Shrub cl.

116 P. CILLATA (Alt. hort. kew. 3. p. 310.) stem glabrous; petioles rather pilose; leaves glabrous, somewhat 5-nerved, cordate at the base, trifid; lobes acuminated, ciliated. t. w. S. Native of Jamaica. Curr. bot. mag. t. 288. Petals greenish on the outside and red within. Rays of crown variegated with white and purple. Stipe of ovarium deep purple, with darker spots.

† Species not sufficiently known.

* Leaves entire.

117 P. APPENDICULATA (Meyer, esseq. p. 223.) leaves glabrous, glandular beneath, 3-nerved, rounded from the base, oblong, mucronate; petioles biglandular, puberulous; pedicels twin, shorter than the petioles; involucrum wanting. t. w. S. Native of Guiana, in shady sandy places. Perhaps belonging to either section Cieca or Decaloba. Flowers yellow.

Appendiculated Passion-flower. Shrub cl.

118 P. CYATHÓPHORA (Desv. in Ham. prod. p. 48.) leaves oblong-lanceolate, undivided, undulated and narrowed in the middle, mucrunolate, 3-nerved, subcordate at the base, quite glabrous above and nerved, glaucencescent beneath; petioles biglandular; glands large, lateral, hollow, cup-shaped, usually twin; involucrum wanting. t. w. S. Native of Guiana. Perhaps belonging to section Cieca or Decaloba.

Cup-bearing Passion-flower. Shrub cl.

119 P. PERIFÓRMIS (D.C. prod. 3. p. 331.) leaves glabrous, ovato-acuminated, feather-nerved; petals biglandular; pedicels solitary; fruit pear-shaped. t. w. S. Native of Brazil.

Pear-shaped-fruited Passion-flower. Shrub cl.

120 P. LANCEOLATA (Desv. 1. c.) branches compressed, angular, ciliated with down; leaves lanceolate, acute, mucrunolate, rounded at the base, with the sides subauricled, pilose on both surfaces, quite entire; petioles biglandular; pedicels twin, capitellate; fruit on a long pedicel. t. w. S. Native of the Antilles. Flowers scarlet. The rest unknown.

Lanceolate-leaved Passion-flower. Shrub cl.

121 P. TETRÁDE'NA (D.C. prod. 3. p. 331.) leaves ovate, quite entire; petioles bearing 4 glands; bracteas toothed; stem tetragonal; membranous. t. w. S. Native of Brazil. Vand. fl. lus. et bras. in Röm. script. 148. Perhaps P. alata or P. quadrangularis.

Four-glanded Passion-flower. Shrub cl.

122 P. THEOBROMOFÓRIA (D.C. prod. 4. p. 331.) stems erect; leaves cordate, ovate, acuminated, unequally serrated, rather puberulous; calyx double; petals spatulate. t. w. S. Native country unknown. Flowers in the Botanical Garden at Schönbrun. P. guazumafolía, Jacq. fragm. p. 18. but not of Juss. This plant perhaps belongs to a different genus, not belonging to this order.
Cacao-leaved Passion-flower. Shrub 4 to 6 feet.

123 P. Cochín-chí'na's (Spreng. syst. app. p. 346.) leaves opposite, glabrous, ovate, undivided, quite entire; petioles biglandular; flowers axillary, twin, 5-cleft; berry ovate. ♀. S. Native of Cochín-china, among bushes. P. pálida, Lour. coch. p. 527. This species differs from all the other Passiflora in the opposite leaves; it is perhaps therefore a species of *Mal-pigia*. Flowers large, pale.

Cochín-chína Passion-flower. Shrub cl.

124 P. Síngapö'ra'na (Wall. cat. no. 1232.) leaves glabrous, oblong; the rest of the plant unknown. ♀. S. Native of Singapore, in the East Indies. Like *P. laurifolia*.

Singapore Passion-flower. Shrub cl.

125 P. Penang'á'na (Wall. cat. no. 1233.) leaves ovate-oblong, long, entire, acuminate; tendrils trifid. ♀. S. Native of Penang. Flowers unknown.

Penang Passion-flower. Shrub cl.

** ♀ Leaves 2-lobed.

126 P. Luná'ta (Juss. herb. ex D.C. prod. 3. p. 331.) leaves rather dwny beneath, glandular, 3-nerved, ovate at the base, lunately truncate at the apex; nerves ending each in a bristle; petioles glandless; pedicels twin; bracteae linear. ♀. S. Native of Peru. Perhaps belonging to the section *Cicca* or *Decóloa*.

Moon-shaped-leaved Passion-flower. Shrub cl.

127 P. Contraye'ra (Smith, in Rees' cyclo. no. 23.) leaves glabrous, deeply 2-lobed; lobes oblong, obtuse, hardly diverging; calyx multifid. ♀. S. Native of Mexico.—Hern. mex. p. 301. lower figure. Allied to *P. Mexicana* and *P. Dic-támo*, but differs from them in the flowers being multifid, not 5-cleft. The root is famous for its medicinal virtues, being sweetish with some pungency and fragrance, and is considered a powerful counterpoison, deobstruent, cordial, &c.

Contraye'ra Passion-flower. Shrub cl.

128 P. Cunae'á (Wild. enum. p. 606.) leaves glabrous, glandular beneath, cuneated at the base, somewhat 2-lobed at the apex, with a mucrone between the lobes; petioles glandless; pedicels twin; calyx 10-cleft, the 5 inner divisions are called petals. ♀. S. Native of Caraccas. Perhaps belonging to the section *Decóloa* or section *Granadilla*.

129 P. Beló'nis (Mill. dict. no. 13.) leaves glabrous, stiff, 2-lobed; pedicels long, horizontal; fruit oval. ♀. S. Native of South America, at Carthagena. Flowers small, white.

Two-lobed-leaved Passion-flower. Shrub cl.

130 P. Clypea'á (Smith, in Rees' cyclo. no. 20.) leaves petate, glandular beneath, 5-7-nerved, reticulately veined, 2-lobed, furnished with a mucrone between the lobes; petioles bearing 2 or 4 glands. ♀. S. Native of New Granada. Flowers unknown.

Buckled-leaved Passion-flower. Shrub cl.

** ♀ Leaves 3-lobed.

131 P. Cephal'éma (Bory, ann. gen. 2. p. 152. t. 22. f. 2.) leaves glabrous, rather glandular beneath, somewhat 3-lobed, emarginate at the base; lobes disarticulate, linear, obtuse, rounded; petioles very short, biglandular beneath the middle. ♀. S. Native country unknown, and has never flowered in the gardens of Europe.

132 P. Multítrósmis (Jacq. fragm. no. 169. t. 67. f. 1.) leaves glabrous, wrinkled beneath, cordate at the base, simple, 2 or 3-lobed, acuminate, very minutely serrated; petioles biglandular. ♀. S. Native of South America, at Caraccas. Wild. enum. 697. Flowers unknown. The plant agrees with *P. in-carnáta* in the shape of the leaves.

133 P. Heterophý'lla (Lam. dict. 3. p. 41.) leaves glabrous, acute, lower ones lanceolate, nearly sessile: middle ones on short petioles, 3-parted: upper ones pedate, in consequence of the petiole being branched at the apex; tendrils wanting; pedicels solitary, without an involucrum; calyx 10-lobed, or the 5 inner lobes, so called, are petals. ♀. S. Native of St. Domingo. Plum. ed. Burm. t. 139. f. 1. Perhaps belonging to section *Decóloa* or section *Astrophí'a*? Flowers yellowish.

134 P. Herma'ní (D. C. prod. 3. p. 332.) leaves velvety, 3-lobed; involucrum small, of 3 entire leaflets; calyx 10-parted. ♀. S. Native of Curassao. Flowers whitish. Allied on one hand to *P. híbris*úta and on the other to *P. híbis-cífolia*.

Herrmann's Passion-flower. Shrub cl.

135 P. ? Túshfóra (H. B. et Kunth, nov. gen. amer. 2. p. 139.) leaves glabrous, coriaceous, rounded at the base, 3-lobed; lobes oblong-lanceolate, equal, entire; petioles biglandular in the middle; pedicels twin; tube of calyx about equal in length to the 5 lobes of the limb. ♀. S. Native of Mexico, in arid places near Acapulco and Etambo del Egido. Probably a species of *Tucáonia*. Flowers with a greenish calyx.

Tube-flowered Passion-flower. Shrub cl.

Cult. All the species of this elegant and curious genus are well suited for planters in conservatories and stoves, being free growers and of easy culture. They thrive well in very light rich soil, and the more room they are allowed, both for roots and stems, the freer they will grow and flower. They are all easily raised from cuttings planted in sand or mould, placed in heat; and the younger the cuttings are, the sooner they will strike root. Most of the species ripen fruit in our stoves, and consequently many fine varieties have been raised by impregnating the stigmas of one with the pollen of another. Several hybrids, raised from seeds set by the pollen of *P. coréidea* are nearly hardy. Several of the species are marked greenhouse, in which they will grow and flower freely. *Passiflora coréidea* is the only species that can be considered quite hardy, and it requires a sheltered situation; it is therefore safest to plant against a wall, that it may be protected by a mat in severe weather: it thrives well in any soil, and cuttings of it are readily rooted, under a hand-glass.

Culture of the edible species of *Granadilla*.—All the species will fruit even in large pots; but it is best to plant them in an angle of a stove, which has been partitioned off, either by boards or brick-work, as low as the pit goes. At the bottom of the cavity formed by this division, should be laid some brick rubbish, over which may be thrown a little dead tan, and the whole be then filled with equal parts of very old tan, and a compost of leaf-mould and rotten dung; therein the roots will strike freely, and will even spread through the partition into the pit. They do not require the full heat of a pine-stove, for they flourish best in a temperature of from 65° to 70°; but they will not bring their fruit to perfection if kept in a common greenhouse or conservatory, though they will grow and flower in it. The shoots as they advance may be trained near to and under the inclined glass of the stove; the first flowers will appear in May, and the blooming will continue until September, the fruit setting the whole time; but if it does not set well it will be advisable to impregnate the stigmas, by applying the pollen with a feather. As they grow, the very strong shoots should be cut out from their origin; for these do not bear fruit so abundantly as those which are less vigorous; but the fruiting-branches must not be shortened on any account. The temperature must be kept up equally during the time of flowering and fruiting; the crop will begin to come in August, and will continue until January, but the earlier produce is the best. When the crop is all off, which will be early in January,
the heat must be reduced to about 50°, so as to check and stop the growth. This being effected, the shoots must be well cut in. As little old wood as possible, besides the main stem, which rises from the pit to the glass, and a few pieces (about 2 or 3 feet of each) of the old branches should be retained; for all that is to be trained under the glass to bear in each year, ought to be the growth of the same season. It is found that the shoots break better and in greater quantity from the older wood than from that of two years’ standing. In this dormant and reduced state it is to be kept during January and February, after which the necessary heat may be applied to cause it to resume its functions for the ensuing season.

IV. DISE'MMA (from κεκ βίως, δίς, two, and στεμμα, stemma, a crown; in reference to the crown of the flower being double, or in two). Lab. sect. calea. p. 78. D. C. prod. 3. p. 332.

Lin. syst. Monadelphus, Pentandria. Tube of calyx short, furrowed below. Crown of throat double; outer one composed of distinct filamentous threads; inner one tubular, with an entire or toothed border. The rest as in Passiflora. All the species are either natives of New Holland or New Caledonia.

* Petioles biglandular at the apex.

1 D. aurantia (Labill. calea. t. 79.) leaves glabrous, ovate at the base, broadly 3-lobed; lobes obtuse, middle lobe the longest: lateral ones furnished with a kind of appendage each on the outside; bracteas bristle-formed, glandular at the apex, rather remote from the flower; petioles biglandular at the apex; threads of outer crown about equal in length to the inner lobes of the calyx or petals. \( h \). G. Native of New Caledonia. Passiflora aurantia. Forst. prod. p. 326. Cav. diss. 10. p. 457. Murucejia aurantia, Pers. ench. 2. p. 222. Flowers orange-coloured, with the tube of the inner crown green, longer than the simple upright rays that surround it.

Orange-flowered Dismema. Shrub cl.

2 D. Herbertiana (D. C. prod. 3. p. 332.) leaves pubescent, cordate at the base, broadly 3-lobed; lobes ovate, acutish; petioles biglandular at the apex; pedicels twin, 1-flowered; bracteas bristle-formed, very remote from the flower; threads of outer crown 3 or 4-times shorter than the inner calyceine lobes or petals. \( h \). G. Native of New Holland, in the interior. Passiflora Herbertiana, Ker. bot. reg. 757. Murucejia Herbertiana, Sweet. Flowers white and greenish, with the crown yellow.

Var. \( \beta \). Calejana (D. C. prod. 3. p. 333.) leaves semiobicular at the base, hardly subcordate; bracteae situated in the middle of the pedicel. \( h \). G. Native of New Holland. Passiflora biglandulosa, Caley. in herb. Lamb. Perhaps a proper species.

3 D. Baueri; leaves 3-lobed, sparingly glandular beneath; lobes oblong, retuse, middle one more prolonged; bracteas and stipulas setaceous; rays filiform, longer than the corolla, which is plicate; disk 5-lobed. \( h \). G. Native of Norfolk Island. Fruit oval, blood-coloured. Flowers at first pale yellow, but at length orange-coloured, with the segments keeled and rather undulated, green on the outside. Murucejia Baueri, Lindl. coll. t. 36.

Bauer’s Dismema. Shrub cl.

4 D. cocceea (D. C. prod. 3. p. 333.) leaves glabrous, glandular beneath, cuneate at the base, 3-nerved, bluntly 3-lobed; petioles biglandular at the apex, longer than the pedicels; bracteas subulate, scattered, remote from the flower. \( h \). S. Native of New Holland. Passiflora cocceea, Banks, but not of Aubl. Flowers scarlet. Crown short, double. Fruit globose. Scarlet-flowered Dismema. Shrub cl.

** Petioles glandless.

5 D. adiantifolia (D. C. l. c.) leaves glabrous, glandular beneath, truncate at the base, 3-5-lobed; lobes obtuse, somewhat 3-lobed; petioles glandless, a little longer than the pedicels; bracteas subulate, scattered. \( h \). G. Native of Norfolk Island. Passiflora adiantifolia, Ker. bot. reg. 233. Passiflora aurantia, Andr. bot. rep. t. 295. but not of Forst. Passiflora glabra, Wendl. coll. 1. t. 17. Passiflora Adiantum, Willd. Enum. 698. Murucejia adiantifolia, Sweet. Flowers yellow first, fading to an orange, with the inner crown green, longer than the purple rays that surround it.

Cult. See Passiflora, p. 55. for culture and propagation. Splendid and curious climbing shrubs.

Lin. syst. Monadelphus, Pentandria. Tube of calyx furrowed below. Crown of throat simple, erect, tubularly-conical, truncate (c. 5. b. f. 6. c.); threads of crown not free, but joined together into a tube.—Habit of Passiflora. Petioles glandless. *Species all natives of the West Indies.*

Sect. I. Pentaria (from πέντε, pente, five; calyx 5-lobed). D. C. prod. 3. p. 333. Calyx 5-lobed (f. 5. a.).

1 M. orbiculata (Pers. ench. 2. p. 222.) leaves glabrous, glandular beneath, 3-nerved, orbicular, somewhat 3-lobed; petioles glandless, twisted; tendrils few; bracteoles narrow, very acute. \( h \). S. Native of St. Domingo. Passiflora orbiculata, Cav. diss. 10. t. 286. Flowers crimson.

Orbicular-leaved Murucuja. Shrub cl.

Sect. II. Decaria (from δεκα, deka, ten; in reference to the calyx being 10-lobed). D. C. prod. 3. p. 333. Calyx 10-lobed (f. 9. a.); the 5 inner lobes probably petals.

2 M. Vcella (Pers. l. c.) leaves glabrous, glandular beneath, emarginate at the base, truncate-2-lobed at the apex; lobes obtuse, divaricate; petioles glandless, shorter than the pedicels; bracteae narrow, very acute. \( h \). S. Native of the Antilles, in woods. Passiflora Murucuja, Lin. amen. 1. t. 10. f. 10. Cav. diss. 10. t. 287. Ker. bot. reg. t. 574. — Plum. amer. t. 87. Flowers deep red. Berry size of a pigeon’s egg, flesh-coloured when ripe. Both the syrup and decoction of the plant is much used in the leeward parts of Jamaica, where it is frequent; and it is said to answer effectually all the purposes for which syrup of poppies and liquid laudanum are generally administered. The flowers are most in use; they are commonly infused in, or powdered and mixed immediately with
wine or spirits; and the composition is generally thought to be very effective and easy narcotic. Browne names it bull-hoof or Dutchman's laudanum, which are probably the vulgar names of the plant in Jamaica.

Var. β; leaves rounded at the base, somewhat 3-lobed. Cav. l.c.

Cult. Climbing shrubs, with the habit of Passiflora, bearing beautiful flowers. Their culture and propagation are as that recommended for that genus, see p. 56.

VI. TACSONÍA (Tacson, the name of one of the species in Peru). Juss. gen. p. 398. ann. mus. 6. p. 388. D. C. prod. 3. p. 333.

LIN. syst. Monadelphía, Pentándria. Tube of calyx long (f. 7. c), with a 10-cleft limb (f. 7. a.); the 5 inner lobes probably petals; throat furnished with a scaly membrane. Habit of Passiflora.

SECT. I. EUTACSONÍA (eu, well or good, and Tacsonia; this section contains the genuine species of the genus). D. C. prod. 3. p. 333. Involucrum large, 3-leaved (f. 6. f.); bracteas sometimes free, sometimes joined together.

* Leaves undivided.

2 T. lana (Juss. ann. mus. 6. t. 59. f. 1.) leaves woolly beneath, glabrous above, ovate-cordate, entire, with somewhat revolute edges; petioles glandless; stipulas narrow, hidden among the tomentum of the stem. h. c. S. Native of the Andes, about Quindiu. H. B. et Kunth, nov. gen. amer. 2. p. 141. Flowers white?

Woolly Tacsonia. Shrub cl.

Blood-coloured-flowered Tacsonia. Shrub cl.

3 T. trifoliata (Juss. l. c. p. 393.), whole plant white from silky tomentum; leaves trifoliolate; leaflets ovate-oblanceolate, quite entire; petioles glandless; stipulas half stem-clasp, ciliated with glands. h. c. S. Native of Peru, in the valley of Canta. Trifoliata Tacsonia. Shrub cl.

4 T. sanguinea (D. C. prod. 3. p. 334.) leaves tomentose beneath, reticulately veined, smooth above, deeply 3-lobed; lobes acute, serrated; petioles glandless; bracteas glandularly-toothed. h. c. S. Native of the West Indies. Passiflora sanguinea, Smith, in Rees' cycl. no. 45. Flowers deep red.

Blood-coloured-flowered Tacsonia. Shrub cl.

5 T. pinnastrifida (Juss. l. c. p. 334.) leaves white from velvety down beneath, trifid beyond the middle; lobes serrated; stipulas pinnate; petioles with 4-8 glands. h. c. S. Native of Chili. Sweet, fl. gard. new. ser. 2. t. 156. Passiflora pinnastrifida, Cav. icon. 5. t. 428. Flowers rose-coloured or purplish; crown deep blue.

Var. β, pennisetipes (Smith, in Rees' cycl. no. 48. under Passiflora) stipulas palmately parted into subulate lobes, one of which is pinnate at the apex.

Vol. III.
Var. β, longiflora (D. C. prod. 3. p. 335.) leaves pubescent beneath; lateral lobes sometimes 2-lobed. ʰ. ʷ. S. Native of Peru. T. longiflora and T. Táspo, Pers. ench. 2. p. 223. Flowers rose-coloured or purplish.

**Mixed Tacsonia.** Shrub cl.

14 T. speciosa (H. B. et Kunth, nov. gen. amer. 2. p. 143.) leaves glabrous, corrodate at the base, reticulately 5-nerved, deeply 3-lobed; lobes ovate-oblong, sharply serrated; petals bearing 6-8 pedicellate glands; stipulas suborbicular, awned, dentilucated. ʰ. ʷ. S. Native of Santa Fe de Bogota. Murucutia speciosa, Spreh, synst. 3. p. 43. Flowers rose-coloured.

**Showy Tacsonia.** Shrub cl.

15 T. glaberrima (Juss. ann. mus. 6. p. 394.) leaves glabrous, coriaceous, 3-lobed; lobes ovate-lanceolate, stiffly serrated; petals bigalldular at the apex; stipulas glove-formed, dentately crested. ʰ. ʷ. S. Native of Peru, on the Andes in shady places. Flowers purple.

**Quite-glabrous Tacsonia.** Shrub cl.

16 T. anastomosans (Lamb. herb. ex D. C. prod. 3. p. 335.) leaves glabrous, coriaceous, cuneate at the base, 3-nerved, trifid; lobes ovate-lanceolate, callously serrated; petals bearing 4 glands; stipulas ovate, awned, callously serrated. ʰ. ʷ. S. Native of Peru.

**Anastomosing-veined Tacsonia.** Shrub cl.

17 T. xerifolia (D. C. prod. 3. p. 335.) leaves glabrous, glandless beneath, 3-5-nerved, trifid; lobes ovate-lanceolate, acutely serrated; petals bearing 4 glands; stipula semi-elliptic, acuminated, nearly entire. ʰ. ʷ. S. Native of Peru. Ruiz et Pav. (v. s. in herb. Lamb.)

**Small-leaved Tacsonia.** Shrub cl.

**SECT. III.** Distephæ'na (from ἐκ, dis, double, and στέφανος, stephanos, a crown; in reference to the double crown in the throat). Juss. l. c. D. C. prod. 3. p. 335.—Distepha, Salisb. in litt. Involucrum small, 3-leafed; leaflets free, bigalldular in the axils. Throat of calyx bearing a membranous tube, and a series of ligules.

18 T. glandulosa (Juss. l. c. p. 391.) leaves glabrous, coriaceous, ovate, acuminate, quite entire, feather-nerved; petals bigalldular at the base, about equal in length to the pedicels; bracteas subulate near the flowe. ʰ. ʷ. S. Native of Cayenne. Passiflora glandulosa, Cav. diss. 10. t. 281.

Var. β, canaliculata (D. C. l. c.) petals thicker, and channelled at the base.

**Glandular Tacsonia.** Shrub cl.

19 T. Rohriana (D. C. prod. 3. p. 335.) leaves glabrous, coriaceous, ovate-oblong, acuminate, quite entire, feather-nerved; petals bigalldular at the base, one-half shorter than the pedicels; bracteas subulate, remote from the flowe. ʰ. ʷ. S. Native of Cayenne.

**Rohr's Tacsonia.** Shrub cl.

20 T. Stoupyana (D. C. l. c.) leaves glabrous, coriaceous, ovate, acuminate, quite entire, feather-nerved; petals bigalldular at the base; bracteas oval, obtuse, foliaceous. ʰ. ʷ. S. Native of Cayenne. Cav. diss. 10. t. 281. lit. x.

**Stoupy's Tacsonia.** Shrub cl.

21 T. citrifolia (Juss. l. c. p. 392. in a note.) leaves oval, coriaceous, quite entire, feather-nerved; petals bigalldular at the apex. ʰ. ʷ. S. Native of Cayenne. (v. s. herb. Juss.)

**Citron-leaved Tacsonia.** Shrub cl.

† *Species belonging to section Distephæna, but doubtful.*

22 T. quadriloculandulosa (D. C. l. c.) leaves glabrous, obtuse at the base, unequally serrated: superior ones oblong; inferior ones 3-lobed; recesses of the lobes of the leaves, petals, and bracteas bearing 4 glands each. ʰ. ʷ. S. Native of Guiana, in woods, in the Island of Arowabish. Passiflora quadriloculandulosa, Meyer, eseq. p. 226.

**Four-glanded Tacsonia.** Shrub cl.

23 T. quadridentata (D. C. l. c.) leaves glabrous, ovate-lanceolate, feather-nerved, with a few coarse acute teeth; petals bigalldular at the base; bracteas oblong, bigalldular. ʰ. ʷ. S. Native of the West Indies.

**Four-toothed-leaved Tacsonia.** Shrub cl.

24 T. pubescens (D. C. l. c.) leaves pubescent, ovate, lanceolate; petals bigalldular at the base; bracteas ovate-lanceolate, acuminate, glandularly serrated, and glandular on the back. ʰ. ʷ. S. Native of the East Indies.

**Downy Tacsonia.** Shrub cl.

25 T. trinervia (Juss. l. c. t. 58.) leaves tomentose beneath, oval, 3-nerved; nerves protruding so much as to form teeth; petals glandless; calyx 10-lobed. ʰ. ʷ. S. Native of South America, in shady places at the river Cassiquiare. H. B. et Kunth, c. l. c. p. 143. Flowers rose-coloured?

**Three-nerved-leaved Tacsonia.** Shrub cl.

**Green-leaved Tacsonia.** Shrub cl.

**Cult.** The species have the habit of Passiflora, and some of them are equally showy. Their culture and propagation are the same, see p. 56.

**VII. PASCHANTHUS.** VIII. Modecca.

**SECT. IV.** Psilanthus (from πσιλός, psilos, naked, and ανθος, anths, a flower; in reference to the flowers being naked, or without the involucrum). D. C. prod. 3. p. 335. Involucrum none under the flower.

26 T. trinervia (Juss. l. c. t. 58.) leaves tomentose beneath, oval, 3-nerved; nerves protruding so much as to form teeth; petals glandless; calyx 10-lobed. ʰ. ʷ. S. Native of Mexico, in the vicinity of Acapulco. Passiflora viridiflora, Cav. icon. 5. t. 424. Intermediate between Tacsonia, Passiflora, and Murucutia. Flowers green.

**Psilanthus.** Shrub cl.

**Cult.** This very singular plant, being a native of the Cape of Good Hope, will thrive in a greenhouse, and will form an excellent climber for the rafters. Its culture and propagation are the same as that recommended for Passiflora, see p. 56.

**Lin. syst. Dióecia, Monadelphia.** Flowers dioecious. Calyx permanent, campanulate, 10-cleft (f. 8. b.): 5 outer lobes ovate acute: 5 inner lobes petaloid or probably petals (f. 8. b.). Scales 5-10 (f. 8. b.), rarely wanting, rising from the calyx. Stamens 5, inserted in the torus? monadelphous: anthers standing. Ovarium (f. 8. d.) on a short stipe. Stigmas 3, petaloid (f. 8. e.). Capsule bladder, 1-celled, 3-valved, one or many-seeded. Seeds furred by rows of tubercles (f. 8. f.), arilulate, fixed to 3 parietal placenta, which are adnate to the middle of the valves. — Habit of plants between Passiflora and Bryonia.
PASSIFLOREÆ. VIII. Modeca. IX. Deidamia. X. Vareca.

1. M. palma'ta (Lam. dict. 4. p. 209.) leaves glabrous, variously palmately lobed, glandular beneath; stipules spinosecent; pedicels bracteless.  ʃ. ʃ. S. Native of Malabar. Yellow flowers. Probably many species are confused under this name.

Var. α, Narola (D. C. prod. 3. p. 336.) lobes of calyx acuminate; petaloid lobes or petals wanting; fruit globose.—Rheed. mal. 8. t. 20.

Var. β, palmodec'ca (D. C. l. c.) lobes of calyx acutish; petaloid lobes or petals feathered palmately; fruit glabrous.  ʃ. ʃ. S. Rheed. l. c. t. 21.

Var. γ, Mitta (D. C. l. c.) lobes of calyx very much acuminate; petaloid lobes or petals wanting; fruit ovate.—Rheed. l. c. t. 22.

Palmate-leaved Modeca. Shrub cl.

2. M. lob'a'ta (Jacq. fragm. t. 131.) leaves glabrous, cordate at the base, 3-5-lobed, glandless; petioles biglandular at the apex; pedicels bracteless.  ʃ. ʃ. S. Native of Sierra Leone. Ker, bot. reg. t. 151. Flowers yellowish. (f. 8.)

3. M. integri'folia (Lam. dict. 4. p. 209.) leaves glabrous, ovate-lanceolate, usually entire, much acuminate; pedicels bracteless, very short, few-flowered; fruit globose.  ʃ. ʃ. S. Native of Malabar.—Rheed. mal. 8. t. 23.

Entire-leaved Modeca. Shrub cl.

4. M. Wight'ta'na (Wall. cat. no. 6764.) smooth; leaves cordate, triangularly ovate, entire; tendrils simple; capsule bladdery; seeds scrobiculate.  ʃ. ʃ. S. Native of the East Indies, on the Ginne Hills. Like M. integri'folia, Lam.

Wight's Modeca. Shrub cl.

5. M. al'ie'na (Wall. cat. no. 6766.) leaves deeply cordate at the base, oblong, acuminate; lobes at the round base; pedicels umbellate on the top of shortish peduncles; tendrils simple.  ʃ. ʃ. S. Native of Silhet.

Alien Modeca. Shrub cl.

6. M. acumina'ta (Blum. bijdr. p. 940.) leaves ovate-oblong, acuminate, somewhat cordate at the base, and acuminate; flowers racemose, rising from elongated axillary tendrils; fruit ovate, acuminate.  ʃ. ʃ. S. Native of Java, on Mount Salak. Allied to M. integri'folia according to Blume.

Acuminated-fruited Modeca. Shrub cl.

7. M. heterophy'li'a (Blum. bijdr. p. 940.) leaves undivided or 3-lobed, acuminate, somewhat cordate at the base, and somewhat baccate; fruit acuminate; flowers baccate, acuminate at both ends. ʃ. ʃ. S. Native of Java, on Mount Gede.

Variable-leaved Modeca. Shrub cl.

8. M. diversi'folia (Wall. cat. no. 6763.) smooth; lower leaves triangularly ovate; upper ones 3-lobed, petulate at the base; lateral lobes sometimes bident; pedicels 1-flowered, bracteless; tendrils simple.  ʃ. ʃ. S. Native of the East Indies. Fruit bladdery, 3-valved. Root tuberous. Momórdica heterophyli'a, Wight, mss.

Diverse-leaved Modeca. Shrub cl.

9. M. cordi'folia (Blum. bijdr. p. 939.) leaves membranous, on short pedicels, cordate, mucronulate, baccate at the base; flowers corymbose, dichotomous, rising from elongated axillary tendrils. ʃ. ʃ. S. Native of Java, on Mount Salak.

Heart-leaved Modeca. Shrub cl.

10. M. obtu'sa (Blum. bijdr. p. 939.) leaves coriaceous, oblong-cordate, obtuse, baccate at the base; flowers corymbose, dichotomous, rising from short axillary tendrils. ʃ. ʃ. S. Native of Java, on Mount Salak.

Oblate-leaved Modeca. Shrub cl.

11. M. farfiflora; leaves oblong-lanceolate, entire, acuminate, glabrous; tendrils simple; peduncles axillary, dichotomous. ʃ. ʃ. S. Native of Sierra Leone. Flowers small, yellow.

Small-flowered Modeca. Shrub cl.

12. M. macrophy'lla (Blum. bijdr. p. 939.) leaves coriaceous, oval, bluntish at both ends, somewhat auriculated at the base; flowers corymbose, dichotomous, rising from axillary tendrils. ʃ. ʃ. S. Native of Java, on Mounts Salak, Parang, &c.

Long-leaved Modeca. Shrub cl.

13. M. australis (R. Br. ined. ex D. C. prod. 3. p. 337.) leaves glabrous, somewhat ptalter at the base, cordate, running down the petiole in an auriculated manner at the base, acute, entire, glandless. ʃ. ʃ. S. Native of New Holland, in the gulf of Carpentaria.

Southern Modeca. Shrub cl.

Cult. See Passiflora, p. 56. for culture and propagation. The flowers of the species are by no means showy.

LIN. SYST. Monadél'phia, Penta-Octândria. Calyx 5-8-parted; lobes petaloid; crown a simple series of filamentose appendages, rising from the interior part of the calyx. Stamens equal in number to the lobes of the calyx; filaments joined at the base into a column. Ovarium ovate. Styles 3-4. Capsule pedicellate, 3-4-valved. Seeds arillate.—Climbing Madagascar shrubs, with axillary tendrils, impari-pinnate leaves, and glandular petioles.

Noronh's Deidamia. Shrub cl.

2. M. commersoni'ana (D. C. l. c.) leaflets elliptic, mucronate at the apex; peduncles 5-7-flowered; flowers pentandrous. ʃ. ʃ. S. Native of Madagascar.

Commerson's Deidamia. Shrub cl.

Thompson's Deidamia. Shrub cl.

Cult. See Passiflora, p. 56. for culture and propagation.

X. VARE'CA (altered from Walwareka, the name of the fruit in Ceylon). Gartn. fruct. 1. p. 219. t. 6. f. 6. D. C. prod. 3. p. 337.

LIN. SYST. unknown. Flowers unknown. Berry 1-celled; pulp divided into numerous partial cells for the reception of the seeds. Placenta 3, parietal, many-seeded.

1 V. Zýla'nica (Gartn. l. c.) Native of Ceylon. Nothing but the fruit of this plant is known.

Ceylon Vareca. Shrub cl.?
Cult. See Passiflora, p. 56, for culture and propagation.

Calyx tubular (f. 9. h.), membranous, inflated, 5-lobed (f. 9. a.); lobes imbricated in aestivation. Petals 5 (f. 9. b.), alternating with the segments of the calyx, permanent, convolute in aestivation, arising on the outside of the short membranous crown (f. 9. e.). Stamens 5-10, perigynous; filaments filiform, distinct, or connected with the stipe of the ovary; anthers versatile. Ovarium superior (f. 9. g.), stipitate, 1-celled, with the placenta at the base, from which the ovules arise by the intervention of umbilicate cords. Styles 3, filiform, very long, arising from distinct points at the apex of the ovary (f. 9. d.); stigmas clavate. Fruit capsular, 1-celled, 3-valved, membranous more or less, many-seeded. Seeds attached by umbilicate cords to the placenta, arising either from the axis of the valves, or from their base; testa crustaceous, brittle, with a fleshy crest, and no arillus. Embryo terete in the centre of fleshy albumen, with the radicle next the hynum.—Herbaceous or half shrubby plants, clothed with glandular pubescence. Leaves alternate, simple lobed, without stipulas. Flowers axillary or terminal, solitary, yellow or blue.

This order agrees with Passiflorae on the one hand, and Turneraceae on the other. From the former they differ in the insertion of their styles, in their versatile anthers, in their short placentas, membranous fruit, terete embryo, want of arillus, and stipulas; and altogether in their habit. From Turneraceae, to which their habit nearly allays them, they differ in the presence of a perigynous membrane, in the remarkable insertion of the styles, and in the want of all trace of an arillus; agreeing with that order in the estivation of the corolla, and in the principal other points of their structure. The plants are unknown except as objects of great beauty.

L. syst. Pentandria, Monogravia. Character the same as that of the order.

Thyrse-flowered Malesherbia. Shrub 1 to 2 feet.

2. M. paniculata (D. Don in edinb. phil. journ. 1837. p. 321.) leaves oblong, obtuse, ciliated, pinnatifid; upper ones nearly entire; throat of calyx dilated; crown simple, acutely toothed. G. Native of the north of Chili. Flowers yellow?

Panicled-flowered Malesherbia. Shrub 1 to 2 feet.

Linear-leaved Malesherbia. Pl. 2 to 3 feet.

4. M. huilensis (D. Don, l. c.) plant very villous; leaves jagged; throat of calyx dilated; crown simple, erose-toothed; anthers roundish. G. Native of Chili about Coquimbo. Stems procumbent. Flowers white.

5. M. corona (D. Don, l. c.) plant clothed with glandular pubescence; leaves linear, sinuate-toothed; throat of calyx dilated; crown simple, toothed. G. Native of Chili, at Valparaiso. Flowers white; crown blue. White. Sweet, fl. gard. new. ser. t. 167. (f. 9.)

6. M. fasciculata (D. Don, l. c.) leaves lanceolate, acuminate, quite entire; flowers in fascicles; crown 10-cleft, with the segments tridentate. G. Native of Chili. A stiff erect shrub. Flowers small, in bundles at the tops of the branches.

Fascicled-flowered Malesherbia. Shrub 1 to 2 feet.

7. M. tenuifolia (D. Don in edinb. phil. journ. Oct. 1832.) leaves nearly pinnate; segments linear; calyx tubular; crown deeply lobed. G. Native of the south of Peru, in the province of Tarapaca at Huatacona, where it is commonly called Agi de Zorra, i. e. Fox capsicum. Flowers reddish, according to the dried specimen.

Cult. This genus is composed of curious plants, bearing very showy singular flowers, and are therefore worthy of culture as ornaments. A mixture of loam, peat, and sand, or any light rich earth is a good soil for them. The shrubby species may either be increased by seeds; or young cuttings will root if planted in light soil, under a hand-glass. The seeds of annual kinds require to be sown in a hot-bed, in order to forward the plants; and after they have grown an inch in height, they may be potted off into small pots, and afterwards shifted into pots of increasing size, as they grow. Some of them may be planted out into the open border, in a sheltered situation, where they will probably flower and seed freely.

Tube of calyx adhering to the ovary, or girding it closely (f. 10. a. f. 12. a.); limb 5-parted (f. 11. a. f. 12. a.), rarely 4-parted, permanent. Petals equal in number to the lobes of the calyx (f. 12. b. f. 11. b.), with an inflexed valvate aestivation, or double that number (f. 10. b.), and disposed in 2 series; those of inner series, when present, usually much smaller (f. 10. b.) than those of the outer, scale-formed and truncate at the apex, inserted in the throat of the calyx. Stamens indefinite, arising from within the petals, disposed in several series, either distinct (f. 10. c.), or joined at the base in several parcels before each petal, within the cavity of which they lie in aestivation; filaments subulate (f. 10. g.), unequal, the outer ones frequently destitute of anthers. Ovarium adnate.
to the calyx (f. 10. a. f. 11. e.), or inclosed within it, 1-celled, with several parietal placentas (f. 11.), or with 1 free central lobed one. Style 1, composed of 3-5-7-jointed ones, crowned by as many lobes as stigmas. Capsule dry or succulent, crowned by the calyx (f. 10. d. f. 11. g. f. 12. c.), 1-celled, with several parietal placentas (f. 11.), originating at the sutures, and therefore may be called marginal, 3-4-7-valved; placentae equal in number to the valves, sometimes drawn out so far as to form sessiments (f. 11. f.). Seeds numerous, without arillus. Embryo lying in the axis of a fleshy albumen; with the radicle pointing to the hilum, and flat small cotyledons.—American herbs more or less pilose or hispid, with the hairs or bristles usually siring like those of the nettle, in consequence of their secreting an acid juice. Leaves opposite or alternate, exatipulate, simple, but usually variously divided. Peduncles axillary, 1-flowered. Flowers elegant. This order is distinguished from Onagrastrae by its unilocular ovary, and indefinite stamens, part of which are sterile; and perhaps by the latter character, and the additional 5 petals, connected with Pasafloria, with which they sometimes also accord in habit. Their rigid siring hairs, climbing habit, and lobed leaves resemble those of some Urtilaeae. On the same account they may be compared with Cucurbitacea, with which they further agree in their inferior unilocular fruit, with parietal placentas, and in the very generally yellow colour of their flowers. This, indeed, is the order with which, upon the whole, Loasaceae must be considered to have the closest affinity.

**Synopsis of the genera.**

1 **Bartonia.** Tube of calyx cylindrically (f. 10. a.); limb 5-parted (f. 10. b.). Petals 5-10 (f. 10. b.), about equal in shape. Stamens numerous (f. 10. c.). Capsule 3-7-valved; each placenta bearing 2 rows of seeds.

2 **Blumenbachia.** Tube of calyx spirally twisted (f. 11. e.); limb 5-parted (f. 11. g.). Petals 10 (f. 11. b.); 5 outer ones cuculate, and the 5 inner ones scale-formed, each scale including 2 sterile filaments. Fertile stamens disposed in 5 bundles (f. 11. b.). Fruit dividing into 10 parts at the base.

3 **Loosa.** Tube of calyx not twisted (f. 12. a.); limb 5-parted (f. 12. c.). Petals 10 (f. 12. b.); the 5 inner ones scale-formed, bearing 2 sterile filaments inside. Outer series of stamens sterile and free; inner ones disposed in 5 bundles, but distinct. Capsule 1-celled, 3-valved at the apex.

4 **Calophora.** The fruit is ovate, bursting into 3 valves from the base upwards; the placentas then separate from the sides of the capsule, and have the appearance of 3 arched columellae. The rest as in Loosa.

5 **Mentzelia.** Tube of calyx cylindrically (f. 13. b.); limb 5-lobed (f. 13. d.). Petals 5 (f. 13. a.). Stamens free, usually disposed in bundles (f. 13. c.). Capsule turbinate, 3-valved, few-seeded (f. 13. f.).

6 **Klaprothia.** Calyx with a turbinate tube, and a 5-parted limb. Petals 4. Stamens numerous, 4-5 sterile in front of each sepal, and 4-5 fertile in front of each petal. Fruit baccate, few-seeded.
posed in a leafy panicle. 

**LIN. SYST.** Polydélphi/a, Polygándria. Calyx 5-parted (f. 11. g.), with the tube adhering to the ovary. Petals 5 (f. 11. b.), inserted in the top of the calycine tube, cucullate, equal, spreading. Scales 5 (f. 11. b.), alternating with the petals, and inserted with them, furnished with 3 sterile filaments at the back of each, and clasping 2 subulate appendages inside. Stamens indefinite, inserted in the top of the calycine tube (f. 11. b.), disposed in 5 bundles, one opposite each petal; anthers 2-celled, bursting inwardly. Ovarium joined to the tube of the calyx. Style simple (f. 11. f.). Capsule marked with 10 spiral ribs, 1-celled, 10-valved; 5 of the valves thicker and broader than the other 5, with the placentas not reaching the axis; the other 5 narrower, with placentas almost reaching the axis (f. 11. h.), and bearing the seeds. Seeds rugged.—Branched, climbing, or trailing herbs, covered with stinging hairs. Leaves opposite, lobed. Flowers axillary, solitary, bracteate.

**Showy Blumenbachia.** Fl. July, Nov. CIt. 1826. Pl. tr.

2 B. **PAlma'ta** (St. Hil. fl. bras. 2. p. 208.) leaves deeply and palmately 3-5-lobed; lobes pinnatifid. O. H. Native of Brazil, on the confines of the province of Rio Grande de St. Pedro do Sul. Flowers with white petals; scales with ciliated edges, yellow at the base, lined with white, and red above it, tipped with vermillion colour.

**Palmate-leaved Blumenbachia.** Pl. tr.

3 B. **LATITÓLIA** (St. Hil. fl. bras. 2. p. 209. t. 118.) leaves trifoliate; lateral segments 3-lobed, unequal-sided, terminal one equal-sided, 3-5-lobed. O. H. Native of Brazil, in the province of St. Paul, between the towns of Rio Grande de St. Pedro do Sul and St. Francisco de Paulo. Flowers with white petals, and yellow scales tipped with orange colour. (f. 11.)

**Broad-leaved Blumenbachia.** Pl. tr.

4 B. **punicæa**; plant very hispid; leaves opposite, pinnatifid, having the segments jagged; calycine lobes jagged, shorter than the petals, which are cucullate; bundles of stamens polyandrous. O. H. Native of Peru. Loasa puricea, Ruiz et Pav. fl. per. 5. t. 446. ined. (v. s. herb. Lamb.)

**Scarlet Blumenbachia.** Pl. 1 to 2 feet.

5 B. **perosprémia**; hispid; leaves opposite, pinnatifid, rather cordate at the base; segments toothed; peduncles long, 1-flowered, cucullate; calycine segments toothed, shorter than the petals, which are cucullate; bundles of stamens polyandrous; stem climbing; seeds bordered by a wing. O. H. Native of Peru. Loasa pterospermia, Ruiz et Pav. fl. per. 5. t. 448. (v. s. herb. Lamb.)

**Winged-seeded Blumenbachia.** Pl. cl.

6 B. **sepíaria**; stem climbing; leaves opposite, pinnatifid, with the segments pinnatifid or coarsely toothed; peduncles long, axillary, 1-flowered; calycine segments jagged, linear, longer than the petals, which are cucullate; bundles of stamens polyandrous. O. H. Native of Peru. Loasa sepíaria, Ruiz et Pav. fl. per. 5 t. 449. ined.

**Hedge Blumenbachia.** Pl. cl.

7 B. **Mira'nta**; hispid; leaves opposite, ovate, serrated, petiolate; peduncles many-flowered, racemose, terminal, and rising from the forks of the stem; calycine lobes ovate, much shorter than the petals, which are cucullate, and holding 2 stamens each. O. H. Native of Peru. Flowers very small. Loasa micrántia, Ruiz et Pav. fl. per. 5. t. 442.

**Small-flowered Blumenbachia.** Pl. 1 foot.

8 B. **grandíflóra**; leaves opposite, petiolate, oblong, runcinate, acute, somewhat cordate at the base; pedicles 1-flowered, rising from the forks of them; stem climbing. O. H. Native of Peru. Loasa contórta, Lam. dict. 3. p. 579. D. C. prod. 3. p. 340. Juss. ann. mus. 5. p. 25. t. 3. f. 1. Loasa physiópètala, Ruiz et Pav. fl. per. 5. t. 447. ined. Flowers yellow.

**Great-flowered Blumenbachia.** Pl. cl.

Cult. Elegant annual plants, with very showy flowers; their culture and propagation are the same as that recommended for the species of Loasa, see p. 64.

**LIN. SYST.** Polydélphi/a, Polygándria. Calyx 5-cleft, with the tube adhering to the ovary (f. 12. a.). Petals 5 (f. 12. b.), cucullate, equal, spreading, inserted in the top of the tube; scales 5, inserted with the petals, furnished with 3 sterile filaments on the back of each, and girding 2 subulate appendages inside. Stamens indefinite, inserted in the top of the calycine tube, disposed in 5 bundles (f. 12. b.), opposite the petals; anthers 2-celled, bursting inwardly. Ovarium joined to the calyx. Capsule crowned by the lobes of the calyx (f. 12. a.), 5-valved at the top, 1-celled; placentas linear, alternating with the valves. Seeds rugged.—Branched, decumbent, or climbing herbes, beset with stinging hairs. Leaves alternate, or opposite, toothed or lobed. Flowers axillary, extra-axillary, or opposite the leaves, solitary or racemose.

* Leaves axillary.

1 L. **tríloba** (Juss. ann. mus. 5. p. 24. t. 1. f. 3.) leaves cordate at the base, usually 3-lobed; lobes acute, toothed; middle lobe usually somewhat 3-lobed; pedicels axillary; caly-
cine lobes small, acute. O. H. Native of Peru and Chili, about Valparaíso. Ruiz et Pav. fl. per. 5. t. 444. ined. Scales petalsoid, equally and bluntly 3-lobed. Flowers small.

Three-lobed-leaved Loasa. Pl. 1 foot.

2 L. acerifolia (Juss. l. c. p. 24. t. 1. f. 2.) leaves nearly opposite, coriace at the base, 5-7-lobed; lobes acute, toothed; pedicels shorter than the floral leaves; calyces lobes oblong, acuminate. o? H. Native of Chili and Peru. Loasa vi-tilfôlia, Ruiz et Pav. fl. per. 5. t. 443. ined. L. tricolor, Ker. bot. reg. 667. Scales as in L. trîloâda, but the calyce lobes are twice the length. Flowers with yellow petals and red scales.

Maple-leaved Loasa. Pl. tr.

3 L. bryonîfôlia (Schr. cat. hort. goett. 1823. pl. rar. hort. goett. with a figure) leaves coriace, lower ones 5-lobed, stalked, upper ones 3-lobed, almost sessile; all the lobes are sinuately lobed; pedicels exceeding the floral leaves; lobes of calyx a little toothed, acuminate. O. H. Native of Chili. Stem erect, bristly. Flowers yellow, hardly smaller than those of L. acerifolia. Stigma blunted. Seeds without aril; hyaline lateral.

Bryony-leaved Loasa. Pl. 1 foot.

4 L. xerîda (Lam. dict. 3. p. 581.) leaves coriace at the base, many-lobed; lobes acute, toothed, lower ones usually pinnatifid; pedicels axillary; calyces lobes oblong, toothed, shorter than the petals; wings of the corona very small, toothed, and stalked; stem much shorter than the petals; style straight, shorter than the stamens; sepals erect, much shorter than the petal-shaped fruit. O. H. Native of Chili and Peru, on the mountains. Juss. ann. mus. 5. p. 25. t. 2. f. 2. Trat. tabl. t. 23. Hook. exot. fl. t. 83. bot. mag. 2372. Ruiz et Pav. fl. per. 5. t. 445. Petals spreading reflexed, yellow, red at the base; scales red. Lobes of leaves bluntish. Stems prostrate.

Var. β: leaves more deeply lobed; lobes narrower.—Chili, about Valparaíso. L. tricolor, Lindl. bot. reg. 667.

5 L. sagittâta (Hook. et Arn. in bot. misc. 3. p. 238.) stems twining, pubescent; leaves all petiole, opposite, cordate-sagittate, acuminate, with rather lobed margins; the lobes crenated; pedicels axillary and terminal, few-flowered; calyce lobes ovate-oblong. O. & H. Native of Chile. There has none of the shining hairs, so peculiar to this genus, been observed on this species.

Sagittate-leaved Loasa. Pl. tw.

6 L. elonâta (Hook. et Arn. in bot. misc. 3. p. 239.) stems much elongated, nearly simple, shining; leaves remote, opposite, petiole, coriace at the base, 5-7-lobed; pedicels axillary, few-flowered, twice the length of the leaves; calyces lobes broadly ovate, shorter than the petals, which are red; fruit hemispherical. O. H. Native of Chili, about Coquimbo.

Elongated-stemmed Loasa. Pl. 2 to 3 feet.

7 L. prostrâta (Gill. ex Arnott, in Cheek, edinb. journ. 3. p. 274.) stems prostrate, flexuous; leaves opposite, sessile, cordate, ovate, deeply angular; pedicels axillary, 1-flowered, about twice the length of the leaves; calyces lobes lanceolate, longer than the fruit, and about equal in length to the petals; valves of capsule closely beset by long, rigid hairs; seeds egg-shaped, large, with a smooth testa. O. H. Native of Chili, on La Cuesta de los Manantiales, Cerro de San Pedro Nolasco, &c. Plant covered with long, rigid, stinging hairs.

Var. β, Cumingii (Hook. et Arnott, in bot. misc. 3. p. 239.) segments of leaves bipinnatifid and sinuately toothed. About Valparaíso, and on the mountains near Aconcagua. In the species the segments of the leaves are simply and sinuately toothed.

Prostrate Loasa. Pl. prostrate.

8 L. pâllida (Gill. ex Arnott, in Cheek, edinb. journ. 3. p. 276.) epidermis of stem loose, and shining; leaves opposite, all petiole, ovate, coarsely toothed; pedicels opposite, axillary, much longer than the leaves; pedicels short, in the forks, about equal in length to the flowers; calyces lobes linear-oblong, one half shorter than the petals. O. H. Native of Chili, among loose debris, on the banks of the El Rio del Yeso, near Arroyo de San Nicholas, at the elevation of about 5000 feet, &c., where it is called by the inhabitants Cavalluna. The plant is most nearly allied to L. sclaereotilfôlia, Juss. but that does not appear to have the loose epidermis on the stem, and the leaves are much larger. The pedicels in the forks of the panicle are elongated.

Pale Loasa. Pl. prostrate.

9 L. laterîta (Gill. sess. ex Arnott, in Cheek, edinb. journ. 3. p. 275.) stems almost wanting; leaves opposite, on long petioles, pinnate; segments roundish, crenated, lobed; pedicels twin, 1-flowered, terminal, about equal in length to the leaves; calyces lobes ovate, exceeding the tube, but one half shorter than the corolla. O. H. Native of Chili, at Los Imposibles, near the foot of the descent from the Planchon towards Chili, and in El Valle de Truy Carlos, at the base of the volcano of Pateroa, at an elevation of about 9000 feet. This species is readily distinguished by its large flowers of a brick red colour, and by its very short stems and radical branches, each of which bear 1 or 2 pairs of opposite leaves, and between the upper pair of which arise 2 1-flowered peduncles, terminating the branch. Seeds with a strongly reticulated tests like the next species; and as in it the hairs are short and not stinging.

Brick-coloured-flowered Loasa. Pl. prostrate.

10 L. pinifatâta (Gill. sess. ex Arnott in Cheek, edinb. journ. 3. p. 275.) stems nearly erect; leaves opposite, on long petioles; radical and lower ones pinnate; segments pinnatifid, with roundish approximate lobes; upper leaves pinnatifid; pedicels axillary, usually 1-flowered; calyces lobes ovate, much shorter than the corolla, and half the length of the fruit. O. H. Native of Chili, at La Cuesta del Inga, at an elevation of about 9000 feet. Plant with short rigid, but not stinging hairs.

Pinnatifid-leaved Loasa. Pl. 1 foot.

11 L. dissectâta (Hook. et Arn. in bot. misc. 3. p. 240.) stems erect, strong, a little branched at the apex, with a loose white epidermis; petioles opposite, lower ones elongated, becoming gradually shorter to the top of the stem; leaves tripinnatifid, with the ultimate segments ovate-obtuse; pedicels short, rising from the forks of the stem; calyces lobes narrow-oblong, not half so long as the petals. O. H. Native about Valparaiso, Los Ogos de Agua, and Aconcagua.

Dissected-leaved Loasa. Pl. 1 foot.

12 L. heterophylâta (Hook. et Arn. in bot. misc. 3. p. 228.) stems prostrate, dichotomous; leaves opposite, on short petioles; lower ones small, hastate triangular, coarsely toothed; lower floral ones nearly reflexed, 5-lobed, with the lobes nearly equal, and furnished with 1 or 2 teeth each; but the middle lobe of the uppermost leaves is rather lengthened; pedicels in the forks longer than the leaves; calyces lobes oblong-lanceolate, about equal in length to the petals; fruit conically hemispherical. O. H. Native about Valparaiso? and at Los Ogos de Agua. The stem is rarely pubescent; but the branches, particularly in their upper part, and the tubinate tube of the calyx, are provided with long sharp spreading hairs.

Variable-leaved Loasa. Pl. prostrate.

13 L. açanthîfolia (Lam. dict. 3. p. 579.) leaves coriace at the base, pinnatifid; lobes acuminate, sinuately toothed; pedicels axillary, and also from the forks, solitary, 1-flowered; lobes of calyx narrow, acuminate, reflexed, equal in length to the petals, which are bidentate. O. H. Native of Chili. Juss. ann. mus. 5. p. 25. t. 3. f. 2. L. nitida, bot. mag. 2372? L. cymbîpetâta, Ruiz et Pav. fl. per. 5. t. 442. b. ined. Oruga
Chilensis, Fruill. obs. 2. p. 757. t. 43. Petals yellow. Scales red. Herb erect, 4 feet high. The leaves are often alternate.

Acanthus-leaved Loasa. Pl. 4 to 5 feet.

14 L. Ruiziana; leaves opposite, ovate, coarsely serrated, hoary from down, petiole; peduncles axillary and terminal, 1-flowered; calycine segments acute, much shorter than the petals, which are ciliate. O. H. Native of Peru. L. incana, Ruiz et Pav. fl. per. vol. 5. t. 441. ined. (V. s. herb. Lamb.)

Ruiz’s Loasa. Pl. 1 foot.

15 L. sclarefolia (Juss. l. c. 5. p. 25. t. 1. f. 1.) leaves ovate-oblong, sinuately lobed; lobes acute, toothed; upper leaves sessile; pedicels solitary, 1-flowered in the forks of the stem; calydic lobes oblong, acuminate, shorter than the petals. O. H. Native of Chili. L. acanthifolia, Ker, bot. reg. t. 785. but not of Juss. Flowers yellow, with red scales.

17 L. grandiflora (Lam. dict. 3. p. 580.) lower leaves opposite; upper ones alternate, coriaceae at the base, 5-lobed; lobes deeply toothed; flowers axillary and terminal, on long pedicels; lobes of calyx acuminate, shorter than the petals. O. H. Native of Peru. Juss. ann. mus. 5. p. 26. t. 4. f. 2. Tratt. tab. t. 29. Ruiz et Pav. fl. per. 5. t. 440. Lower leaves on long, and upper on short pedicels. Flowers yellow. Scales oblong, 2-lobed, not appendiculate on the outside.

13 L. floribunda (Hook. et Am. in bot. misc. 3. p. 239.) root simple, fusiform; stem short, with a loose epidermis, simple beneath the inflorescence, but much branched and panicled above; leaves ovate-oblong, petiole: cauline ones opposite, sinuately lobed, coarsely toothed, coriaceae at the base; lower floral ones alternate, sinuately lobed: upper floral ones smaller, cuneate at the base, toothed or quite entire; pedicels short, rising from the forks of the stems; calydic lobes elliptic, acute, attenuated at the base, shorter than the apiculated petals; scales furnished with 3 appendages each on the back above the middle. O. H. Native about Valparaiso, and on the Cordillera of Chili.

Bundle-floweread Loasa. Pl. 1 foot.

** Leaves alternate.

19 L. Loxea (H. B. et Kunth, nov. gen. amer. 6. p. 116.) leaves alternate, and nearly opposite, ovate-oblong, 3-5-lobed; lobes irregularly toothed; middle lobe very large; flowers terminal and axillary, somewhat racemose; lobes of calyx ovate, acuminate, 3-nerved. O. S. Native of Peru, near Loasa. Leaves white beneath. Flowers yellow. Scales rounded at the apex, drawn out into a lobe at both ends. Herb suffrutescent branched.

Loasa Loasa. Shrub.

20 L. argemoneoides (Juss. ann. mus. 5. p. 26.) leaves coriaceae, sinuately lobed, tomentose on both surfaces, white beneath; flowers terminal and axillary, pedicellate; lobes of calyx lanceolate, one-half shorter than the petals. O. S. Native of South America, near Santa Fe de Bogota. Humb. et Bonpl. pl. equin. 1. p. 53. t. 15. H. B. et Kunth, nov. gen. amer. 6. p. 26. Tratt. tab. t. 30. Flowers nearly 3 inches in diameter. Scales bifid, furnished with 2 acute lobes, which are gibbous at the base.

Argemone-like Loasa. Pl. 6 to 10 feet.

21 L. ranunculifolia (Humb. et Bonpl. pl. equin. 1. p. 50. t. 14.) leaves all alternate, somewhat orbicular, coriaceae, toothed, clothed with yellowish tomentum above, and silky white tomentum beneath; flowers terminal and axillary, somewhat racemose; lobes of calyx ovate-lanceolate, acute. O. S. Native of Peru, on the Andes near Casamara. H. B. et Kunth, nov. gen. amer. 6. p. 117. Tratt. tab. t. 27. Flowers large, yellow. Scales bifid, bigibbous at the base.

Crow-foot-leaved Loasa. Pl. 2 feet.

22 L. inca (Graham in edinb. phill. journ. Oct. 1830.) plant suffrutescent, reddish, erectissime; leaves scattered, petiolate, ovate-lanceolate, hoary, deeply serrated, scabrous; peduncles 1-flowered, opposite the leaves. O. G. Native of Peru, from Yaze to the valley of Canta. Corolla white. Whole plant covered densely with harsh barbed white hairs, intermixed by a few stinging ones. Cuticle papery, and pealing off.

23 L. xanthitilium (Juss. l. c. 2. f. 1.) leaves petiolate, coriaceae, oblong, acute, coarsely toothed; pedicels extra-axillary; lobes of calyx oblong, hardly acute. O. H. Native of Peru. Flowers small, yellow. Stems a foot and half high. Tratt. tab. t. 26. Xanthitilium-leaved Loasa. Pl. 1 f. 2 feet.

24 L. chenopodiifolia (Lam. dict. 5. p. 550.) leaves petiolate, somewhat ovate, deeply toothed; racemes loose, leafy, terminal; flowers drooping. O. H. Native of Peru. Perhaps a mere variety of the preceding, according to Juss. ann. mus. 5. p. 26.

Goosefoot-leaved Loasa. Pl. 1 to 2 feet.

25 L. parviflora (Schrad. pl. rar. bras. ined. ex D. C. prod. 3. p. 312.) leaves on long petioles, ovate-coriaceae, sinuately 3-7-lobed, hairy; flowers racemose; racemes extra-axillary, few-flowered, shorter than the leaves; lobes of calyx acutish. O. H. Native of Brazil, in the provinces of the Mines. Peduncles and calyces bristly. Flowers with white petals and brown scales. Bristles or sterile stamens at back of scales white.

Small-floweread Loasa. Pl. trailing.

26 L. aspera (Ruiz et Pav. fl. per. 5. t. 441.) hibiscid; leaves alternate, angularly lobed, and coarsely toothed; pedicels solitary, lateral; calyx long, very hibiscid; calydic segments ovate, longer than the petals. O. H. Native of Peru.

Rough Loasa. Pl. 1 to 2 feet.

27 L. ambrosefolia (Juss. l. c. 4. f. 1.) leaves petiolate, bipinnatifid; lobes and lobules blunting; pedicels extra-axillary; lobes of calyx lanceolate-linear, acute, shorter than the petals. O. H. Native of Peru. Stem a foot high, hardly branched. Herb beset with yellowish prickles. Flowers yellow, an inch in diameter. Tratt. tab. t. 51. Scales bifid, not appendiculate on the outside.

Ambrosia-leaved Loasa. Pl. 1 foot.

28 L. volubilis (Juss. l. c. 5. f. 1.) leaves alternate and opposite, bipinnatifid; lobes linear, obtuse; flowers terminal and axillary, pedicellate; lobes of calyx a little toothed, one half shorter than the petals; stem twining. O. H. Native of Chili, near Concepcion, in sandy places; and of Peru. Tratt. tab.

FIG. 12.
t. 34.  L. multifida, Ruiz et Pav. fl. per. 5. t. 443. b. Scales 2-lobed. Flowers small, yellow.

Twining Loasa.  Pl. 1. c. 11.

29. L. triphylla (Juss. l. c. p. 27. t. 5. f. 2.) leaves for the most part cut into 3 stalked, oblong, toothed segments: a few triplicate; pedicels extra-axillary; calyceal lobes elliptic-oblong.  O. H. Native of Peru, on the Andes, in the high plains. Tratt. tab. 1. t. 21. H. B. et Kunth, nov. gen. amer. 6. p. 118. Stems ascending. Three-leaved Loasa.  Pl. ascending, 1 foot.

30. L. papaverifolia (H. B. et Kunth, nov. gen. amer. 6. p. 118.) leaves trifoliolate; segments or leaflets stalked, oblong, toothed; middle leaflet large, pinnatifid; flowers opposite the leaves, disposed in something like racemes; calyces of calyx elliptic, 3-nerved.  O. H. Native of the Andes, about Quindin. Stem simple, ascending. Flowers white. There is a figure in the Flora Mexicana which agrees with this plant, except that the petals are drawn bifid at the apex.

Poppy-leaved Loasa.  Pl. 1 foot.

Cul.  All the species of Loasa bear such beautiful flowers, that they are all worth cultivating for ornament, but they are so full of stings that it is impossible to handle them. The seeds of the annual species should be sown early in spring in the open ground, and the plants so raised will flower and produce seed the same season: or the seeds may be sown in pots, and reared in a hot-bed, and the plants may afterwards be planted out in the open border, in any convenient situation. All the species require a rich light soil and a warm situation. Some of the species are said to be perennial; we suppose all would be so if they were protected from frost.

IV. CAIOPHORA (meaning not explained).  Presl. in reliq. Henck. 2. p. 43.

Lin. syst. Polydéphila, Polyángria. Calyx 5-parted; segments jagged. Petals 5, unguiculate, concave. Scales 5, peltate, elliptic, or 4-toothed at the apex, each furnished with a few sterile filaments inside. Stamens numerous, disposed in 5 bundles. Style trigonal, permanent; stigmas 3, conniving. Capsule ovate-oblong with elevated spiral ribs, crowned by the reflexed calyx, 1-celled, many-seeded, opening at 3 of the sutures. Placenta marginal in the valves, but at length distinct from them. Seeds angular, echinated by bristles or reticulated.—Usually climbing plants, with the habit of Loasa, beset with stinging hairs. Peduncles 1-flowered. Flowers yellow. This genus differs from Loasa and Blumenbachia in the character of the capsule, in the scales being furnished with 4 sterile filaments instead of 5, and in many other points. There are several plants now referred to the genus Blumenbachia which belong to this genus; viz. B. grandiflora, which is Caiphora contorta, Presl. reliq. Henck. 2. p. 42. and B. punctata, which is evidently the Caiphora circifolia, Presl, l. c. 54. and carduifolia, Presl. l. c. p. 42.

1. C. corona (Hook. et Arn. in bot. misc. 3. p. 238.) stems short; leaves opposite, petiolate, pinnate; segments bi-pinnatifid; lobules denticulated; peduncles axillary, 1-flowered, elongated; calyceal lobes pinnatifid, with linear segments, longer than the ovary.  O. H. Native of Chili, on both sides of the Cordillera of the Andes, between Mendoza and Chili, at an elevation of 8,500 to 11,000 feet. The burrows of the fruit are nearly straight, or hardly spiral, so that this species partakes in some degree of the characters of Loasa. Loasa corona, Gill. mss. ex Arnott, in Cheek, in edinb. journ. 3. p. 274. C. abisinthaefolia, Presl. in reliq. Henck. 2. p. 43.

Crowned Caiophora.  Pl. prostrate, rising 1 to 2 feet.

Cult.  See Loasa for culture and propagation.

V. SCYPHANTHUS (σκυφός, skyphos, a cup, and ανθος, a flower; in reference to the form of the flower). Sweet, fl. gard. t. 238.

Lin. syst. Polyadéphia, Polyandria. Calyx deeply 5-parted, permanent, equal. Petals 5, inserted in the base of the calyx, on very short claws, concave, equal. Scales inserted with the petals, peltate at the apex, lobed, 3-horned. Stamens numerous, perigenous, the 10 exterior ones destitute of anthers; and these are placed by twos opposite the scales, and are longer than the rest, which are disposed in 5 fascicles opposite the petals; anthers 2-celled, erect. Ovarium prismatic, sique-formed; style one, erect, trigonal. Capsule prismatic, sique-formed, crowned by the tube of the calyx, 3-valved at the apex; seeds oval, wrinkled.—A twining herb, having its branches beset with retrograde strigile. Leaves opposite, pinnatifid; superior ones bipinnatifid, hispid from hairs. Flowers sessile, erect, solitary, yellow.

Lin. syst. Icosandria, Monogynia. Calyx permanent, with a cylindrical, somewhat 5-furrowed tube, and 5 lanceolate or subulate, equal lobes (f. 13. d.). Petals 5 (f. 10. a), equal, inserted in the upper part of the tube of the calyx. Stamens indefinite (f. 13. e), multiple the number of the petals, and inserted with them; filaments free, usually disposed in 5 bundles; anthers erect, ovate, bilocular. Ovarium adnate to the calycine tube. Styles 3, connected to the middle or to the top, marked by 3 corresponding stripes. Capsule turbinate-cylindric, filamented by the calycine lobes (f. 13. d. 1-celled, 3-valved at the apex. Seeds 3-6-9, or irregular in number in consequence of abortion, inserted in 3 parietal placentas.—Erect, branched, dichotomous herbs, rough from bearded or glabrous stiff hairs. Leaves alternate, or nearly opposite, coarsely toothed. Flowers of a deep orange colour, solitary, almost sessile in the forks of the stem, or pseudo-axillary from one of the branches being abortive, expanding in the height of the sun.

2 M. oligosperma (Nutt. in Sims, bot. mag. t. 1760.) petals oval, acuminate, longer than the calyx, but very little longer than the stamens.  G. Native of Louisiana, on the banks of the river Missouri, among rocks. M. aurea, Nutt. gen. amer. 1. p. 300. Root tuberous, succulent. Seeds 3, smooth, linear-oblong. Hairs on plant bearded their whole length.

* * * Stamens 30-100, the 10 exterior ones the longest. Seeds 6-9. Flowers larger than those of the last section.

3 M. mepida (Willd. spec. 2. p. 1176.) petals obovate, muc-

4 M. *stria* (H. B. et Kunth, nov. gen. Amer. 6. p. 120.) petals obovate, mucronately cuspidate, 2 or 3 times longer than the calyx; stamens about 50; leaves and flowers almost sessile; hairs on the branches retrograde. 2 G. Native of Mexico, near Rio Sarceo. Filaments of outer stamens dilated at the apex. Ovula 10.

*Strigose Mentzelia*. Pl. 1 to 2 feet.

5 M. *scabra* (H. B. et Kunth, l. c.) petals obovate, acute, a little longer than the calyx; stamens 100–110; flowers sessile in the forks of the stems; leaves pilose. 2 G. Native of New Granada, on the Andes about Pasto. Seeds scabrous, 6–9.

*Scabrous-seeded Mentzelia*. Pl. 1 to 2 feet.

6 M. *grandiflora* (Ruiz et Pav. Fl. Per. 5. t. 441. ined.) petals obovate, pointed, much longer than the calyx; calyx cleft lobes ovate-lanceolate, acuminate, reflexed when the flowers are open; stamens numerous, from 30–40; outer ones the longest; leaves alternate, ovate, coarsely toothed, on short petioles. 2 G. Native of Peru.

*Great-flowered Mentzelia*. Pl. 2 to 3 feet.

7 M. *hirta* (Pav. in herb. Lamb.) calyx covered with long hairs; calyx segments lanceolate, much shorter than the petals; stamens numerous; leaves cordate, lobed, obtuse, alternate, clothed with soft pubescence; peduncles many-flowered. 2 G. Native of Mexico. (v. s. in herb. Lamb.)

*Hairly Mentzelia*. Pl. 1 foot.

*Stipitate-flowered Mentzelia*. Pl. 1 to 2 feet.

*Cult.* The species grow well in any light rich soil; and cuttings will root readily in sand, under a hand-glass. They are also easily reared from seeds, which ripen in this country.

 **LIN. Syst. Icosándria, Monogynía.** Calyx permanent, with a turbinated tube and a 4-parted limb; lobes ovate, equal. Petals 4, on very short claws. Stamens numerous, especially 4–5 fertile ones in front of each petal; these are longer than the others, and 4–5 sterile ones in front of each sepal; these are pilose, and somewhat dilated at the apex into a 2-lobed membrane. Styles 4, connected together almost to the apex in one. Ovarium 1-celled, 5-nerved inside, and 4-ovulate; ovula pendulous, fixed to the nerves opposite the sepals. Fruit baccate. Herb twining; branches scabrous from retrograde hairs. Leaves opposite, sharply toothed, stalked. Peduncles cymosely corymbose at the tops of the branches. Flowers white.

*Cult.* For culture and propagation see *Loasa*, p. 65.

Calyx free, usually coloured more or less, profoundly 5-cleft (f. 14. a.), deciduous; lobes equal, imbricate in aestivation. Petals 5, equal (f. 14. b.), inserted into the upper part of the tube of the calyx, and alternating with its lobes, narrow at the base, twisted in aestivation. Stamens 5, inserted in the upper part of the tube of the calyx below the petals, and alternating with them; filaments free, flat; anthers oblong, erect, 2-celled (f. 14. c.). Ovarium free, 1-celled (f. 14. d.), many-ovulate. Ovula ascending (f. 14. f.), fixed to 3 linear parietal placenter. Styles 3 (f. 14. e.) or 6, usually more or less deeply bifid, and cleft into many stigmas at the apex (f. 14. e.). Capsule 3-valved, 1-celled (f. 14. f.); valves bearing the seeds in their middle, along a longitudinal placenta, opening from the apex as far as the middle. Seeds subcylindrical, curved, crustaceous, reticulated, furnished with a thin, membranous arillus on one side. Hilum situated at the base of the seed. Embryo in the centre of a fleshy albumen, somewhat incurred, spatulate, with the radicle turned towards the hilum, and with plano-subcconvex cotyledons.—Shrubs, subshrubs, and herbaceous plants, with a simple pubescence. Leaves alternate or scattered, simple, exstipulate, with occasionally 2 glands at the apex of the petioles, toothed, rarely pinnatifid. Flowers axillary, sessile, or pedunculate; the peduncles of the petioles either distinct or connected with the petioles, simple and 1-flowered or branched and many-flowered, articulated in the middle or furnished with 2 small bracteoles. Petals yellow or yellowish, rarely blue. This order is placed by De Candolle between *Loasa* and *Fouquieraceae*, chiefly it would seem on account of its manifest relation to the former, and its perigynous stamens. With *Malaceae* it agrees in the twisted aestivation of the corolla and habit. With *Loasa* and *Passifloraceae*, they have also much in common. In the structure of the fruit it agrees with *Violaceae* and *Cistaceae*, but differs in the petals and stamens being inserted into the calyx, and the circumstance of their certain relationship to *Cistaceae* gives great weight to the ingenious approximation, by M. Du Petit Thouars, of *Passifloraceae* to *Violaceae*. The presence of glands upon the ends of the petals of *Turneraceae* is a confirmation of their affinity to the former. It is distinguished from *Loasa* by the fruit being superior and 1-celled, with parietal placenta, and by the definite stamens; the former character is, however, weakened by the nearly superior fruit of some *Loasa*.

**Synopsis of the Genera.**

1 **Turnéra**. Styles 3 (f. 14. e.), simple, divided at the apex into multifid stigmas (f. 14. e.). Capsule opening from the top to the middle.
2 Periqueta. Styles 3, deeply 2-parted, crowned by 2 multifid stigmas each. Capsule opening from the top to the base.

§ 1. Peduncles joined with the petioles, biparticate.

* Leaves biglandular at the base.

1 T. ulmiifolia (Lin. spec. ed. 1. p. 965.) leaves oblong, acute, serrated, pubescent above, but clothed with white tomentum beneath, and biglandular at the base; flowers almost sessile; styles shorter than the stamens. S. Native of South America. A plant of Brazil, in the provinces of Minas Geraes and St. Paul, in grassy pastures and fields. Petals oblong, ovate, yellow. Oblong-leaved Turnera. Shrubs ½ to 1 foot.

§ 2. Acute-leaved Turnera. Shrubs 1 foot.

3 T. acutata (Mart. reis. bras. ex D. C. prod. 3. p. 346.) plant downy; leaves linear-lanceolate or lanceolate, acute, attenuated and biglandular at the base, remotely and acutely serrated, pubescent; stamens shorter than the calyx. S. Native of Brazil, at Rio Jaquininhona and Rio Verde Grande.

Bee-bearing Turnera. Shrubs 1 foot.

Silky Turnera. Shrubs 1 to 2 feet.

5 T. arenaria (H. B. et Kunt., lac. p. 120.) leaves ovate-oblong, coarsely serrate-serrated, clothed with silky hairs on both surfaces, canescent beneath; flowers sessile; styles pilose. S. Native of New Granada, near Honda. Petals yellow, with violaceous claws. Capsule roundish-ovate.

Soft Turnera. Shrubs 1 foot.

6 T. arenaria (St. Hil. fl. bras. 2. p. 216.) leaves oblong, obtuse, coarsely toothed, biglandular at the base beneath, woolly on both surfaces, but especially beneath; flowers sessile; styles 3-times longer than the stamens. S. Native of Brazil, in the province of Minas Geraes. Petals oblong-obovate, yellow, red at the base.

Long-leaved Turnera. Shrubs 1 to 1½ foot.

7 T. arenaria (St. Hil. fl. bras. 2. p. 217.) leaves lanceolate, acute, coarsely toothed, lower ones glandless, upper biglandular at the base beneath, clothed with silky pubescence on the upper surfaces, and with yellowish tomentum beneath; flowers sessile in fascicles. S. Native of Brazil, in the province of Minas Geraes. Petals oblong-obovate, of a golden yellow colour.

Yellowish Turnera. Shrubs 2 to 3 feet.

8 T. arenaria (St. Hil. fl. bras. 2. p. 217.) leaves oblong or

K 2
oblong-lanceolate, acutish, crenately-toothed, clothed with velvety pubescence above, and hoary tomentum beneath, and biglandular at the base; flowers sessile; styles one half longer than the calyx.

**Hoary Turnera.** Shrub 1 to 2 feet.

17 **T. melochoïdes** (St. Hil. fl. bras. 2. p. 219.) leaves oblong-oblong elliptic, unequally crenate-toothed, rather roughish above, and clothed with rufescent tomentum beneath, biglandular at the base; flowers sessile; styles a little longer than the stamens. Σ. Native of Brazil, in the province of Goyaz. Petals yellow, ovobolate-oblong.

18 **T. na'na** (St. Hil. fl. bras. 2. p. 219.) leaves obovate-oblong, rounded at the apex, crenate, pubescent on both surfaces, but especially beneath, biglandular at the base; flowers sessile; styles 3-times longer than the stamens. Σ. Native of Brazil, in the province of Minas Geraes. Petals ovobolate, yellow.

**Melochia-like Turnera.** Shrub 1 to 1½ foot.

19 **T. genistoides** (St. Hil. fl. bras. 2. p. 220.) leaves linear, acutish, glandless, hairy; flowers sessile; styles twice the length of the stamens. Σ. Native of Brazil, in the province of Minas Geraes, near Tejucó. Petals ovobolate-oblong, glabrous.

**Genista-like Turnera.** Shrub ½ to 1 foot.

21 **T. chamædrifolia** (St. Hil. fl. bras. 2. p. 221.) leaves oblong, acute, deeply toothed, glandless, pubescent on both surfaces, but especially beneath; flowers on short peduncles; styles exceeding the stamens. Σ. Native of Goyaz, in that part of the province of Minas Geraes called Minas Novas, on the banks of the river Jiquitinonha. Petals rose-coloured?

**Germander-like Turnera.** Shrub ½ to 1 foot.

22 **T. pinatifida** (Juss. in Poir. dict. 8. p. 144.) leaves ovobolate-oblong, cuneate, toothed, or pinatifid, glandless, hairy, or tomentose; flowers pedunculate; styles 3-times longer than the stamens, purple. Σ. Native of Brazil, in the province of Cisplatin, in pastures and fields. Petals scarlet, denticulated at the apex.

**Var. β. angustiloba** (D. C. prod. 3. p. 347.) stems diffuse; leaves hairy, pinatifid; lobes narrow, acute; flowers of a dirty red or copper colour. Σ. Native of Brazil, about Monte Video, and in the province of Cisplatin.

**Var. γ. carnea** (St. Hil. fl. bras. 2. p. 222.) stems ascending, 6 inches high; leaves hairy, oblong-lanceolate, cuneate, deeply toothed; petals pale red, usually marked at the base with a dark purple spot each; filaments puberulous. Σ. Native of Brazil, in the province of Cisplatin.

**Pinatifida-leaved Turnera.** Shrub ½ foot.

25 **T. setosa** (Smith, in Rees' cyclo. no. 6.) leaves ovate-wedge-shaped, serrated or pinatifid, very hairy on both sides, without glands; peduncles axillary, partly combined with the footstalks; outer calyx linear. Σ. Native of Monte Video and Buenos Ayres. Flowers tawny, red.

**Bristly Turnera.** Pl. ¼ to ½ foot.

24 **T. mutiflora** (Lin. amen. 5. p. 395.) leaves broad-lanceolate, deeply serrated, hairy; flowers sessile, propped by 2 linear bracteoles; styles and stamens length of petals. Σ. Native of Jamaica, in arid fields. Swartz, obs. 116.—Soane, jum. hist. 127. f. 6.—Pumilia, no. 1. P. Browne, jum. 188. Stem hardly 3 inches long. Plum. icon. t. 150. f. 1. Flowers small, yellow.

25 **T. microphylla** (D. C. prod. 3. p. 347.) leaves oblong, attenuated at the base, crenate, wrinkled, clothed with white tomentum beneath; flowers sessile, bearing 2 linear, adpressed bracteoles at the base. Σ. Native of St. Domingo. T. pumilia, Poic. dict. 8. p. 143. but not of Swartz. Petiv. gaz. t. 38. f. 9. T. diffusa, Wildl. rel. in/Rom. et Schultes, syst. 6. p. 679. This plant differs from T. pumilia in the stem being suffrutsecent, nearly a foot high, and much branched. Perhaps T. microphylla, Desv. in Hamilt. prod. p. 33. is referrible to this plant.

**Small-leaved Turnera.** Shrub 1 foot.

§ 2. Peduncles distinct from the petioles, axillary. Flowers bibracteolate.

26 **T. rupestris** (Abel. guian. 1. p. 289. t. 113. f. 1.) leaves linear, serrated, glabrous, glandless; flowers nearly sessile, bearing 2 seactaceous bracteoles at the base. Σ. Native of Guiana, in the fissures of humid rocks, at the river Sinemari. Petals yellow, somewhat toothed at the apex, 3 lines long. Flowers small, yellow.

27 **T. fruticosus** (Abel. l. c. p. 290. t. 113. f. 2. but not of Mill.) leaves lanceolate, acuminate, equally serrated; flowers nearly sessile, bearing 2 sessile, lanceolate-linear bracteoles. Σ. Native of Guiana, in the fissures of rocks, on the banks of the river Sinemari. Very like T. rupestris, but differs in the leaves being broader, and in the serratures being more crowded. Flowers small, yellow.

**Var. β. latifolia** (D. C. prod. 3. p. 347.) leaves ovate, acute. Σ. Native of Cayenne.

**Subrhyby Turnera.** Shrub 5 to 8 feet.

28 **T. tormentosa** (H. B. et Kunth, nov. gener. amer. 6. p. 123. but not of Willd.) leaves oblong, irregularly crenate-serrated, pubescent above, but clothed with canescens tomentum beneath, glandless at the base; flowers sessile, with 6 stamens and 6 petals. Σ. Native of South America, in the province of Venezuela. Styles hairy, about equal in length to the stamens. Petals yellow.

**Tomentose Turnera.** Shrub 1 foot.

29 **T. sinoides** (Lin. manti. p. 58.) leaves ovobolate-cuneated, serrated, quite entire at the base, rather tomentose on both surfaces, pilose on the veins and margin beneath; flowers on very short pedicels; bracteoles linear, hairy. Σ. Native of Brazil. Habit of T. cistoides. Petals ovoblate, yellow.

**Sida-like Turnera.** Shrub ½ foot.

30 **T. carpentinolos** (H. B. et Kunth, l. c.) leaves oblong-lanceolate, doubly serrated, puberulous, biglandular at the base; flowers on short pedicels; bracteoles ovate, acuminate, serrated. Σ. Native on the humid banks of the river Oriñoco, near Maypures. T. acuta, Willd. rel. in Rom. et Schultes, syst. 6. p. 678. ex Kunth. Flowers yellow. According to Willd. the flowers are petiolate; if such be the case, the plant belongs to the preceding section.

**Hornebeam-leaved Turnera.** Shrub 1 to 2 feet.

31 **T. Duarteana** (St. Hil. fl. bras. 2. p. 223.) leaves ovate,
obtuse, crenated, glandless, pubescent above, hairy, tomentose beneath, white; peduncles simple. $\ddag$. S. Native of Brazil, in the western part of the province of Minas Geraes. Styles shorter than the stamens. Petals 5-times longer than the calyx, erose, or rounded at the apex, rose-coloured when dry. Bracteas small, deciduous.

Var. $\beta$. rotundifolia (St. Hil. l. c.) leaves smaller, ovate-roundish; flowers yellow. This variety will perhaps constitute a distinct species.

Duarte's Turnera. Shrub 1 foot.

32. T. helianthemoides (St. Hil. l. c. p. 224.) leaves oblong or oblong-lanceolate, acutish, unequally denticulated, glandless, pubescent above, but clothed with white tomentum beneath; flowers axillary; peduncles simple; bracteas small, deciduous. $\ddag$. S. Native of Brazil, in the southern part of the province of Goiaz, on the banks of the river Parahyba. Petals obovate. Styles about equal in length to the stamens.

Sun-rose-like Turnera. Pl. $\frac{1}{2}$ to 1 foot.

33. T. rosea (St. Hil. l. c. p. 225.) leaves linear-lanceolate, obtuse, oblongate, denticulated, glandless, rather pilose on both surfaces; pili pilose; peduncles simple; bracteas small, deciduous. $\ddag$. S. Native of Brazil, in the province of St. Paul, not far from the town called Franca. Petals rose-coloured, obovate, erose at the apex. Styles twice the length of the stamens.

Rose-coloured Turnera. Pl. $\frac{1}{2}$ to 1 foot.

34. T. siderifolia (St. Hil. l. c. p. 227. t. 124.) leaves oblong, obtuse, crenated, glandless, rather scabious above, but clothed with hoary tomentum beneath; peduncles axillary, 1-2-flowered; bracteas small, subulate, tomentose. $\ddag$. S. Native of Brazil, in the province of Minas Geraes, at a place called Aldeia da boa Vista. Petals obovate, oblongate, crenulated, yellow. Styles shorter than the stamens.

Sida-leaved Turnera. Shrub $\frac{1}{2}$ to 1 foot.

35. T. aurea (St. Hil. l. c. p. 226.) leaves oblong, narrowed at the base, acute, or rounded at the apex, serrately toothed, glandless, beset with golden hairs; peduncles simple, articulated in the middle. $\ddag$. S. Native of Brazil, in the province of Minas Geraes, near the town of St. Joao del Rey. Petals twice or thrice the length of the calyx, cuneated at the base and rounded at the apex, rose-coloured or flesh-coloured; each marked by a dark purple spot at the base. Styles shorter than the younger stamens.

Golden-haired Turnera. Shrub $\frac{1}{2}$ to 1 foot.

§ 3. Flowers disposed in axillary and terminal racemes.

36. T. racemosa (Jacq. hort. vind. 3. t. 94.) leaves oblong, or oblong-lanceolate, acutish, unequally denticulated, glandless, pubescent above, and clothed with white tomentum beneath; upper flowers leafless at the base, and therefore disposed in a terminal raceme; peduncles simple. $\ddag$. S. Native of Brazil, in the province of Minas Geraes, on the banks of the river Jiquitinonha; and of St. Domingo. Stem and peduncles hispid. Petals ovate, yellow, furnished each with a small jagged appendage on the inside at the base. Styles longer than the stamens.

37. T. salicifolia (St. Hil. l. c. p. 227.) leaves lanceolate, acuminate, serrated, glandless, smoothish; peduncles axillary, many-flowered. $\ddag$. S. Native of Brazil, near Rio Janeiro. Petals obovate, striated, yellow, denticulated at the apex. Styles about equal in length to the calyx.

Willow-leaved Turnera. Shrub 2 to 3 feet.

38. T. capitata (St. Hil. l. c. p. 215.) leaves elliptic-oblong, or oblong-lanceolate, acute, dentately serrated, nearly glandless, pubescent above, and clothed with yellowish tomentum beneath; flowers sessile, forming a many-flowered head at the tips of the branches. $\ddag$. S. Native of Brazil, in the province of Minas Geraes, on the margins of woods near Poso Alto, not far from the confines of the province of St. Paul, and on the iron mountains near Nossa Sena da Conceicao. Petals obovate-oblong, pale yellow. Styles much shorter than the stamens.

Capitate-flowered Turnera. Shrub 2 to 3 feet.

40. T. glabra (D. C. prod. 3. p. 347.) leaves linear, obtuse, subseriately, narrowed at the base, glandless; racemes few-flowered; pedicels rising from the axis of small linear leaves and longer than them, articulated and bracteose at the middle. $\ddag$. S. Native of St. Domingo. Stems erect, glabrous. Flowers yellow?

Glabrous Turnera. Pl. 1 to 2 feet.

41. T. citrus (Linn. spec. 387.) leaves linear-lanceolate, serrated, pubescent above, tomentose beneath, glandless at the base; racemes terminal, leafy; pedicels rising from the axis of lanceolate leaves, and shorter than them, articulated and bracteose above the middle. $\ddag$. S. Native of South America, in sterile places, Surinam, Jamaica, St. Domingo, Georgia, &c. Sloan. Jam. hist. 1. p. 127. f. 7. Plum. Ed Burm. t. 150. f. 1. Swartz. obs. 117. T. hispida, Bert. mass. Flowers small, yellow.

Rock-rose-like Turnera. Fl. June, Oct. Cit. 1774. Pl. $\frac{1}{2}$ ft. 42. T. australis (Poir. dict. 8. p. 144.) leaves elliptic, sessile, a little toothed, pubescent above, and rather tomentose beneath, glandular; stem hardly pubescent, rough; racemes leafy, terminal; pedicels rising from the axis of the leaves, and shorter them, articulated above the middle. $\ddag$. S. Native of French Guiana. Flowers yellow. Perhaps a variety of T. citrus or of Periqueta eilosa.

Rough Turnera. Pl. $\frac{1}{2}$ foot.

† Species not sufficiently known.

43. T. odorata (Rich. in act. soc. hist. nat. par. 1792. p. 107.) shrubby, much branched; flowers small; leaves ovate, acute, toothed, tomentose. $\ddag$. S. Native of Cayenne. Flowers yellow?

Sweet-scented Turnera. Shrub.

44. T. hispida (Willd. rel. in Rom. et Schult. syst. 5. p. 678.) leaves linear-lanceolate, unequal, bluntly serrated, clothed with stellate tomentum on both surfaces; flowers axillary, solitary; stem branched, hairy. $\ddag$. S. Native of Brazil. Yellow flowers.

Hairy Turnera. Fl. June, July. Cit. 1818. Pl. $\frac{1}{2}$ to 1 ft.

45. T. braziliensis (Willd. rel. l. c.) leaves lanceolate, quite entire, clothed with hispid pubescence; flowers axillary, sessile, aggregate. $\ddag$. S. Native of Brazil. Leaves biglandular at the base. ex Spreng.
**Turneraceae. I. Turneræ. II. Piriqueta.**

Endearing Turneræ. Pl. 74 T. vegata (Wild. rel. 1. c.) leaves ovate, serrated, pilose, bilocular at the base; flowers bibracteate; bracteoles linear-setaceous. O. S. Native of Brazil.

Twiggy Turneræ. Pl. 3 to 1 ft. 48 T. corchorifolia (Wild. rel. 1. c.) leaves oblong, doubly serrated, tomentose beneath. O. S. Native of Brazil. The rest unknown.

Corchorus-leaved Turneræ. Pl. 3 to 1 ft. 49 T. Desvauxii (D. C. prod. 3. p. 348.) stem suffruticose, branched; branches assurgent, hairy; leaves ovate, obtuse, crenately toothed at the base, rather pilose beneath; flowers axillary, on long peduncles.—Native of Guiana. H. t. H. Desv. in Hamilt. prod. p. 33. but not of Wild.

Desvaux’s Turneræ. Pl. 1 ft. Cult. All the species of Turnera are elegant plants when in flower, and thrive well in any light rich soil. They seed freely in this country, and may be propagated by that means: cuttings also root freely, under a bell-glass, in heat. The seeds of annual species may be reared on a hot-bed in spring; and some of the plants may be planted out into the open border, in a warm sheltered situation, where they will probably flower and ripen their seeds, if the summer prove dry and warm.

Lin. syst. Pentândria, Tri-Hexâgyния. Calyx campanulate. Style 6, or 3 binate ones; stigmas multifid, flabellate. Capsule 3-valved from the apex to the base. Perhaps this genus is sufficiently distinct from the preceding. Habit of Turnera racemosa, but which plant is only furnished with 3 styles, not 6. Flowers pedicellate, in the axils of the upper leaves. Pedicels bracteose, articulated above the middle.

Villosa Piriqueta. Pl. 2 feet. 2 P. Tomentosa (H. B. et Kunth. nov. gen. amer. 6. p. 128.) leaves oblong, acute at both ends, irregularly crenate-serrate, pubescent above, clothed with soft hoary tomentum beneath. O. S. Native of South America, between Atures and Maypures, on the Orinoco. Turnera tomentosa, Willd. rel. in Ræm. et Schultes, syst. 6. p. 678. but not of H. B. et Kunth. Corolla yellow.

Tomentosa Piriqueta. Shrub 1 to 2 feet. Cult. The culture and propagation of these plants are the same as for the annual species of Turnera, see p. 70.

**Order CIX. Fouquieraceæ (plants agreeing with Fouquier in important characters).** D. C. prod. 3. p. 349.—Portulácææ affines, H. B. et Kunth, nov. gen. amer. 6. p. 81.

Calyx of 5 permanent sepals; sepals imbricate, ovate or roundish. Petals 5, combined into a tube, inserted in the bottom of the calyx or torus; limb of corolla 5-lobed, regular. Stamina 10-12, inserted with the corolla, exserted; anthers 2-celled. Ovarium free, sessile. Style filiform, trifid at the apex. Capsule trigonal, 3-celled; valves bearing dissepiments in their middle, which go as far as the centre of the fruit, and therefore the capsule is 3-celled. Seeds compressed, winged, fixed to the centre of the fruit or axis, few when the capsule is mature, but numerous when it is in a young state. Embryo straight, in the centre of a fleshy albumen, with flat cotyledons.

—Trees or shrubs, natives of Mexico. Leaves in fascicles when young, in the axils of spines or cushions, quite entire, oblong, and rather fleshy. Flowers scarlet, disposed in a terminal spike or panicle.

This order is separated from Portuláceæ by De Candolle, as he tells us, (Mem. portul. p. 4.) for the following reasons: first, because their petals cohere into a long tube, of the same nature as that of gamopetalous Crassuláceæ; second, because their capsule consists of 3 loculical cells, that is to say, which separate through the middle, forming 3 septicidal valves; and thirdly, because their embryo is straight, with flat cotyledons, and stationed in the centre of a fleshy albumen. They approach the monopetalous Crassuláceæ in the structure of their flowers; and Turnerbâceæ and Lobâceæ in the form of their fruit.

**Synopsis of the genera.**

1 Fouquieræ. Sepals ovate, mucronate, free, 2 exterior and 3 interior. Limb of corolla spreadingly reflexed. Stamina 10-12, hypogynous.

Lin. syst. Deccándria, Monogynia. Calyx coloured; sepals ovate, mucronate, 2 exterior and 3 interior, free. Corolla hypogynous; tube cylindrical, a little arching; limb spreadingly reflexed, nearly regular. Stamina 10-12, hypogynous, exserted; filaments ciliated below, and cohering together; anthers cordate. Ovula 18, on each placenta, in 2 rows. Fruit unknown. A somewhat spinose shrub. Spikes terminal, erect. Flowers scarlet. Leaves oblong, rather fleshy.

1 F. rosmàs (H. B. et Kunth, 1. c.). 2 S. Native of Mexico. Echevería spicata, Moc. et Sesse, fl. mex. icon. ined. Flowers flesh-coloured, an inch long. Leaves scattered, according to Kunth’s figure; but according to the figure in the fl. mex. they are a little narrower and in fascicles; therefore the 2 figures mentioned are very unlike each other.

Showy Fouquieræ. Shrub 6 to 10 feet.

Cult. A light rich soil will suit this very showy shrub; and young cuttings will root freely under a bell-glass, in heat.

**II. Brönniæ (in honour of Henry George Bronn, a young botanist, who has written on the form of leguminous plants).** H. B. et Kunth, nov. gen. amer. 6. p. 85. t. 598. D. C. prod. 3. p. 349.—Echevería species, Moc. et Sesse, fl. mex. icon. ined.

Lin. syst. Deccándria, Monogynia. Calyx permanent; sepals 5, roundish. Tube of corolla cylindrical, straight; limb
erect. Stamens 10; filaments filiform, exserted; anthers ovate. Style exceeding the stamens. Cells of fruit 1-seeded when mature. A spinose shrub, with fascicles of obovate-oblong, membranous leaves in the axils of the spines. Flowers panicked, scarlet. It differs from the last genus in the placentas being drawn in more to the centre of the fruit.

Spiny Bromnia. Tree 12 to 14 feet. Cult. See Fouquieria, p. 70. for culture and propagation.

Calyx free, or somewhat adnate to the very base of the ovarium (f. 15. a. f. 18. a.), usually of 2 sepals (f. 16. a. f. 18. a.), seldom of 3 or 5 (f. 20. a.), cohering at the base. Petals usually 5 (f. 15. b. f. 17. b.), but sometimes 3-4-6, very rarely wanting altogether, either distinct (f. 18. b.), or cohering into a short tube at the base (f. 15. b.), alternating with the sepals when the number is equal. Stamens inserted along with the petals, irregularly into the base of the calyx, and sometimes perhaps in the torus, variable in number in the species of the same genus, all fertile; filaments adnate, adnate to the base of the petals (f. 15. g.), and usually opposite them where the number is equal; anthers ovate, 2-celled, opening lengthwise, versatile (f. 18. c.). Ovary one, usually roundish (f. 15. c.), 1-celled (f. 15. f.). Style sometimes single, filiform, cleft into numerous stigmas at the apex (f. 15. c.); sometimes wanting or nearly so; when this is the case the stigmas are distinct (f. 17. c.), and rise in numbers from the top of the ovary. Capsule 1-celled, opening either transversely (f. 15. f.), or by the 3 valves from the base to the apex; but they are also occasionally 1-seeded and indehiscent. Seeds numerous when the fruit is deciduous, attached to the central placenta (f. 15. f.). Albumen farinaceous. Embryo curved round the circumference of the albumen, with a long radicle, and oblong cotyledons.—Fleshy shrubs or herbs. Leaves alternate, rarely opposite, entire, usually succulent, without stipulas, or sometimes with membranous ones on each side of the petioles. Flowers axillary or terminal, usually expanding in the sun, and of short duration. The 1-seeded genera of this order agree in character with the order Paronychieæ, and the apetalous genera with the order Ficoideæ. This order is related in nearly every point of view to Caryophyllaceæ, from which they scarcely differ except in their perigynous stamens, which are opposite the petals when equal to them in number, and two sepals; the latter character is not, however, very constant. The presence of scarious stipulas in several Portulaceæ, although perhaps an anomaly in the order, indicates their affinity with Paronychieæ, from which the monosperous genera of Portulaceæ are distinguished by the want of symmetry in their flowers, and by the stamens being opposite the petals, instead of the sepals. So close is the relationship between these orders, that several of the genus Ginginsia in Portulaceæ have been referred to Pharnacæum in Caryophyllæceæ, and several Portulaceæ have been described by authors as belonging to genera of Paronychieæ. De Candolle remarks, that his G. baccicallis resembles certain species of Androsacæ, and that Portulaceæ have been more than once compared to Primulaceæ (mem. p. 14.), and the same author remarks in his prod. 3. p. 351. that the genera with definite stamens, and hairy axilis approach Cactææ, while the apetalous genera tend towards apetalous Ficoideæ.

Insipidity, want of smell, and a dull green colour, are the usual qualities of this order, of which the only species of any known use are common Parslane and Claytonia perfoliata, which resemble each other in properties.

Synopsis of the genera.

1 Tri'antiæma. Sepals 5, concreto at the base, coloured. Petals wanting. Stamens 5, rarely 10 or more. Styles or stigmas 1-2, rarely 3. Capsule opening transversely.

3 Portulæca. Calyx bipartite (f. 15. a.), at length falling off. Petals 4-6, equal (f. 15. b.), free, or concreto at the base. Stamens 8-15 (f. 15. g.). Style one, 3-6 cleft at the apex (f. 15. c.); or style wanting, and the stigmas 3-8 elongated. Capsule opening transversely (f. 15. f.).

6 Tal'ium. Sepals 2 (f. 17. a.), deciduous. Petals 5 (f. 17. b.), free, or somewhat concreto at the base. Stamens 10-20. Style filiform, 3-cleft at the apex (f. 17. c.). Capsule 3-valved. Seed wingless.

8 Calanbri'nia. Calyx 2-parted (f. 18. a.). Petals 3-5 (f. 18. b.), free or rather concreto at the base. Stamens 4-15 (f. 18. c.). Style one, very short, tripartite at the apex (f. 18. c.); lobes clavate. Capsule oblong-elliptic, 3-valved. Seeds wingless.

9 Portulaca'ria. Calyx of 2 sepals, membranous. Petals 5, permanent. Stamens 5, or probably 10, 5 of which are abortive. Style wanting; stigmas 3, spreading, glandular. Fruit triquetrous, winged, indehiscent, 1-seeded.

PORTULACEÆ. I. TRIANTHEMA.

12 MÔN'TIA. Caly x of 2, rarely of 3 sepals. Petals 5, rather connate at the base, 3 of which are a little smaller than the rest. Stamens usually 3 in front of the smaller petals, making 9, very rarely 3-4. Capsule 3-valved, 3-seeded.

14 COLOBA'NTIUS. Calyx 4-5-parted. Petals wanting. Stamens 4-6. Stigmas 4-5. Capsule 4-7-valved, many-seeded.

15 GINGI'NIA. Calyx 5-parted, permanent, petaloid on the margins and in the inside. Petals wanting. Stamens 5. Ovary girded by a 5-lobed fleshy scale. Capsule 3-valved, many-seeded.

16 AYLM'ERIA. Calyx 2-parted, coloured. Petals 5. Stamens 10, membranous, connected into a hypogynous tube, the 5 inner ones abortive. Style one, crowned by a depressed capitulate stigma. Capsule bladdery, membranous, valveless. Seeds numerous in the bottom of the cell.

LIN. SYST. Pet. Decândria, Monogónia. Sepals 5, permanent, connected together at the base, rather coloured on the inside, and mucronated under the apex. Petals wanting. Stamens 5-10, rarely more, distinct, inserted in the bottom of the calyx; anthers kidney-shaped. Ovary ovate. Styles or stigmas filiform, 1-2, rarely 3. Capsule opening transversely below the middle; the upper valve, which separates like a lid, is hollow, and contains a seminiferous cell; therefore both cells are either simple, or of two divisions, one or few-seeded.—More or less fleshy herbs, which are sometimes suffruticose at the base. Leaves opposite, quite entire, petiolate. Petioles dilated into a stipula-formed membrane on both sides. Flowers axillary, sessile, usually by threes.

1 T. POLY'NDRA (Blum. bijdr. p. 1137.) stems herbaceous, procumbent; branches terete; leaves linear, obtuse; flowers pedunculate, solitary, polyanthrous, trigynous. 2. S. Native of Batavia, in bogs.

Polyandrous Trianthem. Pl. cr.
2 T. GOVÎNDRA (Ham. ex. Wall. cat. no. 6838.) stems suffruticose, trailing; leaves opposite, elliptic, emarginate at the apex; those opposite each other of unequal size; flowers axillary, aggregate, sessile. 3. S. Native of the East Indies, in Mangger. Plant glaucous. The number of stamens and styles unknown.

Govîndra Trianthem. Shrub prostrate.
3 T. DECA'NDRA (Lin. mant. p. 70.) stem herbaceous, gla- bures, diffuse, terete; leaves elliptic, acute. 3 F. Native of the East Indies. Zaläya decândra, Burm. l. c. t. 31. f. 3. Petioles furnished at the base on both sides with a broad membrane. Flowers on short pedicels, disposed in fascicles in the axis. Sepals mucronate at the apex. Stamens 10-12. Styles 2.

Triquêtrus Trianthem. Pl. diffuse.
5 T. HUMI'TSA (Thunb. fl. cap. p. 589.) stems frutescent, trailing, terete; leaves lanceolate, attenuated at both ends. 4 G. Native of the Cape of Good Hope, in Konde Bokeveld. Stamens 10, alternate ones shorter. Thunberg in his prodromus says the flowers are monogyous, but in his flora he says they are digynous.

Var. β; stamens 10, one-half shorter than the calyx, fixed by pairs to the base of the calycine segments.—Native of the Cape of Good Hope, at Hex River.

Trialing Trianthem. Shrub tr.
6 T. ÀNEPS (Thunb. fl. cap. p. 399.) stem frutescent, diffuse, 2-edged; leaves lanceolate, attenuated at both ends, acu- mated. 4. G. Native of the Cape of Good Hope. Stamens 10. Style 1, very short.

Two-edged-stemmed Trianthem. Shrub diffuse.

7 T. PÂN'TÁNDRA (Lin. mant. p. 70.) stem rough from velvety hairs; leaves elliptic, obtuse, flowers crowded in the axils of the leaves. 2. (ex Forsk.) 3. (ex Lin.) Native of Arabia. Rocâma digyna, Forsk. l. c. Rocâma Arábica, Gmel. syst. 1. p. 455. Pluk. phyt. t. 120. f. 3. ex Lin. T. pentândra, Guerri. fruct. 2. p. 213. t. 128. f. 5. Lam. ill. t. 375. f. 2. Stamens 5. Styles 2. Perhaps 2 species are here confused, the stems being, according to Linnaeus, erect and shrubby, and according to Forskal annual and prostrate.

Var. β, obsèrdâta (D. C. prod. 3. p. 352.) leaves obovate, bluntly emarginate at the apex.—Native of the East Indies. T. obsexordata, Roxb. hort. beng. p. 34.

Monogónus Trianthem. Fl. July, Aug. Clt. 1710. Pl. pr. 9 T. CRYS'TALLâNA (Vahl. symb. l. p. 52.) stem shrubby, diffuse, terete, glabrous, papulose; leaves linear or lanceolate, opposite, one of them smaller than the other; flowers crowded, axillary. 3. G. Native of Arabia and the East Indies. Pa- pulâria crystallâna, Forsk. des. p. 69. Stamens alternating with the petals. Style 1.

icy Trianthem. Shrub diffuse.

Cult. The seeds of the species of Triânthema require to be sown on a hot-bed in spring; and about the end of May they may be planted out in the open border in a warm sheltered situation, where they will probably flower and seed. Some are said
to be shrubby, these it will be requisite to treat as other stove plants; and cuttings of them will be easily rooted.

II. CYPSELEA (from κυψήλα, kypsele, a bee-hive; in reference to the form of the capsule). Turp. in ann. mus. 7. p. 219. t. 121. f. 5. D. C. prod. 3. p. 358.—Raddiâna, Rafin. speech. 1. p. 88.

Lin. syst. Di-Triândria, Digyniâ. Calyx campanulate, permanent, coloured, 5-parted; lobes obtuse, 2 of which are smaller than the other 3. Corolla wanting. Stamens 2-3, inserted in the calyx and alternating with its lobes (ex Turp.), or opposite the smaller lobes (ex Rafin.). Ovarium free, 1-celled. Style hardly any, 2-parted, or stigmas 2. Capsule 1-celled, many-seeded, opening transversely. Seeds fixed to an oval, central placenta, very small, and very numerous.—Herbs, natives of St. Domingo, with the habit of Montia or Crypta, rather succulent, annual, and glabrous. Leaves opposite, obovate; petioles widened into a stipule-formed, jagged membrane. Flowers axillary, small, greenish, solitary, on short pedicels.

Lin. syst. Oto-Dodecândria, Monogyâni. Calyx free from or adhering to the ovary at the very base, bipartite (f. 15. a.), at length cut round about the base, and falling off. Petals 4-6 (f. 15. b.), equal, distinct, or joined together at the very base, inserted in the calyx. Stamens 8 (f. 15. g.)—filaments free, sometimes adnate to the bottom of the corolla (f. 15. g.). Ovarium roundish. Style 1 (f. 15. d.), 3-6-cleft at the apex (f. 15. c.), or the style is wanting; but in this case, the stigmas are 3-8 and elongated. Capsule sub-globose (f. 15. f.), 1-celled, opening transversely in the middle. Seeds numerous, fixed to a central placenta (f. 15. f.).—Humble fleshy herbs. Leaves scattered, quite entire, thick, usually bearing hairs in the axils, crowded, or somewhat verticillated about the flowers. Flowers expanding from 9 till 12 o’clock in the morning, if the sun shine, otherwise they remain closed.—This is a heterogeneous genus, and probably divisible, but easily distinguished by the capsule opening transversely.

* Flowers yellow. Axes of leaves naked. *

1 P. oleracea (Lin. spec. p. 638.) leaves wedge-shaped, fleshy; axils and joints naked; flowers sessile. O. H. Native nearly throughout the whole world. D. C. pl. grass. t. 123. Schkuhr. handb. t. 130. Petals concrete at the base. Stamens 10-12, adnate to the corolla. Style wanting. Stigmas 5, elongated. Perhaps specifically distinct from the following varieties.

—Blackw. icon. t. 287.

Var. b, sativa (D. C. prod. 3. p. 358.) stems diffuse; branches erectish. O. H. Native of South America, and now cultivated in some parts of Europe. P. domestica, Lob. icon. p. 388. P. sativa, Haw. misc. p. 136. syn. 129. P. latifolia, Horn. hort. fl. hafn. 2. p. 491. There is a variety of this with green leaves (P. viridis, Hortul.), and yellowish leaves (P. aërea, Hortul.). The young shoots and succulent leaves are esteemed cooling, and are used in spring and summer as an ingredient in salads, and as pot-herbs and pickles. The plant was formerly in much more request than at present. Both the green and yellow-leaved sorts are raised from seed, and for a bed 4 feet by 4 feet, sow either broadcast or in drills, 9 inches apart, one-eighth of an ounce will suffice. “Each variety is somewhat tender; the green, which is usually preferred, is perhaps rather the hardiest. An early crop may be sown in February or March, on a moderate hot-bed; the plants will require the aid of a gentle heat till the middle of May, when the seed may be sown in a warm border. If a continued succession is required, sow every month during summer, till August, or while the plant can be raised; generally in small drills, from 3-6 inches asunder. The plants will soon come up; they should remain where sown. In very dry hot weather, water thrice a-week. The shoots may be gathered for use when they are from 2-5 inches in height, and are well furnished with leaves. Cut them off low, and the bottom part will soon sprout out again. When seed is required, leave some of the first open border plants to run; they will give ripe seed in autumn.”

2 P. farfæolia (Haw. syn. p. 129.) leaves cuneiform, minute, fleshy; stem much branched, prostrate; flowers sessile, or on long peduncles. O. H. Native of Jamaica. Probably only a variety of P. sativa, but the plant is much smaller, and the leaves are 10-times smaller.

** Flowers yellow. Axes of leaves or joints pilose.**

3 P. foliâsâ (Ker. bot. reg. 793.) stem diffuse; branches erect; leaves subulate; flowers solitary at the tops or in the forks of the branches, surrounded by white hairs and a many-leaved involucrum; petals retuse or a little emarginate. O. F. Native of Guinea, near Accra. P. Guineëmis, Spreng. There is a plant figured in fl. mex. of Moc. et Sesso, called by them P. stelliformis, a native of Mexico, which is very like this species. Flowers small, yellow.

5 P. lanuginosâ (H. B. et Kunth, nov. gen. amer. 6. p. 74.) stems procumbent, branched; leaves terete, obtuse, upper ones in whorles; flowers in clusters of 2-5, surrounded by soft hairs; petals obovate-spatulate, obtuse. O. F. Native of South America, on the banks of the Amazon. Style 1; 3-5-cleft at the apex. Petals 4-5, yellow.

Woolly Purslane. Pl. pr.

6 P. marginaâta (H. B. et Kunth, l. c. p. 72.) stems rather dichotomous; leaves cuneately spatulate, rounded at the apex, subverticillate, obsoletely veined, margined with red; axils hairy; flowers 5 in each head, involucrated. O. F. Native near Caracas, in Venezuela. Said to be allied to P. oleracea. Flowers yellow.

Margined-leaved Purslane. Pl. pr.

7 P. laruoetteâna (St. Hil. fl. bras. 2. p. 190.) stem suffruticose at the base, pilose in the axils of the leaves; leaves lanceolate, flatish, narrowed at the base, acute, longer than the hairs; flowers crowded at the tops of the branches; petals ob-

---

VOL. III.
cordate, mucronulate, shorter than the calyx. "S. Native of Brazil, in that part of the province of Minas Geraes called Minas Novas, near Nossa Senza da Penha. Flowers yellow, surrounded by hairs and crowded leaves.

Larrouette's Purslane. Shrub ¾ to ½ foot.

9 P. rubricaulis (H. B. et Kunth, nov. gen. amer. 6. p. 73.) stems ascending, corymbose branches above; leaves lanceolate, acute, nerveless; upper leaves in whorls; axils pilose; flowers 4-8, crowded into a head. "F. Native of South America, in sandy places and on dry mountains on the sea-shore near Laguna. Petals 5, obovate-oblong, emarginate, orange-coloured. Stamens 27-30. Style 6-8-cleft. Said to be allied to P. halimoides.

Red-stemmed Purslane. Pl. ascending ½ foot.

10 P. hirsutissima (St. Hil. fl. bras. 2. p. 121. t. 114.) stem suffruticose at the base, pilose at the ends of the leaves; leaves approximate, oblange-lanceolate, flattish, tapering to both ends, acute, shorter than the hairs; flowers crowded at the tops of the branches; petals obcordate, mucronate, a little longer than the calyx. "S. Native of Brazil, near Minas Geraes, near Bom-Tim and Nossa Sara da Penha, and also near Tejucu. Flowers yellow, surrounded by a whorl of the upper leaves and axillary hairs.

Very hairy Purslane. Shrub ¾ to ½ foot.

11 P. microsacta (Link, enum. hort. berol. 2. p. 2.) stem erect; leaves oblong-oblong, with a short taper point; floral leaves 8, constituting an involucrum; axils pilose; flowers terminal, sessile. "F. Native country unknown.

** Flowers purple; axils pilose, or perhaps sometimes naked.

13 P. pilosa (Lin. spec. 639.) stem diffuse; joints beset with long hairs; leaves alternate, linear-lanceolate, convex on the back, bluish, about equal in length to the axillary hairs; floral leaves in whorles; flowers crowded at the tops of the branches, sessile, surrounded by long hairs; petals ovate, acutish, a little longer than the calyx. "F. Native of South America, about Curassoa, in Brazil, Martinico, Jamaica, &c. in sandy places near the sea. Gaertn. fruct. 2. p. 212. t. 125. f. 4. Haw. misc. p. 137. Ker. bot. reg. 792.—Wolk. norib. 341. with a figure. Herm. par. 215. Comm. hort. amst. 1. t. 5. Flowers 5-parted, pale purple, expanding from 10-120 o'clock in the morning, if the sun is out. Stamens about 20. Root tuberous.

14 P. lana'ata (Rich. act. soc. hist. nat. par. 1792. p. 109.) stems diffuse; leaves linear-sublanceolate, flat; hairs of the axillae and joints longer than the leaves; flowers terminal, surrounded by hairs and a whorle of leaves. "F. Native of Cayenne. Petals red, obcordate. Stamens 15 and more. Perhaps only a variety of P. pilosa.

15 P. pilosissima (Hook, bot. misc. 2. p. 221.) plant annual? small; stems branched, decumbent; leaves terete, obtuse; fasicles of hairs twice or thrice longer than the leaves. "H. Native of Peru, at Yazo, in the valley of Canta. The flowers are concealed by long white solitary tufts of hairs. It comes nearest to the P. lana'ata, Rich.

Very pilose Purslane. Pl. ½ to ¾ foot.

Shaded Purslane. Pl. ½ to ¾ foot.

18 P. hilareana'na; stem trailing, herbaceous, pilose in the axils of the leaves; leaves linear-lanceolate, convex on the back, flat in front, acute, longer than the axillary pili; flowers crowded on the tops of the branches; petals obcordate, much longer than the calyx. "F. Native of Brazil, in the province of St. Paul. P. grandiflora, St. Hil. fl. bras. 2. p. 195. but not of Hook. Flowers purple, surrounded by crowded leaves and hairs.

St. Hilaire's Purslane. Pl. ½ to ¾ foot trailing.

19 P. acutiflora (Hook, in bot. mag. 2885.) stems diffuse, branched; leaves scattered, cylindrical, acute, with pilose axils; flowers 3-4 together, terminal, crowded, surrounded by a whorl of leaves and crowded petals; petals longer than the calyx; style 5-9-cleft at the apex. "F. Native of Chili. There are varieties of this plant with either purple or yellow large flowers. Root tuberous.

Var. a, major; (Hook, in bot. misc. 3. p. 241.) leaves an inch or an inch and a half long.—Bot. mag. t. 2885.

Var. β, microphylla (Hook. et Arn. l. c.) leaves hardly half an inch long. P. Mendoceinensis, Gill. mss. Both varieties are found between Rio Saladillo and Mendoza.

the calyx, obovate-roundish. 2. G. Native of Chili, in the plains near Mendoza. Plant stout, in proportion to its height. Flowers large, bright reddish purple.

**Gillies's Purslane.** Pl. 3 to 4 foot.

21 P. Tereetifolia (H. B. et Kunth, l. c.) stems creeping, corimbosely branched; axes rather pilose; leaves scattered, terete, acuminate; flowers 3-5 in a heap, sessile, involucrated, and surrounded by hairs. O. F. Native of South America, on the sandy banks of the river Orinoco and Rio Negro, near Caracana, Maypures, San Carlos, &c. Very like *P. rubricaxis*, but differs in the flowers being purple. Stamen 18-24.

**Tereete-leaved Purslane.** Pl. creeping.

22 P. Axilliflora (Pers. encir. 2. p. 6.) stems procumbent; leaves oblong, fleshy, in young plants they are opposite; flowers solitary, axillary. O. F. Native country unknown. Meridiania axilliflora, Schrank. bot. zeit. 1804. p. 354. Corolla and stamens rose-coloured.

**Axil-flowered Purslane.** Pl. pr.

† Species not sufficiently known.

23 P. Imbricata (Forsk. descr. 92.) leaves crowded, ovate, acute, flat beneath, and convex above, opposite; joints hairy at the base; flowers sessile, terminal. O. H. Native of Arabia. Flowers yellow, large. Scurf as if they were tetragonal, from the leaves being imbricated on them in 4 rows.

**Imbricate-leaved Purslane.** Pl. pr.

24 P. Castera (Thunb. fil. cap. p. 369.) stem weak, branched, glabrous; leaves linear-oblong, alternate; flowers axillary, pedicellate; pedicels bipecticate. O. F. Native of the Cape of Good Hope. Corella yellow, 6-petalled. Style trifid. Capsule probably 2-cellled and 2-valved.

**Caffraria Purslane.** Pl. pr.

25 P. Arabica (Forsk. descr. 92. no. 81.) calyx of 4 permanent sepals.—Native of Arabia. The rest unknown.

**Arabian Purslane.** Pl. ?

26 P. Flava (Forst. pl. esc. p. 72.) O. F. Native on the shores of the Society Islands, where it is boiled and eaten by the natives, and called by them *Aturi*. This plant has not been described, and is probably nothing else but *P. oleracea*.

**Yellow-flowered Purslane.** Pl. pr.

27 P. Wightiana (Wall. cat. no. 6845.) plant diffuse; leaves small, intermixed with numerous soft leafy stipulas; flowers sessile, terminal, almost hidden by the white bracteas. τ. A. S. Native of the East Indies, at Madras, in moist sand. A singular species.

**Wight's Purslane.** Pl. 1/2 foot.

**Cult.** Being mostly annual plants, growing naturally in sandy soil near the sea, the seeds should be sown in dry warm situations in spring; or it is perhaps better to sow them on a hotbed in spring, and plant them out towards the end of May into the open border; or they may be grown in pots and set in the greenhouse or in a frame.

### IV. GRAHAMI'A (in honour of Mrs. Maria Graham, a great traveller in South America, particularly in Brazil, Peru, and Chili.) Gill. mss. ex Hook. et Arn. in bot. misc. 3. p. 241.

**Lin. syst. Icosandra, Monogynia.** Calyx of 2 permanent, oblong-lanceolate, mucronate, concave, stiff sepals, propped by 8 or 9 imbricate bracteas, similar to the sepals. Petals 5, obovate, mucronulate. Stamens numerous, about 40; filaments filiform, monadophalous at the base; anthers erect, 2-celled. Ovarium oblong, 1-celled. Style filiform, thickened upwards; stigma 4, but usually 5, linear. Capsule 1-celled, 5-valved. Seeds numerous, compressed, broadly winged, each fixed by a podosperm to the central axis.—A smooth branched shrub, with alternate, terete, oblong, obtuse, fleshy leaves, bearing hairs in the axis. Flowers solitary, terminating short or elongated branches, with white sepals and petals; and having the filaments purple at the base, and the anthers and stigmas yellow.

**Cult.** See Portulacària for culture and propagation.

**Lin. syst. Dodecandria, Monogynia.** Calyx of 2 sepals (f. 16. a.); sepals opposite, oblong, rather coarse at the base. Petals 5 (f. 16. b.), very fuscous. Stamens 15-20 (f. 16. d.); filaments distinct, inserted in the bottom of the calyx along with the petals, and adhering a little to them. Style filiform, trifid at the apex (f. 16. d). Capsule conical, 1-celled, 3-valved (f. 16. c.), with the valves eleft longitudinally in the middle, and therefore the capsule appears as if it was 6-valved (f. 16. c.). Seeds numerous, winged, fixed to a central placenta.—Very dwarf herbs or subshrubs, natives of the Cape of Good Hope. Leaves ovate, fleshy. Axes bearing filamentous subscarios stipulate hairs. Bracteas membranous, usually lobed into setaceous segments. Pedicels 1-flowered, elongated, disposed in racemes. Flowers of a rose-purple colour or white, expanding only in the heat of the sun.

2 A. intermedia; leaves very numerous and dense, expanded, flat, convex on the outside, retusely deltoid at the apex; axillary threads twisted, brown. τ. D. G. Native of the Cape of Good Hope. Rulingia intermedia, Haw. in phil. mag. march 1828. Very like *A. polyphylla*, but almost one half smaller, but taller; also like *A. filamentosa*, but broader; the leaves more numerous, more crowded, paler; and the axillary threads are yellow, not white.

4 A. Rubens (D. C. prod. 3. p. 356.) leaves ovate, acuminated, diffusor, shining, dark green, somewhat reflexed at the L 2
PORTULACEÆ. V. ANACAMPSEROS. VI. TALINUM.

apex; axillary hairs shorter than the leaves; racemes simple. 

Lin. syst. Deca-Dodecandra, Monógynía. Calyx of 2 ovate sepals, deciduous. Petals 5 (f. 17, b.), hyppogynous, or inserted in the bottom of the calyx, distinct or joined a little way at the base. Stamens 10-20, inserted along with the petals, and generally adhering a little to them, and joined together at the base. Style filiform, cleft at the apex into 3 spreading or close stigmas. Stigmas bearing papillose inside. Capsules 3-valved, 1-seeded, many-seeded. Seeds wingless, kidney-shaped, scarious, fixed to the central placentae. Fleshly herbaceous, or sufrutescent plants. Leaves alternate, quite entire, exatipulcate. Flowers very fugacious, expanding only in the heat of the sun, cymose or racemose. Cymes or racemes usually forming terminal panicles.

2 T. Napiíforme (D. C. prod. 3. p. 357.) root tuberous; radical leaves terete, fleshy; cymes terminal, dichotomous, corystose; stamens 5, alternating with the petals. 2. F. Native of Mexico. Clatónia tubérosa, Moc. et Sesse, fl. mex. icon. ned. Root tuberous, turnip-formed. Stems numerous from the neck of the tuber, almost leafless at the base, but cymose and dichotomous at the apex. Flowers white. This species from habit and inflorescence agrees with the preceding, but differs materially in having only 5 stamens, and a tuberous root. It is not a Clatónia, in consequence of the stamens alternating with the petals, not opposite them; nor a Calandrinia from the calyx not being deciduous.

Turnip-formed-rooted Talinum. Pl. ½ to 1 foot.

Sect. III. Talinellum (a diminutive of Talinum). D. C.

prod. 3. p. 358.—Talinum, Ruiz et Pav. syst. fl. per. p. 65.

Stamens 5, thick, flatish.—Generally annual herbs; and probably should have been joined with the genus Calandrinia.

10 T. revolutionis (H. B. et Kunth, nov. gener. am. p. 76.) stem erect, simple; leaves glabrous, lanceolate, obtuse, narrow

at the base, with revolute margins; peduncles terminal, somewhat dichotomous, few-flowered; petals awned, glandular towards the base. ○ F. Native of South America, in shady places near Cumana. Flowers yellow. Stamens about 48. Fruit unknown.

Revolute-leaved Talinum. Pl. ½ foot.

11 T. mucronatum (H. B. et Kunth, l. c.) stems erectish; leaves glabrous, oblong or oblong-lanceolate, obtuse, somewhat mucronate, cuneate, and narrowed at the base; peduncles terminal, 2-3-cleft, many-flowered; flowers racemose; petals mucronate. ○ D. F. Native of New Andalusia, near Bordes, in shady humid places. Petals yellow, length of calyx. Stamens about 50.

Mucronate-leaved Talinum. Pl. ½ to ¾ foot.

12 T. Polyaedrum (Ruiz et Pav. syst. fl. per. p. 115.) leaves roundish-obovate, acuminate; flowers racemose, polyandrous; petals obcordate, quite entire. ○ F. Native of Peru, on the hills called Lamas towards Pongo. Herb a foot high, noxious to cattle. The rest unknown.

Polyandrum. Pl. 1 foot.

13 T. Crenatum (Ruiz et Pav. l. c.) leaves roundish-obovate, acuminate; flowers racemose; petals crenulated; sta-
mens about 20.—Native of South America, on hills about Pongo in the province of Atiquipa. Herb a foot high, and is called by the natives 'Langua de Vaca,' as well as the preceding plant. The rest unknown.

Crenated-petalled Talinum. Pl. 1 foot.

14 T. Menzie'sii (Hook. fl. amer. bot. l. 1. p. 223. t. 70.) caulescent; leaves linear-spatulate; lower ones on long petioles; margins naked; superior ones and sepals acutely keeled, glan-
dularly ciliated on the back; flowers pedunculate, axillary. ○ H. Native of the north-west coast of America, south of Co-
lumbia. The habit is that of a species of Talinum, without hav-
ing seen the flowers; it may, however, when better examined turn out to be a species of Calandrinia. Root annual, rather fusiform.

Menzie's Talinum. Pl. ½ foot.

Cult. Pretty succulent plants, most of which require the heat of a stove; a mixture of loam, peat, and sand, or any little soil will suit them; and cuttings of them are very readily rooted. The seeds of the annual species may be reared on a hot-bed, and afterwards planted out in the open border about the end of May.

Lin. syst. Dodecantha, Monogynia. Calyx of 5 sepals; sepals rather membranous. Petals 9-12, inner ones gradually the smallest. Stamens 12-16, hypogynous; anthers linear. Ovarium globose. Ovala many, fixed to a free central receptacle. Style deeply 6-parted: segments filiform; stigmas ob-

1 Lewisia (Pursh. l. c. Hook. l. c.) ½ H. Native of North America.

Var. a; root blood-coloured; flowers white. Native on the banks of Clarke's river.
**V. PORTULACEAE.**

Var. β; root white; flowers rose-coloured. Native of the subalpine regions of the Rocky Mountains, on the west side, and abundant at the junction of the Spokan river with the Columbia, on dry stony rocks; also of the Flathead and Salmon rivers, in similar situations. The roots of this variety are gathered in great quantities by the Indians on the west side of the Rocky Mountains, and highly valued on account of their nutritive qualities. They are boiled and eaten as sappo or arrow-root, and are admirably calculated for carrying on long journeys; two or three ounces a day being quite sufficient for a man, even while undergoing great fatigue. Perfect flowers of the plant have not yet been seen by any botanist, and therefore the genus is not well known; and probably may hereafter verge into Tairnum, *Revived Lewisia*. Clt. 1826. Pl. ½ foot.

Cult. A mixture of loam and brick-rubbish will be a good soil for this plant; and it may be propagated by dividing the plant at the root, by cuttings, or by seeds.

**VIII. CALANDRINIA** (in honour of L. Calandrinia, an Italian botanist, who lived in the beginning of the 18th century).

**Lin. syst. Dodecandria, Monogynia.** Calyx permanent, bi-partite (f. 18. a.); sepals roundish-ovate. Petals 3–5 (f. 18. b.), hypogynous, or inserted in the bottom of the calyx, distinct or connected together at the very base, equal. Stamens 4–15, inserted in the torus or base of the petals, distinct, generally alternating with the petals. Style 1, very short, tripartite at the apex; lobes collected into a clavately capitata stigma (f. 18. c.). Capsule oblong-elliptic, 1-celled, 3-valved, many-seeded. Seeds adhering by capillary funicles to the central placenta.—Succulent or fleshy glabrous American herbs, having the habit of *Sâmolarus*. Leaves quite entire, radical or alternate. Pedicels 1-flowered, axillary or opposite the leaves. This genus hardly differs from *Talinum*, as far as its characters are yet known.

*Stamens 10–15.*

1. *C. paniculata* (D. C. prod. 3. p. 358.) plant caulescent, branched; leaves ovate-oblong, acuminate; flowers panicled; pedicels 5 times longer than the bracteas. O. F. Native of Peru, in the province of Chancay, commonly called Lomas, on sandy hills; and in the province of Atiguao, at Pango, where the plant grows a foot high, and is called there *Orejas de Perro* and *Castanuelas*. Talinum paniculatum, Ruiz et Pav. syst. fl. pet. p. 115. Portulaca carnosa, Domb. herb. Leaves glabrous, fleshy. Stem erect, paniculately branched at the apex. Sepals 2, ovate, permanent. Stamens 10–15. Capsule 3-valved, length of the calyx. Flowers purple.

**Tongue-leaved Calandrina.** Pl. 1 foot.

3. *C. cistiflora* (Gill. msx. ex Arnott, in Cheek, edinb. jour. 3. p. 355.) glabrous; stem ascending, squiffuice; branches leafy at the base, and nearly naked towards the apex; leaves linear-lanceolate, acutish; raceme terminal, few-flowered; pedicels elongated; bracteas minute, foliaceous; sepals ovate, acute; stamens numerous. O. D. G. Native on the Andes of Mendoza and Chili, in many places at an elevation above the sea, from 9,000 to 10,000 feet. The flowers are pretty large, and purple. It ranks near *C. lingulata*.

**VIII. Calandrinia.**

*Rock-rose-flowered Calandrina.* Pl. ascending.

4. *C. affinis* (Gill. msx. ex Arnott, in Cheek, edinb. jour. 3. p. 355.) plant glabrous and stemless; leaves elongated, linear, obtuse, attenuated into the petiole; indurated bases of petioles imbricated and dilated; peduncles radical, 1-flowered, naked, one-half shorter than the leaves. O. D. G. Native on the Andes of Chili, at El Serro de San Pedro Nolasco. This species is closely allied to *C. aculitis*, but differs in the flowers having numerous stamens.

**Allied Calandrina.** Pl. ⅔ foot.

5. *C. capitata* (Hook. et Arn. in bot. misc. 3. p. 244.) root annual; stems erectish, smooth, and nearly simple; leaves linear, smoothish, ciliated; racemes capitate, many flowered, terminal, and axillary, pedunculate; flowers nearly sessile; sepals roundish, tridentate at the apex, beset with long pili on the back. O. F. Native on the Cordillera of Chili, and near Collina.

Capitata-flowered Calandrina. Pl. ⅔ foot.

6. *C. ramosissima* (Hook. et Arn. in bot. misc. 3. p. 244.) root annual; stems many from the same neck, leafy, branched; axillary branches horizontal; leaves linear, pilose, ciliated with long hairs at the base; racemes short, few-flowered; sepals roundish, truncate, bluntly tridentate at the apex, and beset with long pili on the back. O. F. Native of Chili, about Valparaiso.

**Much-branched Calandrina.** Pl. ⅔ to 1 foot.

7. *C. Cumingii* (Hook. et Arn. in bot. misc. 3. p. 244.) root slender, annual; stems many from the same root, procumbent, leafy, dichotomously branched; leaves linear, attenuated at the base, beset with adpressed hairs; racemes few-flowered, terminal; sepals roundish, tridentate at the apex, pilose on the back. O. F. Native of Chili, about Valparaiso; and on the Cordillera of Chili. The upper part of the stems, racemes, and calyxes are beset with glandular viscid hairs. The whole plant has a purplish hue. In character this species approaches near to *C. ramosissima*, but in habit they are very distinct.

**Cuming’s Calandrina.** Pl. procumbent.

**Umbellate-flowered Calandrina.** Pl. ⅔ foot.

9. *C. dipta* (Gill. msx. ex Arnott, in Cheek, edinb. jour. 3. p. 356.) plant caulescent, sparingly branched, perennial, glabrous; leaves obvolutely spatulate, attenuated into the petiole at the base, glaucous; corymb cymose, terminal; pedicels much exceeding the bracteas, which are roundish, membranous, and edged with purple; sepals roundish, reticulated by purple; stamens numerous. O. D. G. Native on the Andes of Mendoza, in many places at the elevation of 10,000 feet above the sea. This is one of the most beautiful of the species; and according to habit comes near *C. glauca*, but differs in the stamens being numerous.

**Painted Calandrina.** Pl. 1 foot.

10. *C. arenaria* (Cham. msx. ex Hook. et Arn. in bot. misc. 3. p. 246.) plant glaucous; stems numerous, prostrate, glabrous, leafy; leaves linear; common peduncle terminal, naked, simple or branched; racemes corymbose; pedicels a little longer than the bracteas; bracteas oval, membranous, painted by a dark purple branched middle nerve; seeds glabrous. O. F. Native of Chili, about Valparaiso. Closely allied to *C. pieta*, Gill. but very distinct from it.
Sand Calandrinia. Pl. prostrate.

11 C. linearifolia (D.C. prodr. 3. p. 359.) stem ascending, a little branched at the base; branches erect, radical and cauline leaves linear, glabrous, bluish; corymb terminal, a little branched; calyx glandular. 2. D. G. Native of South America. Perhaps the same as Talinum lineare, H.B. et Kunt, nov. gen. amer. 6. p. 77, which is found in the arid valleys of Mexico.

Linear-leaved Calandrinia. Pl. ascending.

13 C. sericea (Hook. et Arn. in bot. misc. 3. p. 244.) root perennial, woolly, with a multiple neck; stems erect, very leafy at the base; leaves linear, acute or subulate, clothed with silky hairs; racemes few-flowered, corymbose; upper pedicles hardly equal in length to the bracteas; sepals ovate, tridentate at the apex, clothed with long silky villi; stems numerous. 3. D. G. Native of Chili.

Var. a, longipes (Hook. et Arn. l.c.) lower pedicle elongated, slender, much longer than the rest of the bracteas. On Sierra Bella Vista, and Ancacuegua; and on the Cordillera of Chili.

Var. b, de’ guipes (Hook. et Arn. l.c.) pedicels all nearly equal. Near Collina and Questa. In both varieties the leaves vary much in length, from 1 to 2 or even 3 inches.

Silky Calandrinia. Pl. 1 foot.

14 C. tenellia (Hook. et Arn. in Beech. bot. p. 24.) stems ascending, branched at the base; leaves narrow-linear, glabrous; racemes terminal, branched; sepals glabrous, triangular, cor- date, acuminate. 3. G. Native of Chili, at Valparaiso. Very closely allied to C. pilosuscula, but differs from it in being quite glabrous and in its smaller size. This is said to be only a variety of C. pilosuscula. Hook. et Arn. in bot. misc. 3. p. 245.

Weak Calandrinia. Pl. ascending.

* * Stems from 1 to 9.

16 C. caulescens (H.B. et Kunth, nov. gen. amer. 6. p. 78. t. 526.) plant caulescent and branched; leaves alternate, spatulate-lanceolate, acute; pedicels axillary and opposite the leaves, 1-flowered, bracteate. 3. F. Native of Quito, near Chillo, and near the city of Mexico. Geünsia rœsea, Moc. et Sesse, fl. mex. icon. ined. Talinum calandscens, Spreng. syst. 1. p. 453. Cósma montana, Domb. herb. Stem diffuse or procumbent. Flowers rose-coloured.

Caulescent Calandrinia. Pl. pr.

17 C. procumbens (Moris. hort. tum. sem. 1831.) glabrous, caulescent, filiform, procumbent, branched; leaves succulent, linear, obtuse, alternate; pedicels axillary, and opposite the leaves; sepals triangular; flowers triandrous or hexandrous; capsule 3-celled. 3. H. Native of South America. This species differs from C. comprésa of Schrad. in being glabrous, in the stems being procumbent, in the stems being 3-6, and in the sepals not being cordinate at the base, &c.

Procumbent Calandrinia. Pl. pr.

18 C. comprésa (Schrad. in lett. ex D.C. l.c.) plant caulescent and succulent; leaves linear, ciliated; flowers racemose; calyx compressed; sepals triangular, cordinate, unequal, acuminate. 3. F. Native of Chili. Plant a span high, erect, simple, or somewhat divided, with short hairs on the peduncles and calyces. Leaves obtuse, marked with a longitudinal line above, somewhat keeled beneath: radical ones 1½ or 2 inches long. Pedicels an inch and a half long. Flowers small, purple. Stems 3-4. Capsule 3-4-valved. Schrad. mss.

Var. β, adscéndens (D.C. l.c.) plant smaller; stem ascending. Talinum adscéndens, Hort. berol.

Compressed-calyx Calandrinia. Pl. 1/4 foot.

19 C. denticulata (Gill. mss. ex Hook. et Arn. in bot. misc. 3. p. 243.) plant glabrous; stem suffruticose, leafy; leaves lanceolate, acute, attenuated at the base; raceme terminal, 1-3 or few-flowered; pedicels elongated; sepals roundish-ovate, with denticulate-serrate margins. 3. D. G. Native of Chili, along with C. andicola. The lower part of the stem is much branched.

Denticulated-calyx Calandrinia. Shrub 1 foot.

20 C. andicola (Gill. mss. ex Hook. et Arn. in bot. misc. 3. p. 242.) plant wholly glabrous; stem suffruticose, leafy towards the apex; leaves cuneate-oblong, acute, attenuated at the base; raceme terminal, 1-3 or few-flowered; pedicels elongated; sepals roundish, hardly mucronulate at the apex, with quite entire margins; petals a little longer than the calyx; flowers with few stamens. 3. D. G. Native of Chili, on the eastern side of the Cumbre, and at El Alto de la Laguna. Closely allied to C. denticulata, but apparently quite distinct. From C. denticulata it can only be distinguished by the entire margins of the sepals.

Andes Calandrinia. Pl. 1/4 to 1 foot.

21 C. acuâlis (H.B. et Kunth, l.c.) plant stemless; leaves elongated, linear, obtuse; peduncles radical, 1-flowered, bracteate in the middle, one half shorter than the leaves. 3. D. G. Native of Quito, on Mount Rucu-Pichincha, in humid places. Cósma prostrata, Domb. herb.

Stemless Calandrinia. Pl. 1/4 foot.

22 C. trifida (Hook. et Arn. in bot. misc. 3. p. 243.) root annual, slender; stems erect, simple, rather leafy, pilose; leaves linear, acute, pilose; radical ones elongated; upper cauline ones edged with long hairs, embracing a few flowers in their axils; raceme corymbose, dense, terminal; bracteas ciliate with long hairs; lower ones exceeding the racemes; sepals ovate, trifid at the apex, with a few hairs on the back, but more numerous on the margins; stems 5. 3. H. Native of Chili, about Valparaiso. This and C. Gilliesii and C. sericea seem closely allied to C. umbellata.

Trifid-bracteae Calandrinia. Pl. 1/2 foot.

23 C. Gilliesii (Hook. et Arn. in bot. misc. 3. p. 243.) root perennial, woolly, with a multiple neck; stems erect, simple, very leafy at the base, but sparingly so at the apex; leaves oblong-linear, beset with adpressed hairs; raceme corymbose; lower bracteas hardly equal in length to the pedicels; sepals ovate, somewhat tridentate at the apex, and beset with long pili on the back; stems 5. 3. D. G. Native of the Andes, of Mendoza, and Chili; Cordillerâ of Chili; and Los Ójios de Aqua. C. umbellata, Gill. mss.

Gillies's Calandrinia. Pl. 1/2 foot.

24 C. diffusa (Gill. mss. ex Arnott, in Cheek, edinb. journ.
3. p. 355.) Plant caulescent, glabrous, diffuse; branches leafy at the base and nakedish at the top, 1-2-flowered; leaves spatulate-lanceolate, acute, quite entire; flowers terminal; sepals orbicular, quite entire.  

Diffuse Calandrina. Pl. 1 foot.

25 C. glauca (Schrad. in litt. ex D. C. I. c.) Plant caulescent, glabrous; leaves spatulate-lanceolate, acute, fleshy, glaucous; racemes few-flowered; fruit-bearing peduncules, _1/2_ inch long, reflexed; bracteas ovate, acute, membranous, and spotted with purple.  

Glaucous Calandrina. Pl. 1 foot.

26 C. conferta (Gill. mss. ex Arnott, in Cheek, edinb. journ. 3. p. 356.) Plant caulescent, perennial, glabrous; branches numerous from the neck of the root, simple, leafy at the base, nakedish towards the apex; leaves narrowly spatulate, glaucous; racemes crowded, terminal; pedicels hardly longer than the bracteas; sepals broadly ovate; flowers with few stamens, 3-4.  

27 C. cestrósa (Gill. mss. ex Arnott, in Cheek, edinb. journ. 3. p. 356.) Plant tufted, stemless; leaves linear-spatulate; peduncles radical, 1-flowered, naked, 3-times longer than the leaves; sepals broadly ovate; flowers with few stamens; stigmas 3-5; capsule 4-5-valved.  

Crowded racemed Calandrina. Pl. 1 foot.

28 C. braniflora (Lindl. bot. reg. t. 1194.) Plant glaucous; stem suffruticose; leaves fleshy, rhomboid, acute, petiole-raceme simple, loose; calyx spotted; stamens numerous; petals obcordate.  

29 C. ciliata (D. C. I. c.) leaves linear-oblong, ciliated; flowers solitary, always pentandrous.  

30 C. nitida (D. C. I. c.) leaves oblong-spatulate, acute, glabrous, attenuated at the base; peduncles axillary, solitary, shorter than the leaves; sepals roundish, obtuse, pilose on the backs; stamens 1-9.  

White-flowered Calandrina. Pl. 1 foot.

31 X. ullocus. Herb half a foot high. Talinum nittidum, Ruiz et Pav. l. c.

Chili Calandrina. Pl. 1/4 foot.  

32 C. monandra (D. C. I. c.) leaves spatulate-lanceolate; flowers in spikes, secund, monandrous.  

Monandrous Calandrina. Pl. 2 foot.

Cult. Calandrina is a fine genus of succulent plants; their culture and propagation are the same as that recommended for the species of Talinum, p. 77. The seeds of annual species may be sown in a hot-bed in spring, and the plants planted out into the open border, in a dry sheltered situation, about the end of May.

Lin. syst. Pentandria, Monogynia. Calyx of 2 permanent membranous sepals. Petals 5, permanent, equal, obovate, hypogynous. Stamens 5, inserted with the petals, but disposed without any respect to the number of petals, hence there are probably 10, 5 of which are abortive; anthers short, usually barren. Ovarium ovate-triquetrous. Style wanting; stigmas 3, spreading, mucrinated with glands on the upper side. Fruit triquetrous, winged, indischiscent, 1-seeded. A glabrous shrub, native of Africa. Leaves opposite, roundish-obovate, flat, fleshy. Peduncles opposite, denticulated, compressed; pedicels 1-flowered, 3 arising from each notch in the peduncle. Flowers small, rose-coloured. Fabric of seeds unknown.  

I P. A'fra (Jacq. l. c. t. 22.).  

X. ULLUCUS (Ulluco or Melloco is the name of the plant in Quito). Lozano, in sanan. Novv. gr. 1809. p. 185. D. C. prod. 3. p. 360.

XII. CLAYTONIA (in honour of John Clayton, who collected plants, mostly in Virginia, and sent them to Gronovius, who published them in his Flora Virginica). Lin. gen. 287.
PORTULACEÆ.

XI. Clarytonia.

Where wood has been burnt, or the ground turned up by deer.

Flowers rose-coloured and white. This species differs from C. perfoliata in its linear-spataculate radical leaves, ovate bracteas, and profusion of small flowers. (f. 19.)

Small-flowered Clarytonia. Pl. ½ foot.

5 C. spatulata (Dougl. mss. ex Hook. fl. amer. bor. 1. p. 226. t. 74.) plant minute; root fibrous; radical leaves numerous, linear, narrow, linear-spataculate; the 2 cauline ones ovate, acute, and sessile; racemes solitary, unibracteate; petals entire.  H. Native of the north-west coast of America, in the valleys of the Rocky Mountains. Corolla longer than the calyx. Stems many from the same root. This is the smallest of all the species.

Spatulate-leaved Clarytonia. Pl. ¼ foot.

6 C. sarmentosa (Meyer. nov. pl. in mem. acad. de Mouro. vol. 17.) sarmentose; leaves nervous; radical ones oblong, obtuse, petiolate; cauline ones ovate, somewhat cordate, stem-clasping, but distinct: racemes terminal, solitary, bracteolaceous; petals emarginate.—Native of St. George, one of the Aleutian Islands.

Sarmentose Clarytonia. Pl. sarmentose.

*** Roots tuberos or fusiform.

7 C. Virginiæcea (Lin. spec. 394.) leaves all narrow, linear, obsoletely 3-nerved, with anastomosing veins: radical ones very few; racemes solitary, nodding; pedicels elongated: lower ones bracteate; petals emarginate.  H. Native of North America, in New England, Virginia, and Carolina, in humid woods; and of Kotzebue's Sound. The leaves of the plant, from the last-mentioned habitat, are remarkable for their broadness. Pluk. aln. t. 102. f. 3. Flowers white.

5 C. grandiflora (Sweet. fl. gard. t. 216.) root tuberous; leaves linear-lanceolate, attenuated at both ends; racemes solitary, many-flowered; petals oval, obtuse, entire; sepals very blunt.  H. Native of North America, near Montreal, and on the Saschatchawan. C. Virginica, var. ³, média, D. C. pro. 3. p. 361. D. C. pl. grass. t. 131. Flowers pink or rose-coloured, with darker branched veins, and a yellow spot on the claw.

9 C. acutiloba (Sweet. hort. brit. edit. 2.) root tuberous; leaves all long, linear-lanceolate, 3-nerved, with anastomosing veins; racemes solitary, nodding; pedicels elongated: lower ones bracteate; petals elliptic, entire, acute at both ends: sepals acutish.  H. Native of North America, in humid parts of woods. C. Virginica, Sims. bot. mag. 941. C. Virginica, var. a, acutiloba, D. C. pro. 3. p. 361. Flowers white.

5 C. lanceolata (Pursh. fl. bor. amer. 1. p. 175. t. 3.) root tuberous; radical leaves very few, oblong, on long petioles: cauline ones elliptic, sessile, all 3-nerved, with anastomosing veins; racemes solitary, nodding; pedicels elongated: lower ones bracteate; petals deeply emarginate.  H. Native of North America, in the valleys of the Rocky Mountains, in a rich soil; and perhaps in Eastern Siberia. Flowers large, white. It is very nearly allied to C. Vestiana of Fisch.

12 C. Àrctica (Adams. act. mssce. 5. p. 94.) leaves nerve-
less, fleshy; cauline ones sessile, ovate; radical ones petiolate, subsapalulate; racemes secund; petals obovate, somewhat emarginate. \(2\). H. Native of Arctic Siberia, towards the mouth of the Lena. C. Chamissoi, Led. ex Spreng. syst. 1. p. 790. Flowers large, white, or pale yellow, with an orange throat.

Arctic Claytonia. Pl. 4 \textsuperscript{1/2} foot.

13 C. VESTIN\(\textsuperscript{A}NA\) (Fisch. in litt.) root tuberous; leaves veinless: radical ones oblong; cauline ones opposite, nearly sessile; stem dichotomous; pedunclu long, somewhat corymbose; petals entire. \(2\). H. Native of Siberia. C. Joanni, Röm. et Schultes, syst. 5. p. 434. This species differs from the true C. Siberica in the leaves being narrower, in the petals being white, and in the inflorescence. Flowers secund, at first nodding. Calyces lobes obtuse. Corolla appearing as if it were pedicellate.

14 C. ACCIPITRI\(\textsuperscript{O}LA\) (Pall. ex. Wild. rel. in Röm. et Schultes, syst. 5. p. 436.) leaves oblong, nervose, acute; petals emarginate; branches numerous from the sides of the root. \(2\). H. Native of Eastern Siberia. Flowers white. Stems 3-6 hands high.

Acute-leaved Claytonia. Fl. May, Ju. Clt. 1827. Pl. 1 \textsuperscript{1/2} ft.

15 C. TUBEROSA (Pall. ex Wild. rel. in Röm. et Schultes, 5. p. 436.) root tuberous; leaves linear-lanceolate, attenuated; petals rotor. \(2\). H. Native of Kamtschatka and Eastern Siberia, among hypnumns. Leaves 2, alternate. Tubers edible, like a potatoe.

Tuberous-rooted Claytonia. Pl. 1 \textsuperscript{1/2} to \textsuperscript{3/4} foot.

§ 2. Stem leafy. Leaves all alternate. Plants resembling Calandra in habit.

17 C. LIN\(\textsuperscript{E}RIS\) (Dougl. mss. ex Hook, fl. bor. am. 1. p. 224. t. 71.) stems branched; leaves linear-narrow, obtuse, 3-nerved; racemes terminal, subsecund, bracteate at the base; petals entire. \(2\). H. Native of North-west America, in moist rocky places; on the Great and Little Falls of the Columbia, abundant. Stems filiform, leafy. Petals obovate. (f. 20.)

Linear-leaved Claytonia. Pl. \textsuperscript{3/4} to \textsuperscript{3/2} foot.

18 C. FILICA\(\textsuperscript{U}LE\)S (Dougl. mss. ex Hook. fl. bor. am. 1. p. 224. t. 72.) stems branched at the base: lower leaves obovate, acute, reticulately veined, running into petioles; cauline leaves linear-oblanceolate; racemes terminal; flowers bracteate; petals entire. \(2\). H. Native of north-west coast of America, in rocks in Nootka and Queen Charlotte's Sound; plentiful on moist rocks of the Columbia, near the ocean. Flowers largish.

Thread-stemmed Claytonia. Pl. 4 \textsuperscript{1/2} foot.

19 C. STOLON\(\textsuperscript{E}R\)S (Meyer. l. c.) stems erect, branched, bearing stolons at the base; leaves nearly sessile, oblong-oblanceolate, acute, a little nerved; racemes suberybomybose, lateral, bracteate; petals entire. \(2\). H. Native of Unalaschka.

Stoloniferous Claytonia. Pl. 4 \textsuperscript{1/2} foot.

20 C. PARVIF\(\textsuperscript{O}L\)IA (Moc, icon. pl. nootk. ined. ex D. C. prod. 3. p. 361.) leaves nerveless; cauline ones alternate, elliptic, acute, attenuated at the base; radical ones like the cauline ones on short petioles; racemes few-flowered; pedicels solitary, bracteate; petals acutely emarginate. \(2\). H. Native of North-west America, at Nootka Sound. Flowers rose-coloured.

Small-leaved Claytonia. Pl. 4 \textsuperscript{1/2} foot.

† A very doubtful species.

21 C. NE\(\textsuperscript{M}O\)ROK\(\textsuperscript{O}S\)A (Wild. rel. in Röm. et Schultes, 5. p. 436.) leaves ovate: superior ones tern; racemes twin. \(2\). S. Native of South America, in the shady woods of Javita. Perhaps this plant ought to be removed from the genus. E. B. et Kunth, nov. gen. am. 6. p. 80. The plant, according to Boupland, has a quadrangular stem; opposite petiolate leaves; terminal dichotomous spikes; 10-parted calyx; a semi-5-lefl corolla; a short style, 2 stigmas, and a 1-celled, many-seeded capsule.

Grove Claytonia. Pl. ?

Cult. The greater part of the species of Claytonia are very delicate little plants, especially those with tuberous roots: these grow best in a border of peat soil, and are increased by seeds, which sometimes ripen plentifully. The fibrous-rooted kinds, being all annual, the seeds of them only require to be sown in the open border, in a rather moist shaded situation; if they are allowed to scatter their seeds, plants will rise every year in abundance.

LIN. SYST. TRIANDRIA, TRIGYNIA. Calyx of 2, rarely of 3 sepals. Petals 5, connected a little way at the base, 3 of which are smaller than the other 2. Stamens inserted in the claws of the petals, usually 3 in front of each of the smaller petals, very rarely more. Ovary sessile. Style very short, 3-parted; divisions spreadingly reflexed. Capsule 1-celled, 3-valved, 3-seeded.—European, glabrous, aquatic, or bog herbs. Leaves opposite. Flowers axillary, small. This genus is hardly distinct from Claytonia.

1 M. FONT\(\textsuperscript{A}NA\) (Lin. spec. p. 129.) \(\odot\). W. H. Native of Europe and North America; also of South America, in bogs, ponds and ditches.

Fountain or Water-chickweed. Fl. April, May. Brit. Pl. \textsuperscript{3/4} to \textsuperscript{3/2} foot.

Cult. This plant will grow in any moist soil, or in water.

LIN. SYST. TRIANDRIA, TRIGYNIA. Calyx 3-parted; lobes elliptic, obtuse. Petals wanting. Stamens 3, alternating with the parts of the calyx, and hypogynous. Ovary 1, oval. Styles 3, short, acute. Capsule 1-celled, 3-valved, 3-seeded.
Seeds fixed to the central placenta.—A small smooth herb, native of North America. Radical leaves 3, entire, linear-lanceolate, acute. Scape 1-flowered, length of leaves. This genus is hardly known, but it only appears to differ from Montia in the want of petals.

1. L. autumnalis (Rafin. l. c.). O. B. H. Native of North America, on the banks of the Ohio.

Cult. The seeds of this plant only require to be sown in the open ground, in a moist situation; and if the plant is allowed to scatter its seeds, there will be plenty of plants each year.

XIV. COLOBANTHUS (from κολόβος, kolobos, maimed, and andove, andos, a flower; in reference to the want of petals). Presb. in rel. hook. Haenk. 2. p. 13. t. 49. f. 2.

Lin. syst. Tetra-Hexandria, Tetra-Pentagynia. CaIyx 4-5-parted. Petals wanting. Stamens 4-6, alternating with the segments of the calyx. Stigmas 4-5. Capsule 4-7-valved, many-seeded. Both Bartling and Kunth insert this genus in the order Caryophyllaeae, while the stamens are decidedly perigynous, and therefore ought to come among the Portulaceae.

1. A. Leptopoleis (Gill. mss. ex Hook. et Arn. in bot. misc. p. 246.) root perennial, with a multiple neck; calyx 5-parted; segments ovate; capsule 5-valved. 2. F. Native of Chili, at Los Hornillos, El Paramillo San Isidro, and on the Andes of Mendoza.

Actinio- like Colobanthus. Pl. 1/2 foot.

2. C. Quitensis (Bartling, in Presb. rel. hook. Haenk. 2. p. 13. t. 49. f. 2.) root annual, with a multiple neck; calyx 5-parted; segments lanceolate; capsule 5-valved, O. H. Native about Quito, and on the Cottillera of Chili. Sagina Quitensis, H. B. et Kunth, nov. gen. amer. 6. p. 19.

Quito Colobanthus. Pl. 1/2 foot.

3. C. nigrinae (Bartl. in Presb. rel. hook. Haenk. 2. p. 13. t. 49. f. 1.) root annual, with a multiple neck; calyx 4-parted; segments ovate; capsule 4-valved. O. H. Native of Chili.

Sagina-like Colobanthus. Pl. 1/2 foot.

Cult. See Portulaca for culture and propagation, p. 75.

XV. GINGINSIA (in honour of M. Gingins, who has written upon the genera Viol a and Lavandula). D. C. prod. 3. p. 362.—Pharnaceae species of authors.

Lin. syst. Pentandria, Trigynia. Calyx 5-parted; lobes oval, permanent, petaloid on the inside and at the margins. Petals wanting. Stamens 5, inserted in the bottom of the calyx, and alternating with its lobes; stamens 2-celled, inserted by the base. Ovary surrounded at the base by a 5-toothed fleshy scale. Style wanting. Stigmas 5, crested-formed. Capsule 3-valved, 1-celled. Seeds numerous, fixed to the central placenta.—Cape shrubs. Leaves irregularly verticillate, opposite or alternate, filiform or linear, furnished with scarios stipples at the base. Peduncles axillary, elongated, bearing umbels of pedicellate flowers at the apex; branches of umbels numerous, divided, many-flowered. This genus differs from Pharnaceum and all the other Caryophyllaceous genera in the stamens being perigynous, and in the leaves being usually alternate; and from all the genera in the order Paronychiae in the stamens alternating with the sepals, not opposite them.

§ 1. Leaves linear.

1 G. brevicaulis (D. C. in mem. soc. hist. nat. par. vol. 4. with a figure. D. C. prod. 3. p. 362.) plant almost stemless; leaves linear, mucronate, crowded in whorls, almost radical; stipules membranous, ciliately jagged at the apex. ½ G. Native of the Cape of Good Hope. Pharnaceum ligneare, Thunb. fl. cap. 274. but not of others. Stems very short. Leaves rather spreading, unequal.

Short-stemmed Ginginsia. Pl. 1/2 foot.

2 G. elongata (D. C. l. c. with a figure; prod. l. c.) leaves alternate, linear, crowded at the tops of the branches; stipules linear-elongated, ciliately jagged; peduncles more than 3 times longer than the stem. ½ G. Native of the Cape of Good Hope. Pharnaceum incanum, Lin. mart. p. 358. but not of others. Pharnaceum ligneare, Andr. bot. rep. t. 329. Flowers white.

3 G. aurantiaca (D. C. prod. 3. p. 363.) caulescent; leaves linear, crowded in whorls; whorls distant; stipules small. ½ G. Native of the Cape of Good Hope. Pharnaceum ligneare, Andr. bot. rep. t. 329. but the leaves are linear in Andrews's plant, not filiform. Flowers green on the outside, but yellowish inside and on the edges.

Whitish Ginginsia. Pl. 3/4 to 1/2 foot.

5 G. conferta (D. C. l. c.) plant caulescent; leaves opposite, crowded, terete, mucronate; stipulas cut into several setaceous hairs, one half shorter than the leaves. ½ G. Native of the Cape of Good Hope. Lam. ill. t. 214. f. 3. Pharnaceum incanum, Thunb. fl. cap. 273. Sims, bot. mag. 1883. but not of Lour.

6 G. prinosea; stems branched, thickish; branches pale from membranous stipules; leaves crowded, filiform, acute, terete, fleshy, mealy or prunose. ½ G. Native of the Cape of Good Hope. Pharnaceum prinoseum, Haw. pl. succ. p. 15.

7 G. microphylla (D. C. l. c.) plant caulescent; leaves terete, obtuse, in fascicles at the nodes, the rest scattered; stipulas woolly; branches scattered; divaricate. ½ G. Native of the Cape of Good Hope. Pharnaceum microphyllum, Lin. fl. suppl. 185. Thunb. fl. cap. p. 272. Mollugo microphylla, Ser. in D. C. prod. 1. p. 329. Said to be very like G. conferta.

Small-leaved Ginginsia. Pl. 1/2 to 3/4 foot.

Tere-cleaved Ginginsia. Shrub 1 foot.

Cult. A mixture of loam, peat, and sand will answer the species of this genus; and the pots in which they are grown should be well drained with sherds. The best way of propagating them is by seeds.

XVI. AYLMERIA (in honour of Aymer Bourke Lambert, F. R. S. F. S. A. and V. P. L. S. the celebrated botanist, to whom we owe many obligations in the prosecution of the present work).
portulae. xvi. alymeria. xvii. hydropyxis. paronychieae.

Lin. syst. monadelphia, pentandra. calyx 2-parted, coloured. petals 5. stamens 10, joined into a membranous hypogynous tube; the 5 outer ones abortive; and the inner ones opposite the petals, bearing 2-celled anthers. style 1; stigma depressed, capitata. utriculus membranous, valveless. seeds numerous, lentiform, in the bottom of the cell.—australian perennial herbs. stems terete, jointed, dichotomous upwards. leaves linear, opposite, or in whorls. stipulas scarios. flowers beautifully coloured, in terminal corymbs. according to martius, the genus is related to paronychieae, but this is doubtful, in consequence of the stamens being hypogynous, and also particularly so in their being opposite the sepals. the calyx is of 2 sepals, as in portulaca, and the petals are 5, as in most of the order, and the stamens are 10, as in trianthema.

1. a. rosea (mart. l. c.) stems straightish, and are, as well as the leaves, glabrous; stipulas ciliately serrulately; corymb compact. fl. g. native of new holland, on the western coast. flowers rose-coloured.

rose-coloured-flowered alymeria. pl. 1 foot.

2. a. violacea (mart. l. c.) stems diffusely dichotomous, and are as well as the leaves glabrous; stipulas quite entire; corymb loose. fl. g. native of new holland, on the west coast. flowers violaceous.

violaceous-flowered alymeria. pl. 1 foot.

cult. see ginensing for culture and propagation. p. 83.

xvii. hydropyxis (from vōop, hydor, water, and πυξις, pyxis, a box; the plant is an inhabitant of water, and the capsule resembles a box, from its opening transversely). rafin. fl. lud. p. 94. d. c. prod. 3. p. 364.

lin. syst. tetrandria, monogynia. calyx permanent, 5-parted, bibracteate on the outside; the two inner lobes the smallest. corolla peripetalous (perhaps inserted in the calyx), crateriform, unequally 5-lobed. stamens 4, didynamous, inserted in the corolla; anthers hasteate. ovarium superior. style simple, crowned by a capitale 3-lobed stigma. capsule 1-celled, many-seeded, triangular, opening transversely. central placenta free. this genus is likely to be nearer related to utricularia than to any other.

1. h. panu'estris (rafin. l. c.) native of louisiana, in ditches and marshes. pourry d'harais, robin. voy. p. 488. stems creeping, prostrate. flowers axillar, pedunculate, solitary, white.

marsh hydropyxis. pl. creeping.

cult. this plant should be grown in a pot filled with peat, and placed in a deep pan of water. it is easily propagated by separating the runners.

calyx of 5 sepals (f. 21. a. f. 22. a.), seldom of 3-4; sepals sometimes separate to the base, sometimes joined to the middle (f. 22. a.), and sometimes nearly to the apex (f. 24. a.). petals small, scale-formed (f. 22. a.), emulating sterile stamens, inserted upon the calyx between the lobes, occasionally wanting (f. 23. a.), or converted into superabundant stamina. stamens perigynous, exactly opposite the sepals (f. 22. a.), if equal to them in number, but sometimes fewer by abortion; filaments distinct; anthers 2-celled (f. 21. c.). ovarium free. styles 2-3, either distinct (f. 24. a.), or partially combined (f. 22. d.). fruit small, dry, 1-celled, usually membranous, either valveless and indehiscent, or opening with 3 valves. seeds either numerous, fixed to a free central placenta, or solitary and pendulous, upon a funicle, arising from the base of the cavity of the fruit. albumen farinaeous. embryo cylindrical, lying on one side of the albumen, curved more or less, with the radicle always pointing towards the hyurn. cotyledons small.—herbaceous or half-shrubby branching plants, with opposite or alternate, often fasciaded, entire, sessile leaves and scarious stipulas. flowers small, usually whitish green, sometimes sessile and axillary, and sometimes variously disposed in terminal cymes. bracteae scarious, analogous to the stipulas.

this order comes very near portulaceae, amaranthaceae, and Caryophyllaceae, from which it is distinguished with difficulty. by excluding the section sceléndthece, their scarious stipula will distinguish them from the two last-mentioned orders, and there is scarcely any other character that will; for there are Caryophyllaceae that have perigynous stamens, as lárrea and adenium; and paronychieae which have hypogynous ones, as polycorpa, stipulácida, and ortégia. from portulaceae it is scarcely to be known with absolute certainty, except by the position of the stamens before the sepals instead of the petals. withCrassulaceae, particularly tiliae, they agree very much in habit, but their concrete carpella will always distinguish them. de candolle comprehends in the order various plants without stipulas; but as the latter organs seem to be an essential part of their character, the tribes Querciaceae and Minuartiaceae are excluded, and will be found elsewhere.

synopsis of the genera.

tribe i.

telephieae. calyx 5-parted (f. 21. a.). petals and stamens 5, inserted in the bottom of the calyx (f. 21. b.). styles 3 (f. 21. c.) free, or connected together a little at the base. leaves alternate, stipulaceous.

1. telephium. styles 3, spreadingly flexed, concrete at the base. capsule pyramidal, trigonal, 3-valved, 3-celled at the base, and 1-celled at the apex. seeds numerous, fixed to the central placenta, in 6 rows.

2. corrigiola. style short; stigmas 3 (f. 21. c.). capsule 1-seeded, indehiscent, covered by the calyx. seed suspended by a funicle, originating at the bottom of the capsule.

tribe ii.

Illece'breae. calyx 5-parted (f. 22. a.). petals 5 or wanting. stamens 2-3, inserted in the bottom of the calyx (f. 22. a.). styles free or somewhat concrete at the base (f. 22. d.). capsule indehiscent, 1-seeded. funicle long, rising from the bottom of the capsule, bearing a subpendulous seed at the apex.—herbs, rarely subalbus. leaves opposite, acute, with scarious stipulas.

3. herniaria. calyx almost 5-parted. scales or petals 5, filiform, entire, but sometimes wanting or very small. stamens 5, or only 2-3 from abortion. styles 2, short, distinct, or concrete at the base. capsule covered by the calyx.
I. Telephium.

16 Ceridia. Lobes of calyx petaloid inside, ending in a bristle each at the apex. Petals wanting. Stamens one, in front of one of the sepal. Style filiform, bifid at the apex. Capsule 1-celled, many-seeded.

Tribe IV.

18 Lithophila. Calyx 3-parted, acute. Petals 3. Scales or abortive stamens 2, opposite the sepal. Stamens 2, placed at one side of the ovary. Style thick, bluntly emarginate at the apex. Fruit unknown. A very minute glabrous herb.

19 Selloria. Calyx urceolate, 5-cleft, membranous, 10-ribbed. Petals 5, alternating with the lobes of the calyx. Stamens fixed in the middle of the segments of the calyx, and shorter than them; anthers didymous. Style 1; stigma obtuse. Capsule 3-valved, 1-celled, 1-seeded. A smooth herb, with the habit of Illécebrum verticillatum.

Tribe I.

TELEPHIEÆ (plants agreeing with the genus Telephium in important characters). D. Č. prod. 3. p. 366. Calyx 5-parted (f. 21. a.). Petals and stamens 5 (f. 21. b.), inserted into the bottom of the calyx. Styles 3 (f. 21. c.), distinct, or somewhat conjoined at the base.—Leaves alternate, stipulate.

Lin. syst. Pentástria, Monogynia. Calyx 5-parted, permanent; lobes oblong, concave. Petals 5, inserted in the bottom of the calyx, and alternating with its lobes, and about equal in length to them. Stamens 5, opposite the sepals, and inserted in their bases. Styles 3, spreadingly reflexed, concrete at the base. Capsule pyramidal, trigonal, 3-valved, 3-celled at the base, and 1-celled at the top from the dissepiments not being extended so far. Seeds numerous, disposed in 6 rows on the central placenta. Embryo lateral, curved, but not annular. Albumen mealy.—Subshrubby, procumbent, many-stemmed, glabrous, glaucous herbs. Leaves alternate, rarely opposite, stipulate. Flowers white or greenish white.

2 T. oppositirriformium (Lin. spec. 388.) leaves opposite; flowers in racemose corymbs, crowded. 2. H. Native of Barbary.
Shaw, spec. p. 572, with a figure. Flowers white. Perhaps only a variety of the preceding.

**Opposite-leaved Orpine.** Pl. tr.

3 T. laxiflorum (D. C. prod. 3. p. 366.) leaves alternate; peduncles opposite the leaves, trifid at the apex; middle pedicel 1-flowered, lateral ones elongated, and usually 3-flowered. 2 G. Native of the Cape of Good Hope. Herb glaucous. Leaves alternate, distant, obovate, mucronate; petiole short, margined, with a membrane. Capsule subglobose, 3-celled nearly to the apex. Perhaps a proper genus, but the habit is truly that of Telephium.

**Loose-flowered Orpine.** Pl. tr.

Cult. All the hardy species of Orpine grow well in any light soil; and may either be increased by cuttings or parting at the root; they are well adapted for ornamenting rock-work. The last species being a native of the Cape of Good Hope, requires the protection of a greenhouse in winter.

**Lin. syst. Pentändria, Trigynía.** Calyx 5-parted (f. 21. a), permanent. Petals 5 (f. 21. b), equal to the calyx and inserted in it, and alternating with its lobes. Stamens 5, opposite the sepals. Style short; stigmas 3 (f. 21. c). Capsule 1-seeded, indehiscent, covered by the calyx. Seed suspended by a funicle, which rises from the bottom of the capsule.—Procumbent glaucous herbs, with alternate stipulate leaves, and terminal raceme-corymb of small flowers. Habit of Telephium.

var. β, imbriçá (Lapeyr. abr. p. 169.) stems short; lower leaves rather imbricated. 2 H. Native about Vinea and Nyer.

3 C. deltoïda (Hook. et Arnott, in Beech, bot. p. 24.) stems prostrate; leaves deltoid, long, spatulate; racemes lateral, furnished at the base by a spatulate bractea. 2 H. Native of Chili, about Concepcion and Valparaíso. This plant bears a strong resemblance to C. littoralis. Flowers white.

**Deltoid-leaved Corryiola.** Pl. prostrate.

4 C. squamosa (Hook. et Arn. in bot. misc. 3. p. 247.) cauliflex perennial, a little branched, very scaly at the apex, from which many stems issue; stems prostrate; leaves linear, oblong; racemes corymbose, leafless. 2 H. Native of Chili, about Valparaíso, Vina de la Mar, and Playa Ancha. The lower part of the stem, which is here called a caudex, from its resemblance to that part of ferns, is to be seen in no other species of the genus; the scaly appearance at its summit is obviously caused by a congeries of stipulas. Flowers white.

**Scaly Strap-wort.** Pl. prostrate.

Cult. The seeds of the annual kinds be sown in dry light soil. The culture of the perennial kind is the same as that recommended for the hardy species of Telephium.

**Lin. syst. Pentändria, Digynía.** Calyx nearly 5-parted, somewhat coloured inside. Scales or petals 5, filiform, quite entire, alternating with the sepals, sometimes wanting or very small. Stamens 5, or only 2-3 from abortion, opposite the sepals. Styles 2, short, distinct, or concrete at the base. Capsule 1-seeded, indehiscent, covered by the calyx.—Prostrate suffrutescent small herbs, with branched stems. Leaves opposite, stipulate: stipulas solitary between the leaves, broad at the base. Flowers glomerate in the axils of the leaves. Bacteria small.

§ 1. Herniaria veris (true species of Herniaria). Stems prostrate, small; flowers glomerate in the axils of the leaves, pubescent or hairy on the outside.

1 H. cine'erea (D. C. fl. fr. suppl. p. 375. mem. par. t. 3.) plant of many stems, herbaceous, clothed with cinereous hairs; branches ascending; leaves oval, acute at both ends; flowers crowded, axillary. O. H. Native about Montpelier, Narbonne, plentiful in Spain in dry gravelly or sandy places. In Spain the plant is called Quebrantapiedras. H. annua, Lag. gen. et spec. p. 12. and perhaps H. latifolia, Lapeyr. abr. p. 127.

2 H. vires'cens (Salzm. pl. exsic. ex D. C. prod. 3. p. 367.) herb ascending, many stemmed, smoothish; leaves oval, ciliated; bundles axillary, few-flowered; calyx rather pilose. O. H. Native of Mauritania, about Tangiers. It differs from H. cineerea in the greenish habit, nearly as H. hirista does from H. glabra, or as H. alpina does from H. incana.

**Greenish Rupture-wort.** Pl. tr.

4 H. hirista (Lin. spec. p. 317.) plant herbaceous, prostrate, hairy; leaves oval-oblong; bundles sessile, few-flowered.
§ 2. Polygonomoidae (plants with the habit of *Polygonum*). Stems erect, dichotomous at the apex. Flowers glabrous, disposed in loose cymes. Perhaps a proper genus.

12 H. Polygonoides (Cav. icon. 2. t. 137.) erect, glabrous, shaggy; branches dichotomous at the apex; leaves ovate, cuspidate, distant. ½. H. Native of Mauritania, near Mazar; and on the hills of Spain, in Valenita, as well as in Provence. Illécebrum suffruticosum, Lin. spec. p. 298. Paronychia suffruticos, Lam. fl. fr. 3. p. 290. Herniaria erecta, Desf. alt. 1. p. 214. H. Joanneana, Rom. et Schultes, syst. 6. p. 297. This species differs from *Paronychia*, in the fruit being indehiscent. The habit is very dissimilar from the other species of *Herniaria*, but emulates *Anchusa* and *Paronychia*.

† Species not sufficiently known.

13 H. dichotota (D. C. prod. 3. p. 368.) stems erect, numerous, dichotomous, herbaceous; leaves distant, oblong, mutic, and are, as well as the branches, powdery from short down; flowers cymose. ½. H. Native country unknown. Paronychia dichótoma, D. C. in Lam. diet. enes. 5. p. 25. Illécebrum dichótum, Pers. enh. 1. p. 261. “Calyx glaucescent, striated at the base and pubescent, profoundly 5-cleft; segments bluntish, with scarious margins; sterile threads 5, alternately with the sepalis, and 5 antheriferous ones opposite them, hardly shorter than the sterile ones. Style bidentate at the apex. Ovarium attenuated at the base. Ovulum one, pendulous, suspended from the top of a thread, which arises from the bottom of the capsule.” Adr. Juss. in litt. 1827.

Dichotomous Rupture-wort. Pl. ½ to ¾ foot.

14 H. Lenticula'ta (Thunb. fl. cap. 2. p. 245.) suffruticoso, hairy, pubescent, clothed with cinereous villi; leaves ovate, fleshy. ½. G. Native of the Cape of Good Hope. H. incana Capénis, Pers. This is a very obscure species. The Linnean plant under this name, according to Vahl and Smith, is *Crésus Crética*; but we know not what Thunberg's plant is.

Lenticular Rupture-wort. Pl. procumbent.

Cult. All the species are weedy looking plants, most of them with the habit of wild-thyme, and therefore are only worth cultivating in botanic gardens. The plants grow best in dry light sandy soil, and are increased by seeds.

Linn. syst. Pentándria, Monogónia. Calyx almost 3-parted, permanent; segments coloured inside. Petals 5, emulating sterile filaments. Stamens 5, inserted in the bottom of the calyx. Style one, crowned by a simple stigma. Capsule valveless, 1-seeded, covered by the indurated calyx.—Diffuse subshrubs, with opposite stipulate leaves, usually bearing fascicles of rameal leaves in the axils. Pedicels axillary, solitary, opposite, appearing crowded at the tops of the branches, from the internodes being short. The name of this genus is spelt variously by authors, viz. Gymnocyprados (Forsk.), Gymnocypris (Viv.), Gymnocypris (Pers.), Gymnocypris (Steud.).

Shrubby Gymnocarpum. Shrub 1 foot.

Cult. This shrub will require to be protected from frost in the immediate neighborhood of the "natural" areas.
winter, and for this purpose it should be grown in a pot. A mixture of sand and loam will suit the plant very well, and it may either be increased by seeds or cuttings.

Dichotomous Anychia. Fl. May, Aug. C1t. 1806. Pl. ½ to ½ foot.

2 A. capillacea (D. C. prod. 3. p. 369.) stem quite glabrous, smooth; leaves ovate; stipulas shorter than the flowers; flowers remote. O. H. Native of New Jersey and New England, in pine barrens. Quería capillacea, Nutt. gen. amer. 1. p. 159. Anychia dichotoma β, Torr. l. c. According to Torrey, this is only a smooth variety of the last.

Capillaceous Anychia. Pl. ½ to ½ foot.
Cult. The seeds of these plants only require to be sown in the open border in a dry warm situation in a light soil.

Lin. syst. Di-Pentandria, Digynia. Calyx 5-parted, nearly 3-sepalied; sepals subcucullate, thickened, ending in an awn-like horn at the apex on the back. Petals wanting, or 5 subulate scales in place of the petals, alternating with the lobes of the calyx. Stamens 2-5, opposite the sepals, and inserted in their base. Style hardly any; stigmas 2, capitate. Capsule covered by the calyx, 5-valved, or divisible into 5 at the stripes. Seed solitary from abortion, inserted in the side of the capsule. Embryo hardly placed, on one side of the albumen, which is farinaceous. —A small trailing herb, with opposite leaves, furnished with scarious stipulas at the base. Flowers axillary or cyme. Bracteas scarious, narrower than the flowers.

Cult. The seeds of this plant should be sown in a moist situation, where the plants will thrive and flower freely; and if the seeds be allowed to scatter themselves, the plants will rise regularly every season. It is worth cultivating, being a small delicate beautiful plant.

Lin. syst. Pentandria, Monogynia. Calyx 5-parted (f. 22. f); lobes concave, cucullate, generally mucronate at the apex (f. 22. b). Petals or scales 5, subulate, alternating with the lobes of the calyx. Stamens 5 (f. 22. a). Style one, entire or bifid (f. 22. d); lobes papilliferous inside. Capsule 1-seeded (f. 22. c), membranaceous, indehiscent or 5-valved, covered by the calyx. —Herbaceous or suffrutescent much branched plants.

Leaves opposite, stipulate; stipulas scabrous, twin on both sides between the leaves. Young leaves frequently in fascicles in the axils of the old leaves. Flowers cymose or gloomate, but usually crowded in the axils of the leaves.

SECT. I. CH حتون (from خارن, chait, a head of hair, and ονυξ, onyx, a claw; in reference to the lobes of the calyx ending in a bristle each). D. C. prod. 3. p. 370. Lobes of calyx equal, dilated at the apex, membranous, ending in an awn on the back. Scales or petals, or abortive stamens perhaps wanting.

SECT. II. EUSYCHIA (altered from Paronychia). This section is supposed to contain the genuine species of the genus). D. C. prod. 3. p. 370. Lobes of calyx equal, awned, mucronate or nearly unarmed, not dilated at the apex. Flowers crowded in the axils of the leaves.

2 P. echina (Lam. fl. fr. 3. p. 232. exclusive of Lin. syn.) stems branched, prostrate, smoothish; leaves oval, glabrous; flowers subsecund, crowded in the axils of the leaves, puberulous; lobes of calyx drawn out into somewhat divaricate awns. O. H. Native of Mauritania, Portugal, Corsica, Sicily, Provence, in sand by the sea side. Illecebrum echinatum, Desf. atl. 1. p. 204. Vill. in Schrad. journ. 1801. p. 409. t. 4. Smith, fl. grcc. t. 245.—Bosc. sic. t. 20. f. 3. Flowers greenish.

3 P. Brilliantia (D. C. in Lam. dict. 5. p. 23.) stems trailing, puberulous; leaves oblong-lanceolate, narrowed both at the base and apex, mucronate, pubescent on both surfaces; flowers crowded in the axils of the leaves; calyx glabrous, deeply 5-parted; lobes ending in a long mucron each. O. G. Native of Buenos Ayres and Monte Video, by road sides. P. Bonariensis, D. C. prod. 3. p. 370. Flowers white.

Brazilian Paronychia. Fl. May, July. C1t. 1820. Pl. tr.

4 P. commutis (St. Hil. fl. bras. 2. p. 186.) stems trailing, puberulous; leaves oblong-lanceolate, narrow at the base and the apex, mucronate, pubescent on both surfaces; flowers crowded in the axils of the leaves; calyx turbinate, pubescent; lobes equal, ending in short points. O. G. Native of Brazil, in pastures in that part of the province of St. Paul called Cam-
pos Geraes, and by the sea side in the province of St. Catharine.

Flowers deep brown.

**Common Paronychia.** Pl. tr.

5 P. CHILENSIS (D. C. prod. 3. p. 370.) stems diffuse, tufted; leaves crowded, oblong-linear, mucronate, smoothish; flowers crowded in the axils of the leaves; lobes of calyx harshly mucronate at the apex.  

6 P. Chilian (D. C. prod. 3. p. 370.) stems diffuse, pubescent; leaves linear-subulate, keeled, mucronate, puberulous; flowers crowded in the axils of the leaves; calyx turbinate, smoothish; lobes equal, acute.  

**Chili Paronychia.** Pl. 7/12 foot.

7 P. CAMPHOROSMIFUS (St. Hil. fl. bras. 2. p. 187.) stems diffuse, pubescent; leaves oblong-linear, glabrous, awned mucronate; flowers sessile, rather crowded; lobes of calyx ending in a long awn each.  

**Arabian Paronychia.** Pl. diffuse.

9 P. POLYGONIFOLIA (D. C. fl. fr. ed. 3. vol. 3. p. 403.) stems trailing, branched; leaves oblong-linear, smoothish, acute, not mucronate; flowers rather crowded in the axils of the leaves; lobes of calyx ending in a short mucrone each.  

**Knot-grass-leaved Paronychia.** Pl. tr.

11 P. argéntea (Lam. fl. fr. 3. p. 280.) stems trailing, branched; leaves ovate, smoothish, acute; flowers axillary and terminal, crowded; lobes of calyx ending in a short mucrone each.  

12 P. argéntea, H. Native of Dauphiny, Spain, and Baleares Islands. Illecebrum polygonífolium, Vill. in Schrad. journ. 1801. p. 410. t. 4. Illecebrum verticillatum β, Willd. spec. 1. p. 1205. Illecebrum alpinum, Vill. dauph. 1. p. 296. This plant hardly differs from P. argéntea, unless in the leaves being narrower.

**Silvery Paronychia.** Pl. tr.

13 P. capitáta (Lam. fl. fr. 3. p. 229.) stems erectish; leaves oblong, keeled, ciliated, pubescent; bracteas acuminate; heads of flowers terminal; lobes of calyx linear, unequal.  

**Var. β, Mauritíaca (D. C. prod. 3. p. 571.) leaves broader; heads large, distant.**  

15 P. Mauritíaca, H. Native of Mauritania and the Archipelago. Illecebrum Mauritánicum, Wildl. rel. in Röm. et Schultes, syst. 5. p. 516.

16 P. capitáta, Pl. 1/4 to 1/5 foot.

17 P. serrúllífolía (D. C. in Lam. dict. 5. p. 24. fl. fr. ed. 3. vol. 3. p. 404.) stems prostrate, creeping, knotted, branched; leaves obovate, flat, rather fleshy, with ciliated margins; flowers terminal; bracteas acuminate; lobes of calyx awnless.  

**Serrúllífolía,** Vill. in Schrad. journ. 1801. t. 4. Flowers white.

**Var. β, herniarioides** (Pour. chl. narb. p. 321.) leaves subcordate.

18 P. nivea (D. C. dict. ency. 5. p. 25.) stems erectish, much branched; leaves oblong, acute, flatish, pubescent; bracteas large, short-acuminate; heads of flowers terminal; lobes of calyx awnless.  

19 P. arenícóides (D. C. prod. 3. p. 571.) stems fruticulose, ascending; much branched; branches hairy; leaves clothed with silky pubescence, oval-oblong, obtuse, not exceeding the stipulas; bracteas obtuse; heads of flowers terminal.  

**Arenícóides, H. Native of Spain, in the province of Valencia. Illecebrum arenícóides, Pourr. ined. ex L. Duffl. in litt.**  

**Aretia-like Paronychia.** Pl. 1/3 to 1/5 foot.

20 P. Canariénse (Juss. mem. mus. 1. p. 389.) stem shrubby, erect, branched at the apex; branches rather hairy from short white hairs; leaves ovate, acute, downy; cymes panicled, branched, loose; bracteas mucronately awned at the apex, but not hiding the flowers.  

**G, Native of Tenerife.**  

**Habit of Polyacarpae Canariæsia, but differs in the ovary being 1-seeded.**

**Canary Paronychia.** Pl. 1/2 to 3/2 foot.

21 P. smíthii (Choisy, mus. ex D. C. prod. 3. p. 371.) stem shrubby, erect, branched; leaves linear-oblong, acuminate, nerveless, and are, as well as the branches, glabrous; cymes few-flowered, loose; lobes of calyx mucronately awned.  

**Smiths, G. Native of the Canary Islands.**

**Smith's Paronychia.** Shrub 1/4 to 1/2 foot.

22 P. herniarioides (Nutt. gen. amer. 1. p. 159.) plant herbaceous, trailing, crowded, downy all over; leaves oblong-oval, ciliated, terminated by a bristle; lobes of calyx subulate, ending each in a spreading setaceous acumen.  

**Rupture-wort-like Paronychia.** Pl. tr.

23 P. dichógoma (Nutt. gen. amer. 1. p. 159.) plant rather herbaceous, tufted, procumbent, glabrous; leaves linear, acerate, acute, marked by a double line on the back; stipulas bident; cymes dichotomous; bracteas shorter than the flowers; lobes of calyx ending in a short mucrone each.  

**Dichógoma, H. Native of Virginia, on rocks at the river Shenandoah. Achyranthes dichótoma, Lin. mant. p. 51.**

**Dichotomous Paronychia.** Pl. procumbent.

24 P. argyrocoma (Nutt. l. c. p. 160.) plant herbaceous, tufted, procumbent, pubescent; leaves linear, acutely pungent, villous, nerveless; stipulas entire; cymes dichotomous; bracteas about equal in length to the flowers; lobes of calyx mucronate.  

**Silvery-tufted Paronychia.** Pl. procumbent.

25 P. sessíllífolía (Nutt. l. c. p. 160.) plant densely tufted, much branched, glabrous; leaves linear-subulate, acute; superior ones longer, recurved; stipulas about equal in length to the leaves, bifid; flowers terminal, sessile; lobes of calyx arched on the inside at the apex, and ending in a long awn each on the N.
outside. \( \mathcal{L} \). H. Native of North America, on the more elevated hills about the Missouri, near Fort Mandan; on the dry banks of the north branch of the Saskatchewan, between Carlton House and Edmonton House. Hook. fl. bor. amer. 1. p. 227. t. 75. (f. 22.)

**Sessile - flowered Paronychia.** Pl. \( \frac{1}{4} \) foot.

**SECT. III. ACANTHONYCHIA**

(from *acaride, acanthos*, a spine, and *ovis, onyx*, a claw; in reference to the 3 outer lobes of the calyx, each being furnished with an awn-like spine at the apex). D. C. prod. 3. p. 372. Lobes of calyx unequal, 3 outer ones furnished each with an awn-like spine at the apex, 2 inner ones small, and nearly unarmed. Stigmas 2, sessile.

20 P. Rosetta (St. Hil. fl. bras. 2. p. 188. t. 113.) stems trailing, woolly; leaves linear-lanceolate, somewhat ciliated; flowers axillary, longer than the stipulas. \( \mathcal{O} \). H. Native country unknown. Illécebrum tenuifolium, Willd. enum. suppl. p. 12.

22 P. sedifolia (Saut. itin. abyss. ed germ. 1. p. 476. ex Rom. et Schultes, syst. 5. p. 523.) This species is not described.

**Stone-crop-leaved Paronychia.** Pl.

† Plants referred by authors to the genus Paronychia, which are to be excluded.

1 P. lanuginosa (Poir. suppl. 4. p. 302.) is probably a species of Gomphrena.

2 P. Bengalensis (Rom. et Schultes, syst. 5. p. 521. but not of Juss.) is probably a species of Achynanthus.

3 P. tenella (Hortul. or Illécebrum tenellum of Desf.) is perhaps a species of Alternanthera.

4 P. dichotoma (D. C. in Lam. dict. but not of Nutt.) is Herniaria dichotoma.

5 P. subulata is Polycarpacea spadicea.

6 P. linearifolia is now Polycarpacea linearifolia.

**Cult.** All the species of this genus are well adapted for ornamenting rock-work, from their dwarf stature, and generally trailing habit. Most of them, however, grow best in small pots in sand and loam, filling the pots half way with sherds; and they are easily increased by dividing the plants at the root, or by cuttings under a hand-glass, or by seeds. The seeds of the annual species only require to be sown in the open border or on rock-work. Some of the species are marked green-house and frame; these require to be protected from frost in winter.

**VIII. PENTACÉNA** (from *pente, pente*, five, and *akaima*, akaina, a thorn; in reference to the 5 spiny lobes of the calyx). Bartling in reliq. Hanek. 2. p. 5. t. 49. f. 1.

**LIN. SYST. Pentândria, Digynia.** Calyx 5-parted; segments very unequal: 3 outer ones spiny at the apex, and woolly on the margins: 2 inner ones much shorter, boat-shaped, and armed on the back. Stamens 5, without any sterile filaments; anthers 2-celled. Stigmas 2, short. Fruit 1-seeded.

1 P. ramosissima (Hook. et Arn. in bot. misc. 3. p. 248.) stems trailing, woolly; leaves linear-subulate, mucronate; lobes of calyx unequal, all linear and hood-formed, ending each in a very long point on the back; flowers sessile, axillary, crowded. \( \mathcal{L} \). C. Native of Brazil, on the confines of the province of Rio Grande de St. Pedro do Sul, and of the province of Cisplatín; and among rocks about Monte Video; of Chili, in Las Acharas, province of Cordova, Valparaiso, and Buenos Ayres; also of Mexico, at the foot of Mount Orizaba. Paronychiea ramosissima, D. C. prod. 3. p. 372. mem. paron. p. 12. t. 4. Loeflingia ramosissima, Weimann in bot. zool. p. 608. Pent. polychenomoides, Bartl. in Presl. reliq. Hanek. 2. p. 5. t. 49. f. 1. Stipulas scarious, woolly.

Much-branched Pentacéna. Pl. tr.

**Cult.** See Paronychiea for culture and propagation.

**IX. CARDIONEMA** (from *kapía, cardia*, the heart, and *VENA, nema*, a filament; in reference to the sterile filaments being obcordate). D. C. prod. 3. p. 372.—Bivona, Moc. et Sesse, fl. mex. ined. but not of D. C. nor Spreng.

**LIN. SYST. Pentandria, Digynia.** Calyx 5-parted; lobes conniving, rather coloured inside, and rather concave, drawn out on the back to the apex in a long straight conical horn each. Petals wanting. Stamens 5, opposite the lobes of the calyx, and inserted in their base; 2 of which are sterile, obcordate, and flat: and 3 fertile, obcordate at the base, bearing each a slender antheriferous filament in the recess; anthers roundish, 2-celled. Styles 2, hardly concave at the base, long, revolute. Fruit 1-seeded, ovate-oblong.—A small many-stemmed herb. Leaves opposite, crowded, rather distich, linear, acute. Flowers sessile, axillary, small, greenish white, each furnished with 5 bracteas, 4 of the bracteas linear and entire, the fifth larger and serrulate.

1 C. multicaule (D. C. prod. 3. p. 373. mem. par. t. 1.) \( \mathcal{L} \). G. Native of Mexico. Bivona multicaulis, Moc. et Sesse, fl. mex. icon. ined.

Many-stemmed Cardionema. Pl. small.

**Cult.** This plant is to be cultivated and propagated in the same manner as that recommended for the species of Paronychiea. It will require protection in winter, by placing it in a frame or green-house.

**Tribe III.**

**POLYCARPEÆÆ** (this tribe contains plants agreeing with Polycarpacea in important characters). D. C. prod. 3. p. 373. Calyx 5-parted (f. 23. a.) Petals 5 (f. 23. d.) or wanting. Stamens 1-5, inserted in the bottom of the calyx. Styles 2-3, sometimes distinct from the base, and sometimes connected. Capsule 1-celled (f. 23. e), many-seeded. Seeds fixed to the central placenta.—Herbs or subshrubs. Leaves opposite. Stipulas scarious. The stamens in some of the genera are nearly hypogynous, as in Polycarpus, and altogether so in Polycarpacea, Stipulicida, and Ortégia, and therefore these genera verge very closely on the order Caryophyllaceae, but are distinguished from them in the presence of stipulas, and number of stamens: the habit agrees with Paronychieae.

X. POLYCARPEÆA (from *polý, polý, many, and *kapía, karpos, a fruit; a name, however, only indicating its affinity with Polycarpus). Lam. journ. hist. nat. 2. p. 25. t. 25. D. C. prod. 3. p. 373. St. Hil. fl. bras. 2. p. 182.—Hageà'æ, Vent. tabl. 2.

8
PARONYCHIEÆ. X. POLYCARPEA.

P. 240.—Mollia, Willd. hort. berol. 1. p. 11.—Lahaya, Roem. et Schultes, syst. 5. p. 402.—Hyala, Lher. mss.—Anthyllis species, Alans.—Pölia, Lour.

Lin. syst. Pentándria, Monógyána. Calyx more or less deeply 5-parted, permanent; lobes membranous, flatish, neither keeled nor mucronate. Petals 5, inserted in the bottom of the calyx, and opposite its lobes. Style one, 3-furrowed at the apex. Capsule 1-celled, trigonal, 3-valved, many-seeded. Seeds rather reniform.—Bracted dichotomous herbs. Leaves opposite, stipulate, young ones disposed in fascicles in the axils of the old leaves. Flowers cyose; cyces usually forming a terminal corymb.

2 P. latifolia (Poir. 1. c.) stems suffruticusae, diffuse; leaves obvoate, mucrinate by an awn; cauline leaves usually 6 in a whorl, those of the branches opposite; cyces terminal, corymbose, capitately; stipulas, bracteas, and calyces scarious, and acuminate. 2 F. Native of Tenerife, among rocks in woods. Mollia latifolia, Willd. enum. 1. p. 269. Schrank, pl. rar. hort. mon. t. 29. Lahaya latifolia, Schultes, syst. 5. p. 405. Flowers white.

Tenerife Polycarpacea. Pl. 1/2 to 3/4 foot.

5 P. Memphitica (Delil. fl. egypt. p. 67. t. 24. f. 2.) stems herbaceous, diffuse, branched, villous; leaves usually 6 in a whorl, oval-oblong, narrowed into the petiole; cyces terminal, few-flowered; calyx pubescent, with membranous margins. 2 H. Native of fields about Cairo, and along the banks of the Nile, and in its islands. Style very short; stigmas 3, nearly sessile. Petals quite entire. This plant, although very distinct, is joined with P. gnaphalodes by Spreng.

Memphitic Polycarpacea. Pl. diffuse.

6 P. fragilis (Delile, fl. egypt. p. 65. t. 24. f. 1.) stems herbaceous, prostrate, brittle; leaves opposite, aggregate, lanceolate, mucronate, with replicate edges; cyces corymbose, terminal, many-flowered. 2 F. Native of Egypt, in the deserts about the pyramids, &c. Mollia fragilis, Spreng. syst. 1. p. 795. Style filiform, length of petals. Seeds 8-10. Flowers white.

Var. a. incana (D. C. prod. 3. p. 374.) stems and leaves clothed with grey tomentum.

Var. b. virga (D. C. l. c.) leaves glabrous.—Corrigiola réps, Forsk. descr. p. 207. ex Delisle.

Brittle Polycarpacea. Pl. prostrate.

7 P. stellata (D. C. prod. 3. p. 374.) stems diffuse, much branched, suffruticosae; leaves usually 6 in a whorl, linear, flat, and are, as well as the branches, rather pilose; cyces terminal, many-flowered, corymbose; calyxes scarious. 2 F. Native of Guinea. Achyránthes stellata, Willd. spec. 1. p. 1195. Mollia stellata, Willd. hort. berol. Lahaya stellata, Schultes, syst. 5. p. 403. Root perpendicular, simple. Habit of P. Tenerife, but differs in the leaves being linear.

8 P. corymbosa (Lam. ill. no. 2798.) stems erect, herbaceous, tomentose; branches divaricate; leaves usually 6 in a whorl, linear, awned; cyces corymbose, loosish; calyxes scarious, acuminate. 2 F. or 0. Native of Ceylon. Achyránthes corymbosa, Lin. spec. p. 296. (exclusive of the synonyme of Plukenate, which is referrible to Celosia Monsínice). Willd. spec. 1. p. 1196. (exclusive of the synonyme of Loureiro, which is referrible to Polycarpacea spadicea). Lahaya corymbosa, Schultes, syst. 5. p. 404. Pol. Indica, Lam. journ. hist. nat. 2. p. 8. Celosia corymbosa, Roxb. fl. ind. 1. p. 310.—Boeic. mus. 44. t. 39. good.—Burm. zeyl. t. 65. f. 2. Flowers white.

9 P. spadicea (Lam. l. c. no. 2799.) stems ascending, diffuse, branched, suffruticosae at the base; branches tomentose; leaves linear, bluntnose, when young rather tomentose; cyces terminal, corymbose; calyxes scarious. 2 H. 2 S. Native of the East Indies, on the coasts of Malabar and Tranquebar.—Rheed. mal. 10. t. 66. Celosia spadicea, Willd. spec. 1. p. 1200. exclusive of the synonyme of Retz. Mollia spadicea, Willd. hort. berol. Lahaya spadicea, Schultes, syst. 5. p. 405. Pólia arenária, Lour. coch. p. 164. Allied to P. corymbosa, but more diffuse in habit; leaves broader and shorter, in more distant whors; lobes of calyx less acuminate. Perhaps Paronychia subulata, D. C. in Lam. dict. 5. p. 25. or Illiceburnum subulatum, Pers. ench. 1. p. 261. is referrible to this species.

Chesnut-brown Polycarpacea. Pl. 1 foot, diffuse.

10 P. Brasilienses (Stil. fl. bras. 2. p. 183.) stems erect, puberulous; leaves linear-subulate, with revolute margins, mucronate, puberulous; cyces corymb-formed; calyces lobes very acute, puberulous; petals ovate-ornicular, one-half shorter than the calyx. 2 S. Native of Brazil, in that part of the province of St. Paul called Campos Geraes, near Fazenda de Jaquiraba. Flowers densely clothed with white tomentum. Petals at first white, but at length of a dirty yellow-colour. Root fusiform, with many stems rising from the neck.

Var. b. ramoassina (Stil. Hil. l. c.) stems much branched; leaves setaceous; cyces less; flowers a little smaller than those of the species. Native of Brazil, in the province of Goiyaz, on the sandy Mountain called Serra dos Pyreneos; also on the road to Campo Allegre, in the province of Minas Geraes.

Brazilian Polycarpacea. Pl. 1/2 to 3/4 foot.

N 2
12 P. glabrifolia (D.C. l. c. and mem. par. t. 5.) stems erect, branched, suffruticose; branches pubescent; leaves glabrous, oblong-linear, bluish, twice the length of the stipulas; cymes terminal, dense, many-flowered, in crowded heads. Ψ. Ψ. S. Native of Sierra Leone. This species differs from P. tenifolia in the leaves not being subulate, nor keeled, nor with revolute edges; in the stipulas being large, and in the flowers being capitate.

Glabrous-leaved Polycarpæa. Pl. 1 foot.

13 P. linearifolia (D.C. l. c. and mem. par. t. 6.) stems erect, or somewhat ascending at the base, branched; branches pubescently hairy; leaves linear, elongated, pubescent, 3 times longer than the stipulas; cymes crowded into a dense terminal roundish head. Ψ. F. Native of Senegal. Parochia linearifolia, D.C. in Lam. dict. s. p. 26. Alternanthera erécta, Richb. in Sieb. pl. exsic. seneg. no. 60. Habit of Celosia, but the characters are those of Polycarpæa.

Linear-leaved Polycarpæa. Pl. 1 foot.

14 P. frankenholzi (Presl in Henk. reliq. 2. p. 6.) stems much branched, diffuse, procumbent, roughish; branches opposite; leaves opposite, oblong, obtuse, clothed with rough pubescence; flowers in dichotomous corymbose panicles; sepals bluntish, pilose. Ψ. H. Native of the Island of Luzon.

Frankenlia-like Polycarpæa. P1. procumbent.† Species not sufficiently known.

15 P. carnosa (Chr. Smith in Buch. can. p. 142.) stem subrubby; leaves 6 in a whorl, fleshy; lower ones spatulate, upper ones lanceolate; stipulas very short, jagged. Ψ. G. Native of the Canary Islands.

Fleshy Polycarpæa. Shrub ¼ foot.

16 P. smithii (Link in Buch. can. p. 142.) leaves 6 in a whorl, linear, glabrous, obtuse; stipulas very short; panicle dichotomous; branchlets divaricate; bracteae obtuse, shorter than the calyx. Ψ. G. Native of the Canaries, in the island of Palma, at Cumbre de Caldera. Very nearly allied to P. stelátala but differs in the panicle.

Smith’s Polycarpæa. Pl. 1/2 to 1/3 foot.

17 P. ? minuartioides (D.C. prod. 3. p. 375.) stem subrubby, branched; branches tomentose, leafy subulate, crowded; cymes axillary, few-flowered. Ψ. F. Native of the south of Spain. Mollis minuartioides, Spreng. mant. 1. p. 37, ex Schultes. Lahaya minuartioides, Schultes, syst. 5. p. 496. This is a very doubtful species, being omitted in Spreng. syst.

Minuartia-like Polycarpæa. Fl. Ju. Aug. Clt. 1826. Pl. ½ fl. 15 P. ? depressa (D.C. l. c.) stems herbaceous, depressed, diffuse; leaves opposite, crowded into something like whorles, wedge-shaped; stipulas 4-cleft; flowers terminal, triandrous; calyx fleshy; petals linear, 4-toothed at the apex. Ψ. Native of the East Indies. Phannacemum dépressum, Lin. mant. p. 564. Læflingia Indica, Retz, ind. p. 48. Roxb. fl. ind. 1. p. 169. This plant is certainly neither a Læflingia nor a Phannacam; from the stipulas and many-seeded capsule, it agrees more nearly with Polycarpæa, but differs in the fleshy calyx, and triandrous flowers; perhaps it is more nearly allied to Pollichia, but the calyx in this plant is said to be 5-parted.

Depressed Polycarpæa. Pl. depressed.

Cult. The seeds of the annual species of Polycarpæa should be sown on a hot-bed early in spring. The perennial and shrubby species being either greenhouse, or frame plants, require to be kept in their respective places; they are easily increased by cuttings under a hand-glass, those of the stave species in heat.

Lin. syst. Triandria, Monogynia. Calyx 5-parted; lobes oval, with membranous margins. Petals 5, cuneate-oblong, entire. Stamens 3, inserted with the petals into the disk or torus. Style short; stigmas 3. Capsule 1-celled, 3-valved. Seeds few, fixed by funiculi to the central placenta.—Small perennial dichotomous herbs, native of North America. Radical leaves almost like those of Polycarpæa Tenérfíferæ, ovate, petiolate; cauline leaves sessile, opposite, small. Stipulas jagged. Flowers small, tender, terminal. An intermediate genus between Polycarpæa and Polycarpæa, from the sepals being flatish as in Polycarpæa, and in the stamens being 3, as in Polycarpæa; but differs from both in the petals and stamens being expressly hypo-gynous according to Richard in Michx. l. c.; the genus perhaps once thought to have been placed in Caryophyllæa.

Setaceous Stipulicida. Pl. ½ foot.

Cult. See Orégia, p. 93. for culture and propagation.

XII. BALAR'UDIA (in honour of M. Balard, de Montpellier, who was the first to detect a new chemical principle called brome). St. Hil. fl. bras. 2. p. 160.

An annual, branched, dichotomous herb, with opposite, stipulate leaves, and cymose flowers.

1 B. Plate'sis (St. Hil. fl. bras. 2. p. 181. t. 111.) leaves linear, about equal in length to the internodes, mucronulate; cymes branched, many-flowered. Ψ. H. Native of Brazil, in the southern part of the province of Cisplatine, near Povo de Canelones; and in the western part near Pueblo de las Viboras; also of Buenos Ayres.

Plate Balardia. Pl. ½ foot.

Cult. The seeds of this plant should be sown on a hot-bed in spring, and the plants may be planted out in the open border in the month of May, in any warm dry situation. Not worth cultivating, excepting in a botanic garden.

Lin. syst. Triandria, Monogynia. Calyx deeply 5-parted, permanent; lobes thickened in the middle, keeled. Petals 5, inserted in the bottom of the calyx. Stamens 3, inserted with the petals; filaments dilated at the base, joined to the petals and together at the base. Style 1, tridid; lobes papiliferous inside. Capsule 3-valved, many-seeded; valves membranous. Seeds fixed to the central placenta, cylindrical. Embryo in the middle of fleshy albumen, not at one side as in Polycarpæa. A trailing branched herb, with opposite stipulate leaves; young leaves or abortive branches in fascicles in the axils of the older leaves. Cymes branched, many-flowered.

1 A. frankenholzi (St. Hil. l. c. t. 112.) stems trailing, branched; leaves lanceolate, bluish, narrowed to the petiole, pubescent; cymes many-flowered; segments of calyx obtuse, pubescent; petals and stamens one half shorter than the calyx. Ψ. H. Native of Brazil, on the sandy banks of the rivers Parahyba, Rio Doce, Jiquitinohonha, Rio de St. Francisco, &c. Flowers white.
Frankenia-like Aversia. Pl. trailing, ½ foot. Cult. See Balardia above for culture and propagation.

Lin. syst. Tridonia, Monogynia. Calyx of 5 sepals, or 5-parted; sepals erect, oblong, a little keeled. Petals wanting. Stamens 5, 3 of which are fertile, inserted in the torus in front of the sepals; the other 2 almost vanished, or small, sterile, and scale-formed. Ovarium ovate. Style 1, capitata at the apex, or bifid. Capsule 3-valved. Seeds numerous, fixed to the central placenta. Embryo straight, placed on the back of the albumen. Erect, much-branched herbs. Leaves opposite, linear, with 2 black dots at the sides, from which the stipulas have fallen. Cymes dichotomous, many-flowered. Flowers greenish-white. Stamens hypogynous, as in Stipulicida and Polycarpaea.

Spanish Ortega. Fl. Ju. Jul. Clt. 1768. Pl. ½ foot. Cult. The species thrive best in light soil; and are increased by cuttings or seeds. They are well fitted for rock work, or to be grown in small pots among other alpine plants.

Lin. syst. Tri-Pentandria, Trigynia. Calyx deeply 5-leaflet (f. 23. a), permanent; segments concave, keeled, mucronate at the apex. Petals 5 (f. 23. b), emarginate, inserted in the tube of the calyx. Stamens 5-5, inserted in the tube of the calyx. Style trifid; lobes papilliferous inside. Capsule 1-celled, 3-valved (f. 23. e), many-seeded. Seeds nearly ovoid, a little curved, fixed to the central placenta. Annual, branched, dichotomous herbs. Leaves opposite, or 4 in a whorl; young ones usually disposed in fascicles in the axils of the old leaves. Flowers in cymose corymbs. Stipulas and bracteas small, scarious. This genus agrees with Adenium, but differs in the stamens being equal in number to the petals, not in Carpophyllece, double that number.

* Flowers trianundrous.

Apures All-seed. Pl. ½ to ½ foot. 2. P. Tetraphirylum (Lin. fil. suppl. 116.) flowers trianundrous; petals emarginate; lower leaves 4 in a whorl; rameolous ones opposite, obvate-oblong, rounded at the apex, mucronate, shorter than the internodes. 3. H. Native of Europe, Canary Islands; Brazil on walls, about the town of St. Paul. In England, on the west coast; on various parts of the coast of Devonshire, Somersetshire, and Portland Island.—Smith, engl. bot. t. 1031. Krock. fl. siles. t. 42. Mollugo tetraphylla, Lin. spec. 1. p. 89.

* * Flowers pentanundrous.

3 P. Alsenefolium (D. C. prod. 3. p. 376.) flowers pentanundrous; petals nearly entire; leaves oval, rather fleshy; flowers crowded into terminal cymes. 2. H. Native of Sicily, France, between Cetta and Narbonne, and also of the Cape of Good Hope and New Holland, on the sandy sea-coast. Bosc. sie. p. 71. t. 38. Hagea alsinefolia, Biv. manip. 3. p. 7. Lahaye alsinefolia, Schultes, syst. 5. p. 405. Möllö alsinefolia, Schultes, syst. 1. p. 795. Holostema tetraphyllum, Thunb. fl. cap. p. 120. Polycarpón spec. Sieb. fl. nov. holl. no. 570. Illicee-brum alsinefolium, Lin. mant. 51.? Very like P. Tetraphyllum, but differs in the leaves being smooth and oval; and in the flowers being pentanundrous, larger, fewer, and more crowded.

Chickweed-leaved All-seed. Fl. Ju. Aug. Clt. 1817. Pl. ½ foot. 4. P. Peploides (D. C. prod. 3. p. 376.) flowers pentanundrous; petals quite entire; leaves opposite, obovate; flowers crowded into terminal cymes. 2. F. Native of Sicily; France about Perpignon. Hagea polycarpoides, Biv. manip. 2. no. 3. Möllö Polycarpón, Spreng. nov. prod. p. 28. Lahaye polycarpoides, Schultes, syst. 5. p. 404. Arenaria peploides, Lapeyr. abr. p. 251. but not of Lin. Very like P. Tetraphyllum, and, as in it, the leaves are sometimes 4 in a whorl; but besides these characters, it differs in the leaves being rounder; cymes denser; flowers a little larger, and pentanundrous, &c.

Water Purslane-like Polycarpón. Pl. ½ foot. Cult. The seeds of the annual species of the genus only require to be sown in the open border in spring. The last species being perennial, should be grown in a small pot, and placed among other alpine plants.

Greenish-flowered Cerdia. Pl. pr. 2. C. Purpurea'scens (Moc. et Sesse, 1.c.) leaves 4 together in
a kind of whorl.  "G.  Native of Mexico.  Flowers purplish inside.

_Purplish Cerdia._  Pl. pr.

_Cult._  These plants will grow well in a mixture of loam and sand, and are easily increased by dividing at the root, by cuttings, or by seeds.

**Tribe IV.**

**POLLYCHIA**E (this tribe only contains the genus *Pollychia*).  D. C. prod. 3. p. 377.  Calyx 5-toothed; tube urceolate.  Stamens 1-2, inserted in the throat of the calyx.  Petals wanting.  Stigma bifid.  Fruit or utriculus valveless, 1-seeded.  Bracteas and calyx becoming large and luscious after flowering, and forming something like a berry.—Saufruticose herbs, with opposite, subsessile stipulaceous leaves.

_Lin. syst._  _Monandria; Monogynia._  Calyx campanulately urceolate, 5-toothed, permanent.  Petals wanting, unless the scales at the throat are to be taken for them.  Stamens 1 (ex Mœch. rarely 2) inserted in the throat of the calyx.  Style filiform; stigma bifid.  Capsule valveless, 1-seeded, inclosed in the thickened tube of the calyx.—A suffruticose branched herb.  Leaves linear, opposite, but at first sight appear verticillate, in consequence of 2 rameal leaves rising in each axil, furnished with scarios acute stipulas.  Flowers small, aggregate, sessile, bracteate.

_Cult._  The seeds of _Pollychia_ must be raised on a hot-bed; and when the plants are 2 inches high, they may be planted out singly into pots, placed among the greenhouse plants, and afterwards treated like them.

† Genera placed in _Paronychiæ_, but are not sufficiently known.

**XVIII. LITHOPHILA** (from λιθος, lithos, a stone, and φιλεω, philoe, to love; this plant delights to grow among stones).  Swartz, fl. ind. occ. 1. p. 47.  t. 1.  D. C. prod. 3. p. 380.

_Lin. syst._  _Diandria; Monogynia._  Calyx profoundly 3-parted, acute.  Petals 3, ovate-lanceolate.  Scales, nectaries, or abortive stamens 2, opposite the segments of the calyx.  Stamens 2, at one side of the ovarium.  Style thick, bluntly emarginate at the apex.  Fruit unknown.—A very minute glabrous herb.  Leaves stem-clasping, linear, obtuse.  Flowers white, crowded.

1 L. muscoides (Swartz, 1. c. p. 48.).—Native of the desert island of Navaza, among rocks.

_Mass-like Lithophila._  Pl. 1 inch.

_Cult._  This plant is not worth cultivating, unless in botanic gardens.  Should it ever be introduced to our gardens, we would recommend its being grown in a pot filled with broken stones, having the crevices filled with vegetable mould.  It may probably be propagated by seeds.

**XIX. SELLOWIA** (in honour of Frederick Sello, a German botanist, who was lately drowned in some creek of the Amazon; and who has sent home many fine collections of Brazilian plants).  Roth. nov. spec. p. 162.  D. C. prod. 3. p. 380.

_Lin. syst._  _Pentandria; Monogynia._  Calyx urceolate, 5-cleft, membranous, 10-ribbed; lobes short, lanceolate; ribs bearing alternately a petal and a stamen.  Petals 5, oval, alternating with the calycine lobes.  Stamens 5, fixed in the middle of the calycine lobes, and shorter than them; anthers didymous.  Style 1; stigma obtuse.  Capsule 3-valved, 1-celled, 1-seeded.—A quite glabrous herb, with the habit of _Illicicnum verticillatum_.  Leaves opposite, oblong-oval.  Flowers 1-2 in the axils of the leaves, small, white, and somewhat pedicellate.  It is not known whether the leaves are stipulaceous or naked.

1 S. vulgaris (Roth. 1. c. p. 163.).  Native of the East Indies, in bogs.

_Bog Sellobia._  Pl. proc.

_Cult._  Place a pan of water under the pot in which this plant is grown.

Flowers hermaphrodite.  Calyx 4-5-parted (f. 24. a.).  Stamens from 1 to 10, inserted in the orifice of the tube (f. 24. a.).  Ovarium simple, 1-seeded.  Styles 2 (f. 24. e.) or 1, emarginate at the apex.  Fruit a membranous utricile, inclosed within a hardened calyx.  Seed hanging from the apex of a funicle, which arises from the bottom of the corn.  Embryo cylindrical, curved round farinaceous albumen.—Small herbs.  Leaves opposite, without stipulas.  Flowers axillary, sessile.  This order has been referred by De Candolle to _Paronychiæ_, from which it differs in the absence of petals and stipulas, and therefore appears to constitute a distinct order, more nearly related to _Chenopodæa_ than _Paronychiæ_, from which the plants chiefly differ in the indurated tube of the calyx, from the orifice of which the stamens proceed, and in the number of the latter exceeding that of the divisions of the calyx.  The tribe _Minuartiæa_ is probably not distinguishable from _Scleranthæa_, notwithstanding the supposed presence of petals, which would perhaps be more properly called abortive stamens.  All the plants contained in this order are uninteresting weeds, of no known use.

_Synopsis of the genera._

**Tribe I.**

**Scleranthæa.**  Calyx 4-5-toothed (f. 24. a.), with an urceolate tube.  Petals none.  Stamens 1-10, inserted in the throat of the calyx (f. 24. a.).  Styles 2 (f. 24. e.) or 1, emarginate at the apex (f. 24. b.).  Fruit an utricile, covered by the indurated tube of the calyx, 1-seeded.  Seed hanging by a funicle, which arises from the bottom of the capsule.

1 MNIA^RUM._  Calyx 4-cleft, with an urceolate tube.  Stamens 1.

1. Styles 2.

2 Scleranthus.  Calyx 5-cleft (f. 24. a.), with an urceolate tube.  Stamens from 2 to 10.  Styles 2 (f. 24. e.).

3 Guilleminëa.  Calyx 5-cleft, with a campanulate tube.  Stamens 5.  Style 1, emarginate at the apex.

**Tribe II.**

**Querbachæ.**  Calyx 5-parted.  Petals none.  Stamens 10,
inserted in the bottom of the calyx. Capsule 3-valved. Seed hanging from a long funicle, which arises from the centre of the cell.

4 *Que'ria*. The character is the same as that of the tribe.

**Tribe III.**

6 *Leplin'sia*. The 3 outer lobes of calyx bisetose at the base. Style 1, trifid at the apex.

**Tribe I.**

**Sclerantheae** (plants agreeing with *Scleranthus* in important characters). Paronychtiae, Tribe V. Sclerantheae, D. C. prod. 3. p. 377. Calyx 4-5-cleft, with an urceolate tube. Petals wanting. Stamens 1-10, inserted in the throat of the calyx. Styles 2 or 1, emarginate at the apex. Fruit a 1-seeded membranous utricle, covered by the indurated tube of the calyx. Seed hanging from a long funicle, which arises from the bottom of the cell, and which is recurved at the apex.—Herbs, with opposite exstipulate leaves.

**Lin. syst. Monandria, Digynia.** Calyx 4-cleft, permanent, with an urceolate tube. Petals wanting. Stamens one, inserted in the throat of the calyx. Ovary free, 1-seeded. Styles 2. Capsule valveless, membranous, covered by the indurated tube of the calyx. Seed one, as in *Scleranthus*—Australian herbs. Leaves opposite, subulate. Peduncles axillary, bearing 4 bracteas and 2 flowers at the apex, becoming after flowering elongated and stiff. The ovary, according to Forster, is sometimes 2-seeded.

1 M. *Bi'llium* (Forst. 1. c.) stems tufted; branches quite glabrous; leaves denticulated at the base, the rest quite entire. *H.* G. Native of Van Diemen's Land, Maria Island in New Holland, New Zealand, and of the Straits of Magellan. R. Br. prod. p. 412. Forst. comm. goett. 1789. t. 1. M. pedunculatum, Labill. nov. holl. 1. t. 2. Ditóca muscósia, Gartn. 1. c.

2 M. *Fasciculata'm* (R. Br. prod. p. 412.) stems many from the same neck, procumbent, branched; branches clothed with fine pubescence; leaves denticulated their whole length. *G.* G. Native of Van Diemen's Land.

*Fascicled Mniarum*. Pl. procumbent.

**Cult.** A mixture of loam, peat, and sand, will suit the species of *Mniarum*, and they may be propagated either by seeds or cuttings.

**Lin. syst. Penta-Decandria, Digynia.** Calyx 5-cleft (f. 24. a.), permanent, with an urceolate tube. Petals wanting. Stamens inserted in the throat of the calyx, 10 (f. 24. a.), rarely 5 or 2. Ovary free, 2-seeded. Styles 2 (f. 24. c.). Capsule very thin, valveless, covered by the indurated tube of the calyx. Seed one, hanging from a long funicle, which arises from the bottom of the capsule, and is recurved at the apex.—Small herbs, with opposite linear leaves, which are rather connate at the base. Flowers small, greenish white, sessile in the axils of the forks of the branches.

1 S. *Per'ens* (Lin. spec. 580.) flowers decandrous; lobes of fructiferous calyx closed, obtuse, with white and membranous edges. *H.* Native of Europe and the Levant, in dry sandy fields. In England, on high open sandy fields, rare; as about Eldon, Suffolk, and plentifully near Snettington, Norfolk; near Bury St. Edmunds; and Scotland, on a gravelly bank near Forfar. Schkuhr, handb. t. 120. Fl. dan. t. 563. Smith, engl. bot. t. 352.—Ray, syn. p. 160. t. 5. f. 1. The Polish cochineal (*Coccus Polydennis*) is found upon the roots in the summer months.

2 S. *Poly'ca'rpus* (Lin. spec. p. 581.) flowers subdecandrous; lobes of the calyx when in fruit rather spreading, and without any margin, acute, shorter than the tube. *H.* Native in sandy fields about Montpelier, but never gathered elsewhere in France; also of Italy, according to Linneus.—Column. esphr. 1. t. 294. It differs from *S. annum* at first sight, in the flowers being one-half smaller; but it is probably merely a variety of it.

*Many-fruited Knawel*. Pl. procumbent.

3 S. *A'nummus* (Lin. spec. p. 580.) flowers subdecandrous; lobes of fructiferous calyx spreading, immarginate, acutish, about equal in length to the tube. *H.* Native of Europe, the Levant, also of North America, in dry sandy cultivated fields; plentiful in some parts of Britain. Fl. dan. 504. Smith, engl. bot. t. 531. Knawel annummus, Scop. carp. p. 501. There is a variety, according to Leers, which has only 5 or 7 stamens to each flower. The Swedes and Germans receive the vapour arising from a decoction of it into their mouths to cure the tooth-ache.

4 S. *His'atus* (Presl. del. p. 65.) flowers with 5 petals and 5 stamens; calyxes conniving, obtuse; stamens equaling the calyx in length; anthers hairy; stigmas pubescent. *H.* Native on Mount Etna, in the open regions. Leaves subulate, glabrous. Flowers capitulate.

*Hairy Knawel*. Pl. prostrate.

5 S. *Pun'gens* (R. Br. prod. p. 412.) flowers pentandrous, particularly having 5 fertile and 5 sterile stamens; lobes of fructiferous calyx spreading; leaves subulate, triquetrous, mucronate, pungent, rough on the keel and margins. *H.* Native of New Holland, on the south coast.

6 S. *Di'nder* (R. Br. prod. p. 412.) flowers diandrous; stamens mixed with scales; lobes of fructiferous calyx erect; leaves subulate, keeled, mucronulate, almost naked on the keel and margins. *H.* Native of Van Diemen's Land.

*Diandrous Knawel*. Pl. procumbent.

**Cult.** The seeds of these plants only require to be sown in the open border. None of the species are worth cultivating except in botanic gardens.

LIN. SYST. Pentándria, Monógynía. Calyx 5-cleft, with a campanulate tube; lobes equal. Petals wanting. Stamens 5, inserted in the top of the tube, opposite the calyce lobes, short: anthers 1-celled. Style 1, somewhat emarginate at the apex. Fruit an indehiscent 1-seeded utricle, covered by the calyx. Seed hanging by a funicle, which rises from the bottom of the capsule.—A South American trailing herb, with opposite branches. Stems woolly. Leaves glabrous, oblong, opposite, exstipulate, but the petioles are connate at the base. Flowers capitate, axillary. Bracteas under each flower.

1 G. I'llECEBRiODiES (H. B. et Kunth, l. c.) \quad G. Native of South America, near Quito, in the valley of St. Jago. Illecebrum-like Guilleminia. Pl. tr.

Cult. Any common light soil will suit this plant, and it may be propagated from cuttings or seeds.

Tribe II.

QUERIA'CEÆ (this tribe contains nothing but the genus Queria). Calyx 5-parted. Petals wanting. Stamens 10, inserted in the bottom of the calyx. Capsule 3-valved. Seed 1, on a long funicle, which rises from the centre of the capsule.—Herbs, with opposite exstipulate leaves.

LIN. SYST. Decândria, Trigynia. Stamens 10, slender, unequal, sometimes 5 of which are sterile. Styles 3, very slender. Capsule membranous, 1-celled, 3-valved. Seed reniform when mature.—Small stilt annual herbs. Leaves opposite, crowded, sessile, connate, recurved at the apex. Flowers in the axils of the upper branches and superior leaves, sessile, solitary. This genus is hardly distinct from Minuartia, unless in the styles being 3; in the valves being 3, and form of the seeds, which are evidently solitary from abortion.

1 Q. HisP'Nica (Lin. spec. p. 182). \quad O. H. Native of Spain, in dry exposed places. Quer, fl. esp. 6. t. 15. f. 2. Orocent. t. 15. f. 1.

† A doubtful species.

Trichotomus Queria. Pl. ¼ foot.

Cult. The seeds only require to be sown in the open ground, in any dry situation.

Tribe III.

LIN. SYST. Pentândria, Trigynia. Sepals 5, hardly joined at the very base, quite entire. Petals or abortive stamens 5, small, alternating with the sepals. Stamens 5, opposite the sepals, and longer than the petals. Styles 3, filiform. Capsule 1-celled, 3-valved. Seeds few, fixed to the central axis.—Small annual herbs. Leaves opposite, sessaceous, 3-nerved at the base, quite entire. Flowers in the forks of the branches, and in the axils of the upper leaves, solitary, small, sessile, or on short pedicels; constituting a leafy, dense, dichotomous cyme. Petals bifid, or rather nectaries. (ex Lœfl.) Stamens 10, 5 abortive. (Steven.) Petals and stamens 10. (St. Hil.) According to several specimens examined, the stamens are 10, and the 5 alternate ones are sometimes converted into petals. The genus differs from Loeflingia in the sepals being quite entire, and from Queria in the fruit being many-seeded.

1 M. Campe'stris (Lœfl. itin. p. 122.) flowers distinctly pedicellate, equal in length, or a little longer than the floral leaves; sepals very unequal, 3 large and 2 smaller. \quad O. H. Native of Spain, in dry sandy fields. Habit almost of Bufonia. Act. holm. 1758. t. 1. f. 3.

2 M. Dichó'roma (Lœfl. l. c. p. 121. t. 1. f. 3.) flowers almost sessile, in fascicles, shorter than the floral leaves; sepals nearly equal; mucrone of leaves oblique. \quad O. H. Native of Spain, on hills. Act. holm. 1758. t. 1. f. 5. Plant stiff, dusky.

Dichotomous Minuartia. Fl. Ju. Jul. Cht. 1771. Pl. ½ to ¼ ft. 3 M. Montá'na (Lœfl. l. c. p. 122. t. 1. f. 4.) bundles of flowers about equal in length to the bracteae; sepals nearly equal; mucrone of leaves straight. \quad O. H. Native of Spain, Tauria, and Iberia, on dry hills.—Bieb. fl. taur. 1. p. 90.

LIN. SYST. Pentândria, Monogyûnia. Sepals 5, connected at the base, 3 outer ones bisetose at the base. Petals 5, small, conniving, inserted in the bottom of the calyx. Stamens 5, alternating with the petals, or 3, 2 of them being abortive! Style 1, trifid at the apex, or divided into 3 from the base. Capsule 1-celled, 3-valved. Seeds numerous, fixed to the central placenta.—Small, annual herbs. Leaves opposite, exstipulate, margined on both sides at the base, and appendiculated, these appendages probably supply the place of stipulas. Flowers in the forks of the branches, and in the axils of the upper leaves, solitary, sessile.

1 L. HisP'Nica (Lin. spec. p. 50.) flowers triandrous; style 1, trifid at the apex. \quad O. H. Native of Spain, Mauritania, and South of France, in dry sandy places. Lœfl. itin. t. 1. f. 1. Cav. icon. t. 94. L. prostrâta, Mench. Herb clammy, pubescent. Corolla white; petals obovate, emarginate.

2 L. Pentâ'nda (Cav. icon. 2. t. 148. f. 2.) flowers pentandrous; styles 3, distinct from the base. \quad O. H. Native along
the Mediterranean Sea, in the sand; and of Spain, near Val- lentia. Perhaps sufficiently distinct from the first.

Pentandrous Leflingia. Fl. Ju. Jul. Ctt. 1820. Pl. $\frac{1}{2}$ to $\frac{1}{2}$ ft.

† Species not sufficiently known.

Caspian Leflingia. Pl. $\frac{1}{2}$ foot.

4 L. ? Kefifôlia (Lag. gen. et spec. p. 2.) flowers pentan-
drous; leaves orbicularly reiniiform. O. H. Native of Mexico.

Kidney-leaved Leflingia. Pl. $\frac{1}{2}$ foot.

Cult. The seeds only require to be sown in the open border in any dry lightish soil.

Sepals from 3 (f. 25. c.)—20 (f. 30. a.), more or less united at the base, and therefore the calyx is many-parted (f. 26. b.). Petals equal in number with the sepals (f. 25. b. f. 26. a.), and alternating with them, either distinct (f. 27. b.) or united into a gamopetalous corolla (f. 26. a.), inserted in the bottom of the calyx. Stamens inserted with the petals, either equal to them in number (f. 25. c.) and alternating with them, or twice as many (f. 27. c.); those opposite the petals being shortest, and arriving at perfection after the others; filaments distinct, subulate; anthers oval, 2-celled, bursting lengthwise. Nectariferous scales several, one at the base of each ovarium sometimes obsolete. Ovaria of the same number as the petals, opposite to which they are placed around an imaginary axis, usually distinct, but in some of the anomalous genera rather concrete, all 1-celled, and tapering into 1 stigma each, opening when ripe by a longitudinal chink in front, but in the genus Dimorphæ on the back. Seeds attached to the margins of the suture, in 2 rows, variable in number. Albumen thin, fleshy. Embryo straight in the axis of the albumen, having the radicle directed to the hilum.—Fleshy herbs or shrubs. Leaves entire or pinnatifid, without stipulas. Flowers usually in cymes, sometimes rising in the forks, often arranged unilaterally along the divisions of the cymes.

The plants contained in this order are all remarkable for the succulent nature of their stems and leaves, in which they resemble Càctæe, Portulâceæ, and certain genera of Euphorbiaceæ, &c. but this analogy goes no farther. Their real affinity is probably with Saxifragæ, through Penthorræm, which is not succulent, like the rest of the genera; and with Paronychiacæ, through Tillæ'æ, as De Candolle has remarked. In both those orders, the nectariferous scales of Crassulaceæ are wanting. De Candolle observes (mem. crass. p. 5.) that there is no instance of a double flower in the order, although this might have been expected from their analogy in structure with Caryophyllææ. Sempervivæm tectûræ almost constantly exhibits the singular phenomenon of anthers bearing ovules instead of pollen.

These plants are found in the driest situations, where not a blade of grass nor a particle of moss can grow, on naked rocks, old walls, sandy hot plains, alternately exposed to the heaviest dews of night, and the fiercest rays of the noon-day sun. Soil is to them a something to keep them stationary, rather than a source of nutriment, which in these plants is conveyed by myriads of mouths, invisible to the naked eye, but covering all their surface, to the juicy beds of cellular tissue which lie be-

Refrigerent and abetstringent properties, mixed sometimes with a good deal of acridity, distinguish them. The fishermen of Madeira rub their nets with the fresh leaves of Sempervivæ glutinosum, by which they are rendered as durable as if tanned, provided they are steeped in some alkaline liquor. Malic acid exists in Sempervivæm tectûræ, combined with lime.—Turner, p. 694.

Synopsis of the genera.

Tribe I.

Crassulaææ legûtûm. Carpella distinct, opening when mature by a longitudinal fissure in front (f. 26. b.).

1 Tilæ'æ. Divisions of calyx, petals, and stamens 3-4 (f. 25. a. b. c.). Nectariferous scales none or very small. Carpels 3-4 (f. 25. d.), constricted in the middle, 2-seeded.

3 Dasyste'mon. Sepals 3-7, filiform, unequal, hardly joined at the base. Petals 3-7, often 5, hardly joined at the base, rather revolute at the apex. Stamens 5-7; filaments thick. Carpels 3-5.

8 Cu'rto'gynæ. Calyx 5-parted. Petals united into a 5-

10 Rôcha. Calyx 5-lobed. Petals 5, united into a gamo-
petalous corolla, with a spreading 5-lobed limb. Stamens 5. Glands and carpels 5.

11 Kalosa'sthies. Calyx 5-lobed (f. 26. b.). Petals united into a 5-parted corolla (f. 26. a.), with the tube cylindrical, 2 or 3 times longer than the spreading limb. Stamens 5, inserted in the tube of the corolla. Glands and carpels 5.

12 Kalanchoe. Calyx 4-parted; sepals hardly united at the base. Corolla gamopetalous, with a 4-parted, spreading O.
border. Stamens 8, adnate to the base of the tube of the corolla. Scales 4, linear. Carpels 4; styles filiform.

13 BRYOPHYLLUM. Calyx inflated before flowering, hardly 4-cleft to the middle. Corolla gamopetalous, hypogynous; lobes 4, acute. Stamens 8, adnate to the base of the tube of the corolla. Glands 4.

14 Cotyledon. Calyx 4-parted. Corolla gamopetalous, with a 5-lobed, spreadingly reflexed limb. Stamens 10, adnate at the base to the tube of the corolla. Scales oval. Carpels 5, each drawn out into a subulate style.

15 Pistisia. Calyx 5-parted. Corolla gamopetalous, with a 5-parted spreading border. Stamens 10, adnate their whole length to the tube of the corolla. Scales 5. Carpels 5, ending each in a long filiform style.

17 Echeveria. Calyx 5-parted (f. 27. a); sepals erect. Petals 5, united at the base (f. 27. b), thick, and erect. Stamens 10 (f. 27. c), united to the petals at the base. Scales 5. Carpels 5, each ending in a subulate style.

18 Sedum. Calyx 5-parted (f. 29. a); sepals turgid, leaf-formed. Petals 5 (f. 29. b), usually spreading. Stamens 10 (f. 29. c). Scales 5. Carpels 5.

19 Sempervivum. Calyx 6-20-parted (f. 30. a). Petals 6-20 (f. 30. b). Stamens twice the number of the petals (f. 30. c). Scales toothed or jagged. Carpels equal in number to the petals.

**Tribe II.**

**CRASSULACEÆ ANÓMALE.** Carpels united at the base into a many-celled capsule.

21 Penthórum. Calyx 5-parted. Petals 5. Stamens 10. Scales wanting? Carpels 5, united at the base into a 5-beaked, 5-celled capsule, which is pentagonal at the apex, and opening under the beaks. Seeds small, numerous.

**Tribe I.**

**CRASSULÆÆ** or **CRASSULACEÆ LEGITIMÆ** (this tribe contains the legitimate plants of the order). Carpels distinct; when mature opening on the inside by a longitudinal fissure.

**LIN. SYST.** Tri-Tétrádría, Tri-Tétrágynía. Calyx 3-4-parted (f. 25. a). Petals 3-4 (f. 25. b), oblong, acuminated. Scales none, or very small. Carpels 3-4, somewhat constricted in the middle, 2-seeded.—Small, glabrous, annual herbs, inhabitants of exposed sub-humid places. Leaves opposite. Flowers small, white, for the most part axillary.—Many of the exotic species may probably belong to Bulliardæ.

1 T. MUSCÓSA (Lin. spec. 186.) stems branched at the base, decumbent; leaves connate; flowers axillary, sessile, trifid. O. H. Native of Europe in many places, in dry, barren, sandy, and gravelly soil; plentiful in Britain, on the most barren sandy heaths; frequent in Norfolk and Suffolk. It is a troublesome weed in the gravel walks of Holkham, Bocc. mus. t. 22. Mich. gen. t. 20. Lam. ill. t. 90. D. C. pl. grass. t. 73. Smith, engl. bot. 116. Reich. icon. t. 191. Bocc. sic. t. 29. In exposed situations, this plant becomes reddish; but in that state it is not the T. rubrum of Gouan.

**Simple-stemmed Tillæa.** Pl. 1/2 foot. 3 T. moscháta (D. C. prod. 3. p. 382.) stem prostrate at the base; branches ascending; leaves connate, ovato-oblong; flowers 4-cleft, sessile in the axils of the superior leaves. O. H. Native of the Straits of Magellan, on the mountains; and of the Maclove Islands. Crassula mosscháta, Forst. in act. soci. goett. 9. p. 26. Bulliardæ Magellánica, D. C. bull. philom. no. 49.

**Musk Tillæa.** Pl. prostrate.

4 T. mínima (Miers, chil. 2. p. 530.) stems diffuse, branched; leaves minute, connate at the base, ovato-oblong; flowers 4-cleft, crowded into whorls in the axils of the leaves, on short pedicels; petals 4, acuminate, shorter than the calyx; carpels 1-2-seeded.

**Least Tillæa.** Pl. 1/3 foot. 5 T. verícélílléris (D. C. l. c.) stems prostrate at the base, rooting; branches ascending; leaves opposite, oblong-linear; flowers 4-cleft, crowded in whorls in the axils, some of which are sessile and others pedicellate. O. H. Native of New Holland. Tillæa pedunculátá, Sieb. pl. exsic. nov. holl. no. 173. but not of Smith. Petals acuminated, longer than the calyx. Habit almost of Illécebrum verícélíllérum.

**Verticillate-flowered Tillæa.** Pl. pr. 6 T. pedunculátá (Smith, in Rees’ cyclo. vol. 55. no. 4.) stem erect, simple leaves rather connate, lanceolate, acute; pedicels axillary, solitary, twice or thrice longer than the leaves; carpels truncate at the apex. O. H. Native about Monte Video and Buenos Ayres, in humid places. Bulliardæ Bonanígensis, D. C. bull. philom.

**Peduncled-flowered Tillæa.** Pl. 1/2 foot. 7 T. rubeéscens (H. B. et Kunth, nov. gen. amer. 6. p. 43.) stems branched, prostrate; leaves oblong-lanceolate, ovate, mucronate, rather fleshy, connate at the base; flowers 4-cleft, on long pedicels; petals shorter than the calyx. O. H. Native about Quito, near Alansi. Flowers white. Carpels 2-seeded. T. connáta, Ruiz et Pav. pl. per. 1. p. 70. t. 106. f. a., which was found in Peru, about Chancay, on humid hills, appears to differ from Kunth’s plant in the stems being rather erect.
Reddish Tillæa. Pl. pr. 

Cult. Sow the seeds among gravel, and keep it moist, either in pots or in the open ground.

LIN. SYST. Tétanària, Tetragynìa. Calyx 4-parted. Petals 4, oval or oblong, acute. Stamens 4. Scales 4, linear. Carpels 4, many-seeded.—Small, glabrous, annual, subaquatic herbs. Leaves opposite. Flowers small, white, axillary, sessile, or pedicellate. The parts of the flower are sometimes quinary, and therefore differ from Crássula in the form of the scales, and from Tillæa in the many-seeded carpels, as well as in the number of the parts of the flower.

1 B. Vaillant’n (D. C. pl. grass. t. 74.) stem erect, dichotomous; leaves oblong, acute; pedicels longer than the leaves. O. H. Native of France, at Fontainbleau, in humid shady places, &c. Vaill. bot. t. 10. f. 2. Tillæa aquatìca, Lam. ill. t. 90, but not of Lin. Tillé’a Vaillantûni, Willd. spec. p. 720. Corolla pale flesh-coloured. Stems sometimes erect and sometimes prostrate, generally rooting at the lower nodes. T. prostràta, Poir. dict. p. 7. 674 is perhaps referrible to this plant.

Cult. See Tillé’a for the manner of growing these plants.

III. DASYSTE’MON (from ‘casus, ‘dasyus, thick, and ‘stemon, a stem; in allusion to the thick filaments). D. C. prod. 3. p. 382.

LIN. SYST. Tri-Heptândria, Tri-Pentagynìa. Sepals 3-7, leaf-formed, unequal, hardly united at the base, equalling the corolla in length. Petals 3-7, but generally 5, erect, hardly united at the base, and revolutely spreading at the apex. Stamens 3-7, alternating with the petals, and longer than them; filaments thick; anthers erect. Carpels 3-5.—An Australian herb, covered all over with scaly papule. Root fibrous. Stem branched at the apex. Leaves opposite, connate, linear.

Cult. Sow the seeds of this plant thinly in pots, in gravelly soil.

IV. SEPTAS (from septem, seven; the number 7 prevailing in the fruitication). Lin. gen. 465. Haw. syn. 61. D. C. prod. 3. p. 383.—Crássula species of Thunb. and Willd.

LIN. SYST. Penta-Enneândria, Penta-Enneagynìa. Calyx 5-9-parted, shorter than the corolla. Petals 5-9, stellately spreading. Stamens 5-9; filaments slender, acuminate; scales 5-9, small, roundish. Carpels 5-9, many-seeded.—Herbs, native of the Cape of Good Hope. Roots tuberous, quiescent in winter; tubers roundish; fibres capillary. Stems simple, terete. Leaves of 2 opposite pairs, and the pairs sometimes approximate so near as to make the leaves appear in whorls. Flowers white, disposed in something like umbels. The habit of the plants is referrible to some Sazirfrágea.

1 S. Cape’-ensis (Lin. amoen. 6. p. 87.) leaves roundish, broadly crenated, tapering into the petioles; and the base of the petiole is rather connate; petals spreading. ß. D. G. Native of the Cape of Good Hope. Andr. bot. rep. 90.—Phil. alm. 340. f. 9. bad. Lam. ill. t. 276. Crássula Sétibas, Thunb. fl. cap. p. 291. There are varieties of this plant, differing in the number of the floral parts from 5-9, but generally 7; and with few-flowered or many-flowered umbels; and with leaves more or less stalked, having the crenatures either simple or subcrenated. Flowers white or red.

Cult. A mixture of sand, loam, and peat suit the species of this genus; and they should be watered but sparingly when not in a growing state. They are readily increased by separating the tubers of the roots.

LIN. SYST. Penta’tândria, Pentagynìa. Calyx 5-parted, much shorter than the corolla; sepals flatish. Petals 5, stellately spreading, distinct. Stamens 5; filaments subulate. Scales 5, ovate, short. Carpels 5, many-seeded.—Fleshy shrubs or herbs, generally natives of the Cape of Good Hope. Leaves opposite, quite entire, or sub-crenated. Flowers white, rarely rose-coloured.

§ 1. Laifòlia (from latus, broad, and folium, a leaf; leaves broad). Shrubby. Leaves broader, flat, with the surface and margins smooth.

CRASSULACEÆ. V. CRASSULA.

4 C. aegyptiaca (Lin. fil. suppl. p. 188.) leaves connate, ovate, entire, fleshy, glabrous, silvery; stem shrubby; corymbs subdecumbent. Ἰ. D. G. Native of the Cape of Good Hope. Thunb. fl. cap. p. 289. Flowers white; anthers black. Stem a foot or more in height. Leaves obtuse, with an acumen.

Silvery Crassula. Shrub 1½ foot.

5 C. telephium (Haw. rev. succ. p. 9.) stems herbaceous erect; leaves obovate-oblong, stem-clasping, minutely and punctately crenated below; flowers cymose. Ἰ. D. G. Native of the Cape of Good Hope. Leaves 3 inches long and 18 lines broad. Petals pale rose-coloured. Scales square. Habit almost of Sédum Telephium, but smaller and more humble; and differs in the stamens being 5. D. C. Perhaps Anacampseros. Burm. afr. t. 25. f. 2. is referrible to this plant.

7 C. fruticulosa (Lin. mant. p. 61.) stem shrubby, smooth; leaves opposite, subulate, acute, much spreading, and a little recurved; peduncles solitary, subumbellate. Ἰ. D. G. Native of the Cape of Good Hope. Flowers small, white, campanulate; anthers purple. Very like C. perfoliata, according to Thunberg; but it differs in the leaves being reflexed.

Var. β. Cape or (Lin. mant. p. 222.) stem suffruticose. Shrubby Crassula. Shrub 2 to 3 feet.

8 C. revolvens (Haw. phil. mag. 1824. p. 185.) stem suffruticos; slender, a little branched; branches erect, leaves linear, long, acute, revolutely reflexed, and arched, rather distant. Ἰ. D. G. Native of the Cape of Good Hope. Flowers small, white, in dense terminal heads. Perhaps not distinct from C. fruticulosa.

10 C. biflava (Haw. phil. mag. 1824. p. 186.) stem suffruticos; erect, with spreading branches; leaves erectish, smooth, subulate, acute, flat on both surfaces, channelled beneath. Ἰ. D. G. Native of the Cape of Good Hope. Very like the following. Bracteas larger. Flowers white; anthers reddish.

Biplanate-leaved Crassula. Fl. Sept. Clt. 1823. Sh. 1 ft. 11 C. acutifólia (Lam. dict. 2. p. 175.) stem suffruticos, decumbent, branched, terete; leaves opposite, fleshy, terete, subulate, spreading, glabrous; cymes small, pedunculate. Ἰ. D. G. Native of the Cape of Good Hope. D. C. pl. grass. t. 2. Allied to C. tetragona, but is rather more herbaceous, decumbent, and rooting. Leaves usually reflexed. Flowers white.

12 C. bibacteata (Haw. in phil. mag. 1824. p. 187.) plant effuse, decumbent, rooting; leaves subulate, expanded, flat or furrowed above; bracteas two on each peduncle. Ἰ. D. G. Native of the Cape of Good Hope. Flowers white; anthers sulphur-coloured, but at length becoming brown. Allied to C. acutifólia.

Var. a. minor (Haw. l. c.) plant usually rufescens; leaves less furrowed above or flat, full of rufous dots beneath.

Var. β. majus (Haw. l. c.) greenish; leaves usually furrowed above, and often dotted with brown; branches longer than in var. a.

13 C. filiculæs (Haw. in phil. mag. 1824. p. 188.) plant effusively dichotomous; leaves spreadingly recurved, lanceolate-subulate, smooth, convex beneath; branches rooting, filiform. Ἰ.? Ἰ. D. G. Native of the Cape of Good Hope. Flowers white, disposed in a kind of cyme; anthers yellow. Allied to the two preceding species.

14 C. scabra (Lin. spec. p. 405.) stem suffruticos, erect, terete, branched, covered with retrograde rugosities; leaves opposite, spreading, connate, linear-lanceolate, acute, searbose, ciliated; flowers corymbose terminal. Ἰ. D. G. Native of the Cape of Good Hope. Dill. hort. elth. t. 99. f. 117. Mart. cent. t. 24. Segments of flowers spreading, or a little revolute, white at first, but becoming at length brownish.

15 C. scabrælla (Haw. rev. succ. p. 11.) leaves linear-lanceolate, acuminate, expanded, and are, as well as the stems, rough from scales. Ἰ. D. G. Native of the Cape of Good Hope. Allied to C. scabra and C. squamulosa. Flowers white?

16 C. squamulosa (Willd. enum. suppl. p. 15.) the whole plant scaly from diaphanous papulae; leaves lanceolate; flowers capitate. Ἰ. D. G. Native of the Cape of Good Hope. Haw. rev. succ. p. 11. Flowers white. Said to be nearly allied to C. scabra.

17 C. bullula (Haw. rev. succ. p. 11.) leaves forate-lanceolate, and are, as well as the stems, roughish from whitish blisters; flowers cymose. Ἰ. D. G. Native of the Cape of Good Hope. Cotylédon, &c. Mart. cent. t. 24. Flowers said to be yellow. Allied to C. scabra, according to Haworth.

Prunose Crassula. Shrub 1 foot.
19 C. muricata (Thunb. prod. p. 55. fl. cap. p. 283.) stem frutescent, erect; branches tetragonal; leaves connate, trilobal, scariously ciliate, obtuse; flowers subumbellate. §. D. G. Native of the Cape of Good Hope. It differs from C. tetragona in the stem being erect, and in the leaves being scarious. Muricata Crassula. Shrub 1 foot.

21 C. cyclopodio'des (Lam. dict. 2. p. 173.) stem shrubby, branched, covered with leaves on all sides; leaves decussate, ovate, acute, smooth, imbricating in 4 rows; flowers axillary, sessile, bracteolate. §. D. G. Native of the Cape of Good Hope. Cr. imbricata, Ait. hort. kew. 1. p. 393. C. muscosa, Lin. spec. p. 405. Thunb. fl. cap. p. 281. ex Thunb. in litt. Corolla small, purple at the base. There is a variety of this plant having the stems naked at the base, according to Thunberg. Club-moss-like Crassula. Shrub tr.

§ 5. Perforatæ (from per, through, and fitum, a thread; in reference to the thread-like stems). Fruitescent or nearly herbaceous. Leaves flat, broader, glabrous, connate, usually glaucous. Haw. syn. p. 54.

26 C. margina'lis (Ait. hort. kew. 1. p. 306.) stem perennial, herbaceous, glabrous, pellucid; leaves connately perforate, roundish-ovate, ending in a recurved mucron, flat, spreading, glabrous, dotted within the margin; flowers disposed in umbellate corymb. §. D. G. Native of the Cape of Good Hope. Jacc. schenbr. 4. t. 471. C. marginata, Thunb. prod. p. 56. fl. cap. 287. Stems prostrate, jointed, rooting. Leaves reddish beneath, quite entire, with cartilaginous margins, which are at first reddish, but at length becoming white from farina. Peduncles terminal, with two lateral ones, rising from the axils of the upper leaves. Flowers white; petals lanceolate, acute. The characters and synonyms are taken from the manuscript of the Prince de Salm-Dyck.

28 C. pro'stra'ta (Thunb. prod. p. 56. fl. cap. p. 288.) stems herbaceous, decumbent, pellucid, glabrous; leaves lanceolate, acute; flowers subumbellate. §. D. G. Native of the Cape of Good Hope. Like C. pellícula, but differs in the form of the leaves.

Prostrate Crassula. Pl. prostrate.

29 C. centauri'o'des (Lin. spec. p. 404.) stems herbaceous, dichotomous, prostrate; leaves opposite, sessile, flat, oblong-ovate, glabrous, punctately toothed on the margins; peduncles axillary, 1-flowered. §. D. G. Native of the Cape of Good Hope. Sims. bot. mag. t. 1765. C. pellícula, Jacq. fragm. t. 44. f. 3. Flowers rose-coloured, nearly like those of C. spatulata; the ultimate ones somewhat corymbose.

Centuary-like Crassula. Pl. prostrate.

30 C. corda'ta (Ait. hort. kew. ed. 1. vol. 1. p. 396.) stem shrubby; leaves opposite, petiolate, cordate, obtuse, quite entire, dotted above, glabrous; cymes panicle-formed. §. D. G. Native of the Cape of Good Hope. D. C. pl. grass. t. 121. Jacq. schenbr. t. 431. Flowers reddish. Allied to C. perforáta. C. cordátà, Wild. spec. 1. p. 153. but the C. cordata of Thunb. appears to be a distinct plant, who says that his plant is annual, and that the flowers are solitary. Plant glaucous.

§ 7. Delto'idææ (leaves resembling in figure the Greek delta). Plants suffruticose. Leaves deltoid, sessile.

Leaves almost like those of *Mesembryanthemum deltoides*. Corymbs few-flowered; pedicels angular. Root fusiform.

**Deltoid-leaved Crassula.** Pl. ½ foot.

33 C. *corallina* (Lin. fil. suppl. p. 188.) leaves opposite, deltoid, obtuse, approximate, dotted; flowers in unumbellate corymbs; stems erect, dichotomously branched. b. Lin. 2. Thunb. D. G. Native of the Cape of Good Hope. Thunb. fl. cap. p. 290. Stem an inch high. Leaves nearly orbicular, white, and powdery at the apex, 1-2 lines long, longer than the internodes.

**Coralline Crassula.** Pl. 1 inch.

**Pubescent Crassula.** Pl. ½ foot.

35 C. *obicularis* (Lin. mant. p. 361.) radical leaves oblong, obtuse, cartilaginously ciliated, flat, rosulate; runners or twigs rising from the root; scape nearly naked; bundles of flowers opposite, pedunculate. 2. D. G. Native of the Cape of Good Hope.—Düll. elt. t. 100. f. 118. D. C. pl. grass. t. 43. C. sedioides, Mill. dict. no. 2. Herb 4-5 inches high. Petals greenish white, rose-coloured at the apex. Stigmata purple.

36 C. *rostralis* (Haw. rev. succ. p. 18.) leaves radial, obtuse, minutely ciliated, flat, rosulate; runners or twigs none; scape nearly naked; bundles of flowers opposite, pedunculate. 2. D. G. Native of the Cape of Good Hope. Very like *C. obicularis*, but differs in the plant being 3 times the size, destitute of runners, and in the flowers being 4-5-cleft and white; it is, however, probably only a variety of it.

**Strigose Crassula.** Pl. ½ foot.

§ 10. Tillaeoides (plants with the habit of *Tillaea*). Small subaquatic glabrous herbaceous plants, having 4-cleft flowers.

40 C. *nata* (Thunb. prod. p. 54. fl. cap. p. 281.) stems erect, dichotomous; leaves connate, linear-oblong, obtuse; pedicels axillary, opposite, shorter than the leaves; petals obovate, a little longer than the calyx. 2. B. G. Native about Cape Town, in ditches and other watery places. Tillaea *Capensis*, Lin. fil. suppl.

**Floating Crassula.** Fl. fl.

41 C. *ina* (Thunb. l. c.) stem erect, simple, branched at the apex; leaves perfoliate, ovate, obtuse; flowers corymbose; petals ovate-lanceolate, twice the length of the calyx. 2. D. G. Native of the Cape of Good Hope. Tillaea *perfoliata*, Lin. fil. l. c.

**Dwarf Crassula.** Pl. ½ foot.

42 C. *umbellata* (Thunb. l. c.) stem simple, erect; leaves on short petioles, ovate, obtuse; flowers umbellate. 2. D. G. Native of the Cape of Good Hope. Tillaea *umbellata*, Willd. spec. 1. p. 721.

**Umbellate-flowered Crassula.** Pl.

43 C. *decumbens* (Thunb. l. c.) stem erect or decumbent; leaves connate, terete, subulate; flowers pedicellate, fastigate at the base of the branches. 2. D. G. Native of the Cape of Good Hope. C. *Thunbergiana*, Schultes, syst. 6. p. 758. The stems are said to be decumbent in the diagnosis, but in the description erect. Scales very short, red.

**Decumbent Crassula.** Pl. decumbent.

† Species not sufficiently known.

* Leaves opposite.

44 C. *neglecta* (Schultes, syst. 6. p. 722.) stems herbaceous; leaves petiole, cordate, and are as well as the branches glabrous; flowers solitary. 2. G. Native of the Cape of Good Hope. C. cordata, Thunb. nov. act. nat. cur. 6. p. 330. fl. cap. p. 293, but not of others.

**Neglected Crassula.** Pl. ½ foot.

45 C. *expansa* (Ait. hort. kew. 1. p. 390.) stems herbaceous, dichotomous; leaves semicylindrical, subulate, channelled above, spreading; peduncles axillary, solitary, 1-flowered. 2. G. Native of the Cape of Good Hope. It is not known whether the leaves are opposite or alternate.

46 C. *diffusa* (Ait. hort. kew. ed. 1. vol. 1. p. 395.) stems herbaceous; leaves oblong, attenuated at the base, crenated; peduncles opposite the leaves and axillary, solitary. 2. G. Native of the Cape of Good Hope. Flowers pink? The rest unknown.

47 C. *subulata* (Lin. mant. p. 360.) stem herbaceous, branched; leaves opposite, terete, spreading; flowers capitate. 2. G. Native of the Cape of Good Hope. Herm. lindg. bat. 552 with a figure. Flowers white, ex Herm. and Petiv. gaz. t. 89. f. 8.

48 C. *sylvatica* (Licht. in Schultes, syst. 6. p. 726.) stem herbaceous, dichotomous, beset with stigrose hairs; leaves obovate-oblong, with the margin and base beset with stigrose hairs; flowers terminal and axillary, solitary.—Native of the Cape of Good Hope. The rest unknown.

**Wood Crassula.** Pl. ?

49 C. *abscændens* (Thunb. nov. act. nat. cur. 6. p. 341.) stem suffrutescent, decumbent; branches erect, filiform above,
and naked; leaves connate, triquetrose, entire, spreading, glabrous; corymb compound. \( \text{h}. \) D. G. Native of the Cape of Good Hope. This plant is omitted in Thunberg's flora, cap. and prod. and is therefore doubtful.

Ascending Grassula. Pl. decumbent.

50 C. ? ALBA (Forsk. descr. 60. but not of Hortul.) stem simple; leaves opposite, crowded, sheeting, lanceolate, cartilaginously ciliated; peduncles dichotomous; flowers corombose.—Native of Arabia, on the mountains of Hadie and Boka. Flowers white, 5-parted.

White-flowered Grassula. Pl. \( \frac{1}{2} \) foot.

51 C. ? LINOLEATA (D. C. prod. 3. p. 590.) stem herbaceous; leaves cordate, sessile; peduncles nearly terminal, axillary, approximate, umbel-formed. \( \text{c}. \) D. G. Native of the Cape of Good Hope. Sims, bot. mag. 1765. Flowers yellow. Mr. Haworth has placed this species between C. retroflexa and C. centaurioides; but C. retroflexa is now referrible to Grammánthes, and therefore this species is probably a species of that genus.

Lined-leaved Grassula. Fl. June, Aug. Clt. 1774. Pl. \( \frac{1}{2} \) ft.

52 C. ? AGARDHIANA (Schultes, syst. 6. p. 718.) stem suffrutescent, twisted, branched; branches naked; radical leaves ovate, imbricated; cauline ones remote, alternate. \( \text{h}. \) D. G. Native of the south of Spain. According to the description this is a species of Sédum or Sempervivum.

Agardh's Grassula. Pl. \( \frac{1}{2} \) foot.

** Alternifolíae. The leaves being alternate in the following plants, they are probably species of Sédum.

53 C. ? MICROCARPA (Sibth et Smith, fl. græc. prod. 1. p. 217.) leaves oblong; stem thickened; capsule angular, dotted, mucil. \( \circ \). H. Native of the island of Cyprus, among rocks.

Small-fruited Grassula. Pl. \( \frac{1}{2} \) foot.

54 C. ? PULCHELLA (Ait. hort. kew. ed. 1. vol. 1. p. 392.) leaves ovate-oblong, fleshy, reflexed; stem herbaceous, dichotomous; flowers pedunculate in the forks; peduncles turbinate. \( \circ \). G. Native of the Cape of Good Hope. Haw. succ. p. 12. Lobes of calyx leaf-formed, spreading, \( 2 \) short, and \( 3 \) about equal in length to the petals, which are ovate and acute. Flowers pink.

Neat Grassula. Fl. July. Clt. 1810. Pl. \( \frac{1}{2} \) foot.

55 C. ? SALSA (Ait. l. c. p. 395.) stems herbaceous; leaves alternate, rather spatulate, acute, quite entire; racemes compound. \( \text{c}. \) D. G. Native of the Cape of Good Hope. Flowers white?

Scattered Grassula. Fl. June, July. Clt. 1774. Pl. \( \frac{1}{2} \) foot.

N. B. Plants formerly included in the genus Crassula, but are now to be excluded from the order.

1 C. ? ALTERNIFOLIA (Lin. hort. cltv. p. 497, according to the figure in Burm. afr. p. 58. t. 24. f. 1.) is probably a species of Bourrignaea, and perhaps B. ciliata.

2 C. ? PINNATA (Lour. coch. p. 185.) is a plant far separated from Crassula, and most probably belonging to the order Terebinthiaceæ. C. pinnata of Dum. Cours. is a species of Bryophyllum or Kalanchœ. The C. pinnata of Lin. fil. suppl. 191. is probably the same plant as Loureiro's.

Cult. Crassula is an extensive genus of rather ornamental plants, and some of which are rather grotesque. A mixture of loam, sand, and brick rubbish, is the best soil for them. Cuttage root very readily if dried for a few days, after being cut off from the plants before being planted. The seeds of the annual species should be sown in pots, and when the plants have grown a little may be separated, and planted into other pots. All the species are well fitted for a dry stove, or to be placed on shelves erected in a greenhouse.

Lin. syst. Pentandria, Pentagynia. Calyx 5-parted, much shorter than the corolla. Petals 5, imbricated at the base, mucronulate beneath the apex. Stamen 5; filaments subulate. Scales 5, marginale. Carpels 5, flat inside, and gibbous on the outside.—Herbaceous half naked plants. Leaves for the most part radical. Inflorescence spicately thyrsoïd. Flowers in whorles, almost sessile. The species are probably all biennial.

§ 1. Linguéfolíae (from lingua, a tongue, and folium, a leaf; form of leaves). Leaves lorately tongue-formed, thick, acutish. Haw. l.c.

1 P. LINGUEFÓLIA (Haw. rev. succ. p. 14.) lower leaves distinct, opposite, tongue-formed, ciliated, pubescent; stem leafy; flowers verticillate, crowded, sessile. \( \text{Y}. \) or \( \text{c}. \) D. G. Native of the Cape of Good Hope. Crássula linguéfolia, Haw. misc. nat. p. 175. Stem simple, a foot high. Corolla ampulliform, from green to white. Perhaps only a variety of P. tomentósa.

2 P. TOMENTÓSA (Haw. rev. succ. p. 14.) radical leaves oblong-lanceolate, imbricated, bluntish, villous, ciliated; stem nearly naked; flowers verticillate. \( \text{Y}. \) or \( \text{c}. \) D. G. Native of the Cape of Good Hope. Crássula tomentósa, Lin. fil. suppl. p. 190. Stem erect, angular, villous, a foot high. Flowers white.

4 P. PERTUSÁLIA (Haw. in phil. mag. 1828. p. 184.) leaves lanceolate, recurved, beset with impressed dots on both surfaces; upper bracteas cordate, entire; scape panicled. \( \text{c}. \) D. G. Native of the Cape of Good Hope. Corolla snow white.

5 P. hírta; radical leaves lanceolate, hairy; stem herbaceous, erect, nearly naked, rather pubescent; heads of flowers verticillate. \( \text{c}. \) D. G. Native of the Cape of Good Hope. Crássula hírta, Thorn. fl. cap. 284. Like P. spicátà. Leaves fleshy, white, erect, acute. Flowers white.

Hairý Purgosia. Pl. \( \frac{1}{2} \) to 1 foot.

6 P. CEPAHOLóPHORA; radical leaves connate, linear-oblong, obtuse, entire; stem nearly naked, erect; heads of flowers opposite, pedunculate. \( \text{c}. \) D. G. Native of the Cape of Good Hope. Crássula cephalóphora, Lin. fil. suppl. p. 190. Thuin. fl. cap. 287. Flowers white. Leaves long.

Head-bearing Purgosia. Pl. \( \frac{1}{2} \) foot.

7 P. CRENULÁTA; leaves connate, lanceolate, obtuse, punc- tately crenulated, glabrous; stem herbaceous, erect, glabrous, terete; corymb decompound. \( \text{c}. \) D. G. Native of the Cape of Good Hope. Crássula crenuláta, Lin. fil. suppl. p. 189. Thuin. fl. cap. p. 287. Flowers white.

Crenulated Purgosia. Pl. 1 foot.
CRASSULACEÆ. VI. Purgosia.

§ 2. Ovatifolious (from ovas, ovate, and folium, a leaf). Leaves ovate, oval, or obovate.

Alp Purgosia. Pl. ½ foot. ɣ. D. G. Native of the Cape of Good Hope. Crassula montana, Lin. fl. suppl. p. 190. Thumb. fl. cap. 286. nov. act. nat. cur. 6. p. 336. t. 56. f. 4. Allied to Crassula montana, but differs in the leaves being more acuminate, not ciliate, in the stem being thicker, and clothed with leaves, and in the flowers being larger.

Hemispherical Purgosia. Pl. ½ foot. ɣ. D. G. Native of the Cape of Good Hope. Crassula montana, Lin. fl. suppl. p. 190. Thumb. fl. cap. 286. nov. act. nat. cur. 6. p. 336. t. 56. f. 4. Allied to Crassula montana, but differs in the leaves being more acuminate, not ciliate, in the stem being thicker, and clothed with leaves, and in the flowers being larger.

leaves obliquely cuneate-ovate, dark purple; scape or flower bearing stem, very long, and panicked. 2. D. G. Native of the Cape of Good Hope. Crassula obliqua, Haw. rev. succ. p. 204. It approaches very near G. cultrata, but differs in the florescence. Flowers white.

1/2 to 1 foot.

§ 2. Linguatæ (from lingua, a tongue; form of leaves). Leaves lorate, obtuse, convex beneath, or narrow tongue-formed, imbricating exactly in 4 rows. Stem very short or herbaceous. Scapes or floriferous stems naked. Haw. in phil. mag. 1824. p. 191.

4 G. lingua (Haw. in phil. mag. 1824. p. 28.) leaves elongated, lorate, ventricosely semi-lanceolate, culitate, and as are well as the calyces ciliated. 2. D. G. Native of the Cape of Good Hope. Leaves without dots. Flowers panicked, white; anthers yellow.

Tongue-leaved Globulea. Fl. Ju. Clt. 1823. Pl 1 ft. 5 G. lingulæ (Haw. l. c. p. 29.) leaves rather elongated, ventricosely semi-lanceolate, culitate, thin, flaccid. 2. D. G. Native of the Cape of Good Hope. Very like the preceding, but the preceding, being much larger.

6 G. capitata (Haw. rev. succ. p. 17.) leaves ventricosely lanceolate, culitate, rather convex beneath, imbricately decussate, when young hoary. 2. D. G. Native of the Cape of Good Hope. Crassula capitata, Salm-Dyck, cat. 1820. p. 14. but not of Lam. Very like G. obvallată, but larger, and the leaves are more aciniform, usually an inch and a half broad.

8 G. cænescens (Haw. syn. p. 61.) leaves all radical, decussately imbricated, ciliated, lorate lanceolate, bent, culitate, canescent. 2. or D. G. Native of the Cape of Good Hope. Crassula canescens, Salm. sect. 6. p. 734. An intermediate species between G. obvallata and G. nudicaulis.

9 G. nudicauïlis (Haw. syn. p. 61.) stemless; leaves radical, crowded, rosulate, semi-terete, subulate, acute, rather pubescent; scape nearly naked; heads of flowers somewhat ventricosely convolute, glomerated at the apex of the scape. 2. or D. G. Native of the Cape of Good Hope. Crassula nudicaulis, Lin. spec. p. 405. D. C. pl. grass. t. 132.—Dill. hort. elth. p. 115. t. 97. f. 114. Flowers white.

10 G. sulcata (Haw. rev. p. 18.) stemless; leaves incurved, subulate, semi-terete, deep green, shining, broadly channelled. 2. or D. G. Native of the Cape of Good Hope. Very like G. nudicaulis, but differs in being glabrous, and in the leaves being broadly furrowed above.

11 G. impresa (Haw. in phil. mag. 1824. p. 189.) plant stemless; leaves lorately-lanceolate, green, full of impressed dots; dots large, scattered, numerous. 

14 G. Mesembryanthemoides (Haw. l. c. p. 190.) stems suffrutiçose, bushy, erect; leaves subulate, and are as well as the branches, branchlets, and calyces hispid. 

12 G. paniculatâ (Haw. in phil. mag. 1825. p. 29.) leaves aruncate, acuminate, green, beset with minute impressed dots; branches of panicle spike-formed. 

106

CRASSULACEÆ. VII. GLOBULEA. VIII. Curtogyne. IX. Grammánthes.

Florescence disposed in umbellate cymes. Flowers white. —This is an intermediate genus between Crassula and Röchea.

1 C. unduláta (Haw. rev. p. 8.) leaves oblong, or ovate-tongue-shaped, expanded: upper ones waved. 

12 G. paniculatâ (Haw. in phil. mag. 1825. p. 29.) leaves aruncate, acuminate, green, beset with minute impressed dots; branches of panicle spike-formed. 

106

CRASSULACEÆ. VII. GLOBULEA. VIII. Curtogyne. IX. Grammánthes.

1 C. unduláta (Haw. rev. p. 8.) leaves oblong, or ovate-tongue-shaped, expanded: upper ones waved. 

12 G. paniculatâ (Haw. in phil. mag. 1825. p. 29.) leaves aruncate, acuminate, green, beset with minute impressed dots; branches of panicle spike-formed. 

106

CRASSULACEÆ. VII. GLOBULEA. VIII. Curtogyne. IX. Grammánthes.

1 C. unduláta (Haw. rev. p. 8.) leaves oblong, or ovate-tongue-shaped, expanded: upper ones waved. 

12 G. paniculatâ (Haw. in phil. mag. 1825. p. 29.) leaves aruncate, acuminate, green, beset with minute impressed dots; branches of panicle spike-formed. 

106

CRASSULACEÆ. VII. GLOBULEA. VIII. Curtogyne. IX. Grammánthes.

1 C. unduláta (Haw. rev. p. 8.) leaves oblong, or ovate-tongue-shaped, expanded: upper ones waved. 

12 G. paniculatâ (Haw. in phil. mag. 1825. p. 29.) leaves aruncate, acuminate, green, beset with minute impressed dots; branches of panicle spike-formed. 

CRASSULACEÆ. X. ROCHEA. XI. KALOSANTHES.

LIN. SYST. Pentandria, Pentagynia. Calyx 5-lobed. Petals 5, united into gamopetalous hypocotyliform corolla; with a short tube, equal in length to the spreading limb, or shorter than it. Stamens 5, alternating with the petals, a little exserted. Glands and carpels 5.—Tall, fleshy, simple, succulent shrubs. Leaves opposite, connate at the base, thick, white. Flowers disposed in terminal corymbs, without any bracteas.

Var. β, minor (Haw. rev. succ. p. 3.) all parts of the plant smaller.

Sickle-leaved Rochea. Fl. Ju. Sept. Cl. 1795. Sh. 3 to 8 ft.

Var. β, albiflora (Haw. l. c.) flowers white. Crassula perfollata, D. C. pl. grass. t. 13.—Dill. hort. elth. f. 113. Mill. fig. t. 108. Comm. præl. t. 23. without any flower, and is therefore referrible to Aðie pertusa, Haw. in Lin. trans. 7. p. 25.

3 R. ALBIFLORA (D. C. prod. 3. p. 393.) leaves distinct, ovate, acuminate, spreading, cartilaginozously ciliated. ɣ. D. G. Native of the Cape of Good Hope. Crassula albiflora, Sims. bot. mag. t. 2391. Flowers white, disposed like those of R. falcata, but larger than those of R. perfollata. Anthers blackish, and a little more exerted than those of the other species.

White-flowered Rochea. Fl. July, Aug. Cl. 1800. Shrub 2 to 3 feet?

Cult. Large, succulent plants, elegant when in flower. Their culture, propagation, and treatment are the same as that recommended for Globolæa, p. 106.

LIN. SYST. Pentandria, Pentagynia. Calyx 5-lobed (f. 26. a.). Petals 5, united into a gamopetalous hypocotyliform corolla (f. 26. a.), with a cylindrical tube 2 or 3 times longer than the spreading limb (f. 26. a.). Stamens 5, alternating with the petals; anthers in the throat of the tube of the corolla. Glands and carpels 5. Succulent shrubs. Leaves opposite, oval, or oblong, connate, flat, cartilaginozously ciliated. Flowers disposed in cymose umbels or heads, involucrated with numerous bracteas.

1 K. COCCINEA (Haw. rev. p. 18.) leaves connate and sheathing at the base, ovate-oblong, acutish. ɣ. D. G. Native of the Cape of Good Hope. Larochea coccinea, Haw. syn. p. 50. Crassula coccinea, Lin. spec. Curt. bot. mag. t. 495. Dietrichia coccinea, Tratt. thes. t. 19.—Comm. rar. t. 24. Bradl. succ. t. 50. Burn. a. f. t. 23. f. 1. Flowers scarlet; tube an inch long. According to Breyn. prod. 3. t. 20. f. 1. there is a variety with flesh-coloured flowers; and according to Bradl. succ. t. 50. and Haw. rev. p. 8. there is a variety with white flowers, but in the gardens it is not to be found but with scarlet flowers.

Scarlet-flowered Kaloanthes. Fl. June, Aug. Cl. 1710. Shrub 1 to 3 feet.

3 K. VERSCOLOR (Haw. rev. p. 7.) leaves oblong-lanceolate, acute, connate and sheathing at the base; stem erect, branched; flowers in umbellate heads. ɣ. D. G. Native of the Cape of Good Hope, on the Table Mountain. Crassula versicolor, Burch, ex Ker. bot. reg. t. 320. Rōchæa versicolor, D. C. prod. 3. p. 394. Flowers about the size of those of K. coccinea, having the tube white, and the segments of the limb oval, white in the middle, edged with scarlet. Calyx as long as ⅔ of the tube of the corolla.

4 K. ODORATISSIMA (Haw. rev. p. 7.) leaves linear-lanceolate, gradually acuminate, connate; stem-clasping; flowers in umbellate heads; segments of the corolla oblong, acutish. ɣ. D. G. Native of the Cape of Good Hope. Crassula odoratissima, Andr. bot. rep. t. 26. Jacq. hort. schœnbr. t. 434. Larochea odoratissima, Haw. syn. p. 51. Dietrichia odoratissima, Tratt. Rōchæa odoratissima, D. C. prod. 3. p. 394. The flowers are yellow, according to Andrews; yellowish, Haworth; but with red claws and white lamina, according to Jacquin; they have the scent of those of Polyanthus tuberosus, or Tube-rose.

Var. β, alba (D. C. prod. 3. p. 394.) flowers white. ɣ. D. G. Native of the Cape of Good Hope. Crassula capitata, Lodd. bot. cab. t. 1029. Leaves less ciliated, according to the figure, than those of the species.

5 K. BICOLOR (Haw. rev. p. 7.) flowers capitata, sessile, yellow, and scarlet. ɣ. D. G. Native of the Cape of Good Hope. Very like the preceding species, but larger and more rigid, and the leaves are more acute.

Yellow-flowered Kaloanthes. Shrub 1 to 2 feet?

10 K. FASCICUL'AT'IS (Schultes, syst. 6. p. 709, under Röchea,) leaves comatose sheathing at the base, linear-lanceolate; flowers in fascicles; segments of the calyx lanceolate, acute, ciliated. ɣ. C. G. Native of the Cape of Good Hope. Crassula fasicul'aris, Lam. dict. 2. p. 171. Leaves glabrous, cartilagineously ciliated. Corolla almost as in K. cocinea, but is a little shorter.

Fascicled-leaved Kalosanthes. Shrub 1 to 2 feet.

Cult. Elegant succulent shrubs, worth cultivating in every collection for the beauty of their flowers. The culture, propagation, and treatment they require are the same as that recommended for Globularia, p. 106.

LIN. SYST. OCTÁN'DRIA, TETRAGAYÓ. Calyx 4-parted (rarely 5-parted); sepal united only at the very base, lorate, acute, sparsely recurved at the apex. Corolla gamopetalous, hypocrateriform with an obvively clavate tube, and a 4-parted (rarely 5-parted) spreading limb. Stamens 8, 4 of which are adnate to the tube, nearly to the middle, the other 4 almost to the apex. Scales 4, linear, but almost obsolete in the K. vár'ians. Carpels 4, continuous, with the filiform styles.—Succulent subshrubs, from 1 to 2 feet high, erect, a little branched. Leaves opposite, fleshy, more or less irregularly impari-pinnate, or ovate, toothed or serrated, and often of a glaucous hue. Flowers disposed in loose cymose terminal panicles, yellow, or rufescent, rarely white, scentless. This is a very natural genus.

* Leaves pinnatifid.

* * Leaves simple; but in K. vár'ians some of them are tricuspidate.

6 K. LANCEO'LÁTA (D. C. prod. 3. p. 395.) leaves lanceolate, crenated at the apex; segments, pubescent, calyces, and corollas, villous; cymes panicked. ɣ. D. G. Native of Arabia. Cotyledon lanceolátá, Forsk. desc. p. 89. Flowers said to be reddish yellow, that is, probably brown.

Lanceolate-leaved Kalanchoe. Shrub 1 to 2 feet.

7 K. BRASILÍ'NIS (St. Hili. fl. bras. 2. p. 196.) puberulous; lower leaves roundish; middle ones obovate-lanceolate; upper ones linear; all crenately serrated; cymes dense; lobes of corolla very acute. ɣ. D. S. Native of Brazil, near Rio Janeiro by the sea side. Corolla with a yellow tube, and a rose-coloured limb. This plant seems to be an exception from the exciting and acid properties peculiar to the rest of Crassuláceae, it being used by the Brazilians in their domestic medicine.

Brazilian Kalanchoe. Shrub 1 to 2 feet.

Alternating Kalanchoe. Shrub 1 to 2 feet.

9 K. RÔN'DIFÓLÍÁ (Haw. in phl. mag. July, 1825. p. 51.) plant straight and slender; leaves thick: lower ones roundish: upper ones obovate, and almost entire; flowers small. ɣ. D. G. Native of the Cape of Good Hope. Flowers rufescent or yellow.

Cult. The species of Kalanchoe being succulent, require very little water unless when growing freely; and the pots in which they are grown ought to be well drained with shers. A mixture of loam and sand appears to be the best soil for them. The species are easily increased by cuttings. A leaf taken off any
of the species, and laid on the pot of mould, or on a tan-bed, will shoot out young plants from the notches on the edges of the leaf.

XIII. BRYOPHYLLUM (from βρυο, bryo, to sprout, and φυλλον, phyllon, a leaf; plants spring from the notches on the edges of the leaves when taken off the plant, and placed in a moist situation). Salisb. par. 3. D. C. prod. 3. p. 395.—Crassovià, Comm. mass.—Physocalyçium, Vest. in fl. 1820. p. 409.—Cotalylæ species, Lam.—Calanchoê species, Pers.

LIN. SYST. Octândria, Tetrâgynia. Calyx inflates, bladdery before flowering, hardly 4-cleft to the middle; lobes 4, valvate. Corolla gamopetalous, hypogynous, having a long cylindrical tube, which is bluntly tetragonal at the base; and the lobes of the limb triangular and acute. Stamens 8, adnate to the base of the tube. Glánds 4, oblong.—A fleshy, erect, branched, glabrous shrub. Leaves opposite, thick, petiolate; some impari-pinnate, with one or 2 pairs of segments, the terminal segment large; others solitary, all ovate and crenated; crenae bearing an opaque dot in each, which is easily made to evolve into a plant. Cymes panicled, terminal. Flowers yellowish red, or green and red. Calyx almost like that of Silâne infâta.

Large-calyxed Bryophylum. Fl. April, July. Clt. 1806. Shrub 2 to 8 feet.

Cult. See Calanchoê above for culture and propagation.

LIN. SYST. Decândria, Pentâgynia. Calyx 5-parted, much shorter than the tube of the corolla. Corolla gamopetalous; tube ovate-cylindrical; limb 5-lobed, spreadingly reflexed or revolute; lobes obutate. Stamens 10, adnate to the base of the tube of the corolla; the upper part free, exserted or almost inclosed. Scales oval. Carpels 5, continuous, with the styles, which are subsulate.—Fleshy shrubs, native of the Cape of Good Hope. Leaves usually scattered. Flowers loose, panicled, purplish or orange-coloured. This genus has been divided into sections from the form of the corolla by the Prince Salm-Dyck, but the corolla being unknown in a great many of the species we cannot follow these divisions.

* Leaves opposite.

1 C. unbûlata (Haw. suppl. 20. rev. 20.) leaves opposite, rhomboïd-ovate, with an acumen, pale green; older ones large and very thick, margined with red at the apex; when young lean and waved. ἦς, D. G. Native of the Cape of Good Hope. Flowers unknown. Very similar to C. orbiculâta, but the stem is more humble, and the leaves longer, and less obtuse at the apex. Salm-Dyck, in litt.

Var. a, rotundifolia (D. C. prod. 3. p. 396.) leaves roundish.

Var. β, orbiculâta (D. C. l. c.) leaves orbiculate, margined with red.—C. orbiculâta, Haw. l. c. C. orbiculâta var. a, D. C. pl. grass. t. 76. Curt. bot. mag. t. 921.—Mor. oxon. sect. 12. t. 7. f. 39. Herm. lugd. bat. 551. with a figure.

Var. γ, orbiculata (D. C. l. c.) leaves orbiculate. C. orbiculâta, Haw. l. c.

Var. δ, orbiculata (Salm-Dyck. in litt.) leaves orbiculate, white, and mealy; stem tall, firm, a little branched. C. orbiculâta, Haw. suppl. p. 20.

Var. ε, orbiculata (Salm-Dyck. in litt.) leaves ovate-spulate, white, and mealy; caudex much branched; branches effuse. C. orbiculâta, Haw. suppl. p. 20. C. ramosissima, Mill. dict. C. orbiculata γ, Ait. hort. kew.

3 C. crassifôlia (Haw. in phil. mag. 1826. p. 272.) stem erect, shrubby; plant white from mealiness; leaves rhomboïd, obcutene, thick. ἦς, D. G. Native of the Cape of Good Hope. Leaves distant, decussately opposite, edged with brownish purple on the margin above the middle. Flowers not seen.

Thick-leaved Cotyledon. Clt. 1824. Shrub 1½ to 3 feet.

4 C. vîrîdens (Haw. in phil. mag. 1826. p. 272.) stem shrubby, erect, nearly simple; leaves ovate-cuneate, green. ἦς, D. G. Native of the Cape of Good Hope. Leaves middle-sized, lean. In habit it follows C. crassifôlia.

Green Cotyledon. Clt. 2 to 4 feet.

5 C. ramosissima (Haw. suppl. p. 25.) leaves oblong-spulate, fariâsously margined with red at the apex; caudex much branched; young branchlets erect; old ones twisted, and crowded. ἦς, D. G. Native of the Cape of Good Hope. C. orbiculata, Lin. fil. suppl. Flowers unknown. Leaves not half the size of those of the smallest variety of C. orbiculata, hardly 15 lines long, and 9 lines broad.

7 C. ungulâta (Lin. dict. 2. p. 139.) leaves opposite, semi-cylindrical, channelled, glabrous, purple, and furnished with a callous point at the margin near the apex; flowers in a kind of panicle, glabrous; caudex erect. ἦς, D. G. Native of the Cape of Good Hope. Burm. aîr. dec. 3. p. 24. t. 22. f. 1. Flowers purplish, pendulous. Very like C. orbiculata.

Claw-leaved Cotyledon. Shrub 1 to 2 feet.

9 C. tricuspidâta (Haw. in phil. mag. 1825. July, p. 32.) plant white from mealiness; leaves narrow, usually deeply tricûspîdâta. ἦς, D. G. Native of the Cape of Good Hope.
Very like *C. papillaris*, but differs in the leaves being tricuspidate.

*Tricuspidate-leaved Cotyledon.* Clt. 1823. Shrub 1 foot.

10 **C. purpurea** (Thunb. fl. cap. p. 396.) leaves opposite, linear-oblong, fleshy, concave, glabrous; flowers panicked, glabrous; caudex erect, nearly herbaceous. \(\ddot{c}.\) D. G. Native of the Cape of Good Hope. Corolla purple, an inch long.

*Purple-flowered Cotyledon.* Shrub 1 foot.

11 **C. teretifolia** (Thunb. prod. p. 83. fl. cap. p. 397. but not of Lam.) leaves opposite, nearly terete, fleshy, hairy, obtuse, with an acumen; flowers panicked, hairy, caudex erect, simple. \(\ddot{c}.\) D. G. Native of the Cape of Good Hope.

*Terete-leaved Cotyledon.* Shrub 1 foot.

12 **C. cuneiformis** (Haw. in phil. mag. March, 1826. p. 185.) stems short, branched; leaves crowded, obovate, mucronate, rather white from mealliness. \(\ddot{c}.\) D. G. Native of the Cape of Good Hope. Like *C. crassifolia*, but much more humble.

*Wedge-leaved Cotyledon.* Shrub 1 foot.

**Leaves alternate, marcescent.**

13 **C. curviflora** (Sims, bot. mag. t. 2044.) leaves scattered, semicylindrical, glabrous; cicatrices of the stem, where the old leaves have fallen off, rather prominent; flowers panicked, nodding; calyces loose; tube of corolla pentagonal, incurved. \(\ddot{c}.\) D. G. Native of the Cape of Good Hope. Flowers of a dirty yellow-colour, almost reddish, about an inch long. Styles longer than the stamens.

14 **C. tuberculosa** (Lam. dict. 2. p. 139.) leaves scattered, subcyllindrical, linear-oblong, acute; cicatrices of the old leaves tubercular; flowers subpanicled, erect; peduncles and calyces pubescent. \(\ddot{c}.\) D. G. Native of the Cape of Good Hope.—Burman. at. 20. f. 1. **C. grandiflora**, N. L. Burm. prod. fl. cap. 13. **C. tuberculosa**, D. C. pl. grass. t. 86. Flowers showy, orange-coloured, tubular, an inch or more long; limb spreading, not repicate.

15 **C. cacaloides** (Lin. suppl. p. 242.) leaves scattered, terete, acute; cicatrices of the old leaves pitted; flowers panicked, erect, seated on a long, elongated, nearly naked stem. \(\ddot{c}.\) D. G. Native of the Cape of Good Hope. Burman. at. 20. f. 2. Flowers yellow, rather villous, half an inch long. Leaves deciduous when the plant is in flower; hence Burmann called it *C. aphylla*.

16 **C. ventricosa** (N. L. Burm. prod. fl. cap. p. 13.) leaves scattered, linear-oblong, acute at both ends; cicatrices on old stems tubercular; flowers in loose racemes, pedicellate, erect; tube ventricose, pentagonal; lobes acute. \(\ddot{c}.\) D. G. Native of the Cape of Good Hope. Burman. at. dec. 3. p. 51. t. 21. f. 1. Flowers greenish, almost like those of *C. hemispheirica*. Leaves like those of *C. tuberculosa*, according to Burman.

*Ventricose-flowed Cotyledon.* Shrub 1 to 2 feet.

17 **C. spuria** (Lin. spec. p. 614.) exclusive of the synonyms, leaves almost radical, terete, oblong, fleshy, obtuse, narrower at the base; caudex very short, thick; flowering stem erect, naked; flowers somewhat panicked. \(\ddot{c}.\) D. G. Native of the Cape of Good Hope. Burman. at. 43. t. 19. f. 1. Pluk. alm. t. 323. f. 1.—Willd. spec. p. 754. **C. teretifolia**, Lam. dict. 2. p. 139. but not of Thunb.

18 **C. fasciculare** (Ait. hort. kew. ed. 1. vol. 2. p. 106.) leaves scattered, but in fascicles at the tops of the branches, cuneiform, obtuse, flat, thick; caudex thickened, branched; flowers panicked, pendulous, with revolute limbs. \(\ddot{c}.\) D. G. Native of the Cape of Good Hope. Burman. fl. cap. p. 396. *ex* Burman. syn. *C. radians*, Bochl. nav. t. 37. Corolla with a short, greenish, broad, subpentagonal tube, and a reddish revolute limb.

**Leaves alternate, permanent.**

19 **C. triflora** (Thunb. prod. p. 83. fl. cap. p. 396.) leaves scattered, oblong-spatulate, obtuse, fleshy, of a greyish shining colour; flowers by threes, in spikes, approximate, with repicate limbs; stem suffrutescence. \(\ddot{c}.\) D. G. Native of the Cape of Good Hope, near Zehorivier. Salm-Dyck. obs. p. 6. **C. elata**, Haw. suppl. Corolla with a green tube, and an acute limb, variegated with white and purple.

20 **C. macula** (Salm-Dyck. obs. p. 5.) leaves scattered, ovate-spatulate, somewhat auriculatus at the base, fleshy, shining, marked with dark red spots on both surfaces; flowers spicate, almost alternate; limb spreading; stem suffruticos. \(\ddot{c}.\) D. G. Native country unknown. **C. altamura**, Haw. suppl. ex Salm-Dyck. but not of Vahl. Spike terminal, generally simple. Tube of corolla green, subventricose, with the segments of the limb acute, variegated with white and purple.

21 **C. rhombifolia** (Haw. in phil. mag. 1825. July. p. 38.) leaves approximate, ovoborate-romboid, mucronate, white and mealy; stem branched, strong, decumbent. \(\ddot{c}.\) D. G. Native of the Cape of Good Hope. Allied to *C. hemispheirica*, but more humble and branched, and the leaves are rhomboid, and more acuminate. Flowers unknown.

*Romb-leaved Cotyledon.* Clt. 1823. Shrub decumbent.

22 **C. jasminiflora** (Salm-Dyck. obs. Haw. rev. p. 20.) leaves rather crowded, green, rhomboide-spatulate, fleshy; stem humbe; peduncle terminal, branched; flowers erect, with a green tube, and a revolute limb, variegated with white and purple; pedicels long, thicken. \(\ddot{c}.\) D. G. Native of the Cape of Good Hope. Allied to *C. hemispheirica*, but the stems are more humble, thickened from the root; the leaves longer, and the flowers with the tube and limb more ample, and more like a jasmine flower. Salm-Dyck in litt.

23 **C. hemispheirica** (Lin. spec. p. 614.) leaves scattered, ovate-roundish, thick, dotted, glabrous; flowers nearly sessile, erect, along an elongated peduncle; lobes of corolla spreading. \(\ddot{c}.\) D. G. Native of the Cape of Good Hope.—Dill. cith. 2. t. 95. f. 111. *C. hemispheirica*, D. C. pl. grass. t. 87. Flowers small, with a green tube, and the limb variegated with white and purple.

24 **C. rotundifolia** (Haw. in phil. mag. 1826. p. 273.) shrubby, dwarf; leaves straight, crowded, roundish, dirty green; branches short, decumbent. \(\ddot{c}.\) D. G. Native of the Cape of Good Hope. Leaves flat, convex beneath, mealy. Allied to *C. hemispheirica*.

*Round-leaved Cotyledon.* Shrub decumbent.

25 **C. mahillbris** (Lin. suppl. p. 242.) leaves scattered, crowded into something like whorls, terete, ovate, obtuse, glabrous; flowers spreading on short pedicels, which are seated on an elongated peduncle; stem creeping. \(\ddot{c}.\) D. G. Native of the Cape of Good Hope, near Olyphants Bad. Thunb. fl. cap. p. 397. *Haw. rev. p. 21. suppl. 22.* Corolla tubular, glabrous, with a green tube, and a spreading reflexed limb, which is variegated with white and purple.

ated, fleshy, hairy, with purple margins; stem erect, somewhat herbaceous, pubescent, viscid; corolla hairy. £. D. G. Native of the Cape of Good Hope.

Very like C. spatia', but differs in being higher, in the leaves being shorter, thicker, and narrower, more channelled, and without doubt incurved.

Close-like Cotyledon. Stem 1 foot. 29 C. muscouna' (Lam. dict. 2. p. 142.) leaves nearly radical, oval, flat, with undulated margins, mucronate at the apex; stem branched, very short; floriferous stem naked; flowers erect, in loose panicles. £. D. G. Native of the Cape of Good Hope. Burm. afr. p. 44. t. 19. f. 2. C. undulata, Haw. Lobes of corolla acute.

30 C. reticula' (Thumb. fl. cap. p. 393.) leaves scattered at the tops of the branches, terete, acute, erect, soft, glabrous; stem erect, shrubby, fleshy; flowers erect, in dichotomous panicles. £. D. G. Native of the Cape of Good Hope, in Carro. Caudex a hand high. Panicle compound.

Reticulated Cotyledon. Shrub ½ foot. 31 C. dichoto'ma (Haw. suppl. 27. ex rev. 22.) leaves channelled; cymes dichotomous, puberulous, bracteated by spines; tube of corolla somewhat bottle-formed, with a replicate limb. £. D. G. Native of the Cape of Good Hope.

Dichotomous Cotyledon. Shrub ½ to 1 foot. 32 C. па'vula (Bureh. cat. geogr. no. 1818. ex voy. cap. 1. p. 219.) leaves oval, rather compressed, thick; panicle dichotomously branched; pedicels erect, very long, capitillary; stem erect. £. D. G. Native of the Cape of Good Hope. Plant 6-9 inches high.

Small Cotyledon. Pl. £ to 1 foot. 33 C. та'zuka (Bureh. trav. afr. 2. p. 226.) stemless; leaves glabrous, flattened, fleshy, cuneate-oval or nearly orbicular; flowers erect, alternate on an elongated simple scape, rarely on a bifid one. £. D. G. Native of the Cape of Good Hope. Corolla cylindrical, purplish, with a short reflexed limb, and a purple throat. Carpels 3.

Trigynous Cotyledon. Pl. £ to 1 foot. 34 C. cresc'ta (Haw. phil. mag. 1827, April 1, p. 123.) leaves petiolate, cuneately triangular, curled and crested at the apex. £. D. G. Native of the Cape of Good Hope. Herb succulent, leafy, evergreen. Stem short, with the surculi densely clothed with rufous hairs. Leaves erect, an inch long, thick, purplish at the apex, beset with dots of scurfy down. Spikes terminal. Flowers small, open in the morning.

Crested Cotyledon. Pl. Sept. Cult. 1820. Pl. £ foot. 35 C. clavifolia (Haw. l. c.) leaves petiolate, club-formed, incurved, acuminated, and rather curled at the apex. £. D. G. Native of the Cape of Good Hope. Allied to the preceding species; but the flowers are about twice the size, and purple.

Club-leaved Cotyledon. Fl. Sept. Cult. 1824. Pl. fo. foot. Cult. Cotyledon is a genus of pretty succulent plants. The culture, propagation, and management of the species are the same as that for Gloibaea, p. 106.

XV. PISTORINIA (meaning unknown to us). D. C. prod. 3. p. 399. mem. crass. p. 25. t. 10. f. 5.—Cotyledon species of authors.

LIN. SYST. Decandria, Pentagynia. Calyx 5-parted, much shorter than the tube of the corolla. Corolla gamopetalous, funnel-shaped; tube long, terete; limb spreading, 5-parted. Stamens 10, adnate the whole length of the tube, but free at the throat, and exserted. Scales 5, oblong, obtuse. Carpels 5, each ending in a long filiform style.—Erect annual or biennial herbs. Leaves nearly terete, oblong, scattered, sessile. Flowers cymose, red. Habit of the plants belonging to that section of Umbilicus called Mucizionia, and the flowers like those of Cotyledon.

1 P. hispánea (D. C. prod. 3. p. 399.) 0. or z. H. Native of Spain and Barbary, in exposed sandy places. Cotyledon Hispánica, Leef. itin. p. 77. t. 1. Lin. spec. 615. D. C. pl. grass. t. 122. Cotyledon Pistorinia, Ort. mon. 1772, with a figure.

XVI. UMBILICUS (from umbilicus, the navel; hollow leaves of some species). D. C. in bull. phil. 1801. no. 49. prod. 3. p. 399. LIN. SYST. Decandria, Pentagynia. Calyx 5-parted. Corolla gamopetalous, campanulate, 5-cleft; lobes ovate, acute, erect, about the length of the tube. Stamens 10, inserted in the corolla. Scales 5, obtuse. Carpels 5, attenuated at the apex. Styles subulate.—Herbs, indigenous to the south of Europe and the Levant. Leaves rosulate or alternate, quite entire, or a little toothed. Flowers white or yellow, in branched or simple terminal racemes, never in cymes.

SECT. I. Rosula'ria (from rosa, a rose; in reference to the leaves being rosulate, or disposed like the petals in the flower of a rose). D. C. prod. 3. p. 399. Sepals equal to the tube of the corolla. Leaves radical, rosulate. Scapes subpanicled, annual.—Perennial herbs, natives of the Levant, with the habit of Semprevirem.

Houseleek-like Navel-wort. Pl. £ foot.

3 U. pàvescens (Meyer in verz. pfanz. p. 150. under Coty-

ledon,) plant pubescent; leaves linear-oblong, blunting: radical ones rosulate, cauline ones scattered, erectly spreading; racemes corymbose; corolla twice the length of the calyx, with the segments of the limb acute and spreading at the apex; stem herba-

CRASSULACEÆ. XIV. COTYLEDON. XV. PISTORINIA. XVI. UMBILICUS. 111
Pubescent Navel-wort. Pl. 1/4 foot.

Samos Navel-wort. Pl. 1/4 foot.

**SECT. II.** Micrìzònia (meaning unknown to us). D. C. prod. 3. p. 399. Cauline leaves alternate. Annual herbs, with the habit of Sedum.

**SECT. III.** Cotty (from cotyled, cottle, a cavity; in reference to the cup-like leaves). D. C. prod. 3. p. 400. Umbilicus J. and C. B. A. Roots tuberous. stems usually branched. Radical leaves petiolate, succulent, more or less peltate. Corolla hardly 5-cleft to the middle.

7 U. pendulinus (D. C. pl. grass. t. 156.) lower leaves peltate, concave, repandly crenated, roundish; racemes entire; flowers tubular, pendulous, or spreading. *H.* Native of Europe, among stones and rocks, on walls and under hedges; in Britain, on moist dripping rocks and old walls. Cotyledon Umbilicus, Lin. spec. 615. var. a. Sow. engl. bot. t. 325. Cotyledon umbilicata, Lam. C. rupéstris, Salisb. Cotyledon Umbilicus vénéris, Blackw. herb. t. 263. Root tuberous. Flower-bearing stem branched; with its branches bearing racemes. Flowers yellow.

*Horizontal-flowered Navel-wort.* Pl. 1/4 foot.

**SECT. IV.** Pistroïnoidea (plants intermediate between Pistroïnia and Umbilicus). Roots perennial, thick, woody. Leaves terete, subulate. Stems numerous, erect, simple, fustular, densely leafy, for the most part naked below, in consequence of the leaves having fallen.

11 U. lievènnii; glabrous; stems herbaceous, erect, simple; leaves scattered, crowded, nearly terete, blunted; flowers cymose; limb of corolla erect. *H.* Native of Altai, between the river Irtysh and Lake Noo-Saisan, in dry saltish fields; in fields on the mountains of Kutchurn, Arkaul, and in the rivulet called Urmichaika, near Buchtorninsk. Cotyledon Lievènnii, Led. fl. ross. alt. t. 57. fl. alt. t. 2. p. 197. Corolla fine red. Carpels 5-6.

12 U. subulata; plant quite smooth, glaceanscent; leaves all scattered, terete, subulate, acute, erectly spreading; racemes corymbose; corolla twice the length of the calyx, with the segments of the limb acute and erect; stem herbaceous, very simple. *H.* Native of Caucasus, among stones, on the mountains of Taulisch, at the altitude of 2700 to 3300 feet. Cotyledon subulata, Meyer. in verz. pl. p. 150. Very nearly allied to U. Lievènnii, but the leaves are acute and erectly spreading, and the corolla is white, twice the length of the calyx, not rose-coloured, and 4 times longer than the calyx.

**SECT. V.** Orotostachys (from ὤρας, horos, the ends, and στακχυς, stachys, a spike; the spike of flowers terminate the scapes). D. C. prod. 3. p. 400. Orotostachys, Fisch. cat. cor. 1806. p. 99. Roots not tuberous. Stems simple. Leaves not peltate nor succulent; radical ones rosulate. Corolla 5-parted.

Flowers yellow, 5-parted, on short pedicels, collected into a cylindrical spike.

* Var. *polygalachus* (Led. fl. alt. 2. p. 200.) spikes numerous, rising from the axils of the radical or cauline leaves, somewhat fastigiate.

**Sepals**.

**Soft-leaved Navel-wort.** Fl. June, July. Clt. 1810. Pl. 1 ft. 15

**Thyrse-flowered Navel-wort.** Fl. Aug. Pl. 1 ft. 17

**Cult.** The hardy perennial species of this genus thrive well on rock-work, or on old walls; they will also grow freely in pots, in a soil composed of loam, peat, and sand, which should be placed among other alpine plants; these are propagated by offsets from the roots or by seeds. The seeds of annual and biennial kinds should be sown on rock-work, or in the open border, in a sandy or gravelly soil.

XVII. Echeveria. (this genus is named after M. Echeveri, author of the fine drawings of the Flora Mexicana, commenced under the direction of MM. Sesse, Mocino, and Cervantes). D. C. prod. 3. p. 401. mem. crass. p. 28.—Cotyledon species of authors.

**Lin. syst. Decandria, Pentagynia.** Calyx 5-parted; sepals erect, referable to leaves, united at the very base (f. 27. a.). Petals 5 (f. 27. b.), also united at the base, erect, thick, sti'fis, thickest at the middle nerve, and nearly trigo'nal at the base, acute. Stamens 10 (f. 27. c.), shorter than the petals, and adnate to them at the base. Scales 5, short, obtuse. Carpels 5, ending each in a subulate style. — Fleshy shrubs, natives of Mexico. Leaves alternate, cauline, or rosulate, and nearly opposite, nerveless. Flowers sessile, disposed along the rachis or branches of the cyme, scarlet or yellow.

* Shrubs. Flowers panicked or spicate, scarlet.

1. **E. grandifolia** (Haw. in phil. mag. sept. 1828. p. 261.) leaves orbicularly cuneate; petals thick; flowers in spicate vol. iii.

**Lin. syst. Decandria, Pentagynia.** Calyx 5-parted (f. 29.a.); sepals ovate, usually turgid, leaf-formed. Petals 5 (f. 29. b.), Q

FIG. 27.
generally spreading. Stamens 10. Nectariferous scales entire, or hardly emarginate. Carpels 5.—Herbs or subshrub. Stems usually branched from the base. Sterile stems or suckers usually crowded with leaves. Leaves alternate, rarely opposite, fleshy, terete or flat, quite entire, rarely toothed. Flowers cymose, white, purple, or blue, but usually yellow; in some species the flowers are 4 or 6-7-petalled, and the stamens always double that number.

* Leaves flat. Flowers yellow.

1 S. Rhodiola (D. C. fl. fr. ed. 3. vol. 4. p. 386. pl. t. 143.) leaves oblong, serrated at the apex, glabrous, glaucous; root rather tuberous; stems simple; flowers corymbose, usually of 4 petals, ovoid-cylindrical, and diocious from abortion.  

2 H. Native of middle Europe, on the mountains; of Siberia, and of North America, on the Arctic Sea shore, and Islands; of Newfoundland and Labrador; and on the Rocky Mountains, Kotzebue's Sound, &c.; in Britain, in the north of England, Scotland, and Wales, on the mountains. Rhodiola rosea, Linn. spec. 1465. Smith, engl. bot. t. 508. fl. dan. t. 182. Plant glaucous. The flowers are yellow, and are said to be sometimes hermaphrodite, but are usually of different sexes on different plants. The root is sweetish when dried; in this state a fragrant water may be distilled from it. The inhabitants of the Faro Island use it as a remedy for scurvy. In Greenland they eat it as garden stuff. A caput of the fresh roots, applied to the forehead, is said to relieve the head-ache, and to heal malignant ulcers. The specific name is from ὅδωρ, a rose; in reference to the fragrance of the roots.

2 S. Asianicum (D. C. prod. 3. p. 401.) leaves linear-ligulate, quite entire, obtuse; umbels few-flowered; calyce segments 4, oblong, obtuse; flowers 4-petalled, hermaphrodite.  

Asiatic Rose-root. Pl. 1 1/2 foot.

3 S. elongatum (Led. fl. alt. 2. p. 193.) leaves scattered, oblong, almost quite entire, glabrous, hardly glaucosecent; root rather tuberous; stems simple; flowers in cymose corymbs; pedicels rarely exceeding the flowers in length; nectariferous scales 3 times longer than broad; carpels recurved.  

4 H. Native of Altaia, in alpine humid places, on the edges of rivulets. Plant glaucous. Flowers yellow; hermaphrodite, but sometimes dioecious or polygamous from abortion, as in S. Rhodiola. Stamens 8 or 10.

4 S. altaicum; leaves scattered, obovate-lanceolate, serrated at the apex, glabrous, glaucous; root rather tuberous; stems simple; flowers in cyme corymbs; pedicels shorter than the flowers; nectariferous scales about as long as broad; carpels erect.  

5 S. himalensis (D. Don, prod. fl. nep. p. 212.) stem erect; leaves oval-lanceolate, flat, acute, toothed, glaucous, smooth; corymbs almost simple; root thick.  

8 H. Native of Gossiasthan, in the alpine regions of the Himalaya or Emodi. Habitat of S. Rhodiola. Flowers yellow.

Himalaya Stonecrop. Pl. 3/4 foot.

6 S. aizoön (Linn. spec. 617.) leaves lanceolate, flat, serrated, alternate, glabrous; stems erect; cymes terminal, crowded.  

7 H. Native of Siberia, in woods; on shady rocks, at Lake Teletzkoi. D. C. pl. grass. t. 101.—Amn. ruth. no. 96. t. 11. Perhaps Anacampseros Aizoon, Haw. syn. p. 112.? Flowers yellow, varying with 4-6 petals and 8-12 stamens. Root branched, fascicled, thickish.

7 S. hybridum (Linn. spec. 617.) leaves cuneiform, rather concave, bluntly serrated, rather crowded, alternate, glabrous; those of the branches crowded; stems ascending, rooting at the base; cymes terminal.  

8 H. Native of Altaia and Tartary, at the bottom of the Ural mountains; on the upper Iris. Murr. nov. comm. goett. 6. p. 35. t. 5.—Gmel. fl. sib. 4. p. 171. no. 851. t. 62. f. 1. Anacampseros hybrida, Haw. l. c. Flowers sulphur-coloured. This is not a hybrid, but a true species. S. altaica, Bess. enum. sem. cren. 1823.

8 S. spatulifolium (Hook, fl. bor. amer. 1. p. 227.) glabrous; stem erect; leaves obovate-spatulate, flattened, acute; upper ones linear; cyme terminal, leafy, trichotomous; flowers pedicellate, decandrous; petals linear-spuriate, much longer than the calyx.  

9 H. Native of the north-west coast of America; common on dry rocky places of the Columbia river. Flowers yellow, very like those of S. stenopetalum. Lower parts of stems decumbent.

Spatulate-leaved Stonecrop. Pl. 1 to 2 foot.

9 S. douglasi (Hook, fl. bor. amer. 1. p. 228.) stem erect, proliferous above from recurved branches; leaves linear-subulate, very acute, flat on the inside, and a little keeled on the back, with dry membranous edges; cymes dichotomous; flowers sessile, decandrous; petals narrow-lanceolate, twice the length of the calyx.  

10 H. Native of North America; common on rocky places on the Columbia to the mountains. Flowers yellow, like those of S. stenopetalum.

Dougla's Stonecrop. Pl. 1/2 foot.

10 S. aegidius (Led. fl. ross. alt. ill. t. 418.) leaves scattered, linear, quite entire, flat, glabrous; root thick, of many necks; stems numerous, simple; cyme terminal, simple; pedicels about equal in length to the flowers; breadth of nectariferous scales exceeding their length; petals longer than the stamens.  

11 H. Native of Altaia, on the higher alps, about the fountains of the rivers Inja, Uba, and Sentelek, and on the mountains Koborga, at the sides of rivulets. Flowers at first yellow, but fading to a dirty red. Allied to S. quadrifidum.

** Leaves flat. Flowers white.

11 S. involucratum (Bieb. fl. taur. 1. p. 352.) leaves cuneiform, crenated, opposite, pubescent, ciliated; stems decinate, hairy; corymbs crowded, involucrured; petals subulate.  

12 H. Native of Caucasus, among stones, at the foot of Mount Kaischaur. Flowers white, about the size of those of S. hybridum.

Involucrated Stonecrop. Pl. 1 foot.

12 S. latifolium (Bert. amen. itin. p. 366.) leaves ovate, cordate, very blunt, serrated, glabrous, usually opposite; coryms cymose, on long peduncles; stamens longer than the corolla.  

13 S. obtusifolium (Meyer. verz. pflanz. p. 150.) plant glabrous, green; stems erect; leaves orbicular-ovate, obtuse, nearly quite entire, with scabrous margins; lower ones opposite; rays of cyme elongated, spreading, and leafy; flowers nearly sessile; petals acute, longer than the calyx.  

14 H. Native of Caucasus, on the Talusch mountains, towards Perim.
Crassulaceae.

XVIII. Sedum.

115. Native stems rare petal's foot. Flowers white; anthers purple. There is a variety of this plant with ovate leaves and few flowers, and is perhaps referrible to S. Notarjanni. Poplar-leaved or Shrubby Stonecrop. Fl. July, Aug. Clt. 1780. Shrub 1 foot.

22 S. Notarjanni (Ten. fl. neap. 1. p. 245. t. 40.) stems ascending, suffruticose; leaves petiolate, flat, ovate, bluntly and simitately toothed, glabrous; flowers solitary or few, terminal; petals lanceolate. H. Native of Naples, near Funda, among calcareous rocks. S. Notarjanni, Ten. cat. 1819. p. 43. Very like S. populifolium, but differs in the stems being almost herbaceous, in the leaves not being coriaceous, in the flowers being nearly solitary, and in the anthers being yellow.

Notarjanni's Stonecrop. Shrub 1 foot.

23 S. stella'tum (Lin. spec. 617.) leaves flat, roundish, angularly toothed, tapering into the petioles, opposite, or alternate, glabrous; flowers axillary, sessile along the branches of the cyme; petals lanceolate. H. Native of the Islands of Corsica, Melos, and of Italy, and the south of Switzerland. Smith, fl. grece. 446. Comm. hort. 7. t. 2. Col. phyt. 39. 11. Petals white, tinged with red.

24 S. Cepae'a (Lin. spec. 617.) stem herbaceous, terete, pubescent; leaves flat, quite entire; lower ones rather spatulate: upper ones oblong or linear; flowers panicled; petals ending in an awned point. H. Native of middle and south Europe, in hedges and among bushes. Smith, fl. grece. 447.—Clus. hist. 2. p. 68. with a figure.—Mor. hist. 3. p. 473. sect. 12. t. 7. f. 37. —S. paniculatum, Lam.—Anacampseros Cepae'a, Haw. Flowers white.

Var. b, galioides (D. C. prod. 3. p. 404.) upper leaves nearly opposite: lower ones in whorls, spatulate. S. galioides, All. pedem. no. 1742. t. 65. f. 3. S. verticillatum, Loutur, but not of Lin.

Var. c, alsinifolium (D. C. 1. c.) oval leaves, for the most part alternate. S. alsinifolium, All. ped. no. 1740. t. 22. f. 2. Pedals acutish. Cepaea or Purslane-leaved Stonecrop. Fl. July, Aug. Clt. 1610. Pl. 3/4 to 1 foot.

25 S. spatulatum (Waldst. et Kit. pl. rar. hang. 2. p. 108. t. 104.) stem herbaceous, terete, pubescent; leaves flat, entire, nearly all alternate, spatulate: upper ones cuneiform; flowers panicled; petals ending each in an awn. H. Native of Hungary. S. Cepae'a, var. γ, spatulatum D.C. prod. 3. p. 404. Flowers white.

26 S. tetraphyllum (Smith, fl. grece. t. 448. prod. 1. p. 309.) plant pubescent; leaves spatulate, quite entire, four in a whorl; stem branched at the base: peduncles axillary, few-flowered, the whole forming a terminalpanicled raceme; petals ending in a long point. H. Native of Greece. Ray. syn. ext. 233. Petals white, with a red keel.

Four-leaved Stonecrop. Fl. 1/4 foot.

27 S. eriocarpum (Smith, fl. grece. t. 447.) stem twisted, pubescent above; leaves smooth, alternate, oblong, obtuse; stems cymose; flowers axillary, nearly sessile; petals mucronated; calyx glabrous; ovaries hairy. H. Native of Greece. Flowers red.

*** Leaves flat. Flowers purple or red; rarely blue.

28 S. cyanèum (Rud. mem. petersb. 1811. p. 351. t. 2. f. 2.) q 2
CRASSULACEÆ. XVIII. SEDEUM.

stems simple; leaves flat, nearly linear, entire, sessile; cymes leafy.

Blue-flowered Stonecrop. Pl. ½ foot.

29 S. deltoides (Ten. cat. 1819. p. 43.) stems erectish; leaves alternate, flat, deltoidly-cuneiform, unequal, crenated, and toothed; cymes lateral. Native of the Kingdom of Naples, on Monte Novo and Goat's Island. Flowers purpure.
The rest unknown.

Deltoid-leaved Stonecrop. Pl. ½ foot.

31 S. nematodes (Mill. dict. no. 15.) stems erect, fleshy; leaves ovate, quite entire; upper ones stem-clasping; corymbs terminal. Native of Louisiana. There are two varieties of this plant, one with white and another with purple flowers. Said to be allied to S. Telephium and S. Anacampseros.

33 S. pulchrum (Michx. fl. bor. amer. 1. p. 277.) stems assurgent, glabrous; leaves scattered, linear, obtuse; cymes of many spikes; flowers sessile, of 4 petals and 8 stamens. Native of the mountains of Carolina, and Georgia, on the banks of the river Ohio. Flowers purpure. Allied to S. reflexum, according to Pursh, but according to Nutt. to S. ternatum.

Fair Stonecrop. Pl. trailing.

35 S. ibexicum (Stev. in Bieb. fl. taur. suppl. p. 312.) leaves cuneiformly oblong, reuddedly crenated, petiolate, with scabrous margins; cauline leaves opposite; cymes leafy, dichotomous; flowers nearly sessile; petals subulate. Native of the northern part of Iberia, in subalpine places. Flowers reddish. Habit of S. spurium.

Iberian Stonecrop. Pl. ½ foot.

36 S. roseum (Stev. mem. soc. nat. curt. mosq. 3. p. 263.) leaves spatulate-obovate, opposite, quite entire, fleshy, glabrous, imbricated at the tops of the surculi; stems much branched, loose, creeping; cymes terminal; petals lanceolate-subulate. Native of Eastern Caucasus, among stones.

Bieb. suppl. 314. Flowers almost like those of S. spurium, of an elegant rose-colour.

Rose-coloured-flowered Stonecrop. Pl. ½ to ¾ foot.

37 S. spurium (Bieb. fl. taur. 1. p. 852.) leaves cuneiformly-oblong, crenate toothed in front, pubescent beneath, somewhat ciliate; cauline leaves opposite; radical ones in fascicles usually alternate; cymes terminal, compound; petals lanceolate.

38 S. wederi (Lud. fl. alt. ill. t. 58. fl. alt. 2. 191.) leaves opposite, obesely dentilicate, adnate; inferior ones broad-elliptic; superior ones sessile, cordate; cymes terminal, compound; petals lanceolate, acute, a little longer than the stamens. Native of Asia Minor, on the banks of the river Otis. Flowers purpure. Stem rooting at the base.

39 S. telephioideis (Michx. fl. bor. amer. 1. p. 924.) leaves ovate, flat, acutish at both ends, corymb compound, in fascicles. Native of Virginia and Carolma, on the banks of the river Ohio. Flowers purpure. Stem rooting at the base.

40 S. telephium (Lin. spec. 616. 1. β, et γ.) leaves oblong or oval, attenuated at the base, flat, toothed, glabrous; stems erect; cymes corymbose, terminal; stamens not exceeding the corolla. Native of Europe, in exposed places; in Britain on the borders of fields, or in hedges or bushy places, on a gravelly or chalky soil. Smith, eng. bot. 1319. Curt. Lond. 3. t. 25. 210. Oed. fl. dan. 686. Blackw. 191. There are several varieties of this plant:—1, leaves opposite (Anacampseros albida, Haw. syn. p. 111.)—2, leaves in a whorl (Anacampseros triphylla, Haw. syn. p. 111. Sedum triphyllum, Haw.)—3, alternate leaves; flowers purpure (D. C. pl. grass. t. 92. Anacampseros purpurea, Haw. syn. p. 111.)—4, leaves oblong-lanceolate, sharply toothed (Anacampseros arguta, Haw. Sedum argutum, Haw.)—5, leaves cuneately obvate, slightly 4-toothed towards the apex; stems decumbent (Anacampseros paucifid, Haw. rev. p. 24.). All these are referrible to this species. A decotion of the leaves in milk is a forcible diuretic. It has been given in success with the cure of hemorrhoids.

42 S. verticillatum (Lin. amem. 2. p. 352. t. 4. f. 14. exclusive of the synonyme of Ravy.) stems erect; leaves 4 in a whorl, lanceolate, serrated; racemes axillary, few-flowered, shorter than the leaves. Native of Kantschatka. Leaves a finger in length. Flowers small, purple or pink? This species is allied to S. Telephium according to Steuer.

* * * Leaves terete. Flowers white.

43 S. Morangei (H. B. et Kunth, nov. gen. 6. p. 44.) stems branched, creeping at the base, ascending, glabrous; leaves scattered, loosened at the base, thick, fleshy, obtuse; cymes uniflorous; petals nearly sessile; petals 5, oblong-linear, blunthit. Native of Western Europe.
Native of Mexico, near Real de Moran. The colour of the flowers is unknown, but the plant is said to be very like S. Anglicum, and the flowers are therefore perhaps white.

**Moran Stonecrop.** Pl. 1/4 foot.

44 S. A'nglicum (Huds. angl. p. 196.) stems ascending, humble, branched at the base; leaves crowded, alternate, short, ovate, gibbous, loosened at the base, glabrous; cyme branched, few flowered; flowers sessile along the branches; petals acuminate

44 S. a'tritum, but perhaps only a pentandrous variety of S. dasyphyllum, and the flowers are probably white like it.

**Andegaevnny Stonecrop.** Pl. 1/2 foot.

50 S. dasy'phyllum (Lin. spec. p. 618.) stems weak, decumbent; leaves ovate, nearly globose, fleshy, glabrous, opposite, rarely alternate; sterile branches rather imbricated; cymes puberulous, few-flowered, terminal; petals bluish.

51 S. brevi'folium (D. C. r. v. 1808. p. sv. suppl. no. 3615. a, mem. crass. t. 4. f. A.) stems fruticulose, glabrous, twisted at the base; leaves opposite, ovate, obtuse, short, thick; cymes quite glabrous, loose, terminal; petals bluish.

2 H. Native of the Pyrenees and of Corsica, among rocks in dry pastures. S. sphecium, Lapeyr. abr. 1815. p. 259. Sepals of calyx thin, not so in S. dasyphyllum (to which species it is nearly allied) thick.

**Short-leaved Stonecrop.** Pl. 1/4 foot.

52 S. Cor'sicum (Duby, in D. C. syn. fl. fr. ed. 2.) stems ascending, branched at the base, twisted; leaves ovate, obtuse, hispid; sterile shoots crowded; cymes terminal, few-flowered, glabrous; petals acutish.

**Hairy Stonecrop.** Pl. 1/4 foot.

54 S. pilosum (Bieb. fl. taur. 1. p. 352.) stems ascending, leafy; leaves oblong, obtuse, rather fleshy, hairy, alternate; radical ones in fascicles; cymes terminal, coriaceous; petals lanceolate, hardly twice the length of the sepals.

2 H. Native about the port of Caucasus, among rocks. Allied to S. his'tatum, but differs in the sepals of the calyx being twice the length, and in the duration being perennial, not biennial.

**Pilos Stonecrop.** Pl. 1/4 foot.

55 S. his'pantium (Lin. spec. 618.) stems erect, branched, glabrous; leaves scattered, terete, acutish, glabrous; sterile stems rosetulate, crowded; cymes branched; flowers sessile along the branches of the cyme; petals 6, acuminate.

56 S. A'leum (Lin. spec. 619.) branches perennial, rooting, when young rather puberulous; leaves ovately club-shaped, green, nearly terete, glabrous; cymes branched, terminal, sub-

Small-flowered Stonecrop. Fl. June, July. Brit. Pl. ⅓ ft. 58 S. græc'ìle (Meyer, verz. pianz. p. 151.) plant glabrous and green; stems herbaceous, diffuse; leaves subulate, bluntrast, loose at the base, those of the sterile branches imbricated; rays of cyme elongated, much spreading; flowers decandrous, almost sessile; petals acuminate, longer than the calyx; style rather longer than the breadth of the acute capsule. *H. Native of Caucasus. Flowers white.

Var. a, minus (Meyer, l. c.) flowers smaller. On Mount Gugora at the altitude of 3300 feet.

Var. β, majus (Meyer, l. c.) flowers almost twice the size of those of var. a. On the Taulus Mountains, at the altitude of 1400 to 2700 feet.

Slender Stonecrop. Pl. diffuse.

60 S. Atho'um (D. C. prod. 3. p. 407.) stems erect, a little creeping at the base; leaves semi-cylindrical, short, remote, and are, as well as the stem, glabrous; cyme terminal, somewhat corymbose, many-flowered; petals acute. *H. Native on the top of Mount Athos. S. τύργιδιμ, D. Urv. enum. p. 51. exclusive of the synonyms. Flowers white, like those of S. album, but the petals are acute and distinct.

Athos Stonecrop. Pl. ½ foot.

** ** Leaves tereete. Flowers red or blue.

61 S. cœrûleum (Vahl. symb. 2. p. 51.) stem flat on the ground at the base, ascending; leaves oblong, alternate, obtuse, loosed at the base; cymes bifid, glabrous; petals 7, obtuse. *H. Native of Tunis, in the fissures of rocks. Shaw. tin. 550. with a figure. Sims. bot. mag. 2224. Kew. bot. reg. 526. S. azûreum, Desf. fl. atl. 1. p. 392. Flowers not blue, but at first purplish, and fading to blue (f. 28.).

62 S. heptapétalum (Poir. voy. barb. 2. p. 169. dict. 4. p. 630.) stems erect, branched at the apex; leaves ovate-orbicular, scattered, depressedly gibbous; cymes panicled; petals 7, acuminate. *H. Native of Barbary, Corsica, and Malta, on rocks by the seaside. D. C. fl. fr. 4. p. 392. Flowers purplish as in S. cœrûleum, fading to blue. S. heptapétalum, Hornt. hafn. suppl. p. 138. said to be originally from the Russian empire, is perhaps distinct from this species, but is not sufficiently known.

Small-petalled Stonecrop. Pl. ¾ foot.

63 S. bracteatum (Viv. fl. lyb. 24. t. 8. f. 3.) stems erect, branched at the apex, beset with spreading hairs, as well as the leaves; leaves alternate, linear, thick, obtuse; cymes trichotomous; flowers on short pedicels along the branches of the cyme; petals 5, elliptic, keeled. *H. Native of the Great Syrtus, in Libya on the sea shore. The colour of the flowers agrees with that of S. cœrûleum, but the habit is that of S. Hispánicum. Nectariferous scales emarginate.

Braecated-flowered Stonecrop. Pl. ¼ foot.

Var. β, pentándrum (D. C. fl. fr. suppl. p. 524.) stems 5 (especially those that are epipetalous are abortive) or 6; the 4 epipetalous ones of which having vanished.

Villosum Stonecrop. Fl. June, July. Britain. Pl. ½ to ⅓ ft. 65 S. rubens (D. C. prod. 3. p. 405.) stem erect, branched; leaves oblong, obtuse, nearly terete, sessile, spreading, glabrous; cymes branched, pubescent; flowers sessile, unilateral along the branches of the cyme, pentandrous; petals 5, acuminate awned. *H. Native of south and middle Europe, in cultivated sandy fields. Crassula ruîna, Lin. syst. veg. p. 253. D. C. pl. grass. t. 55. S. rubens β pentandrum, D. C. prod. 3. p. 405. Flowers pale red. Mature carpels puberulous. The epipetalous stamens are all or for the most part abortive, and therefore the flowers are pentandrous.

66 S. pube'sulum (D. C. mem. crass. p. 33.) stems erect, branched, puberulous; leaves scattered, terete, acutish, glabrous; cymes branched; flowers sessile along the branches of the cyme; petals 6, acuminate awned. *H. Native of Calabria. This species comes very near S. pilulìdum and S. rubens.

Puberulous Stonecrop. Pl. ½ foot.

67 S. páladium (Bieb. fl. taur. 1. p. 353.) stem erect, branched; leaves oblong, obtuse, nearly terete, spreading, glabrous; cymes branched, pubescent; flowers sessile, unilateral along the branches of the cyme, decandrous; petals acuminate awned. *H. Native of Caucasian. Flowers pale red or white. Mature carpels puberulous.

* • • • • • Leaves terete. Flowers yellow.

69 S. quadrifidum (Pall. itin. 3. p. 730. append. no. 90. t. P. f. 1.) leaves scattered, terete, bluntest; root thick, of many necks; stems numerous, erect, simple; corymbs terminal, few-flowered, simple; pedicels about equal in length; neck of neocarpferous scales exceeding the breadth; flowers octandrous, 4-cleft; stamens a little longer than the petals. Ζ. H. Native of Dahuria, the Ural Mountains, and Altaiam, in humid stony places, on the tops of the Alps. Pall. ed. gall. in 8vo. vol. 8. p. 311. t. 104. f. 4. S. quinquifidum and S. hexatéllum, Haw. rev. p. 26. ? Flowers yellow.

70 S. açere (Lin. spec. 619.) stems rather creeping at the base; branches erect; leaves ovate, adnate, sessile, gibbous, erectish, alternate, glabrous; cymes trifid; flowers sessile along the branches of the cyme; petals lanceolate, acuminate. Z. H. Native of Europe, common on walls, roofs of houses, rocks, and dry sandy ground; plentiful in Britain. Bull. herb. t. 30. D. C. pl. grass. t. 117. Smith, engl. bot. 939. Woodv. med. bot. t. 821. Curt. lond. 1. t. 32. Flowers yellow. The whole plant is acrid, and chewed in the mouth has a hot biting taste; whence, and from its common place of growth, it has the name of wall-pepper. Applied to the skin it blisters, and taken inwardly it excites vomiting. In scorbatic cases and quartern aegies, it is an excellent medicine under proper management. For the former, a handful of the herb is directed to be boiled in eight pints of beer till they are reduced to four, of which 3 or 4 ounces are to be taken every morning. Milk has been found to answer this purpose better than beer. Not only ulcers simply scorbatic, but those of a scrofulous or even cancerous tendency, have been cured by the use of this plant. It is likewise useful as an external application, in destroying fungous flesh, and in promoting a discharge in gangrenes and carbuncles.

**Var. β, diminutum** (Haw. in phil. mag. 1831. p. 416.) much smaller than the species, hardly an inch high; stem creeping. Ζ. H. Native of the higher Alps of Provence; also on Swafian Heath, Norfolk. S. açere glácti, D. C. prod. 3. p. 407. S. glácti, Clarion in D. C. fl. fr. 4. p. 393.

**Var. γ, elongatum** (Haw. l. c.) pendulous branches of 7 inches high; erect ones 4 inches; leaves loosely imbricating.

**Acrid Stenocrop.** Fl. June. Britain. Pl. ½ to ¾ foot.

71 S. sexangularè (Lin. spec. 620.) stems branched at the base, floriferous ones erect; leaves nearly terete, adnate-sessile, usually by threes on the flowering stems, and 3 in a whorl on sterile branches, imbricating in 6 spiral rows; cymes trifid; petals lanceolate, acuminate. Ζ. H. Native of Europe, in dry sandy ground, and on walls. In England, but not common; as near Northfleet, Sheerness, and on the Isle of Sheppy; on Greenwich Park wall on the south side, near the western corner; on the famous Roman walls of Old Sarum; also of Cambridgeshire. D. C. pl. grass. t. 118. Curt. lond. 4. t. 33. Smith, engl. bot. 1646. S. açere β, Huds. Lam. fl. fr. S. spirálæ, Haw. in phil. mag. 1824. no. 176.—Cam. epít. 856. with a figure. Flowers yellow. Habit of S. açere.

**Sixangled Stenocrop.** Fl. June, July. Britain. Pl. ¼ foot.

72 S. Boloniaë (Lois. not. p. 71.) stem branched at the base; floriferous ones erect; leaves nearly terete, obtuse, loosened at the base, glabrous, imbricating on all sides; cymes trifid; flowers sessile, along the branches; petals acuminate. Ζ. H. Native of sandy woods, about Bologna. D. C. suppl. 532. Root creeping. Sepals cylindric, obtuse. Branches of cyme 6-10-flowered. S. chisitósum, Lejeune, fl. spa. Flowers yellow. Perhaps sufficiently distinct from S. sexangularè.

**Bologna Stenocrop.** Pl. ¼ foot.

**Stem-clasping Stenocrop.** Pl. ½ foot.

74 S. rupe'stre (Lin. spec. p. 618.) stems branched at the base, floriferous ones erect; leaves terete-subulate, glaucous, loosened at the base; sterile stems cylindric, densely imbricating; flowers cymose, 5-7-petalled; sepals bluntish. Ζ. H. Native of Europe, on walls and rocks. In England on St. Vincent’s rock, Bristol; on Cheddar rocks, Somersetshire, and upon walls about Darlington. Englt. bot. t. 170. —Dill. elth. 2. f. 333. Reich. icon. 3. f. 459. S. minus, Haw. in phil. mag. 1825. p. 174. ? S. réflexum, D. C. pl. grass. t. 116. Flowers yellow (f. 29.)

75 S. sectangula're (Haw. syn. 116. and in phil. mag. 1834. p. 175.) glaucous; leaves imbricating in 7 rows, incurved, spreading, middle-sized, acute. Ζ. H. Native of Europe. Flowers yellow. S. rupestrè β, septangulare, D. C. prod. 3. p. 407. S. rupestrè, D. C. pl. grass. t. 115. Very like S. coeruleóscens, but is distinguished by the shorter and hardly subulate leaves, and in being more branched, and the branches shorter.

**Seven-angled Stenocrop.** Fl. June, July. Clt. 1795. Pl. ½ ft.

76 S. al'éscens (Haw. rev. succ. p. 28.) stems branched at the base; flowers erect; leaves terete-subulate, glaucous, loosened at the base; sterile stems elongated, with spreading leaves; flowers cymose, 5-7-petalled; sepals lanceolate. Ζ. H. Native of England and Denmark, on barren sandy hills and walls. In England, especially on the sides of some rough hills near Middenhall, Suffolk. S. glácti, Smith, engl. fl. 2. p. 321. engl. bot. 2471. but not of Waldst. et Kit. S. réflexum, fl. dan. t. 113. Flowers yellow.

77 S. Forsteri'ænum (Smith, comp. 71. engl. bot. 1802.) stems branched at the base; flowers erect; leaves semicylindric, bluntest, green tinged with red; sterile stems short; leaves crowded, somewhat rosulate at the tops of the branches; flowers cymose, 5-7-petalled; sepals obtuse. Ζ. H. Native of Wales, on rocks at the falls of Rhydoll, near the Devil’s bridge, Cardiganshire; on the rocks of Hisval, overhanging the little valley of Nant-Phrancon. S. Forsteriæ, Haw. syn. p. 117. S. rupestrè, D. C. pl. grass. 115. Flowers yellow.

**Forster’s Stenocrop.** Fl. July, Aug. Wales. Pl. ½ foot.

78 S. réflex'um (Lin. spec. 618. Smith, fl. brit. p. 490.) stems branched at the base; floriferous ones erect; leaves terete-subulate, green, loosened at the base; sterile shoots somewhat
cylindrical, spreading; flowers cymose, 5-7-petalled; sepal tips bluish. 2. H. Native of Europe, in fields and on walls; in Britain on walls and thatched roofs, abundant. Smith, engl. bot. t. 695.—Park. theat. 1. t. 734. f. 1. Flowers yellow.

Var. β, recurvatum (D. C. prod. 3. p. 408.) leaves glaucous; sterile stems somewhat reflexed. S. recurvatum, Willd. enum. suppl. 23. Perhaps a variety of S. albescens, according to Haw.

For. ε, cristatum (D. C. l. c.) leaves glaucouse; sterile stems spreading. S. collinum, Willd. l. c. p. 25. S. elegans, Lejeune fl. sp. 1. p. 205.?

For. γ, collinum (D. C. l. c.) leaves glaucous; sterile stems spreading. S. collinum, Willd. l. c. p. 25. S. elegans, Lejeune fl. sp. 1. p. 205.?

79 S. virens (Ait. hort. kew. 2. p. 110.) leaves scattered, subulate, green, loosened at the base; flowers cymose, petals lanceolate, much longer than the sepals. 2. H. Native of Portugal. S. reflexum, Willd. enum. suppl. p. 25. S. crassi-caule, Link. enum. 1. p. 498. Flowers yellow. Very like S. reflexum, and probably only a variety of it.

80 S. virens (Willd. enum. suppl. p. 25.) stems branched; floriferous ones erect; leaves terete-subulate, those of the sterile branches spreading and glaucous; flowering stems spreading, compressed; branches of cyme crowded, erect. 2. H. Native of Siberia. The leaves, according to Haw. in rev. p. 29. are green, and the flowers nearly white; but according to Willd. 1. e. the leaves are glaucose, and the flowers greenish-yellow, therefore two species are probably confused under this name, and perhaps both are only varieties of S. reflexum.

81 S. subcylindricum (Haw. in phil. mag. 1831. p. 414.) leaves imbricate, rostrate at the tops of the branches, somewhat glaucous, turgid, green, attenuated towards the apex, and acute. 2. H. Native of North America. Flowers not seen. From habit this species appears to come nearest S. Forsterianum.

Subcylindric-leaved Stonecrop. C1t. 1830. Pl. ½ foot.

82 S. stenopterulum (Pursh, fl. amer. sept. 1. p. 324.) stems assurgent, glabrous; leaves scattered, crowded, adnate-sessile, compressed, subulate, acute; cymes terminal, trichotomous, and dichotomous; spikes recurved; flowers sessile, decandrous; petals 5, linear, much longer than the calyx. 2. H. Native of North America, on the banks of Clark’s river, and on the Kooskoosky; and frequent on the east side of the Rocky Mountains. Flowers golden yellow. Said to be allied to S. reflexum.

83 S. coryle-sens (Haw. in phil. mag. 1825. p. 174.) leaves long, spreading, subulate, acute, bluish-glaucous, flattish above. 2. H. Native country unknown. Very like S. altissimum, but not half the size, more bluish-glaucous; leaves more distant, petals more acute, pale yellow.

84 S. altissimum (Poir. dict. 4. p. 631.) stems fruticosum, branched at the base; floriferous ones erect; leaves nearly terete, acute, glaucous, glabrous: superior ones scattered, flattish above; those of the sterile branches imbricated; cymes branched, many-flowered; flowers sessile along the branches of the cyme, which are twisted at the apex; petals 6-8, lanceolate, acute, spreading. 2. H. Native of the south of Europe. D. C. pl. grass. t. 116. Semprevivum, sediforme, Jacq. hort. vind. t. 51. and var. monstrosa, mic. t. 135. t. 5. S. fruticosum, Brot. fl. lus. 2. p. 206. S. rupestris, Tenore. fl. neap. t. 41. S. Nicaënsis, All. pedem. no. 1752. t. 90. f. 1. S. Jacquinii, Haw. in phil. mag. 1825. p. 174. S. rupestris, Gouan. S. dioicium, Donn, hort. cant. Flowers cream-coloured. Lobes of calyx bluish. A strong, bluish-glaucous plant.

85 S. ochroleuca (Smith, in Lin. trans. 10. p. 7.) stems branched; leaves glaucous, scattered, acute: lower ones terete; upper ones elliptic, depressed; cymes branched, many flowered; flowers sessile along the branches of the cyme; calyce segments acutish; petals oblong-spatulate. 2. H. Native of the south of Europe. S. altissimum, ochroleucum, D. C. prod. 3. p. 408. Flowers pale yellow. Very like S. altissimum, but rather larger.

86 S. anopetalum (D. C. rupl. 2. p. 80. suppl. fl. fr. p. 526. mem. crass. t. 8.) stems branched at the base, erect; leaves nearly terete, rather depressed, loosened at the base, glaucous, mucronate; those of the sterile branches imbricated; cyme 4-5-5, corymbose; petals lanceolate, acuminate, erect. 2. H. Native of the south of France, on calcareous rocks, and among stones. Bauh. hist. 3. p. 428. S. Hispanicum, D. C. fl. no. 1326. but not of Lin. S. rupestris, Vill. dauph. 3. p. 678. but not of Lin. S. anopetalum, Spreng. syst. 2. p. 435. exclusive of the synonyme of Tenore. Flowers cream-coloured. There is also a variety with orange-coloured flowers, according to Haworth.

87 S. urvillei (D. C. prod. 3. p. 408.) stems glabrous; erect, creeping; and branched at the base; leaves scattered, nearly terete, obtuse, dilated, and stem-clasping at the base; cyme 2-3-cleft; flowers sessile along the branches; petals acuminate awned. 2. H. Native of the Island of Lazzaretto. S. pallidum, D’Urv. enum. p. 51. but not of Bieb. Flowers yellow. Capsules pale, somewhat stellate.

D’Urvilie’s Stonecrop. Pl. ½ foot.

88 S. virens (Haw. in phil. mag. 1827. p. 183.) leaves erectish, linear-subulate, green, somewhat mucronulate on one side. 2. H. Native country unknown. Very like S. virens, and S. recurvatum, Willd. but the leaves are a little larger and flatter, greener and blunter. It is less than S. anopetalum.

89 S. litoreum (Guss. pl. rar. p. 185. t. 37. f. 2.) stem erect, branched at the base; branches ascending; leaves spatulate-cuneate, semiterete, obtuse, glabrous; flowers sessile, lateral, solitary. 2. H. Native of Calabria, among rubbish by the sea-side. Flowers pale yellow, alternate. Petals a little longer than the calyx, linear-lanceolate.

Sea-shore Stonecrop. Pl. 2 inches high.

91 S. tentæ (Meyer, verz. pl. 152.) plants glabrous, glaucous; stems herbaceous, erectish; leaves subulate, blun-

ish, loose at the base; those of the sterile branches imbricated; rays of cyme short, few-flowered, coricate; flowers deciduous,

erect; flowers yellow, disposed in short recurved spikes; leaves linear, scale-formed, reflexed.—Native of Spain, on the rocks called Borrequislos, in Sierra Nevada. Perhaps a species of Sempervivum, ex Bory. ann. gen. 3. (1820) p. 14. The rest unknown.

Bory's Stonecrop. Pl. ½ foot.
110 S. melananthæ rum (D. C. prod. 3. p. 410.) stems weak; leaves ovate, attenuated at the apex; flowers in corymbose panicles.—Native of Spain, in Sierra Nevada, on the rocks of Borrequislos. Flowers small, densely paniced, rather sweet scented. Antlers black. The rest unknown.

Black-aneathed Stonecrop. Pl. ½ foot.
† Species only known by name.
1 S. stoloniferum (Gmel. itin. 3. t. 35. f. 2.)
2 S. lilacium (Led. ex Steud. nom.)
3 S. procumbens (Schrak, hav. p. 726.)
4 S. Monregalense (Balb.)
N.B. Rhodiola biternata, Lour. coch. p. 627, is totally different from Rhodiola, Lin. and is perhaps a plant belonging to Sepiandaece.

Cult. The greater part of the species being quite hardy, and all succulent, they therefore succeed best on rock-work, for which they are well adapted. Some of the rarer kinds may be grown in small pots. They succeed best in light, sandy soil, or one composed of loam and brick rubbish. All are readily increased by cuttings. The seeds of the annual species only require to be sown on rockwork. There are a few of the species marked greenhouse; these will require the same treatment as that recommended for the species of Globularia, see p. 106.

XIX. SEMPERVIVUM (from sempervivo, to live for ever; the tenacity of life of the Houseleek tribe is well known). Lin, gen. no. 612. Lam. ill. t. 413. D. C. in bull. philom. no. 49. prod. 3. p. 411.

Lin. syst. Dodecánandra, Dodecagynía. Calyx 6-20-parted. Petals 6-20, oblong, acute. Stamens double the number of the petals. Scales at base of carpels toothed or jagged at the apex. Carpels equal in number to the petals.—Herbs sometimes stemless, with young plants rising from the axils; or calecent, without any young plants; or shrubby and flaccid. Leaves usually revolute. Branches of cymes sometimes disposed into a corymb, and sometimes into a panicle. Petals yellow, white, or purplish.

Sect. I. Chronòbium (χρονός, chronos, time, and βιος, bious, to live; plants living only for a time, and are not so tenacious of life as those of the following section). D. C. pl. rar. gard. gen. no. 21. Young plants, none from the axils. Flowers usually yellow, rarely white. Species all natives of the Canary Islands.

* Shrubby species.

1 S. aizoides (Lam. dict. 3. p. 290.) stem frutescent, erect, branched; leaves scattered, obovate, flat, quite entire, glabrous; flowers corymbose; petals 5-8, spreading. ½. D. G. Native of Madeira. Sedum aizoides, D. C. pl. grass. t. 4. Sédum diversicàtum, Ait. hort. kew. ed. 1. vol. 2. p. 108. Perhaps also Anacàmpseros diversicàta, Haw. syn. p. 113.? Flowers yellow.

3 S. villòsum (Haw. syn. p. 166. rev. 65. but not of Ait.) stem frutescent, erect, twisted; leaves oblong-obovate, crowded, gibbous beneath, villous; scales of flower fringed. ½. D. G. Native of the Canary Islands. Flowers yellow. Leaves 5 lines long and 3 lines broad. S. villòsum, Ait. is referrible to S. stellàtum.

4 S. cilìatum (Wild. enum. 1. p. 508. mem. crass. t. 10.) stem frutescent, glabrous; leaves oblong-obovate, somewhat spathulate, mucronate, cartilagineously ciliated; thyrse paniced, having the branches crowded, with flowers at the apex; petals 6-7. ½. D. G. Native of the Canary Islands. Coll. hort. rip. append. 4. t. 7. Flowers pale yellow.

Ciliated-leaved Houseleek. Clt. 1815. Shrub 1 to 1½ feet.

6 S. glutinòsum (Ait. l. c. p. 147.) stem frutescent; leaves cuneiform, hispid, rather scattered, fringed with adpressed, cartilagineously ciliate; petals 8-10. ½. D. G. Native of Madeira. Jacq. hort. schönb. 4. t. 464. Sims, bot. mag. t. 1965. Ker. bot. reg. t. 294. Branches of panicle loose. Flowers golden yellow. The stem rises to the height of 2 feet, and even more, according to Prince de Salm-Dyck. The fishermen of Madeira rub their nets with the fresh leaves of this species, by which they are rendered as durable as if tanned, provided they are steeped in some alkaline liquor. (f. 30.)

7 S. vèrècum (C. Smith, ms. Horn. suppl. p. 66. Haw. in phil. mag. 1827. p. 125.) stem frutescent, erect, leafy at the top; leaves broad, cuneiform, glabrous, cartilagineously ciliated on the margins, running into the petiole at the base, broad and blunt at the apex, and ending in a small point. ½. D. G. Native of the Canary Islands, on the walls of towns and the roofs of houses. Leaves green. Flowers yellow. Perhaps the same as S. latifòlum. Hoffm. verz. 2. p. 208. Haworth's plant is probably the same as that of Hornemann.

8 S. retùsum (Haw. in phil. mag. 1827. p. 125.) stem frutescent, simple, leafy at the apex; leaves broadly cuneate, expanded, smooth, ciliate, somewhat cuneate at the apex, truncate and retuse. ½. D. G. Native of Teneriffe, on walls and the roofs of houses. Flowers yellow. Very like S. ursìcum, but differs in the form of the leaves.

Smith, fl. græc. 473. Shrubs from 3-6 feet. Flowers golden yellow.

Var. β, variegatum; leaves margined with white or purple.

Tree Houseleek. Fl. Mar. Dec. Clt. 1640. Sh. 3 to 6 ft. 10 S. fruticæs (Haw. phil. mag. 1857. p. 125.) stem shrubby, simple; leaves crowded in a rosulate manner at the tops of the branches, spathulately cuneate, green, ciliated. ¹⁺. D. G. Native of Teneriffe. Flowers yellow. Very like S. arboresum, but the plant is not above half a foot high.

Frutescens Houseleek. Fl. Mar. Dec. Clt. 1824. Pl. ¾ to 1 ft. 11 S. Table-forhæm (Haw. suppl. p. 69. rev. 69.) stem frutescens, erect, simple; leaves spatulate, flat, ciliated, attenuated at the base, crowded at the top of the stem, and forming a rosulate flat disk, in consequence of the leaves being so closely imbricated over each other. ¹⁺. D. G. Native of Madeira. Stems branching after the first time of flowering. Petals 10-12, linear-lanceolate, very pale sulphur-coloured. Glands minute, pedunculate.

Table-formed Houseleek. Fl. Jul. Jul. Clt. 1817. Pl. 1 ft. 12 S. Canariense (Lin. spec. p. 604.) stem short, frutescens; radical leaves expanded, rosulate, obturately-spataluate, villous, large; leaves scattered along the flowering stem, ovate; branches of panicle expanded; flowers pedicellate; petals 9-10. ¹⁺. D. G. Native of the Canary Islands.—Comm. hort. amst. 2. t. 95. D. C. pl. grass. t. 141. Petals white, linear.

Var. β, hybridum (Salm-Dyck, and Haw.) all parts of plant larger.

Bearded Houseleek. Fl. Jul. Aug. Clt. 1815. Sh. 1 to 2 ft. 15 S. caespitosum (C. Smith, in hort. berol. p. 38.) stem frutescens, very short, at length a little branched, leafy at the apex; leaves oblong-linear, glabrous, stiffly ciliated, marked with brown lines on both surfaces, crowded in a rosulate manner, but the ciliate ones are scattered; flowers in cymose corymbs, with the branches dichotomous; petals 7-8, spreading. ¹⁺. D. G. Native of the Grand Canary Island, on rocks on the highest mountains. D. C. rapp. jard. bot. 1822. no. 13. S. ciliare, Sims, bot. mag. t. 1785. but not of Wild. S. ciliare, Haw. rev. p. 64. S. Simsi, Sweet, hort. suburb. p. 230. S. barbatum, Horn. suppl. p. 61. but not of Smith. Flowers yellow. This plant survived 18 months in paper in the herbarium of C. Smith, and afterwards when put into the earth grew.

16 S. Dordanale (Wildl. enum. p. 508.) stem herbaceous, erect, glabrous; leaves flat, glabrous, quite entire; radical ones obovate, attenuated at the base, disposed in a spreading rosulate manner; ciliate ones erect, oval, sessile, obtuse at both ends; cymes corymbose; petals 20. ¹⁺. D. G. Native of the Canaries. D. C. mem. crass. t. 11. Pedicels puberulous. Corymbs few-flowered. Petals linear; pale when dried.

Stellate Houseleek. Fl. Jul. Aug. Clt. 1790. Pl. ¼ foot. 20 S. dichotomum (D. C. jard. gen. t. 21.) stem herbaceous, terete, erect, dichotomous, beset with soft spreading hairs; leaves obovate-spataluate, tapering into the petiole, dotted with soft villi; flowers in loose corymbs; petals 8-9, spreading; scales of flower 2-lobed, small. ¹⁺. D. G. Native of the Canary Islands, among rocks. S. laxum, Haw. rev. 65. Nearly allied to S. hisimum, ex Buch. cat. Flowers yellow. This plant is nearly allied to S. tortuosum, but differs in being herbaceous.

P zwyiny Houseleek. Pl. 1 inch.

Sect. II. Jovibarba (Jupiter, Jovis, Jupiter, and barba, a beard; Jupiter's beard; application not evident). D. C. pr. gen. no. 21. obs. prod. p. 341. Young plants rising from the axis of the lower leaves. Flowers purplish or pale yellow.—European species.

* Flowers yellowish.

Var. β; offsets rather loose; petals 12. ¹⁺. H. Sims, bot. mag. 2115. More villous and pale than the species.
**CRASSULACEÆ.**

obelisci, or leaves. 

**September.**

**Flowers purplish.**

24 S. **tectorum** (Lin. spec. p. 664.) leaves ciliated; offsets spreading; petals 5-9, spreading; scales of flowers cuneiform, carunculate. 2. H. Native of Europe, on rocks and roofs of houses; also in many parts of Britain, on walls and cottage roofs, but perhaps not properly indigenous. D. C. pl. grass. t. 104. Smith, engl. bot. 1320. Curt. lond. 3. t. 29. Oed. fl. dan. 601. Blackw. t. 366. Sèdum tectorum, Scop. cart. ed. 2. no. 529. Flowers purplish. Stems sometimes changed into carpel according to Pet. Thours, in bull, phil. nov. 1807. The juice of the common house-leek either applied by itself, or mixed with cream, gives present relief in burns, and other external inflammations; it is also said to cure corns. With honey it is a useful application in the throat. Boerhaave found 10 ounces of the juice beneficial in dysenteries, and others have found it useful in gonorrhæa; but it is not admitted into modern practice. The house-leek had several names formerly, as sengreen and aygreen, both translations of Semprevium. It has also been called Jupiter's eye, bulbuck's eye, and Jupiter's beard. In German it is called hauswurz; in French la grande joubarde, and in Italian sempervivo maggiore.

25 S. **flagelliforme** (Fisch. in Link, enum. 2. p. 20.) leaves ovate, mucronate, papillosé, with papillously ciliated margins; offsets spreading, lateral; branches of cyme bifid. 2. H. Native of Siberia. Allied to S. montanum, but differs in being larger, and in the offsets being at the ends of long flagella. The leaves of the offsets terminate in a stiff brown point; caule leaves narrower. Corolla reddish.

26 S. **montanum** (Lin. spec. p. 665.) leaves of the offsets obovate-oblong, shortly acuminate, beset with glandular pubescence on both surfaces, obsolescently ciliated, entire, pubescent; offsets rather contracted; flowers rotate; petals 10-14, lanceolate, acuminate, spreading, 3 times longer than the calyx, scales of flowers small, nearly quite entire; style discoloured at the apex. 2. H. Native of the Pyrenees and the Alps of Europe, &c. on rocks. D. C. pl. grass. t. 105. Jacq. fl. aust. 5. append. t. 41. Flowers deep red. This species differs from S. tectorum in the smaller stature, and in the nectariferous scales being almost wanting; and from S. arachnoideum in the absence of the cobwebbed wool. Scales of flower red and retuse.

27 S. **Funkii** (Braun, in bot. zool. Jan. 1832. p. 4. t. 1.) leaves of the offsets oblong, shortly acuminate, beset with glandular pubescence on both surfaces, with ciliated margins; flowers rotate; petals lanceolate, acuminate, about 3 times longer than the calyx; germins dilated, ovate; style discoloured at the apex. 2. H. Native of the Alps of Europe, as in Switzerland, Piedmont, &c.

28 S. **arachnoideum** (Lin. spec. 665.) leaves covered with interwoven cobwebbed hairs or wool; offsets globose; petals 8-9, spreading; scales of flower truncate emarginate. 2. H. Native of the Alps of Europe and the Pyrenees, &c. among rocks. D. C. pl. grass. t. 106. Curt. bot. mag. t. 68. Jacq. austr. 5. append. t. 42. Flowers purple.

29 S. **fulmidum** (Bieb. fl. taur. 1. p. 381.) leaves lanceolate, acute, ciliated by long hairs; offsets globose; stem few-flowered; petals 12, hairy. 2. H. Native of Caucasus, at the torrent of Terek, on rocks. Flowers red. Very like S. arachnoideum, but differs in the hairs on the leaves being distinct, not cobwebbed.

**Fine-leaved House-leek.** Pl. ½ foot.

† **Species hardly known.**

32 S. **africanum** (Mill. dict. ed. 8. no. 7.) margins of leaves serrately toothed; offsets spreading. 2. D. G. Native of the Cape of Good Hope. Haw. syn. p. 367. This species has never been seen except by Miller; it is therefore doubtful. Sprengel says it is the same as S. arboréum.

**African House-leek.** Clt. 1768. Shrub.

33 S. **seguei** (D. C. prod. 3. p. 414.) stem herbaceous, erect; leaves opposite, obovate.—Native on Mount Baldo. Sèdum perterræum, &c. Scarella in Seg. ver. 2. p. 360. t. 17. S. stellatum, Poll. fl. ver. 2. p. 114. exclusive of the synonyme of Smith. It is probably a variety of Sèdum dasyphylæum, but the flowers are said to be yellow. The plant is therefore very doubtful.

**Seguer's House-leek.** Pl. ½ foot?

34 S. **hispanicum** (wild. enum. p. 508.) leaves subulate, semi-terete, ciliate, imbricated; cymes bifid. 2. H. Native of Spain. The rest unknown. Perhaps a species of Sèdum.

**Spanish House-leek.** Pl. ½ to ¾ foot.

35 S. **clavulatum** (Sieb.) These two species are only 36 S. muta'nil ex Schlecht. † known by name.

**Cult.** The greenhouse kinds of house-leek are chiefly natives of the Canary Islands. A mixture of sand, loam, and brick-rubish is a good soil for them; and care must be taken not to give them too much water when not in flower. Cuttings taken off the plants, and laid to dry a few days, will strike root freely without any covering of glass. Cuttings of some species are difficult to obtain, such as of S. tabuliforme, &c.; the best way in such cases is to cut the top out, and lateral shoots will be immediately produced. The hardy kinds are well fitted for rock-work, or to grow on walls; and they are easily increased by the offsets, which are issued in great abundance. A light soil suits them best.

**TRIBE II.**

**CRASSULA'E ANOMALÆ** (the plants contained in this
XXI. PENTHORUM (from πεντα, pente, five, and ἄπατος, apate, a boundary; in reference to the 5 leaves which terminate the capsule). Lin. gen. no. 580. Gærtn. fruct. 1. p. 312. t. 65. D. C. prod. 3. p. 414.

Lin. syst. Decandra, Pentagynia. Calyx 5-parted. Petals 5. Stamens 10. Scales wanting? Carpels 5, united at the base, in a 5-seaked 5-celled capsule, which is pentagonal at the apex, and opening under the beaks. Seeds numerous, small, fixed on every side of the broad placenta, and probably exalbominous. —Erect perennial herbs, with scattered, membranous, oblong-linear, unequally serrated leaves: and unilatral cymes, which are turned back at the points. 1. P. sedoïdes (Lin. spec. p. 620.) stem a little branched; leaves lanceolate; cymes numerous, panicked, many-flowered; seeds scrobiform. 2. H. Native of North America, in bogs, from New England to Carolina, and on La Grande Chaudière. Lam. act. ups. 1744. t. 2. Lam. ill. t. 390. Flowers white or pale yellow.

Stonecrop-like Penthorum. Fl. July, Aug. C1t. 1768. Pl. 1 ft. 2. P. Chinensis (Pursh. fl. amer. sept. 1. p. 323. in obs.) stem simple; leaves long, linear-lanceolate; cymes few, corymbose, few-flowered; seeds ovate, horny. 2. H. Native of China. D. C. mem. crass. pl. 13. Very like P. sedoïdes, but the seeds are certainly distinct. Stems, as in it, terete at the base, and angular at the apex.

China Penthorum. Pl. 1 foot. Cult. The species of this genus grow freely in light sandy soil, and are easily increased by dividing at the roots. Cuttings also strike freely under a hand-glass. P. Chinensis, if ever it should be introduced to the gardens, will require protection in winter until its hardness be ascertained.

Calyx constantly of a definite number of sepalos, usually 5, but varying from 4 to 8, more or less united at the base, either cohering with the ovary, or almost distinct from it, equal or unequal, quincuncial or valvate in stivation. Petals indefinite, coloured, narrow, a little combined at the base, sometimes wanting, but in that case the inside of the calyx is coloured. Stamens indefinite, arising from the calyx, distinct; anthers oblong, incumbent. Ovarium distinct, or adnate to the calyx, many-celled, crowned by numerous distinct stigmas. Capsule either girdled by the fleshy calyx or naked, usually many-celled, but often 5-celled, opening in a stellate manner at the apex. Seeds attached to the inner angle of the cells, definite or indefinite. Embryo lying on the outside of a mealy albumen, curved.—Shrubby or herbaceous plants, variable in habit. Leaves fleshy, opposite, simple. Flowers usually terminal.

The curved embryo and mealy albumen, along with the superior calyx, and distinctly perigynous stamens, characterise these among their neighbours, independently of their succulent habit. With Crassulaceæ, Chenopodiaceæ, and Caryophyllaceæ they are more or less closely related. Reumurioæ and Nitrariiæ are families different in affinity. The hottest sandy plains in the Cape of Good Hope nourish the largest part of this order. A few are found in the south of Europe, north of Africa, Chili, China, Peru, and the South Seas. The succulent leaves of a few of the species are eaten, as of Tetragonia expansa, Mesembryanthemum edule, and Sesuvium portulacastrum; others yield an abundance of soda. Mesembryanthum nodiflorum is used in the manufacture of Moroquin leather.

Synopsis of the genera.

1 Mesembryanthemum. Calyx of 5, rarely of 2-8 sepalos. Petals indefinite, linear. Stamens indefinite, inserted in the top of the calyx along with the petals. Capsule adnate to the calyx, from 4 to many-celled; cells many-seeded.

2 Tetragonia. Calyx 4, rarely 3-cleft; lobes coloured inside. Petals wanting. Stamens variable in number. Capsule 3-8-celled; cells 1-seeded.

4 Aizoon. Calyx 5-parted, coloured inside. Petals wanting. Stamens about 20, inserted in the bottom of the calyx, 3-5 in each fascicle. Capsule 5-celled; cells many-seeded.

5 Glauces. Calyx 5-parted, coloured inside, with 3 inner sepals and 2 outer ones. Petals 5-20, tongue-shaped, 2-4-cleft at the apex. Capsule covered by the calyx, 5-celled; cells many-seeded.

Lin. syst. Icandrina, Tetra-Polygynia. Calyx of 5, rarely of 2-8 sepalos; sepalos united to themselves, and to the ovary even to the middle; lobes unequal, usually leaf-formed. Petals innumerable, in one, but more often in many series, united among themselves at the base. Stamens indefinite, disposed in many series, inserted with the petals at the top of the calyx. Ovarium adnate to the calyx, many celled inside (4-20), but usually 5-
celled. Stigmas 4-20, but usually 5. Capsule many-celled, opening stellately at the apex, adnate to the permanent calyx. Seeds numerous. Embryo curved at the side of a mealy albumen. Cotyledons thick, very blunt.—Subshrub, rarely herbs, almost all natives of the Cape of Good Hope. Leaves usually opposite, thick, fleshy, flat, terete or trigonal. Flowers terminating the branches, white, yellow or purple, the greater part of which open in the heat of the sun, very few of them opening in the evening. Fruit opening in a humid atmosphere, and relieving the seeds, which are then dispersed by the wind along with the sand.

In consequence of this genus being very large, we think it necessary to give a synopitical table of the sections, in order to render a reference to the species more easy.

### Synopitical Table of the Sections.

### Subdivision I. Acaulis (acaulis, without a stem; plants stemless or nearly so). Haw. rev. succ. p. 81. Stems wanting or very short. Root perennial. Leaves large, variable in form and thickness, but not flat.

§ 1. Sphaeroida (from σφαρος, sphaira, a sphere; in reference to the leaves being joined together into a globe). Salm-Dyck.—

**Minima et Sphaeroida, Haw. rev. succ.** Plants stemless. Leaves opposite, very blunt, joined even to the apex into a globe, but separating at length at the apex, and becoming marcescent, but still sheathing at the base. Flowers solitary, sessile, central. Calyx 4-5-cleft. Stigmas 4-5. Petals joined into a loose tube.

1. *M. minutum* (Haw. obs. 126. misc. 21. rev. 82.) plant stemless, obconical, glaucous, without spots; flowers long, tubular. 2. D. G. Native of the Cape of Good Hope. Sims, bot. mag. t. 1376. Plant hardly the size of a common bean. Petals pale reddish in the free part, spreading; tube slender, half an inch long, inclosing the ovary.

**Minute Fig-marigold.** Fl. Sept. Nov. Pl. ½ inch.

2. *M. minusculum* (Haw. obs. 126. misc. 21. syn. 203. rev. p. 82.) plant stemless, obconical, glaucous, with confluent rather branched spots; ovary exserted. 2. D. G. Native of the Cape of Good Hope. Petiv. gaz. t. 39. f. 3. ? ex Haw. Flowers very pale yellow, almost white, sessile. The cultivated plants of this species are sometimes somewhat caulescent. Offsets fewer from this species than from the other allied species.

3. *M. perpusillum* (Haw. rev. p. 82.) plant stemless, obconical, green, with strong confluent branched dots; ovary inclosed. 2. D. G. Native of the Cape of Good Hope. Very nearly allied to *M. minimum*, but the colour of the flowers is deeper, and the offsets more numerous.

5. *M. obconium* (Haw. misc. 21. syn. 203. rev. 82.) plant stemless, obconical, green, with confluent rather tubercle-formed dots; ovary inclosed. 2. D. G. Native of the Cape of Good Hope. Calyx 4-cleft. Corolla white.

**Fig-formed Fig-marigold.** Fl. Feb. Oct. Clt. 1819. Pl. ½ inch.

**Button-shaped Fig-marigold.** Fl. 2 Clt. 1795. Pl. ½ inch.

9. *M. turbiniforme* (Haw. rev. p. 84.) plant stemless, obconical, exactly truncate, and therefore top-formed, obscurely dotted. 2. D. G. Native of the Cape of Good Hope. Burch. cat. 1630. 2. voy. 1. p. 310. This species is twice or thrice the size of *M. truncatum*.

**Top-shaped Fig-marigold.** Pl. 2 inches.
10 M. uveförmë (Haw. rev. p. 84.) plant stemless, nearly globose, green, form and size of a grape berry, with small, rather confluent deeper dots. 

Grape-formed Fig-margd. Fl. 1790. Pl. 1 inch. Native of the Cape of Good Hope. Burm. afr. t. 10. F. 55.

§ 2. Subquadrifolía (the plants belonging to this section are usually furnished with about 4 leaves). Salm-Dyck, obs. 17—Semicôta and Observ., Haw. rev. p. 85. Plants almost stemless. Leaves 4-6, decussate, quite entire, obtuse, flat convex beneath. Flowers nearly sessile, solitary. Calyx 4-6-cleft. Stigmas 4-6. The upper leaves are usually commate, as in section Spheroideae, and at length separate, but more distinctly.

11 M. unciförmë (Haw. obs. 129, misc. 22. syn. 204. rev. 84.) plant stemless, glaucous, without dots, nearly spherical; tops of leaves unequal, distinct, flat above. 

Nut-formed Fig-margd. Clt. 1790. Pl. 1 inch. Native of the Cape of Good Hope. Flowers unknown.

§ 3. Moniliförmë (from monile, a bracelet, and forma, form; appearance of stems). Haw. and Salm-Dyck, i. c. Stems very short, moniliform, leafless in the summer. The two first leaves united even to the apex, and deciduous; the two following leaves elongated, and joined at the base, marcescent, and deciduous. Calyx 4-6-cleft, and is, as well as the leaves, full of crystalline papulae. Stigmas 7-8.

18 M. risfoförmë (Haw. misc. 23. syn. 205. rev. 93.) leaves full of crystalline papulae; the first two united into the form of a pea; the following 2 semi-terete; cædæx much branched, and very dwarf. 

Pea-formed Fig-margd. Clt. 1796. Pl. 1 inch. Native of the Cape of Good Hope. The first leaves are produced in autumn, and the second in winter. Flowers unknown.

Pea-formed Fig-margd. Clt. 1796. Pl. 1 inch. Native of the Cape of Good Hope. The first leaves are produced in autumn, and the second in winter. Flowers unknown.

20 M. noibile (Haw. in phil. mag. 1823. p. 881.) plant rather caulescent; leaves coarsely and triquetrously ciliate, obtuse, somewhat recurved, rather concave above, marked by large elevated tubercles. 

21 M. magnipunctatum (Haw. rev. p. 86.) plant stemless; leaves perfect, usually about 4, large, clavately triquetrous, very thick, glaucous, flat above, keeled beneath, obtuse at the apex, marked with very large and numerous dots. 

22 M. Caœnæ (Haw. obs. 158. misc. 25. syn. 219. rev. 87.) but not of Salm-Dyck,) plant stemless; leaves hoary, semi-terete at the base, attenuated, gibbously keeled at the apex. 

25. M. digitatum, Ait. hort. kew. 2. p. 181. Flowers white, according to Thunberg. Leaves alternate. Perhaps belonging to a different section.

Finger-shaped Fig-margd. Clt. 1775. Pl. 1 inch. Native of the Cape of Good Hope. Flowers unknown.

20 M. noibile (Haw. in phil. mag. 1823. p. 881.) plant rather caulescent; leaves coarsely and triquetrously ciliate, obtuse, somewhat recurved, rather concave above, marked by large elevated tubercles. 

21 M. magnipunctatum (Haw. rev. p. 86.) plant stemless; leaves perfect, usually about 4, large, clavately triquetrous, very thick, glaucous, flat above, keeled beneath, obtuse at the apex, marked with very large and numerous dots. 

22 M. Caœnæ (Haw. obs. 158. misc. 25. syn. 219. rev. 87.) but not of Salm-Dyck,) plant stemless; leaves hoary, semi-terete at the base, attenuated, gibbously keeled at the apex. 

25. M. digitatum, Ait. hort. kew. 2. p. 181. Flowers white, according to Thunberg. Leaves alternate. Perhaps belonging to a different section.

Finger-shaped Fig-margd. Clt. 1775. Pl. 1 inch. Native of the Cape of Good Hope. Flowers unknown.

§ 5. Albinota (from albus, white, and nota, a mark; plants marked with white). Haw. in phil. mag. Aug. 1826. p. 126. Plants almost without stems, tufted. Roots perennial. Leaves decussate, entire, obliquely incurved, green, spreading, full of large tubercular white dots, semi-terete at the base, acainiformly triquetrous at the apex, or nearly equal-sided, more or less mucronulated. Flowers sessile, central, sessile, yellow. Staminodes erectly spreading, as in those of section Ringèntia.

24 M. albinotæ (Haw. in phil. mag. Aug. 1826. p. 126.) leaves acainiformly triquetrous upwards, with a recurved
FICOIDEÆ. I. MESEMBRYANTHEMUM.

26 M. mutisellum (Salm-Dyck and Haw. suppl. p. 87. rev. p. 89.) plant almost stemless, green, full of pellucid dots; leaves triquetrous, gradually thickening towards the apex, ciliately toothed, pulsatilis gibbous on the inside at the base; flowers on short pedicels; calyx 4-cleft. 4. D. G. Native of the Cape of Good Hope. Salm-Dyck, obs. 1830. p. 9. Flowers yellow, expanding in the evening, sweet-scented.

Weasel-chop Fig-marigold. Clt. 1820. Pl. 1/4 foot.

Var. β, mágus (Haw. l. c.) corolla yellow, red at the apex.

28 M. agnus (Haw. in phil. mag. Aug. 1826. p. 126.) plant almost stemless, canescent, wrinkled from dots; leaves semi-terete, serrulate from elevated dots, and hence somewhat toothed, pulsatilis on the inside at the base. 4. D. G. Native of the Cape of Good Hope. Leaves with a large white pustule on the inside at the base. Flowers sessile, solitary, central, expanding in the evening.

Var. β; plant a little smaller; leaves of more obscure.

Var. γ; leaves more erect, entire.

29 M. murinum (Haw. obs. p. 165. misc. p. 30. syn. 217. rev. 90. phil. mag. 64. p. 111.) plant almost stemless, glaucescent; leaves ciliately denticulated, 3 rows on each side, and full of tubercular dots, with the margins and keel ciliately denticulated at the apex; flower sessile. 4. D. G. Native of the Cape of Good Hope. Flowers small, yellow. Styles 5, very short, erect, green, a little thickened towards the apex.

31 M. lupinum (Haw. in phil. mag. 64. p. 111.) plant stemless; leaves glaucous, marginal ciliate very long, and very numerous. 4. D. G. Native of the Cape of Good Hope. Very like M. felinum, but differs according to Salm-Dyck in the leaves being narrower, more attenuated, and in the ciliate being more numerous, but probably it is only a mere variety of it.

Wolf-chop Fig-marigold. Pl. 1/4 foot.

33 M. caninum (Haw. obs. p. 159. syn. 217. rev. p. 87.) plant almost stemless; leaves glaucescent, carinately triquetrous, rather club-shaped, incurved towards the apex, and somewhat toothed, as well as the bracteas; peduncles longer than the leaves. 4. D. G. Native of the Cape of Good Hope. D. C. pl. grass. t. 95.—Dill. elth. f. 231.—Bradh. succ. t. 17. M. ringens a, Lin. spec. 698. Flowers of a yellowish orange colour, opening after meridian.

34 M. vulpinum (Haw. syn. p. 417. rev. p. 88.) plant almost stemless; leaves glaucescent, carinately triquetrous, rather club-shaped, with large teeth at the apex or entire; old leaves horizontal; bracteas entire; peduncles longer than the leaves. 4. D. G. Native of the Cape of Good Hope. M. caninum β, Haw. misc. p. 32. Very like M. caninum, but taller, and the leaves are longer and greener, with fewer teeth. It is, however, perhaps only a variety of it. Flowers yellow.

35 M. nympheum (Haw. syn. 218. rev. p. 88.) plant stemless, smooth, white; leaves semi-terete, entire, carinately triquetrous above, and a little thickened, ending in a recurved mucron each. 4. D. G. Raised in the gardens from the seeds of M. albiflorum, impregnated by the pollen of M. caninum.

Hybrid Fig-marigold. Fl. May, Oct. Pl. 1/4 foot.

36 M. musevitum (Haw. in phil. mag. Nov. 1826. p. 328.) margins and keel of leaves usually bearing but one tooth each; branches prostrate, half a foot long. 4. D. G. Native of the Cape of Good Hope. Flowers yellow, opening in the morning, scentless. This plant is very like M. murinum, but differs in the prostrate branches, and in the teeth of the leaves being fewer. It comes perhaps nearest in habit to M. erissonum, but differs in the petals being a line broad, not capillose.

37 M. albidum (Lin. spec. p. 699.) plant stemless, smooth, whitish; leaves thick, subulate, triquetrous, obtuse, with an acumen, but semi-terete at the base; all quite entire. 4. D. G. Native of the Cape of Good Hope.—Dill. hort. clth. f. 232. Bradl. succ. t. 43. Sims, bot. mag. t. 1824. Haw. rev. p. 88. Flowers large, yellow, opening early in the morning, but afterwards remaining expanded throughout the whole day, sweet-scented. Stigmas 11. This plant is intermediate between the section Ringuetia and Rostrata.

38 M. denticulatum (Haw. obs. 149. misc. syn. 215. rev. 91.) plant stemless; leaves very glaucescent, subulate triquetrous, compressed, dilately keeled at the apex; keel usually
**SALM-DYCK**

*Salvia.* 

1. **FIOCHIE.** 1. Mesembryanthemum.

Small-branched Fig-marigold. Fl. March, Nov. Ch. 1791. Pl. 1/4 foot.

* Disticha* (from *distichus*, distichs, having two rows, a distich; leaves disposed exactly in two opposite rows), *Haw. misc.* p. 82. —**Linguiforumia**, *Haw. rev.* p. 93. —Glossoeidae, *Spreng. syst*. 2. p. 514. Leaves exactly distich.—Perhaps all the plants contained in this name are nothing more than varieties of one species, and probably of garden origin. The whole have been collected under the name of *M. linguiforme* in *Linn. spec.* p. 699. and *D. C. pl. grass*. no. 71.

48 M. *pra6anum* (Salm-Dyck, obs. 1830. p. 8.) plant almost stemless; leaves tongue-shaped, thick, one side rather convex, and obtuse at the apex, the other side thrown out into a keel; flower on a short peduncle. 2. D. G. Native of the Cape of Good Hope. *Haw. rev.* p. 95. Hoffmans. *verz.* 1. p. 220. Otto et Link, *abw.* t. 43. Flowers fragrant, yellow, 5 inches in diameter. Calyx 5-cleft. Allied to *M. sclaphatum*, but the leaves are narrower and thicker.

Fragrant Fig-marigold. Fl. Aug. Pl. 1/2 foot.

50 M. *grandiflorum* (Haw. in *phil. mag.* nov. 1826. p. 328.) leaves broad tongue-shaped, long, thick, having a large pustule on the inside at the base; petals very broad. 2. D. G. Native of the Cape of Good Hope. Flowers yellow, almost sessile, large, sessile; petals 3-4 lines broad. Leaves 3/4 inches long, and 15 lines broad. Capsule subconical. This is the largest species in the present section.

Var. *β* (Haw. l. c.) leaves deeper green.

Great-flowered Fig-marigold. Fl. July. Ch. 1824. Pl. 3/4 foot. 51 M. *medium* (Haw. *suppl.* p. 88. rev. p. 95.) plant almost stemless; leaves tongue-formed, sloping, cultrate, deep green, without any claw-like point at the apex; peduncles longer than the flowers. 2. D. G. Native of the Cape of Good Hope. Leaves 4 inches long, and an inch broad. Peduncles an inch long. Flowers yellow.

52 M. *cultratum* (Salm-Dyck, obs. 1820. p. 7.) plant almost stemless; leaves distich, exactly tongue-shaped, cultrate at the margin and apex; peduncles compressed, rather longer than the

VOL. III.

Var. β, rufescens (Haw. syn. p. 221.) leaves very closely imbricated, rufescent.

Var. β, brève (Haw. rev. p. 99.) leaves short, very blunt, depressed on the ground; capsule small, depressed.

59 M. DEPRESSUM (Haw. misc. p. 221. rev. 190.) plant almost stemless, prostrate; leaves pale, narrow-tongue-shaped, obtuse, recurved, depressed, variously incurved at the apex; capsule depressed. *L. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 226? Flowers yellow.

Var. β, bifidum (Haw. l. c.) leaves of a livid rufescent colour.

Depressed Fig-marigold. Fl. Sept. Nov. Cl. 1795. Pl. ½ ft.

* Crucifera (from crucis, a cross; leaves disposed crosswise more or less). Haw. syn. p. 222.—Crucifera and Difforia, Haw. rev. 100. and 101. Leaves more or less cruciate, usually obliquely decussate.

Cross-leaved Fig-marigold. Fl. May. Nov. Cl. 1792. Pl. ¼ ft.

60 M. TAURUM (Haw. syn. p. 224. rev. 100.) plant almost stemless; leaves disposed in 2 rows, obliquely cruciate, semi-terete, obtuse, very thick, of a yellowish green colour, incurved; flowers sessile; calyx bifid? *L. D. G. Native of the Cape of Good Hope. Calyces segments unequal. Styles 6. Old stem branched at the base, half a foot high. Flowers yellow.

61 M. SALMI (Haw. suppl. p. 89. rev. p. 100.) plant nearly stemless; leaves decussate, semi-cylindrical, attenuated and acute at the apex, or oblique and bluntish; flowers exactly sessile; calyx 4-cleft; capsule half closed. *L. D. G. Native of the Cape of Good Hope. Salm-Dyck. obs. bot. 1820. Link. et Otto. agg. g. t. 44. Flowers large, yellow. Leaves pustulate at the base, according to Haworth.

Var. β, semi-cruciatum (Salm-Dyck. l. c.) leaves obliquely distinct, straight, and more tongue-shaped than the species.

62 M. SUBREPTUM (Haw. rev. p. 101.) leaves decussate, erectish, or spreading, more or less semi-terete, subulate, acute, soft, usually pustulate at the base; ovary exserted, somewhat pustulate. *L. D. G. Native of the Cape of Good Hope. Flowers yellow.

63 M. HETEROPHYLLUM (Haw. obs. p. 420. misc. 36. syn. 225, rev. 101.) plant stemless; leaves green, divided, without dots; upper ones the longest. *L. D. G. Native of the Cape of Good Hope. Flowers yellow. Leaves obliquely cruciate; lower ones like those of M. canum; upper ones like those of M. difforium.

Variable-leaved Fig-marigold. Cl. 1795. Pl. ½ foot.

64 M. AUGUSTUM (Haw. obs. 176. misc. p. 34. syn. 222, rev. p. 101.) plant almost stemless; leaves linear-tongue-shaped, semi-cylindrical, very long; flowers nearly sessile; calyx 4-cleft. *L. D. G. Native of the Cape of Good Hope. Flowers yellow, having the petals broader than any other species of this section. Calyx 4-cleft; stigmas 10, according to Haworth.

Var. β, brevicaule (Haw. rev. p. 103.). Cauliflor shorter.

Difforium Fig-marigold. Fl. Aug. Cl. 1732. Pl. dec.

66 M. BIIFERATUM (Haw. in phil. mag. nov. 1825. p. 239.) leaves obliquely somewhat cruciate, semi-cylindrical, pale green, varying at the apex, usually with 2 gibbosities; capsule depressed. *L. D. G. Native of the Cape of Good Hope. Very like M. difforium, but smaller and slenderer. Flowers yellow.

Two-bunched-leaved Fig-marigold. Fl. Aug. Cl. 1820. Pl. ¼ foot.

67 M. BIDENATUM (Haw. suppl. p. 89. rev. p. 103.) plant stemless; leaves semi-cylindrical, thick, soft, oblique at the apex, and divided, bearing 2 large, almost opposite, fleshy teeth in the middle. *L. D. G. Native of the Cape of Good Hope. Flowers large, yellow, on short peduncles; petals erosely toothed at the apex. Capsule a little depressed.—The figure in Dill. hort. elth. f. 241. is referrible to this plant and not to the next.

Bidenate-leaved Fig-marigold. Fl. Aug. Cl. 1818. Pl. ¼ ft.

68 M. SEMICYLINDRUM (Haw. obs. p. 238. misc. p. 36. syn. 225. rev. p. 103.) plant rather canescent; leaves very narrow, tongue-shaped, semi-terete, oblique towards the apex, furnished
with 1 oblique tooth on one side, and another stronger one on the other; flowers on short pedicels; calyx 4-cleft. 2. D. H. Native of the Cape of Good Hope.—Pluck. mant. t. 325. f. 4. Flowers yellow, size of those of *M. linguiforme*. Styles 8.

70 M. *Carinans* (Haw. rev. p. 90.) plant nearly stemless; leaves elongated, somewhat incurved and spreading, semiterete at the base, compressed at the apex, and dilated into a keel, whithis and dotted. 2. D. G. Native country and flowers unknown. M. cænum, *Salm-Dyck*. obs. p. 20. but not of Haw. Flowers by threes, yellow, expanding, very in the like M. dolabrilforme.

Obsubulate-leaved Fig-marigold. Clt. 1796. Pl. ½ foot.

80 M. *Teretiu'sculum* (*Haw*. obs. 410. misc. 27. exclusive of the synonymes) plant stemless; leaves triquetroously terete, firm, thick, green, dotted. 2. D. G. Native of the Cape of Good Hope. Leaves 2 inches long. Flowers unknown, but probably red.

*Nearly terete-leaved Fig-marigold*. Clt. 1794. Pl. ½ foot.

§ 13. *Bellidiflora* (from *bellis*, a daisy, and *flos*, a flower; the flowers bear some resemblance to those of the daisy). *Haw*. rev. p. 106. Plants stemless or caulescent. Leaves triquetrous,
acut at the angles, toothed at the apex. Flowers solitary, pedicellate. Petals purple on the ribs and white on the margins. *Calyx* 5-cleft. Capsule 5-celled. Stigmas numerous, small, hair-formed.

81. *M. bellidiformis* (Lin. spec. p. 630.) caudex short, subfruticose; leaves triquetrous, compressed, rather acinaciform, denticulat at the apex; pedicels short. .getFullYear(). D. G. Native of the Cape of Good Hope. Petals red and white.

*Var. β*, glaucoscens (Haw. rev. p. 105.) leaves rather glaucous, with the teeth in 3 rows at the apex.—Dill. elth. f. 233.

*Var. γ*, viride (Haw. rev. p. 105.) leaves pale green, toothed beneath on the keel.

*Daisy-flowered* Fig-margold. Fl. June, Aug..Ct. 1717.

Pl. 3/4 foot.

82. *M. subulatum* (Mill. dict. ed. 8. no. 10.) caudex branched; leaves rather glaucous, triquetrously subulate, denticulate at the apex. .getFullYear(). D. G. Native of the Cape of Good Hope. Haw. syn. 208. *M. bellidiformis* simplex, D. C. pl. grass. t. 41.

*Flowers reddish.* The plant is very like *M. bellidiformis*, but is much smaller and more branched.

83. *M. Burgmanni* (Haw. rev. p. 106.) leaves succulent, simple; leaves triquetrous, with 3 rows of teeth at the apex; pedicels rather elongated. .getFullYear(). D. G. Native of the Cape of Good Hope.—Burn. afr. t. 25.

*This species is hardly known.*

Burmann’s Fig-margold. Pl. 3/4 foot.

*Plants stemless or nearly so.* Leaves semiterete, subulate, incurved, triquetrous at the apex, green, full of peduncled dots. *Flowers pedicellate; petals deep purple.* *Calyx* 5 cleft. *Stigmas 10?*

85. *M. functum* (Haw. obs. p. 411. rev. 107.) plant smooth, stemless; leaves semiterete, triquetrous at the top, flat above, full of peduncled dots, pale green, furnished with a minute white point at the apex. .getFullYear(). D. G. Native of the Cape of Good Hope. Flowers unknown. Perhaps only a variety of *M. diminutum*.

*Dotted-leaved* Fig-margold. Fl. April, Nov. Ct. 1793. Pl. 3/4 foot.

*Var. β*, cauliculatum (Haw. suppl. 90. rev. 107.) stem half erect; leaves longer, and with larger dots, but is perhaps only an old plant.

*Diminished* Fig-margold. Fl. Apr. Ct. 1789. Pl. 3/4 ft.

87. *Macrorhizum* (Haw. l. c. D. C. l. c.) stem very short; root large, tuberous; leaves connate, bluntly triquetrous, crowded, spreading; branches erect, bent; flowers 1-3 together, nearly terminal, pedicellate. FullYear(). D. S. Native of the Island of Bourbon, among scoria near the sea. Stems 8 inches high. Flowers small, white, numerous. The leaves have an acid taste when eaten, as those of *Salsola*. La Lavangere, Comm. mss. and figure. *Ficoide*, De Pet. Th. mel. bot. p. 37.

**Subdivision II. Cephalophylla** (from κεφαλή, cephale, a head, and ψιλλόν, phyllon, a leaf; in reference to the leaves being collected in heads at the tops of the branches). *Haw.* rev. 108.

*Stems suffrutescent, decumbent.* Leaves long, triquetrous, or nearly cylindrical, disposed in heads. Flowers pedunculate, yellow. *Calyx* 5-cleft. *Stigmas 10-20.* This division is perhaps not very natural.

*Var. β*, congestum (Haw. l. c.) plant more greenish; lower pair of leaves very long.

*Var. β*, brevifolium (Haw. l. c.) leaves shorter than in any of the other varieties.

*Var. γ*, latifolium (Haw. l. c.) leaves pale green.

*Var. c*, atroirens (Haw. l. c.) leaves dark green.

90. *M. decipiens* (Haw. rev. p. 110.) stems prostrate, with rather distant nodis; leaves rather crowded, long, areately ascending, triquetrously semi-cylindrical, green, shining, minutely and finely wrinkled. FullYear(). D. G. Native of the Cape of Good Hope. *Flowers pale yellow.*

*Deceiving* Fig-margold. Fl. May. Ct. 1820. Pl. pr.

91. *M. Dubium* (Haw. misc. p. 39. syn. 231. rev. 110.) stems prostrate, nearly terete, with the nodis contiguous; leaves rather crowded, longish, triquetrously semi-cylindrical, ascending, green, shining; stigmas 12. FullYear(). D. G. Native of the Cape of Good Hope.—Brasil. succ. t. 40. Petiv. gaz. 77. f. 10. Leaves 2 inches long, but shorter than those of *M. corniculatum*. Peduncles terminal, shorter than the leaves. *Petals sulphur-
coloured on the inside, and of an orange red colour on the outside.

**Doubtful Fig-marigold.** Fl. May, Nov. Clt. 1800. Pl. pr.

**Horned Fig-marigold.** Fl. May. Clt. 1732. Pl. pr.

§ 17. **Procumbêntia** (procumbens, procumbent; plants). Haw. in phil. mag. dec. 1826. p. 329. Old stems procumbent. Leaves connate at the base, long, semiterete or cylindrical.

93 M. PROCUMBENS (Haw. rev. 111.) stems flexuous, procumbent; leaves by pairs, recurved, corniculate, semi-cylindrically triquetrous, glaucescent. § D. G. Native of the Cape of Good Hope. M. dubium, Salm-Dyck. obs. p. 22. Allied to *M. tricolor*, but the leaves are shorter and more expanded, &c.

95 M. PURPUREUM (Haw. in phil. mag. dec. 1826. p. 329.) branches short, angular, prostrate, furrowed, yellowish; leaves green, triquetrous semi-cylindrical, full of little dots, upper ones crowded. § D. G. Native of the Cape of Good Hope. Peduncles filiform. Flowers showy; petals white, polished, naked, with a broad, dark, purple line. Styles 10, redish.

**Purple and white-flowered Fig-marigold.** Fl. Aug. Clt. 1824. Pl. pr.

§ 18. **Capitata** (from capitatus, headed; leaves crowded into heads at the top of the stems or branches). Haw. syn. 227. rev. 111. Salm-Dyck. obs. p. 30. Caudex erect, much branched. Leaves crowded at the tops of the branches, alternate, very long, triquetrous, or semi-terete, without either dots or papule. Florigerous branches disposed in something like whorls, decumbent. Peduncles bracteate at the base. Flowers large, yellow. Calyx 5-lobed; lobes elongated. Petals ciliated at the base. Stigmas 10-20. The species are very nearly allied to each other.

96 M. FUGITIVUM (Lin. spec. 699.) stem suffruticoso, erectish; branches few, terete, decumbent; leaves alternate, crowded at the tops of branches, glaucous, triquetrous; petals shorter than the calyx; stigmas 15, expanded. § D. G. Native of the Cape of Good Hope.—Dill. elth. f. 269. Bradt. succ. t. 14. D. C. pl. grass. t. 82. Haw. misc. 42. syn. 218. rev. 112. Flowers large, pale yellow. Perhaps the flesh-coloured and purple-flowered varieties mentioned in Breyn. cent. p. 164. belong to this species.

97 M. CAPITATUM (Haw. misc. p. 41. syn. 228. rev. 112.) stem simple, suffruticoso, with the leaves alternate and crowded at its top, rather glaucous, and triquetrous; petals length of calyx; stigmas 16, straight, setaceous. § D. G. Native of the Cape of Good Hope. Ker. bot. reg. 494. M. pugionifórmef Haw. obs. p. 396. Stem simple. Flowers pale yellow.

**Var. β, ramigerum** (Haw. l.c.) stem a little branched. **Capitata Fig-marigold.** Fl. Jul. Sept. Clt. 1717. Sh. 1 ft. 98 M. BREVICÂULÉ (Haw. suppl. p. 91. rev. 113.) caudex suffruticoso, simple, erect, with the leaves alternate, greenish, triquetrous, and crowded at its apex. § D. G. Native of the Cape of Good Hope. Breyn. cent. p. 165. Much smaller than *M. capitatum*. Flowers pale yellow.

**Short-stemmed Fig-marigold.** Fl. Jul. Sept. Clt. 1820. Sh. ½ ft. 99 M. CORUSCANUM (Haw. suppl. 90. rev. 113.) stem shrubby; leaves alternate, dagger-shaped, long, glittering, crowded at the top of the stem. § D. G. Native of the Cape of Good Hope. Flowers yellow.

**Var. γ, minus** (Haw. l.c.) corolla a little smaller; petals hardly ciliated. Ker. bot. reg. t. 493.

**Elongated Fig-marigold.** Fl. May. Clt. 1793. Sh. 1 foot.

101 M. GEMINIFORUM (Haw. rev. 114.) stem shrubby, diffuse; branches elongated, slender, creeping; leaves triquetrous, nearly equal-sided, rather connate at the base, acute, and a little hooked at the apex, dotted; pedicles twin or tern; stigmas 5. § D. G. Native of the Cape of Good Hope. M. geminiyum, Jacq. fragm. t. 50. but not of Haw. Petals purple. Flowers hardly half an inch in diameter. Leaves 12-15 lines long, scarious from elevated dots.

**Twin-flowered Fig-marigold.** Clt. 1819. Pl. creeping.

102 M. SIMILE (Haw. rev. p. 115.) stems shrubby, firm, procumbent; leaves triquetrous, equal-sided, glaucescent, full of very small dots, straight at the apex, longer than the internodes: margins not serrated. § D. G. Native of the Cape of Good Hope. Flowers unknown. Allied to *M. geminiiforum*, but the branches are shorter; and to *M. lâxum*, but the internodes are shorter.

**Similar Fig-marigold.** Clt. 1819. Pl. pr.

103 M. LâXUM (Wild. enum. p. 536.) stem loose, diffuse, shrubby; branches creeping, very slender; leaves connate, compressed, triquetrous, more green than the others, tubercularly dotted, usually shorter than the internodes: with the margins and keel finely denticulated. § D. G. Native of the Cape of Good Hope. Haw. rev. 115. Flowers reddish.

**Loose Fig-marigold.** Fl. May. Clt. 1820. Pl. creeping.

104 M. SARMENTOSUM (Haw. syn. 238. rev. 115.) stem shrubby, diffuse; branches prostrate, rooting, sarmentaceos; leaves crowded, compressed, triquetrous, pale green, roughish on the edges; peduncles club-shaped above; stigmas 5. § D. G.

_Twiggy Fig-marigold._ Fl. April. Clt. 1805. Pl. pr.

105. **M. rigidicaule** (Haw. rev. p. 116.) stem firm, procumbent, not pendulous; leaves long, triquetrous, equal-sided, straight, with roughish margins. ɣ. D. G. Native of the Cape of Good Hope. The rest unknown.

106. **M. Validum** (Haw. in phl. mag. dec. 1826. p. 329.) leaves long, pale green, with roughish margins; branches robust, stiff, decumbent; flowers usually by threes; keel of bracteas entire. ɣ. D. G. Native of the Cape of Good Hope. Flowers showy, rose-colored, with a deeper colored line in the middle.

**Strong Fig-marigold.** Fl. May. Ju. Clt. 1824. Pl. pr.

108. **M. repans** (Ait. hort. kew. vol. 2. p. 185.) stems filiform, very slender, creeping; leaves much crowded, triquetrous, acute, glaucous, scabrous from large pellucid dots. ɣ. D. G. Native of the Cape of Good Hope. Flowers reddish. (ex Ait.), yellow (ex Salm-Dyck.), rarely flowering (ex Haw. obs. p. 349. misc. 80. syn. 212. rev. 121.).

110. **M. de Bile** (Haw. in phl. mag. dec. 1826. p. 331.) plant smooth; branches filiform, a little compressed; leaves crowded about the knots of the creeping stems, bluntly and aciciniformly triquetrous, glaucous. ɣ. D. G. Native of the Cape of Good Hope. This species differs from **M. repans** in being smooth, not rough. Flowers unknown.

_Weak Fig-marigold._ Clt. 1824. Pl. creeping.

111. **M. Clayellatum** (Haw. misc. 79. syn. 242. rev. 122.) branches angular, creeping; leaves crowded, expanded, obliquely triquetrous, firm, clavate, very blunt, mucronulate, green; peduncles rather compressed; stigmas 5, very slender. ɣ. D. G. Native of New Holland. Flowers like those of **M. crasifolium**, but more beautiful and of a deeper red. Calyx 5-cleft; stigmas setaceous, green.

114. **M. Serrulatum** (Haw. misc. 77. syn. 239. rev. 117.) stem shrubby, when young erect; branches erectly decumbent; leaves compressed, triquetrous, rather aciciniform, and rather glaucous, usually longer than the internodes, with the margins minutely serrulat, but hardly cartilaginous; flowers solitary; stigmas 7-8, ramentaceous. ɣ. D. G. Native of the Cape of Good Hope. Flowers reddish, and ternately disposed, as in **M. rubricaulis**; lateral ones usually abortive.

_Var. β. viridus** (Haw. l. c.) leaves green.

115. **M. Rubricaulis** (Haw. misc. p. 77. syn. 239. rev. 117.) stem shrubby, when young erectish; branches opposite, rather effuse; leaves compressed, triquetrous, usually shorter than the internodes, cartilaginous and serrulat on the margins; flowers solitary; stigmas 5, expanded. ɣ. D. G. Native of the Cape of Good Hope. Willd. enum. p. 536. Flowers middle-sized, pale purple. There is a more dense variety, and a greenish one.

116. **M. Edule** (Lin. spec. 695.) branches expanded, with quite entire angles; leaves equally triquetrous, dotted, a little channelled, attenuated at both ends, with the keel serrulat; stigmas 8. ɣ. D. G. Native of the Cape of Good Hope.—Dill. elth. 272. Seb. thes. 1. t. 19. f. 6. Haw. obs. 392. misc. 76. syn. 234. rev. 110. Flowers large, yellow. Calyx 5-cleft. Capsule 8-celled, with the baccate calyx edible. Rarely flowering in the gardens.

_Edible Fig-marigold or Hottentot Fig._ Fl. July. Aug. Clt. 1690. Shrub pr.

Flowers large, reddish. There are two varieties of this species, one with short and the other with longer branches.

118 M. _levigatum_ (Haw. syn. 233. rev. 118.) stems rather procumbent, long; leaves aciciniform, smooth, glaucous, with cartilaginous, entire margins. ‡. D. G. Native of the Cape of Good Hope. Flowers unknown. Allied to _M. aciciniforme_, but differs in being smaller, and the branches being angular. &c.

_Smooth_ Fig-margold. Fl. June. C1t. 1802. Pl. pr.

119 M. _rubrocentral_ (Haw. syn. p. 284. rev. 118.) stems rather procumbent, long; leaves aciciniform, with rough red edges and keel. ‡. D. G. Native of the Cape of Good Hope. There is a variety of this species with thicker and more compressed leaves.

_Red-bordered-leaved_ Fig-margold. Fl. May. C1t. 1811. Pl. pr.

120 M. _subala'num_ (Haw. misc. 76. syn. 235. rev. 199.) branches 2-edged at the apex, somewhat undulated winged; leaves compressed, triquetrous, equal-sided, dotted, rather aciciniform, with cartilaginous margins, which are scabrous on both sides. ‡. D. G. Native of the Cape of Good Hope. Flowers unknown, but probably reddish.

_Rather-winged_ Fig-margold. C1t. 1796. Shrub pr.

121 M. _lacerum_ (Salm.-Dyck. obs. 1820. p. 31.) stem shrubby, erect; branches erectly spreading, 2-edged; leaves rather aciciniform, acutely triquetrous, rather compressed, glaucous, full of pellucid dots: with the keel laterately toothed; stigmas 10, very short, approximated. ‡. D. G. Native of the Cape of Good Hope. _M. aciciniforme_, D. C. pl. grass. t. 80. _M. dimidiatum_, and probably _M. lacerum_, Haw. rev. 119. and 131. M. Miller, Wild. enum. suppl. 31. and _M. gladiatum_, Jacq. ex Salm.-Dyck. Leaves large, red, opening in the sun; petals linear, very numerous. Calyx 5-cleft; lobes leaf-formed. Stigmas for the most part 10, but sometimes even to the number of 20.

_Jagged-keeled_ Fig-margold. C1t. 2. Shrub 1 to 2 feet.

122 M. _viexns_ (Haw. rev. 121.) stem erectish; branches at length spreading; leaves compressed, triquetrous, rather aciciniform, smooth, dotted, green, pubescent on the inside at the base, having the keel roughish at the apex. ‡. D. G. Native of the Cape of Good Hope. Flowers reddish, disposed by threes. This species hardly belongs to this section, according to Salm-Dyck.

_Green_ Fig-margold. Fl. June. C1t. 1821. Pl. 1 foot.

Stems usually elongated, weak, prostrate, and creeping: when young thick and fleshy. Leaves triquetrous, with the sides nearly equal, thick, usually soft. Flowers solitary, terminal, reddish, large, showy, and hexagonous. Capsule pulpy on the outside, even when ripe.

123 M. _equilaterale_ (Haw. misc. 77. syn. 237. rev. 120.) stems weak, prostrate; leaves almost equally triquetrous, greenish; peduncles angular, thickening towards the top; calyx 5-cleft; stigmas 5, short, erect. ‡. D. G. Native of New Holland. Flowers showy, reddish.

Var. _β_. _decagonum_ (D. C. prod. 3. p. 429.) stigmas 10; branches shorter.

_Equal-sided-leaved_ Fig-margold. Fl. Ju. C1t. 1791. Sh. pr.

124 M. _glauceae_ (Haw. syn. p. 236. rev. 120.) stems robust, decomprocumbent, somewhat prostrate; young leaves a little incurred, triquetrous, with the sides equal, soft, glaucous: with cartilaginous, smoothish margins; flowers solitary, sessile; stigmas 5. ‡. D. G. Native of New Holland. Branches furrowed at the top. Calyx 5-cleft. Petals pale purple.

125 M. _Rosii_ (Haw. rev. p. 120.) stems decomprocumbent; leaves aciciniform, or decomprocumbent triquetrous, glaucous, with cartilaginous, smoothish margins; flowers solitary, sessile; stigmas 5. ‡. D. G. Native of Van Diemen's Land. Flowers unknown. Very like _M. glaucum_.

_Rosii's_ Fig-margold. C1t. 1820. Shrub pr.

126 M. _Abbreviatum_ (Haw. in _phil. mag._, dec. 1826. p. 330.) plant tufted; stems short, coarse, and prostrate, crowded; leaves acutely triquetrous, thick, green, much longer than the internodes, which are short. ‡. D. G. Native of New Holland. This species comes very near to _M. glaucum_, but the leaves are more crowded. Flowers not seen.

_Short-stemmed_ Fig-margold. C1t. 1825. Shrub pr.

127 M. _virescents_ (Haw. syn. p. 236. rev. 120.) stems decomprocumbent; leaves triquetrous, with the sides nearly equal, greenish; peduncles terminal, solitary, 2-edged, winged; calyx 4-cleft; stigmas 8, filiform. ‡. D. G. Native of New Holland. Corolla showy, pale red; petals white at the base, and obtuse at the apex.

_Subdivision IV. Perfoliata_ (from per, through, and folium, a leaf; stem running through the leaves). _Haw._ rev. p. 133. Usually erect shrubs, with erect or decumbent branches. Leaves opposite, connate, and sheathing at the base, usually triquetrous towards the top, and for the most part looked at the apex. Flowers white, red, or reddish. Calyx 5-cleft. Stigmas 5.

§ 24. _Forfexita_ (from forfex, a pair of scissors; form and disposition of leaves). _Salm-Dyck_, obs. p. 33._—_Forfexita Geminita_, &c. _Haw._ Stems frutescent; branches erect or decumbent. Leaves opposite, triquetrous, compressed, scissor-shaped, erect, with the corolla angle drawn out. Flowers reddish, solitary, on short peduncles. Calyx 5-cleft; petals very narrow. Stigmas 5, short, thick.

128 M. _heterophyllum_ (Haw. misc. 67. syn. 294. rev. 128.) stem shrubby, short; branches crowded, ascending; leaves crowded, glaucous, compressed, triquetrous, rather aciciniform; with cartilaginous edges, and a jagged keel; petals unequal, shorter than the calyx, which is large and 5-horned; stigmas 5, very short. ‡. D. G. Native of the Cape of Good Hope. Wild. enum. suppl. 36. Petals white.

_Various-leaved_ Fig-margold. Fl. May. Aug. C1t. 1794. Shrub 1 to 2 feet.

129 M. _mutabile_ (Haw. obs. 377. misc. 74. syn. 294. rev. 133.) stem shrubby, erect; branches 2-edged; leaves nearly distinct, crowded, triquetrous, dotted; with a cartilaginous, entire keel; petals subulate; stigmas 5, short, thick. ‡. D. G. Native of the Cape of Good Hope. Flowers reddish.

_Changeable_ Fig-margold. Fl. Jul. Sept. C1t. 1792. Sh. 1½ ft. 130 M. _glaucum_ (Haw. suppl. 97. rev. 132.) stem shrubby, erect; leaves much crowded, compressed, triquetrous, rather aciciniform, glaucous, entire, with subcartilaginous edges, a little dotted; petals subulate; stigmas 5, short, thick. ‡. D. G. Native of the Cape of Good Hope. Flowers reddish. Perhaps sufficiently distinct from _M. mutabile_.

_White-edged-leaved_ Fig-margold. C1t. 1793. Shrub ½ ft. 132 M. _inclu'dens_ (Haw. syn. 295. rev. 133.) stem shrubby; leaves triquetrous, rather deltoid, smooth, green, with a gibbous
FICOIDÆ. 1. MESEMBRYANTHEMUM.

**Embracing Fig-marigold.** Fl. Ju. Sept. Clt. 1805. Sh. 1 to 2 feet.

133 M. FORICATUM (Lin. spec. 695.) stems suffrutescent, decumbent; leaves opposite, compressed, triquetrous, green, ending in a spinulos mucrone at the apex; peduncles angular; petals in 1 series; stigmas 5, very short. η. D. G. Native of the Cape of Good Hope. Haw. obs. 394. descript. misc. p. 78. syn. 280. rev. 123. Jacq. vind. 1. t. 3. M. filamentosum β. D. C. Petals purplish, with a deeper-coloured keel.

Shrub decumbent.

134 M. EXIMA (Haw. misc. p. 92. syn. 280. rev. 123.) stem suffruticos, dwarf; branchlets dichotomous, ascending; leaves connate a long way, triquetrous, erect, glaucous, smooth, cartilaginous at the margins. η. D. G. Native of the Cape of Good Hope. Flowers unknown, but probably white.

135 M. ROSELLATUM (Haw. rev. 123.) stems branched, prostrate; leaves beaked, connate, semi-terete, subulate, recurved, dotted, green; peduncles clavate, bibracteate at the base; stigmas 5, spreading. η. D. G. Native of the Cape of Good Hope. Calyx with 5 long lobes. Corolla expanded before meridit, whitish, tipped with red.

**Little-beaked-leaved Fig-marigold.** Fl. Ju. Clt. 1820. Sh. pr.

Var. β. monacanthum (Brd. succ. f. 26.) keel of leaves furnished with only one tooth beneath.

**Perfoliata-leaved Fig-marigold.** Fl. June, Aug. Clt. 1714. Shrub 1 to 3 feet.

137 M. UNCINELLUM (Salm-Dyck, in litt. and Haw. rev. p. 124.) stem shrubby, erect, with numerous branches; leaves connate and sheathing at the base, rather decurrent, triquetrous, thick, whitish, dotted, recurved at the apex; keel furnished with one tooth beneath. η. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 239. Flowers reddish.

**Small-hooked-leaved Fig-marigold.** Fl. June, Aug. Clt. 1819. Shrub 1 foot.

138 M. SEMIDENTATUM (Haw. suppl. 95. rev. 125.) stem shrubby, with simple striated branches; leaves connate and sheathing at the base, triquetrous, compressed, white, dotted; keel furnished with 1-4 teeth. η. D. G. Native of the Cape of Good Hope. Salm-Dyck, obs. 1850. p. 9. Leaves 2 inches long. Flowers on short peduncles, reddish. Differ in the length of the leaves from M. perforiatum.

**Half-toothed-leaved Fig-marigold.** Fl. Aug. Clt. 1820. Shrub 1 foot.

139 M. UNCINA (Mill. dict. ed. 8. no. 18.) stem shrubby, erect; leaves connate, and sheathing at the base, rather decurrent, green, dotted, triquetrous, furnished with 1-2 spines underneath at the apex. η. D. G. Native of the Cape of Good Hope. Brd. succ. f. 27. M. uncinatum a, Lin. spec. 692. D. C. pl. grass. t. 54. Flowers red.

**Hooked-leaved Fig-marigold.** Fl. Aug. Clt. 1725. Shrub 1 to 2 feet.

140 M. VIRIDE (Haw. obs. p. 314. misc. 93. syn. 282. rev. 126.) stem shrubby; leaves connate and sheathing at the base, quite entire, deep green, dotted, smooth, uncinately recurved at the apex; stigmas 7, subulate. η. D. G. Native of the Cape of Good Hope. Peduncles clavate, bibracteate, axillary. Calyx 5-cleft. Petals pale red, expanded both by night and by day.

**Green Fig-marigold.** Fl. July. Clt. 1792. Shrub 1 foot.

141 M. UNIDENTIS (Haw. in phil. mag. Dec. 1826. p. 391.) plant depressed, stiff; branches crowded; leaves rather acneciform, white, with large dots; keel bearing one tooth near the top. η. D. G. Native of the Cape of Good Hope. Leaves less perfoliate than any other of the section. Flowers not seen.

**One-toothed Fig-marigold.** Clt. 1824. Shrub 1/2 to 1 foot. § 27. Paniculata (from panicula, a panicle; disposition of flowers). Haw. syn. 283. Salm-Dyck, obs. p. 33.—Vagnata, Linéa, and Tumidula, Haw. rev. 126-129. Shrubby, erect; branches hard. Leaves connate and sheathing at the base, with the longitudinal lines of the sheath more or less distinct, for the most part glaucous and triquetrous. Flowers panicked, numerous. Peduncles bracteate. Calyx 5-cleft. Stigmas 5. Petals white, rarely reddish.

142 M. TUMIDULUM (Haw. syn. p. 286. rev. p. 129.) stem erect, with spreading branches; leaves connate and sheathing at the base, remote, green, smooth, rather recurved at the apex; sheaths tumid at the top. η. D. G. Native of the Cape of Good Hope. Leaves an inch and a half long. Flowers reddish.

**Tumid-sheathed Fig-marigold.** Fl. March. Clt. 1802. Shrub 2 feet.

143 M. FOLIOSUM (Haw. misc. 97. syn. 287. rev. 130.) stem erect, much branched; branches crowded, hardly erect; leaves connate and sheathing at the base, rather glaucous, smooth, crowded, obtuse, ending in a rather recurved mucrone; sheaths thickened at the top. η. D. G. Native of the Cape of Good Hope. Leaves an inch long. Petals reddish, with a deeper coloured line. Stigmas 5, expanded at length.

**Leafy Fig-marigold.** Fl. Sept. Clt. 1802. Shrub 2 to 3 ft.

**Umbellate-flowered Fig-marigold.** Fl. June, Sept. Clt. 1727. Pl. 2 to 3 feet.

145 M. IMBRICATUM (Haw. obs. p. 317. misc. 96. syn. 285.)
rev. 128.) stem and branches erect, subtubercular; leaves connate and sheathing at the base, glaucous, remote, smooth, dotted, rather compressed, triquetrous; calyx tubinicate, much attenuated at the base. ʒ. D. G. Native of the Cape of Good Hope. Peduncles bracteate even to the calyx. Corolla white, nearly an inch in diameter. Leaves nearly an inch long.

Var. β, majus (Haw. syn. 285.) leaves green, an inch and a half long.

Imbricated-leaved Fig-margold. Fl. July. Clt. 1792. Shrubs 2 to 3 feet.

146 M. MULTIFLORUM (Haw. obs. p. 318, misc. 96, syn. 285, rev. p. 128.) stem and branches erect; leaves connate and sheathing at the base, remote, glaucous, somewhat compressed, triquetrous, smooth, dotted; calyx cylindrical, hardly attenuated at the base. ʒ. D. G. Native of the Cape of Good Hope. Peduncles bracteate even to the calyx. Flowers white, larger than those of M. imbricatum.—Pluk. phyt. t. 117. f. 1.

Var. γ, rubrum (Haw. rev. p. 128.) leaves glaucous; calyx turbinate, much attenuated at the base. Perhaps a variety of M. imbricatum.

Var. δ, pâtens (Haw. l. c.) stem spreading; flowers solitary. M. pâtens, Willd. enum. suppl. p. 37.

Var. ε, nitens (Haw. l. c.) smooth; branches spreading; leaves green. Perhaps a proper species.

147 M. kÎndem (Haw. misc. 95, syn. 283, rev. 127.) stem erect; branches very stiff, spreading a little; leaves connate, and sheathing at the base, horizontal, and are, as well as the sheaths, glaucous, but with the keel scabrous at the apex. ʒ. D. G. Native of the Cape of Good Hope. Allied to M. tenellum. Leaves 3 lines long. Peduncles bracteate nearly to the apex. Petals snow white, shining.

148 M. TÉRELLUM (Haw. obs. 315, misc. 94, syn. 283, rev. 127.) stem erect, bushy; branches filiform, decumbent; leaves connate and sheathing at the base, rather spreading, slender, and are, as well as the sheaths, scabrous at the margins. ʒ. D. G. Native of the Cape of Good Hope. Flowers panicked, snow white. Calyx 4-5-cleft. Stigmas 5, erect, subulate. Leaves 3 lines long, glaucous.

149 M. cîrtum (Haw. syn. p. 284, rev. 126.) stem erect, bushy; leaves connate and sheathing at the base, usually approximative, incurved, smooth, green, with the angles rough at the top. ʒ. D. G. Native of the Cape of Good Hope. Flowers unknown, but probably white.

Var. γ, nitens (D. C. prod. 3. p. 432.) smaller in all its parts. M. hamatum, Willd. ex Haw. Perhaps a proper species.

Short-sheathed Fig-margold. Shrubs 1 to 1 ½ feet.

150 M. ACUTA (Haw. in phill. mag. 64. p. 424.) stem erect, bushy; leaves connate and sheathing at the base, forming a kind of rectangle, triquetrous, acuminate, incurved, green, with roughish margins. ʒ. D. G. Native of the Cape of Good Hope. Allied to M. cîrtum, but much more dwarf. Flowers unknown.

Acuteangled Fig-margold. Clt. 1821. Shrubs ½ to 1 foot.

151 M. VAGINATUM (Haw. misc. 95, syn. 284, exclusive of var. β, rev. 127. but not of Lam.) stem erect, bushy; leaves spreading, straight, remote, triquetrous, rather recurved at the apex, and are, as well as the sheaths, green and glaucous, but with the angles rough near the top. ʒ. D. G. Native of the Cape of Good Hope. Flowers panicked, white, small, numerous. Leaves an inch long.

152 M. PARVIFLORUM (Haw. misc. 95. syn. 284, rev. 127. but not of Jacq.) stems and branches erect; leaves connate and sheathing at the base, glaucous, erectish; keel finely serrulater. ʒ. D. G. Native of the Cape of Good Hope. Peduncles bracteate even to the calyx. Corolla white, small. Leaves half an inch long.

Small-flowered Fig-margold. Fl. Aug. Clt. 1800. Shrubs 1 to 2 feet.

153 M. LINEOLATUM (Haw. rev. p. 130.) stem short, depressed; branches spreading; leaves connate, incurved and a little recurved, obtuse, triquetrous, with nearly equal sides, and having the keel roughish at the apex; sheaths with a short impressed line. ʒ. D. G. Native of the Cape of Good Hope. Flowers small, terminal at the tops of the branches, solitary. Peduncles an inch long, compressed, smooth, bibracteate at the base. Calyx 5-cleft, wrinkled. Petals in one series, obtuse, reddish, with a deeper coloured middle line, expanded, rather incurved. Stamens collected; filaments white at the base, and reddish at the apex; anthers pale yellow. Styles 5, subulate, diverging in a stellate manner. This is rather an anomalous species, but it approaches nearest to the section Uneinata.

Var. β, minus (Haw. l. c.) margins of leaves roughish.

Var. γ, nitens (Haw. l. c.) leaves shining, greener.

Subdivision V. Trique'tra (from triquetrous, triangular; triangular leaves). Haw. rev. 135. Subshrubs. Leaves opposite, distinct more or less, triquetrous. Flowers usually solitary, terminal. Calyx 5-cleft. Stigmas 5.

Caulescens Fig-margold. Fl. May, July. Clt. 1731. Shrub 1 foot.

Deltoid-leaved Fig-margold. Fl. May. Clt. 1731. Sh. 1 ft.

156 M. MIRICATUM (Haw. obs. p. 364, misc. 75, syn. 297. rev. 139.) stem erect, branched; leaves crowded, deltoid, glaucous, and are, as well as the bractees, and lobes of calyx trifuriously denticulated. ʒ. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 246. Flowers red. Very like the two

Vol. III.
preceding species, but smaller. Stigmas erect, hardly the length of the filaments. Capsule more depressed.

**Muricate Fig-margold.** Fl. May. Cilt. 1731. Sh. 1½ foot.

* * Flowers aggregate, reddish.

**Lunate**-leaved Fig-margold. Fl. July. Cilt. 1812. Sh. 1 ft.

159 M. *falciforme* (Haw. syn. 299. rev. 127.) stem suffruticosité, at length decumbent; leaves much crowded, small, thick, falcate, aciciniform, glaucous, largely toothed; flowers somewhat fastigate. D. G. Native of the Cape of Good Hope. Flowers reddish, showy, an inch and a half in diameter.

160 M. *falcatum* (Lin. spec. 694.) stem woody, erect; branches numerous, panicked, filiform; leaves minute, distinct, compressed, *triquetrous*, falcate, rather glaucous. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 275. and 276. Haw. obs. 366. misc. 72. syn. 298. rev. 136. Flowers small, numerous, pale red, expanded through the day, sweet scented.

**Falcate**-leaved Fig-margold. Fl. June, Aug. Cilt. 1727. Shrub 1 foot.

**Twiggy** Fig-margold. Fl. Feb. Apr. Cilt. 1793. Sh. 2 to 3 ft.

* * Flowers solitary, rose-coloured or pale red.

163 M. *decumbens* (Haw. obs. 352. misc. 69. syn. 300. rev. 136.) branches much crowded, decumbent; leaves compressed, *triquetrous*, incurved, attenuated at both ends, very glaucous. D. G. Native of the Cape of Good Hope. Flowers 2 inches in diameter, almost white, or very pale red.

165 M. *incunatum* (Haw. obs. p. 69. syn. 300. rev. 136.) stem suffruticosité, erect; branches slender, effuse, leafy; leaves compressed, *triquetrous*, very glaucous, attenuated at both ends, aciciniform. D. G. Native of the Cape of Good Hope. Flowers pale red.

Var. *γ*, *roseum* (Wild. enum. p. 535.) leaves obtuse, attenuated at the base.

Var. *δ*, *multiradiatum* (Jacq. fragm. t. 53. f. 2.) leaves acute, spreading, blunt on the back.

**Incurred**-leaved Fig-margold. Fl. June. Cilt. 1802. Sh. 1½ ft.

164 M. *confluentum* (Haw. syn. p. 301. rev. 137.) stem erect, much branched; leaves *triquetrous*, crowded, robust, incurred, very glaucous. D. G. Native of the Cape of Good Hope. Flowers showy, pale red. Perhaps only a variety of *M. incuinum*.

§ 30. *Stenax* (from *steno*, stenosph, narrow; leaves and petals). Haw. in phil. mag. Sept. 1831. Small subshrubs, with the branches nearly half a foot high, effuse, and are, as well as the leaves, filiform. Petals very narrow, or setaceous, very pale red.

165 M. *stenum* (Haw. in phil. mag. 1831. p. 420.) branches effusely decumbent, flexuus, filiform; leaves slender, falcate incurred, *triquetrous* terete, mucronate, with few dots, glaucous; flowers 1 or 3 together, terminal. D. G. Native of the Cape of Good Hope. Flowers expanding before meridian, of a violaceous reddish-colour.

**Narrow** Fig-margold. Fl. Aug. Cilt. 1829. Shrub ½ foot.

166 M. *dehile* (Haw. in phil. mag. Nov. 1826. p. 331.) smooth; branches filiform, a little compressed; leaves crowded at the nodes of the repent stems, bluntly and aciciniforme *triquetrous*, glaucent; flowers few, terminal. D. G. Native of the Cape of Good Hope. Flowers very pale red, or nearly white, expanding before meridian.

**Small-leaved** Fig-margold. Fl. May. Cilt. 1795. Sh. dec.

169 M. *pygmeum* (Haw. suppl. 99. rev. 134.) stem very short, branched; leaves conuate at the base, oblong-ovate, semiterete, awnless, in winter united nearly to the top. D. G. Native of the Cape of Good Hope. Flowers unknown, but probably pale red.

**Pygmy** Fig-margold. Cilt. 1805. Shrub ½ foot.

§ 32. *Scábrida* (a dim. of *socber*, rough; rough or scabrous leaves). 
*Haw.* misc. 71.— *Scábrus*, *Salm-Dyck*, obs. 27.— *Asperifólia*, *Haw.* rev. 138. Stems suffruticosse; branches expanded, filiform. Leaves more or less triquetrous, rather compressed, scabrous from dots, usually a little incurred. *Flowers pedunculate, reddish, middle-sized.*

*Stamens collected.*

171 *M. Scábrus* (Lin. spec. 692.) stem shrubby, branched; leaves rather triquetrous, green, straight, very rough from shining warts; lobes of calyx ovate, acuminate; petals crenated at the apex; stamens collected. \( \text{F}. \text{G}. \text{D}. \text{Native of the Cape of Good Hope. — Dill. elth. f. 251. — Haw. obs. 345. misc. 71. syn. 267. rev. 138. Flowers rose-coloured.} \)

*Var. \( \beta \), purpureum; flowers purple.*

*Scabrous Fig-marigold.* 
*Fl. July.* Clt. 1731. Sh. 1 foot.

172 *M. versicolor* (Haw. misc. 71. syn. 268. rev. 139.) stem shrubby, branched; leaves almost triquetrous, glaucous, scabrous from warts; lobes of calyx ovate, acuminate; petals somewhat bidentate at the apex; stamens collected. \( \text{F}. \text{G}. \text{D}. \text{Native of the Cape of Good Hope. Petals variable, expanding in the heat of the sun, of a shining white or silvery colour, but when closed in the morning and evening they are pale reddish.} \)

*Party-coloured-flowered Fig-marigold.* 
*Fl. May,* Clt. 1795. 
Shrub 1 foot.

173 *M. retrofléxum* (Haw. misc. 71. syn. 269. rev. 139.) stem suffruticosse; branches decumbent; bark white; leaves rather triquetrous, very glaucous, scabrous; lobes of calyx retroflexed; petals distant; stamens collected. \( \text{F}. \text{G}. \text{D}. \text{Native of the Cape of Good Hope.} \)

*Emarginate-petalled Fig-marigold.* 
*Fl. May,* Clt. 1724. 
Shrub dec.

174 *M. imbericans* (Haw. suppl. p. 94.) stem erect, shrubby; leaves linear, obsolesly triquetrous, smoothish, of a whitish glaucous-colour, imbricated at the tops of the canescent branches. \( \text{F}. \text{G}. \text{D}. \text{Native of the Cape of Good Hope. Flowers red. Said to be allied to } M. \text{ retrofléxum.} \)

*Imbricating-leaved Fig-marigold.* 
*Fl. May,* Clt. 1818. 
Shrub 1 foot.

175 *M. defléxum* (Ait. hort. kew. 2. p. 187.) stems shrubby, rather crowded, deflexed; leaves rather triquetrous, glaucous, roughish, attenuated downwards; petals numerous, much imbricated; stamens collected. \( \text{F}. \text{G}. \text{D}. \text{Native of the Cape of Good Hope.} \)

*Deflexed-branched Fig-marigold.* 
*Fl. July,* Clt. 1774. 
Shrub 1 foot.

176 *M. polyanthum* (Haw. syn. 270. rev. 140.) branches bushy, expanded, crowded; bark on young stems rufous; leaves small, glaucous, triquetrous, scabrous; flowers very numerous, panicked; petals imbricated. \( \text{F}. \text{G}. \text{D}. \text{Native of the Cape of Good Hope. Flowers small, very pale red. } M. \text{ flexile, Haw. rev. 141. is only a variety of this species in a younger state, which has been confirmed by Salm-Dyck.} \)

*Many-flowered Fig-marigold.* 
Shrub 1 1/2 foot.

177 *M. polyphyllum* (Haw. rev. 141.) branches bushy, decumbent, assurgent; leaves much glomerated, rather robust, somewhat incurvally recurved, clavately and bluntly triquetrous, compressed, scabrous from dots, glaucous. \( \text{F}. \text{G}. \text{D}. \text{Native of the Cape of Good Hope.} \)

*Many-leaved Fig-marigold.* 
*Fl. June,* Clt. 1819. 
Shrub 1 to 2 feet.

178 *M. violaceum* (D. C. pl. grass. t. 84.) stem shrubby, erect; branches expanded; leaves triquetrously semi-terete, rough from dots, acute, glaucous; peduncles 1-flowered, naked or bacteate at the very base; lobes of calyx spreading, unarmed, but prickle-formed. \( \text{F}. \text{G}. \text{D}. \text{Native of the Cape of Good Hope.} \)

*Violaceous-branched Fig-marigold.* 
*Fl. June,* Clt. 1820. 
Shrub 1 to 2 feet.

179 *M. emarginatum* (Lin. spec. 692.) branches expanded; leaves triquetrous, scabrous, glaucous; peduncles bibracteate; lobes of calyx unarmered, but spine-formed; petals deeply emarginated at the apex. \( \text{F}. \text{G}. \text{D}. \text{Native of the Cape of Good Hope. — Dill. elth. f. 250. — Haw. obs. 340. misc. 70. syn. 268. rev. 142. Flowers pale red, like those of } M. \text{ violaceum.} \)

*Emarginate-petalled Fig-marigold.* 
*Fl. June,* Clt. 1792. 
Shrub 1 to 2 feet.

§ 33. *Bracteata* (bracteatus, bacteate; flowers girded by bracteas). *Salm-Dyck*, obs. 28. *Haw.* rev. 143.— *Addinca Inclusíentía*, *Haw.* syn. 288. Stems erect, shrubby; branches much decomposed. Leaves distinct, triquetrous, hooked at the apex, more or less scabrous from dots. *Flowers girded by 2-4 broadly ovate keeled bracteas, which clasp the calyx, solitary, reddish, always expanded; inner petals thread-formed.*

180 *M. bracteatum* (Ait. hort. kew. 2. p. 185.) stem shrubby, erect; branches compressed, of a reddish brown colour; leaves green, triquetrous; bracteas 4, broadly ovate, keeled, claspine the calyx. \( \text{F}. \text{G}. \text{D}. \text{Native of the Cape of Good Hope.} \)

*Bracteate Fig-marigold.* 
*Fl. July,* Clt. 1774. 
Shrub 1 1/2 foot.

181 *M. ançeeps* (Haw. syn. 289. rev. 143.) stem shrubby; branches decomposed, 2-edged, of a brownish canescent-colour; leaves acinaciformly triquetrous; sides rather membranous below; dots large, pellucid, elevated. \( \text{F}. \text{G}. \text{D}. \text{Native of the Cape of Good Hope. Flowers of a deep red colour.} \)

*Var. \( \beta \), pálldídum* (Haw. rev. 143.) branches of a rufous coppery colour; leaves rather incurved; petals pale reddish. 
*Two-edged-branched Fig-marigold.* 
*Fl. Sept.* Clt. 1811. 
Shrub 1 1/2 foot.

182 *M. gracile* (Haw. rev. 144.) stem shrubby; branches very slender, straight; leaves glaucous, slender, rather scabrous; bracteas ovate, acute, almost clasping the calyx. \( \text{F}. \text{G}. \text{D}. \text{Native of the Cape of Good Hope.} \)

*Slender Fig-marigold.* 
*Fl. Aug.* Clt. 1794. Sh. 1 1/2 ft.

183 *M. radiaííum* (Haw. obs. 232. misc. 90. syn. 289. rev. 144.) stem shrubby; branches crowded; bark canescent; leaves glaucous, attenuated, and hooked at the apex; bracteas
broadly ovate, clasping the peduncles above.  M. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 249. Corolla reddish, larger than those of its allies.

184 M. compres'sum (Haw. obs. 326. not 416. misc. 91. syn. 289. rev. 144.) stem shrubby; branches rather compressed; leaves glaucous, triquetrous, with equal sides, very rough; bracteas ovate, acute, clasping the top of the peduncles.  M. D. G. Native of the Cape of Good Hope. Flowers middle-sized, reddish. Perhaps M. compres'sum, Horn. hort. haft. 2. p. 454. is the same species.

**Compressed-branched Fig-margold.** Fl. July, Sept. Cilt. 1792. Shrub 1½ foot.

185 M. pat'tatum (Haw. syn. p. 334. rev. 145.) stem shrubby; branches hardly erect; leaves linear, half erect, glaucous, roughish from pellucid dots.  M. D. G. Native of the Cape of Good Hope. This species comes near to M. compres'sum, but is less stiff; the leaves shorter and thicker, and the flowers are larger and paler.

**Spreading Fig-margold.** Fl. Oct. Nov. Cilt. 1811. Sh. 1½ ft.

186 M. Aspereum (Haw. rev. p. 145.) stem shrubby; leaves compressed, triquetrous, long, of a bluish green-colour, all of pellucid dots, very sebaceous, hooked at the apex; keel furnished with one tooth.  M. D. G. Native of the Cape of Good Hope. Flowers unknown. Perhaps this species does not belong to the present section.

**Rough Fig-margold.** Cilt. 1818. Shrub 1½ foot.

187 M. serra'tum (Linn. spec. 696.) stem erect, branched; leaves opposite, distinct, triquetrous, subulate, having the carinal angle serrated, with the serratures turned backwards.  M. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 238. Flowers solitary, terminal, pedunculate. Calyx 5-crenate, attenuated at the base. Petals yellow, copper-coloured at the apex. Stigmas 5, short, obtuse, approximate. This species was formerly cultivated by Dillenius, but has now vanished from the gardens, and is therefore very little known.

**Serrate-keeled Fig-margold.** Fl. June, July. Cilt. 1707. Shrub 1 to 2 feet.

§ 34. **Conferta** (from confertus, crowded thick together; branches). *Haw.* syn. 240. *Salm-Dyck,* obs. 29.—*Eximia* and *Blánda,* Haw. rev. 145-147. Stems shrubby; branches crowded, ascending. Leaves opposite, rather concave, crowded, triquetrous, entire, acute, with the angles smooth. Flowers pedunculate, solitary or by threes, shonny, expanding in the sun, reddish or pale rose-coloured.

188 M. ama'rum (Salm-Dyck in litt. ex D. C. prod. 3. p. 436.) stem branched, shrubby; leaves green, crowded, elongated, nearly triquetrous, bluish, with a mucron; flowers terminal, showy, disposed by threes.  M. D. G. Native of the Cape of Good Hope. Flowers red.

**Pleasing Fig-margold.** Shrub 1 foot.

189 M. fornòsum (Haw. rev. 145.) stems suffruticoso, humble; branches rather decumbent, elongated; leaves triquetrous, long, green, glittering in sunshine, much crowded, but more remote on the branches; flowers terminal, disposed by threes; stigmas 5-6, shorter than the filaments, rather lanceolate.  M. D. G. Native of the Cape of Good Hope. Petals beautiful red, blurr.

**Beautiful Fig-margold.** Fl. Aug. Sept. Cilt. 1828. Sh. 1 ft.

190 M. spectac'ulare (Haw. obs. 385. misc. 68. syn. 240. rev. 145.) stems rather humble; floriferous ones ascending or erect; leaves glaucous, triquetrous, and are, as well as the branches, crowded; stigmas 5, obovate, one-half shorter than the stamens, which are white.  M. D. G. Native of the Cape of Good Hope. Curt. bot. mag. t. 396. D. C. pl. grass. t. 153. Leaves rather connate, sometimes furnished with one tooth at the top of the keel. Flowers beautiful reddish, 2 inches in diameter.

**Showy Fig-margold.** Fl. May, Aug. Cilt. 1787. Shrub 1 ft.

191 M. conspicuum (Haw. syn. 240. rev. 146.) floriferous stems erect; leaves green, glittering in sun-shine, triquetrous, and are, as well as the branches, crowded; stigmas lanceolate, length of the stamens.  M. D. G. Native of the Cape of Good Hope. Flowers middle-sized, reddish. Perhaps M. conspicuum, Spreng. nov. prov. 27. but the leaves are there said to be semi-terete. Flowers beautiful red.

**Conspicuous Fig-margold.** Fl. Sept. Oct. Cilt. 1806. Sh. 1 ft.

192 M. turbinátum (Jacq. hort. vind. t. 476.) stem shrubby, branched, diffuse; leaves glaucous, elongated, acute, triquetrous, crowded; flowers on long peduncles, reddish; ovary contracted into a neck beneath the calyx.  M. D. G. Native of the Cape of Good Hope. Petals numerous, linear, spreading much. Salm-Dyck. In litt.

**Turbinate Fig-margold.** Shrub 1 foot.

193 M. blán'dum (Haw. suppl. 95. rev. 147.) stem shrubby; branches numerous, compressed, ascending; leaves compressed, triquetrous, crowded, narrow, acutish, smooth; peduncles equal, longer than the bracteas; stigmas 5, short, ramentaceous.  M. D. G. Native of the Cape of Good Hope. Branches rufous or bay-coloured. Leaves twice the thickness of those of *M. blándum,* to which it is nearly allied, and the corolla is less open. It is, however, perhaps only a variety of it.

**Curred-leaved Fig-margold.** Cilt. Ju. 1818. Sh. 1½ ft.

195 M. tetra'gonum (Thunb. prod. 91.) stem erect, tetragonal, shrubby; leaves cylindrically trigonal.  M. D. G. Native of the Cape of Good Hope. Haw. rev. 149. Corolla yellow. This species is omitted by Haworth.

**Tetragonally-stemmed Fig-margold.** Shrub 1 foot.

196 M. stríc'tum (Haw. misc. 82. syn. 262. rev. 149.) stem woody, branched, very stiff, straight; leaves triquetrous, obtuse, expanded, glaucous, beset with large dots.  M. D. G. Native of the Cape of Good Hope. This species grows 2 or 3 feet high in the gardens, but has never yet flowered. But from a specimen of it received from the Cape by Haworth, they are said to be showy and yellow.

**Straight Fig-margold.** Cilt. 1795. Shrub 2 to 3 feet.

197 M. cymifórmia (Haw. obs. 264. misc. 82. syn. 263. rev. 149.) stem suffruticoso; branches erectish, filiform, crowded; leaves triquetrous, boat-shaped, spreading, glaucous.  M. D. G. Native of the Cape of Good Hope. Flowers unknown. Perhaps *M. süssile,* Thunb. fl. cap. 419. belongs to this species, which Thunberg says has red flowers.

**Boat-formed-leaved Fig-margold.** Cilt. 1793. Sh. 1 ft.

198 M. slóile (Ait. hort. kew. 2. p. 192.) branches crowded, 2-edged, decumbent; leaves spreading, turgidly triquetrous, firm, canescent, with the margins blunt, and lined with dots.  M. D. G. Native of the Cape of Good Hope. Haw. obs.
FICIOIDE. 1. MeseMbranthemum.

200 M. Cymborium (Haw. in phil. mag. 1824. vol. 64. p. 424.) stem shrubby, erectish; branches few, 2-edged, hoary; leaves trigonal, boat-shaped, pale green, beset with large dots. § D. G. Native of the Cape of Good Hope. Flowers unknown. This species appears to be intermediate between M. aureum and M. cymbiforme.

Boat-leaved Fig-marigold. Clt. 1822. Shrub 1 to 2 feet.

§ 36. Aérea (from aureus; of gold; in reference to the yellow flowers). Haw. rev. 148.—Equisetaria, Salm-Dyck, obs. 33.—Frequentiflora, Haw. syn. 263. exclusive of some species. Stems suffruticosum, and as we are as the branches erect. Leaves distinct, dotted, blunter or acutely triquetrous, elongated, glaucous. Flowers large, solitary, yellow, or copper-coloured, expanding in sun-shine. Stigmas thick.

Subdivision VI. Teretiu’scula (a dim. of teres, cylindrical; leaves nearly cylindrical). Haw. rev. 150. Subshrubs. Leaves distinct, rarely connate at the base, nearly terete, without any papule. Calyx 5-cleft. Stigmas 5, except in one of the species, which vary to 7.

204 M. verruculatum (Lin. spec. 696.) stem erect; leaves much crowded, very glaucous, cylindrical, hardly triquetrous, obtuse, and a little mucronate, sebaceous, longer than the internodes. § D. G. Native of the Cape of Good Hope.—Dill. edth. 259. D. C. pl. grass. t. 36. Haw. obs. 260. misc. 81. syn. 258. rev. 165. Flowers small, yellow, subumbellate, expanding in the evening. The stigmas are said to be 5, but Dillenius has seen them varying from 5-7.

Warted Fig-marigold. Fl. May, Ju. Clt. 1731. Sh 1 ½ ft.

§ 38. Croceum (from croceus, like saffron; colour of flowers). Haw. in phil. mag. Aug. 1826. p. 128. Subshrubs with second branches. Leaves thick, of a bluish glaucous colour, semi-terete at the base, oblong-ovata at the apex. Flowers terminal, solitary, small or middle-sized, scentless, at first yellow, but as they become older change to a copper-coloured. Peduncles succulent.

Calyx succulent, unequal.

205 M. lute’um (Haw. in phil. mag. Aug. 1826. p. 128.) leaves obtuse; flowers small; stem branched, erect, and the nodes tumid, and throwing out roots. § D. G. Native of the Cape of Good Hope. This species comes very near M. croceum, var. γ, lute’olum, but is taller, more slender, and more branched, and the leaves and flowers are much smaller. Corolla pale yellow, but becoming of a deeper colour as they fade.

206 M. lute’olium (Haw. l. c. p. 129.) leaves crowded, acute at the apex, and a little recurved; branches slender and dense; flowers small. § D. G. Native of the Cape of Good Hope. M. laeve, Thunb. prod.? Flowers yellow, and more numerous than those of the last species. It differs from the last in the leaves and in the more dwarf stature.

207 M. croceum (Jacq. fragm. t. 11. f. 3.) stem erect; leaves crowded, semi-cylindrical, mealy, glaucous, bristly, shorter than the internodes, somewhat sebaceous; lobes of calyx somewhat unequal. § D. G. Native of the Cape of Good Hope. Haw. rev. 156. Leaves evidently connate. Petals obtuse, copper-coloured.

Var. β, purpureo-croceum (Haw. obs. 257. misc. 81. syn. 259. rev. 155.) flowers copper-coloured, purple on the outside. M. insititu, Willd. enum. 536. Hardy distinct from the species, and ought probably to be joined with it, according to Salm-Dyck, in lit.

Var. γ, luteo-croceum (Haw. rev. 155.) flowers yellow on both sides, but as they fade become copper-coloured.

§ 39. Frequentiflora (from tenuis, slender, and flos, a flower; slender flowers). Salm-Dyck, obs. 24. Haw. rev.—Frequentiflora, Haw. syn. 263. exclusive of the species. Stems shrubby; branches slender, effuse. Leaves opposite, distinct, nearly terete, rather triquetrous or somewhat compressed, without papule. Flowers solitary, pedunculate, expanding in the morning, yellow or scarlet. This section is nearly allied to Aérea.

208 M. cocce’um (Haw. obs. 247. misc. 85. syn. 265. rev. 150.) stem shrubby, erect; leaves teretely triquetrous, rather compressed, obtuse, glaucous; peduncles smooth at the base; calyx of calyx bluish, nearly equal. § D. G. Native of the Cape of Good Hope. D. C. pl. grass. t. 83. Lodd. bot. cab. t. 1033. Curt. bot. mag. 59. M. bicolorum minus, Haw. obs. 246. M. bicolorum cocceum, Willd. spec. 2. p. 1039. Leaves shorter than in the following species. Petals scarlet on both surfaces. There are 2 varieties of this plant, the one with obtuse leaves and the other with acute leaves.

209 M. bicolorum (Lin. spec. ed. 1. p. 485.) stem shrubby, erect; leaves rather triquetrous, acute, green; peduncles and calyxes scabrous; calyce lobes unequal. Æ. D. G. Native of the Cape of Good Hope.—Dill. eth. f. 258. Haw. obs. 241. misc. 85. syn. 265. rev. 151. This species is usually confused with M. coccineum, but the leaves are longer and the petals are yellow inside and scarlet outside. Stigmas shorter than the filaments. There are 2 varieties of this plant, one with erect branches and the other with spreading branches.

210 M. inaequalle (Haw. syn. 266. rev. 151.) stem shrubby, erectish; branches effusely decumbent; leaves rather triquetrous, deep green; fructiferous peduncles compressely clavate; lobes of calyx very unequal. Æ. D. G. Native of the Cape of Good Hope. Bradl. succ. 7. bad. ex Haworth. Very like M. bicolorum, but differs in the branches being effuse, the flowers being paler on the outside, and in the calyce lobes being longer than the membrane.

211 M. tenutifolium (Lin. spec. 693.) stem shrubby, erectish; leaves semi-terete, rather compressed, subulate, green, glabrous, longer than the internodes; peduncles elongated, naked. Æ. D. G. Native of the Cape of Good Hope. Petals yellow, at length becoming reddish. There are varieties of the species with distant and crowded leaves and branches.

212 M. variaible (Haw. misc. 85. syn. 266. rev. 152.) stem shrubby, effuse, rather decumbent; leaves somewhat triquetrous, compressed, glaucous, scabrous; lobes of calyx nearly equal. Æ. D. G. Native of the Cape of Good Hope. Petals yellow, at length becoming reddish. There are varieties of the species with distant and crowded leaves and branches.

§ 40. Adéncæ (from adunca, hooked; leaves hooked at the apex). Salm-Dyck, obs. 25. Haw. rev. 152.—Adénca claudéntia, Haw. misc. 87. Stems suffruticoso, hardly half a foot high. Leaves nearly terete, subulate, usually incurved, acutely hooked at the apex. Flowers solitary, expanding before meridian, and closing in the evening, small, reddish. Petals usually striated or white at the base.

213 M. spiniförmé (Haw. obs. 240. misc. 87. syn. 291. rev. 152.) stem suffruticoso, with erect branches; leaves cylindrical, subulate, spine-formed, erect, recurved at the apex; peduncles and keels of the bracteas rather scabrous. Æ. D. G. Native of the Cape of Good Hope. Bark of branches dark. Flowers small, pale red, with the petal paler at the base.

Var. β. subalbidum (Haw. suppl. 96. ex rev. 152.). Leaves less hooked.

214 M. curviförmé (Haw. misc. p. 88. syn. 290. rev. 152.) stems suffruticoso; branches firm, erectish, roughish, angularly compressed; leaves rather distant, expanded at the base, and incurvously recurved at the apex. Æ. D. G. Native of the Cape of Good Hope. Flowers numerous, middle-sized, pale red. Stigmas blackish. M. ceratophyllum, Willd. enum. suppl. p. 37. is referred to this species by the Prince de Salm-Dyck, but this is doubted by Haworth, who gives a different character to the plant.

215 M. flexiförmé (Haw. suppl. 98. rev. 153.) stem suffruticoso; branches filiform, compressed, flexuous, decumbent; leaves subulate, triquetrous, incurved below, recurved and rather flexuous above, and a little hooked at the apex. Æ. D. G. Native of the Cape of Good Hope. This plant is 3 times smaller than the preceding species, and more depressed. Flowers unknown. There are varieties of this species with pale green and dark green leaves.

216 M. inconspicuum (Haw. in phil. mag. aug. 1826. p. 128.) stems suffruticoso, very stiff; leaves trigonal-semi-terete, small, hooked; flowers solitary, minute, terminal. Æ. D. G. Native of the Cape of Good Hope. A small, bushy shrub, with spreading, ascending, or incurved, hard, glistering branches; leaves glittering in the sunshine from papule. Flowers deep red, expanding in the morning.

217 M. aduncus (Haw. syn. 291. rev. 153.) stem shrubby; branches erect, much crowded; leaves crowded, semi-cylindrical, acuminate, very much recurved at the apex. Æ. D. G. Native of the Cape of Good Hope. Peduncles elongated, flexuous, bibracteate in the middle. Petals pale red inside, but of a deeper colour on the outside, and more so at the apex. Stigmas erect, subulate, green.

218 M. filicau'le (Haw. syn. 291. rev. 153.) stems tufted, suffruticoso, filiform, very weak, creeping; leaves much crowded, semi-cylindrical, acuminate. Æ. D. G. Native of the Cape of Good Hope. Peduncles elongated, flexuous, bibracteate in the middle. Petals pale red inside, but of a deeper colour on the outside, and more so at the apex. Stigmas erect, subulate, green.

219 M. produc'tum (Haw. in phil. mag. 1824. p. 424.) stem suffruticoso, erect; branches finely decussate, numerous; leaves crowded at the tops of the branches, semi-cylindrical, glaucous, rather incurved, full of pellucid dots; flowers terminal, by threes; calypce lobes unequal, two of which are long and the other three short. Æ. D. G. Native of the Cape of Good Hope. Corolla rose-coloured. Stigmas 5, erect.

Produced-calyxed Fig-margarid. Fl. May, June. Clt. 1822. Shrub 1 foot.

220 M. stipula'ceum (Lin. spec. 693.) stem shrubby, and is as well as the branches erect; leaves teretely triquetrous, long, subulate, incurved, glaucous, full of pellucid dots, margined at the base. Æ. D. G. Native of the Cape of Good Hope.—Dill. eth. f. 267 and 268. Haw. obs. 256. misc. 65. syn. 301. rev. 154. Axes usually bearing leaves, hence the metaphorical name of stipulaceum, there being no stipules. Corolla light red, paler on the under side, 2 inches in diameter.

Stipulaceus Fig-margarid. Fl. May, Ju. Clt. 1723. Sh. 1 ft.

221 M. Haworthiánum (Willd. enum. suppl. 36. Dom. hort. cant. ed. 6.) stem shrubby, erect; leaves crowded, compressedly cylindrical, attenuated at both ends, erect when young, but spreading and glaucous when old. (Salm-Dyck. in litt.). Æ. D. G. Native of the Cape of Good Hope. Haw. syn. 302. rev.
Mesembryanthemum.

Native leaves. Native D. Haw.

228 M. stelligerum (Haw. in phil. mag. 1824. p. 61. but not of his syn.) branches procumbent, elongated; leaves remote, half-erect, terminating in 5-6 radiating hairs at the apex; calyx glabrous at the base; lobes 5, nearly equal. D. G. Native of the Cape of Good Hope. M. barberatum, Haw. syn. 277. rev. 190. but not of phil. mag. Bradl. succ. t. 5. Curt. bot. mag. 70. Perhaps merely a variety of M. barberatum.

229 M. intonsum (Haw. in phil. mag. 1824. p. 62.) branches erectly decumbent, effuse, hispid; leaves terminating in 10-15 radiating hairs at the apex; calyx girded by a black beard. D. G. Native of the Cape of Good Hope. Flowers reddish.

Flowers reddish. Common in the sand and earthy soils of the bays of the Cape of Good Hope.

230 M. vulgatum (Haw. in phil. mag. 1824. p. 428.) leafy, procumbent; branches rather villous; leaves horizontal, crowded, terminating in 10-15 radiating hairs. D. G. Native of the Cape of Good Hope. Root referable to that of M. intonsum; the root of the plant comes nearest to M. intonsum. Flowers middle-sized, reddish.

232 M. brevissum (Haw. obs. p. 302. misc. 105. syn. 279. rev. 191. phil. mag. 1824. p. 62.) plant densely tufted; leaves semiterete, scabrous from pulpule, terminating in many radiating hairs, rather ciliated at the base, greenish; peduncles very hairy as well as the calyx, which is 6-lobed. D. G. Native of the Cape of Good Hope. —Dill. elth. f. 236. without a flower. Sims, bot. mag. t. 1220. Old stem thick, branched, very short. Flowers expanding in the heat of the sun, purple, larger than those of M. stellatum.

Dense Fig-margold. Fl. May, Aug. Clt. 1732. Sh. ½ foot.

— Echinata (from echinatus, set with prickles; leaves). Salm-Dyck. obs. 27. Haw. rev. 189. — Hispifolia, Haw. syn. 275. Stems suffruticose, much branched. Leaves nearly terete, distinct, more or less hispid all over, as well as the branches. Lobes of calyx 5, leaf-formed. Corolla white or pale yellow. Stigmas 5.

233 M. echinatum (Ait. hort. kew. 2. p. 194.) stem erect, branched; leaves oblong-ovate, filled, rather triquetrous, gibbous, ramentaceous-echinated; lobes of calyx leaf-formed, unequal. D. G. Native of the Cape of Good Hope.

Var. álbum. (Haw. l. c.) flowers white.

Hedge-hog Fig-marigold. Fl. Jul. Oct. Ct. 1774. Sh. $\frac{1}{2}$ to $\frac{3}{4}$ ft. 234 M. strúmosúm (Haw. rev. 190.) stems decumbent, branches; leaves crowded, depressingly cylindrical, hispid all over; lobes of calyx nearly equal; root at length tuberous. $\gamma$. D. G. Native of the Cape of Good Hope. Corolla pale straw-coloured or white.

Strúmosúm Fig-marigold. Fl. Aug. Ct. 1820. Sh. $\frac{1}{2}$ to $\frac{3}{4}$ ft.

235 M. calyctínum (Haw. rev. 187.) branches effuse; leaves cylindrical, rather filiform, obtuse, papillose; two of the calyceal lobes are foliaceous, much exceeding the other three in length; stems longer than the stigmas. $\gamma$. D. G. Native of the Cape of Good Hope. Flowers white.

Long-calyced Fig-marigold. Fl. Jul. Aug. Ct. 1819. Sh. $\frac{2}{3}$ ft. 236 M. türberculátum (D. C. in Pers. ench. 29. p. 44.) stems decumbent, much branched; branches ascending; leaves terete, acute, papillose, soft; branches, peduncles, and calyces hispid; calyx campanulate at the base; stamens hardly exceeding the stigmas. $\gamma$. D. G. Native of the Cape of Good Hope. M. hispidúlum, Haw. suppl. 94. rev. 189. Petals rose-coloured, but purplish above, with a deeper-coloured middle line. There is also a variety of this with white flowers.

237 M. attenuátem (Haw. rev. 183.) plant slender; branches decumbent, filiform; leaves semi-cylindrical, filled, obtuse, or nearly terete, papillose; peduncles elongated; calyces hairy at the base. $\gamma$. D. G. Native of the Cape of Good Hope. Petals at first white, or with a rose-coloured middle line, whence there is a rose-coloured circle in the flower.

238 M. striátum (Haw. obs. 289. misc. 188.) stem erect; leaves semi-cylindrical, subulate, papillose; calyx woolly; stamens collected, length of stigmas. $\gamma$. D. G. Native of the Cape of Good Hope. Capsule angular at the apex.

Var. a. roșéum (Haw. rev. 183.) petals paler rose-coloured, with a deeper-coloured line in the middle.—Dill. elth. f. 231.

Var. b. pálínns (Haw. l. c.) petals white, each with a red line at the base. D. C. pl. grass. t. 132.

Striated-flowered Fig-marigold. Fl. May, Oct. Ct. 1727. Shrub $\frac{3}{4}$ foot.

239 M. floribundum (Haw. misc. p. 100. syn. 274. rev. 187.) branches spreading, very numerous; leaves almost cylindrical, somewhat incurved, papillose, obtuse; calyces hemispherical, beset with papillose pili; stamens not equaling the stigmas in length. $\gamma$. D. G. Native of the Cape of Good Hope. M. hispidum $\beta$. pallidum, Haw. obs. 279. Flowers numerous, pale red, with the petals white at the base.

Var. b. torquátum (Haw. rev. 187.) flowers fewer, larger and more remote; stamens exceeding the stigmas. According to Salo-Dyck this is not distinct from M. floribundum, which are both perhaps referrible to M. striátum, var. $\beta$.

Bundle-flowered Fig-marigold. Fl. May, Oct. Ct. 1704. Shrub $\frac{3}{4}$ foot.

Var. a. glaucoscens (Salm-Dyck. in litt.) leaves glaucous. M. cândens, var. a, minus, Haw. in phil. mag. dec. 1831. p. 425.

Var. b. viréscens (Salm-Dyck. in litt.) leaves greener; branches less elongated. M. cândens $\beta$, virédeus, Haw. l. c.

Glittering Fig-marigold. Ct. 1820. Shrub pr.

241 M. hirtéllum (Haw. obs. 284. exclusive of the synonyms, misc. 102. syn. 274. rev. 186.) stem erect, bushy; leaves crowded, cylindrical, very blunt, beset with glistering papula; calyx turbinate, beset with papulose pili; stamens equal in length to the stigmas. $\gamma$. D. G. Native of the Cape of Good Hope. Flowers larger than those of any other species of this section, showy; petals pale red, white at the base.

Brísty Fig-marigold. Fl. May, Nov. Ct. 1792. Sh. $\frac{1}{2}$ to $\frac{3}{4}$ ft. 242 M. subcompressum (Haw. in phil. mag. Aug. 1826. p. 183.) plant erect and twiggy; leaves greenish-canaceous, compressely semi-terete, obliquely obtuse; upper part of branches rather pilose. $\gamma$. D. G. Native of the Cape of Good Hope. Flowers of a reddish violaceous colour.

Var. b. minus (Haw. l. c.) plant not half the size of the species.

243 M. furfuréllum (Haw. in phil. Dec. 1831. p. 421.) shrub bushy; branches crowded, straightish, stiff, furfuraceous; leaves cylindrical, very blunt, and are, as well as the calyx, beset with obsolete crystalline papula; flowers small, numerous. $\gamma$. D. G. Native of the Cape of Good Hope. Flowers terminating the branches, usually solitary, very pale red.

Furfuraceous Fig-marigold. Ct. 1830. Shrub 1 foot.

244 M. hispidum (Lin. spec. 691.) stem erect, bushy; leaves cylindrical, very blunt, green, glabrous, and covered with glistering papula, as well as the calyx, which is conical; stamens exceeding the stigmas. $\gamma$. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 278. D. C. pl. grass. t. 66. M. hispidum a, Haw. obs. 277. M. hispidum, Haw. syn. 273. rev. 186. Flowers deep purple.

Hispid Fig-marigold. Fl. May, Oct. Ct. 1704. Sh. $\frac{1}{2}$ to 1 ft. 245 M. subhispidum (Haw. in phil. mag. Dec. 1831. p. 421.) stem erect; branches and peduncles usually without hairs; leaves cylindrical, very blunt, and are, as well as the obconical calyces, glabrous, greenish, and covered with glistering papula. $\gamma$. D. G. Native of the Cape of Good Hope. M. hispidum $\beta$, platypétalum, Haw. rev. 186. Petals pale purple, whitish at the base, emarginate at the apex. Very like M. hispidum, but taller, less branched; but the branches are longer, more erect, and straight, and the flowers paler.

§ 46. Aspericádium (from asper, rough, and caulis, a stem; stems rough). Haw. misc. 97. rev. 182. Salm-Dyck. obs. 26. Stems shrubby, hardly a foot and a half high; branches filiform, scabrous. Leaves distinct, remote, nearly terete, glistering from papula. Flowers expanding before meridian; reddish or copper-coloured. Calyx 5-cleft. Stigmas 5, but in one of the species the calyx is 6-cleft, and the stigmas are 6.

* Flowers reddish.

246 M. pulvéruléntum (Haw. obs. 265. misc. 89. syn. 279. rev. 185. but not of Willd.) stem erect; branches crowded; leaves cylindrically trigonous, obtuse, dotted with white, powdery, scabrous; calyx 6-cleft. $\gamma$. D. G. Native of the Cape
of Good Hope. Flowers almost like those of *M. barbatum*, reddish. Stigmas 6, recurved at the apex.

**Pondery Fig-marigold.** May. Clt. 1792. Sh. 1/2 to 1 foot.

247 M. *seisile* (Thunb. fl. cap. 419.) stem erect, terete; branches flexuous, divaricate; leaves globose-trigonal, very blunt, glabrous; flowers sessile.  

D. G. Native of the Cape of Good Hope. Leaves a line long. Flowers red.

**Sessile-flowered Fig-marigold.** Shrub 1 foot.

248 M. *subglobosum* (Haw. syn. 273. rev. 185.) branches numerous, filiform, divaricate, rather decumbent; leaves expanded, rather papillose, very short, cylindrical subgloboso.  

**Subglobose-flowered Fig-marigold.** Fl. July, Oct. Clt. 1795.  

Shrub 1 foot.

249 M. *brevifolius* (Ait. hort. kew. 2. p. 188.) stems erect; branches diffuse, filiform, numerous; leaves cylindrical, very blunt, spreading, papillose.  

**Short-leaved Fig-marigold.** Fl. July, Oct. Clt. 1777. Sh. 1 ft.

250 M. *parvifolium* (Haw. rev. 184.) but not of Lam.) stem erect; branches rather crowded, filiform, rough, hard; leaves grain-formed, expanded, bluntly triquetrous, rather splitting from papillose.  

D. G. Native of the Cape of Good Hope. Corolla expanding in the day time, deep purple, nearly like that of *M. hircinum*, but one-half smaller. Stigmas 5, erect, green.

**Small-leaved Fig-marigold.** Fl. Aug. Clt. 1820. Sh. 2 to 1 ft.

251 M. *oralrum* (Haw. rev. 183.) but not of Wild.) stem erect; branches filiform, hard, roughish, erectish; leaves distant, cylindrical, obtuse, small, glancing from papillose, with one of the pair deflexed, and the other opposite it ascending.  

**Oblique-leaved Fig-marigold.** Fl. Aug. Clt. 1819. Sh. 1 ft.

**Flowers copper-coloured or yellow.**

252 M. *flavum* (Haw. rev. 183.) stem erect; branches very slender, scabrous from dots; leaves nearly terete, rather attenuated at both ends, glancing from papillose, erectly incurved or variously bent; lobes of calyx obtuse, nearly equal.  

D. G. Native of the Cape of Good Hope. Corolla expanded half an inch broad, of a golden yellow-colour, rather reddish on the outside; filaments white.

**Yellow-flowered Fig-marigold.** Fl. Aug. Clt. 1820. Shrub 1 1/2 to 1 foot.

253 M. *means* (Lin. spec. 606.) stem erect; branches scabrous; leaves semi-cylindrical, bluntish, rather recurved, glancing from papillose; lobes of calyx and petals acutish.  

**Glittering Fig-marigold.** Fl. May, Aug. Clt. 1704. Sh. 1 1/2 ft.

254 M. *maculatum* (Haw. syn. 271. rev. 182.) stems erect, covered with rough spots; leaves expanded, remote, obtuse, semi-cylindrical, and rather compressed, papillose.  

**Spotted-stamened Fig-marigold.** Clt. 1732. Shrub 1 1/2 foot.

255 M. *speciosum* (Haw. obs. 367. misc. 98. syn. 270. rev. VOL. III. 182.) stem erect, with scabrous branches; leaves semi-cylindrical, subulate, acutish, incurved, glittering a little from papillose; lobes of calyx and petals obtuse; corolla rather funnel-shaped.  

D. G. Native of the Cape of Good Hope. Corolla large, deep scarlet, with a green base, less than that of *M. micans*, expanding in the height of the sun.

**Elegant Fig-marigold.** Fl. May, Oct. Clt. 1793. Shrub 1 1/2 ft.

§ 47. **Trichotoma** (the flowers are disposed by threes, or in a trichotomous manner). *Haw. rev. 178.* Tuberous. Salsa-Dyck, obs. 25. Erect branched subshrubs. Leaves usually nearly cylindrical, and glancing in the sun from papillose. Calyx 5-cleft. Flowers small, disposed by threes, of various colours, but usually of a yellowish coppery-colour.—An artificial section.

256 M. *tuberosum* (Lin. spec. 693.) stem erect, branched; leaves rather triquetrous, compressed, beset with minute papillose, recurved at the apex; flowers trichotomous; root tuberos, hard.  

**Tuberous-rooted Fig-marigold.** Fl. June, Oct. Clt. 1714. Shrub 2 to 3 feet.

257 M. *megatherum*; root large, tuberous; stem erect, branched; leaves recurvly hooked; branches erect, thong-formed, flexible.  

D. G. Native of the Cape of Good Hope. Very like *M. tuberosum*, but differs from it in the principal stem being more equal in thickness; and in the flowers being more numerous and white. *M. macrorhizum*, Haw. in phil. mag. Nov. 1826. p. 332. but not of D. C.

**Large-rooted Fig-marigold.** Fl. May, Aug. Clt. 1824. Shrub 2 feet.

258 M. *testaceum* (Haw. suppl. 97. rev. 178.) stem shrubby, erect; leaves semi-terete, rather triquetrous, glaucenose; flowers disposed in trichotomous umbels.  

D. G. Native of the Cape of Good Hope. Stems 2-3 feet high. Flowers small, of a coppery-colour, pedunculate. Petals in one series. Both the fertile and sterile stamens are snow white, collected into a cone.

**Testaceus-flowered Fig-marigold.** Fl. Aug. Sept. Clt. 1820. Shrub 2 to 3 feet.

259 M. *trichotomum* (Thunb. fl. cap. 419.) stem straight; branches divaricate; leaves connate, trigonal, obtuse, flowers terminal, sessile; calyx 4-cleft.  

D. G. Native of the Cape of Good Hope. It differs from *M. geniculiflorum* in the leaves being connate, and without papillose, and in the flowers being red. Stigmas 4, purple, short.

**Trichotomous Fig-marigold.** Shrub 2 to 3 feet.

260 M. *sulpinanium* (Haw. in phil. mag. Dec. 1824. p. 427.) stem firm, branched, erect; leaves expanded, compressed, trigonal, rather canescent, soft, recurved, and mucronulate at the apex; flowers terminal, disposed by threes; lobes of calyx 5, unequal.  

D. G. Native of the Cape of Good Hope. Flowers middle-sized, snow white, expanding before meridian. This species is most nearly allied to *M. trichotomum*.

**Rather-hoary Fig-marigold.** Fl. Aug. Sept. Clt. 1820. Sh. 2 to 3 feet.

261 M. *decussatum* (Thunb. fl. cap. 414.) stem shrubby, trichotomous; branches erect; leaves connate, linear-semiterete, rather papillose; flowers pedunculate, solitary.  

D. G. Native of the Cape of Good Hope. Flowers spreading, snow white. Calyx 5-cleft.

**Decussate-leaved Fig-marigold.** Shrub 2 to 3 feet.

262 M. *brachiatum* (Ait. hort. kew. 2. p. 119.) stem much branched; branches trichotomous, papillose; leaves cylindrical, U...
FICOIDEÆ. I. MESEMBRYANTHEMUM.

265. **M. spinuliferum** (Haw. obs. 206. and 443. misc. 57. syn. 252. rev. 176.) caudex and branches erect and thickened; leaves linear, channelled, and are, as well as the branches, papulous; old leaves permanent, long, hard, and spine-like; flowers usually solitary; peduncles strong, subclavate. \( \gamma \). D. G. Native of the Cape of Good Hope. Petals pale yellow or straw-coloured. Stigmas 5, erect.

266. **M. caulicola** (Haw. obs. 218. misc. 57. syn. 253. rev. 177.) stems procumbently prostrate, filiform; leaves linear-semiterete, covered with shining papulose. \( \gamma \). D. G. Native of the Cape of Good Hope. Corolla pale rose-coloured. Old stems half a foot high.

267. **M. viridiflorum** (Ait. hort. kew. 2. p, 196.) caudex thickened; branches diffuse, knotted; leaves semiterete, beset with papulose hairs; calyx hairy, pedunculate. \( \gamma \). D. G. Native of the Cape of Good Hope. Curt. bot. mag. t. 326. D. C. pl. grass. t. 159. Jacq. fragm. t. 52. f. 2. Petals very narrow, greenish. Stigmas 5, joined in one body.

268. **M. gróssum** (Haw. misc. p, 57. syn. 252. rev. 176.) caudex thickened; branches effusely decumbent; leaves linear, nearly terete, obtuse, attenuated at both ends, papulose. \( \gamma \). D. G. Native of the Cape of Good Hope. \( \gamma \). D. G. Native of the Cape of Good Hope. M. gróssum, M. cárnée, and M. aggregátum, Haw. obs. 205, 206. and 410. Corolla middle-sized, pale, at length becoming of a reddish straw colour.

270. **M. ni'tidum** (Haw. obs. 412. misc. 57. syn. 243. rev. 177.) stem erect; branches slender, efluse, knotted; leaves semiterete, beset with glistering papulose; flowers terminal, usually by threes. \( \gamma \). D. G. Native of the Cape of Good Hope. Flowers yellow. Salm-Dyck ex Spreng. nov. prov. 37. M. brachiatíum, D. C. pl. grass. t. 129. M. prínsósum, Thunb. fl. cap. 425. ex Salm-Dyck and Spreng. but according to Haworth this species differs in the stem being decumbent, and in the branches being bent.

271. **M. noctíflorum** (Lin. spec. 689.) stems suffruticoso; branches erect, with white bark; leaves rather remote, obsolescently semi-serrulato, glaucous; peduncles binate. \( \gamma \). D. G. Native of the Cape of Good Hope. Haw. rev. 179. Lodd. bot. cab. 495.

273. **M. clávatum** (Jacq. hort. schenbnr. t. 108.) stem erect, sparingly branched; leaves nearly terete, remote, horizontal; peduncles clavate, aggregatum. \( \gamma \). D. G. Native of the Cape of Good Hope. M. delófíatum, Haw. misc. 83. rev. 181. Flowers white.

275. **M. simplex** (Jacq. fragm. t. 52. f. 2.) stems erect, sparingly branched; leaves nearly terete, remote, horizontal; peduncles clavate, aggregatum. \( \gamma \). D. G. Native of the Cape of Good Hope. M. delófíatum, Haw. misc. 83. rev. 181. Flowers white.

277. **M. clávatum** (Jacq. hort. schenbnr. t. 108.) stem erect, sparingly branched; leaves nearly terete, remote, horizontal; peduncles clavate, aggregatum. \( \gamma \). D. G. Native of the Cape of Good Hope. M. delófíatum, Haw. misc. 83. rev. 181. Flowers white.

§ 51. Splendencia (from splendens, shining; in reference to the leaves, which are covered with glittering papule, which shine in the sun). D. C. prod. 3. p. 445.—Digitiflora and Crassulina, Haw. rev. 170. and 172. —Teretsicia albidiflora, Salm-Dyck. phys. p. 23. Stems suffruticoso, branched, erect. Leaves opposite, distinct, somewhat cylindrical, when young, farrowed above, beset with papille more or less, which glitter in the sun. Flowers middle-sized, solitary, rarely by threes, white, expanding before meridian. Calyx generally 5-lobed, rarely 4 or 6-lobed, usually leaf-formed. Stigmas as many as there are calyceine lobes.

275 M. crassulina (D. C. prod. 3. p. 445.) stem suffruticoso, erect, decumbent; branches numerous, rather effuse; leaves crowded, thick, linear-lanceolate, channelled, almost without papule, green; flowers solitary; 3 of the segments of calyx membranous at the base, and 2 larger than the rest. h. D. G. Native of the Cape of Good Hope. M. crassuloides, Haw. rev. 170. Flowers expanding before meridian; petals 4 lines long, white, but at length becoming pale rose-coloured. Stigmas 5, which after fecondation are very conspicuous above the anthers.

276 M. inscrutum (Haw. suppl. 96. rev. 171.) stem suffruticoso, branched, bushy; leaves crowded, rather papule, evenly imbricating, semi-terete, firm, almost subulate; flowers by threes; peduncles clavate; lobes of calyx finger-shaped, acute. h. D. G. Native of the Cape of Good Hope. Plant half a foot high, pale green. Corolla snow white. Stigmas 5, ramentaceous, equal in length to the anthers.

278 M. sulcatum (Haw. rev. p. 173.) stem shrubby, erect; leaves crowded, linear-subulate, semi-terete, channelled, pale-green, adult ones expanded, semi-terete; lobes of calyx leaf-formed, acute. h. D. G. Native of the Cape of Good Hope. Flowers Stigmas 5, erect, not exceeding the stamens. Perhaps only a variety of M. splendens.

279 M. acuminate (Haw. in phil. mag. 1824. vol. 64. p. 426.) stem and branches erect; leaves crowded, semi-terete, acuminated, green; lobes of calyx 5, 2 of which are much more prolonged than the other 3. h. D. G. Native of the Cape of Good Hope. Allied to M. sulcatum, but differs from all the species of this section in the lobes of the calyx being very unequal. Corolla white, expanding before meridian.

280 M. albicaule (Haw. in phil. mag. Nov. 1826. p. 331.) stem and branches erect, slender, and whitish; leaves subulate, green, semi-terete, a little recurved, and mucronulated at the apex. h. D. G. Native of the Cape of Good Hope. Flowers white. Like M. acuminatum in habit, but three times smaller.

281 M. flexuosa (Haw. misc. p. 61. syn. 257. rev. 173.) stem suffruticoso, and is, as well as the branches, flexuous, slender, and shining; leaves crowded, flexuously incurved, very green, semi-terete; lobes of calyx finger-shaped. h. D. G. Native of the Cape of Good Hope. Flowers white, reddish on the outside. Stigmas 4-5.

282 M. fastigiata (Haw. rev. 173. but not of Thunb.) stems slender, erect at first, but at length becoming decumbent; leaves crowded, flexuously reflexed, subulate, semi-terete, glauccecent; lobes of calyx equal, 3 of which are membranous on both sides. h. D. G. Native of the Cape of Good Hope. Corolla of a dirty fulvous-colour on the outside, white and paler on the inside. fastigiata, Haw. misc. p. 60. exclusive of the synonyme of Brall.

Var. β, reflexum (Haw. rev. p. 173.) lobes of calyx unequal; stem erect. M. reflexum, Haw. misc. 60. var. a.

283 M. umbelliflorum (Jacq. ex Willd. enum. 534.) stem leaves; erect leaves, distinct, nearly terete, papulose; branchlets 1-flowered. h. D. G. Native of the Cape of Good Hope. The rest unknown. Perhaps only a variety of M. fastigiata, Haw. or a proper species, ex Haw. rev. 174.

284 M. longistylus (D. C. pl. grass. t. 147.) stem suffruticoso; branches elongated; leaves opposite, distinct: when young linear-filiform, but at length becoming a little keeled, acute, and minutely papulose; peduncles 1-flowered; calyx 5-cleft, with 2 or 3 of the lobes having hyaline margins; stigmas 5, exceeding the stamens. h. D. G. Native of the Cape of Good Hope. M. pallens, Jacq. hort. schoenbr. 3. t. 279. but not of Ait. M. pallescens β, Haw. rev. p. 174. Flowers white, or somewhat rose-coloured, half an inch in diameter.

§ 52. Juncus (from juncus, like a bull-rush, slender; stems).

285 M. junceum (Haw. misc. 175. syn. 255. rev. 59.) stem shrubby, much branched; branches articulated, filiform; leaves subulate, semi-terete, acute, remote; flowers terminal, dichotomous; lobes of calyx 4, very unequal. h. D. G. Native of the Cape of Good Hope. Corolla small; petals reddish, but whitish at the base. Stigmas 4, erect, a little longer than the filaments. M. aphyllum, Hort. M. articulatum, Thunb. fl. cap. 415. ?

286 M. granuliculce (Haw. in phil. mag. 1824. vol. 64. p. 424.) stem very slender, suffruticoso; branches terete, dotted from numerous grains; leaves very narrow, obtuse, glauccecent, semi-terete, longer than the internodes. h. D. G. Native of the Cape of Good Hope. Flowers unknown.
Granular-stemmed Fig-marigold. Clt. 1820. Shrub 1½ foot. 228. M. microstomum (Haw. syn. 257. rev. 174.) stem sulfurific, slender, much branched; leaves linear, keeled, dotted, distinct; peduncles 1-flowered; calyx 4-cleft, having 2 of the lobes very long, and 2 very short. h. D. G. Native of the Cape of Good Hope. M. parviflorum, Jacq. hort. scheenbr. 3. t. 278. but not of Haw. Corolla small, snow white, shorter than the calyx. Stigmas 4, spreading.

Weak Fig-marigold. Clt. 1819. Shrub 1 foot. 289. M. karacemum (Jacq. fragm. 43. t. 52. f. 1.) root turgid; stem herbaceous; branches terete, and somewhat articulated; leaves distinct, terete, obtuse, dotted, spreading much; peduncles 1-flowered; lobes of calyx filiform; stigmas 5, spreading. h. D. G. Native of the Cape of Good Hope. Flowers snow white, 9-10 lines in diameter. Lobes of calyx nearly equal, or very unequal.

Turnip-like-rooted Fig-marigold. Pl. 1 foot. § 53. Nodiflora (from nodus, a knot, and flo, a flower; flowers rising from the knots of the stem, or axils of the leaves). D. C. prod. 3. p. 446.—Cylindrica, Haw. rev. 163. Salm-Dyck, obs. 15. Roots annual. Stems herbaceous, branched. Leaves nearly terete or linear, thick, opposite, rarely alternate, papulose. Flowers axillary, nearly sessile. Calyx 4-5-lobed, exceeding the petals, which are small and white. Stigmas 4-5.

290. M. nodiflorum (Lin. spec. 687.) stem erectish; leaves opposite and alternate, nearly terete, obtuse, ciliated at the base; flowers axillary, nearly sessile; lobes of calyx very unequal, exceeding the petals, which are small. h. D. G. Native of Egypt, Barbary, Corsica, and Naples, in sandy places by the sea side. D. C. pl. grass. t. 88. Smith, fil. geac. t. 480.—Moris. hist. sect. 5. t. 37. f. 7.—Haw. rev. 166.—Column. ecphr. 2. t. 73. This species is often confused with the two following. Perhaps the calyx is 4-cleft, as mentioned by Haworth, but in some plants which have been examined it has been found to be 5-cleft.

Var. g. album (Haw. rev. 163.) flowers white. M. lineare, Thunb. fl. cap. 411.

Wheat-leaved Fig-marigold. Pl. ¼ foot. 296. M. gramineum (Haw. misc. 55. exclusive of the syn. of Thunb.) plant almost stemless; leaves linear; scapes filiform; lobes of calyx 5, lanceolate, longer than the corolla. h. D. G. Native of Cape of Good Hope.—Petr. gaz. t. 88. f. 7. Corolla yellow. This species is not sufficiently known. Perhaps it comes nearest to M. tricolor.

Grassy-leaved Fig-marigold. Pl. ½ foot. 297. M. crinkulorum (Hout. phil. syst. 2. p. 53.) plant almost stemless; leaves radical, comate, ovate, papulose; peduncles rising from the root like scapes; calyxine lobes 5, oval, 3 of them longer than the rest. h. D. G. Native of Cape of Good Hope. Thunb. fl. cap. 411. M. spatulatum, Thunb. in Willd. spec. 2. p. 1025. Flowers white.

Hair-flowered Fig-marigold. Pl. ¼ foot. 298. M. sabulorum (Thunb. fl. cap. 422.) plant almost stemless; leaves radical, stem-clasping, oblong, flat, acutish, furrowed above; calyxine lobes 5, oblong. h. D. G. Native of the Cape of Good Hope. Flowers yellow.

Gracilly Fig-marigold. Pl. ¼ foot. 299. M. claviforme (D. C. prod. 3. p. 448.) plant almost stemless; leaves clavate, obtuse; flowers terminal. h. D. G. Native of the Cape of Good Hope.—Petr. gaz. t. 88. f. 7. M. clavatum, Haw. obs. 471. spec. 56. rev. 164. but not of Jacq. Flowers golden yellow. Species hardly known.

Club-formed-leaved Fig-marigold. Pl. ⅛ foot. § 55. Platypelphilla (from τόπος, breadth, and φυλλον, phyllon, a leaf; leaves broad). Haw. rev. p. 156. Roots annual or biennial. Stems herbaceous. Leaves flat, variable in form, and are papulose, as well as the branches. Flowers of various colours. Calyx 5-cleft. Stigmas 5.
300 M. crassilinum (Lin. spec. 688.) plant diffusely procumbent, herbaceous, covered with large glittering papule on every part, which makes the plant appear as if covered with ice; leaves ovate, alternate, stem-clasping, undulated; flowers axillary, almost sessile. O. H. Native of the Cape of Good Hope, Canary Islands; and of Greece, about Athens, in the sand by the sea side. Smith, fl. grece. t. 481.—Dill. elth. f. 24. Bradl. succ. t. 48. D. C. pl. grass. t. 128. Haw. misc. 43. Flowers white. There are two varieties of this plant; one a biennial, which is said to be the true M. crassilinum; and the other an annual, which is the common ice-plant of the garden, which is called by Haw. M. glaciolum. The whole plant is covered with glittering white papule, that shine in the sun, whence it is called ice-plant; others name it the diamond-plant.

**Crystalline Fig-marigold or Ice-plant.** Fl. May, Aug. Clt. 1775. Pl. procumbent.

301 M. crispub (Haw. misc. 44. rev. 157.) leaves alternate, ovate, petiolate, undulated; petals minute. O. H. Native of the Cape of Good Hope.—Petiv. gaz. t. 88. f. 5. M. crispa-tum, Haw. obs. 470. Flowers reddish. This species is hardly known.

**Curled-leaved Fig-marigold.** Pl. pr.

302 M. pinnafridum (Lin. fil. suppl. 260.) stems diffuse; leaves opposite, oblong, bluntly pinnafridum, papulous; petals shorter than the calyx. O. H. Native of the Cape of Good Hope, and also said to be a native of Chili. Curt. bot. mag. t. 67. D. C. pl. grass. t. 142. Haw. obs. 112. misc. 44. syn. 244. rev. 157. Stems reddish, papulous. Petals small, yellow in one series. Stigmas 5, ascending. Flowers small in the forks of the branches, pedunculate.

**Pinnafrid-leaved Fig-marigold.** Fl. May, Oct. Clt. 1774. Pl. pr.

303 M. sessiliflorum (Ait. hort. rew. 2. p. 193.) branches divaricate; leaves flat, spatulate, and are, as well as the stems, beset with papule; flowers sessile. O. H. Native of the Cape of Good Hope. Flowers yellow. Haw. syn. p. 247. Var. β, album (Haw. rev. 158.) flowers white; leaves ovate, petiolate; upper ones alternate; flowers paniced, small. D. G. Perhaps a proper species, but is not sufficiently known.

**Sessile-flowered Fig-marigold.** Fl. July. Clt. 1774. Pl. pr.

Var. β, roséum (Haw. rev. 159.) flowers reddish; leaves lanceolate-spatulate.

**Lanceolate-leaved Fig-marigold.** Fl. May, Aug. Clt. 1795. Pl. dec.

**Lance-leaved Fig-marigold.** Pl. f. foot.

306 M. papuliferum (D. C. prod. 3. p. 448.) stem very short; branches almost radical, somewhat fastigate, gradually thickened, and are as well as the leaves and calyces beset with papule; leaves conuate, ovate; flowers terminal, sessile; 1-3 together; calyx 5-cleft. O. H. Native of the Cape of Good Hope, on hills in very dry places. M. fastigiatum, Thunb. fl. cap. 413. but not of Haw. Flowers white. Lobes of calyx purple. This species differs from M. rectum of Haw. in being annual, not shrubby.

**Papulle-bearing Fig-marigold.** Pl. f. to f. foot.

308 M. clandestinum (Haw. in phil. mag. aug. 1826. p. 120.) branches procumbent, papulous; leaves acutely ovate, petiolate; flowers usually terminal, solitary or by threes, on a terete, clavate peduncle; petals very small. D. G. Native of the Cape of Good Hope, Hidden-flowered Fig-marigold. Fl. May, Aug. Clt. 1822. Pl. pr.

309 M. puberulum (Haw. in phil. mag. sept. 1821. p. 419.) stems branched, procumbent, papulous; floriferous branches and margins of leaves pubescent; leaves opposite or alternate, obtuse-spatulate, channelled, keeled; peduncles subhyaline. O. D. G. Native of the Cape of Good Hope. Very like M. papulosum. Flowers white.

310 M. angulatum (Thunb. fl. cap. 426.) stem herbaceous, decumbent, angular, branched; leaves opposite, ovate, sessile, papulous; calyx 5-cleft, angular. O. D. G. Native of the Cape of Good Hope. Flowers yellow, as in M. papulosum, but the stems are angular, not terete. The stems are angular, however, in M. Aitoni, but the flowers are pale red, not yellow.

**Angular-stemmed Fig-marigold.** Pl. pr.

311 M. Aitoni (Jacq. hort. vind. t. 7.) branches decumbent, angular; leaves opposite or alternate, ovate-spatulate, papulous; pedicels short; calyces angular. D. G. Native of the Cape of Good Hope. Haw. misc. 48. rev. 158. Flowers expanding in the evening, pale reddish, about the size of those of M. cordifolium. Lobes of calyx very unequal. Stigmas 5, erect, recurved at the apex.

**Aiton’s Fig-marigold.** Fl. June, Oct. Clt. 1774. Pl. pr.

**Heart-leaved Fig-marigold.** Fl. May, Sept. Clt. 1774. Pl. diffuse.

§ 57. Expansa (from expansus, expanded; stems). D. C. prod. 3. p. 449.—Planifolia †, † Haw. rev. 167. Stems suffrutescent, diffuse, or procumbent, terete. Leaves flat, opposite, almost without papule, stem-clasping, a little keeled. Flowers white or pale yellow, rarely pale red. Tube of calyx somewhat pear-shaped; lobes 4-5, unequal. Stigmas 4-5.

314. M. varùns (Haw. misc. p. 51. syn. 249. rev. 168.) branches prostrate; leaves opposite, lanceolate, acuminate, keeled, hence they are bluntly triquetrous and channelled; pedicelles very thick. ʁ. D. G. Native of the Cape of Good Hope.—Petiv. gaz. t. 78. t. 10. The whole plant is beset with pubescent. Calyx 4-5-cleft. Corolla white on the outside and yellow on the inside; but according to Haworth it is whitish, and according to Petiver yellowish. Stigmas 5, short.

316. M. concavum (Haw. rev. 168.) stem procumbent; leaves concave, ovate-lanceolate, alternate, thick; flowers terminal, solitary. ʁ. D. G. Native of the Cape of Good Hope.—Bur. afr. dec. 3. t. 26. f. 1. Flowers yellowish. This is a very doubtful species.

Concave-leaved Fig-marigold. Shrub pr.

318. M. lóratum (Haw. rev. 168.) stems diffuse; leaves lorate, canaliculately-inked, obtuse, very glaucous, convex beneath; lobes of calyx oblong, attenuate, obtuse. ʁ. D. G. Native of the Cape of Good Hope. Flowers white. Perhaps only a variety of M. pallens.

319. M. crassicùle (Haw. in phil. mag. 1824. p. 425.) caudex very short and thick; branches expanded; leaves crowded, flat, lorate, acuminate, green, glabrous, a little incurved; peduncles furnished with 4-5 bracteas; lobes of calyx 5, one of which is smaller than the rest. ʁ. D. G. Native of the Cape of Good Hope. Flowers pale yellow, expanding before meridian. Stigmas very short.

Thick-stemmed Fig-marigold. Fl. May, July. Clt. 1815. Pl. 3 foot.
320. M. rëlláxum (Wilk. enum. suppl. p. 36.) stems decumbent, terete, flexuous; leaves linear-lanceolate, obtuse, of a vivid glaucous colour, channelled, dotted from papule, costately keeled; lobes of calyx 5, foliaceous, one of which is very small. ʁ. D. G. Native of the Cape of Good Hope. Spreng. nov. prov. 28. Haw. rev. 169. Flowers purple (ex Wilk.), rose-coloured (ex Spreng.), reddish or nearly scarlet (ex Haw.).

321. M. anatómìcum (Haw. misc. 50. syn. 249. rev. 169.) stems filiform, procumbent; leaves opposite, lanceolate-elliptic, full of crystalline papule, when dead the nerve alone remains permanent. ʁ. D. G. Native of the Cape of Good Hope.

Var. β, frígile (Haw. rev. 169.) leaves large, concave, greener than the species.

Ovate-leaved Fig-marigold. Shrub dec.
323. M. humiìfìsum (Ait. hort. kew. 2. p. 179.) stems suffruticose, trailing; leaves stem-clasping, spatulate, keeled, scabrous from conical papule; petals very minute. ʁ. D. G. Native of the Cape of Good Hope. Corolla white. The rest unknown.

324. M. trípólium (Lin. spec. 690.) stems herbaceous, loose, simple; radial leaves flat, crowded, ramal ones alternate, lanceolate, dotless, almost destitute of papule; flowers pedunculate; calyx pentagonal, 5-cleft. ʁ. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 220.—Pluk. mant. 329. f. 4. Haw. obs. 122. misc. 49. syn. 247. rev. 167. Flowers middle-sized, white. There is no ally to this species, according to Haworth.

Var. β, glabrum (Haw. rev. p. 160.) plant more glabrous and naked; upper leaves a little ciliated; petals longer than the calyx. ʁ. D. G. Andr. bot. rep. t. 57. Haw. misc. 44. but not of Ait. Perhaps a proper species.

327. M. caléndulae'ceum (Haw. rev. 161. but not of his misc.) leaves linear-lanceolate, hardly spatulate, ciliated; peduncles scabrous; petals about equal in length to the loripetely-linear, thick, ciliated, calyceine lobes; ovarium sparingly pubescent. ʁ. D. G. Native of the Cape of Good Hope. Stem much branched. Hairs on the ovary or tube of the calyx white and short. Flowers yellow. The rest unknown.

328. M. fláccidum (Jacq. hort. vind. t. 475.) leaves lanceolate, acute, flat, glabrous, quite entire; peduncles 1-flowered, erectish, glabrous, very long. ʁ. D. G. Native of the Cape

† Species not sufficiently known.

332 M. humile (Haw. misc. 80. rev. 122.) stems prostrate; leaves triquetrous, subulate; calyx 4-cleft. D. G. Native of the Cape of Good Hope. Leaves opposite, or probably ternate.

Var. a, ribrum (Haw. l.c.) flowers red.—Petiv. gaz. t. 88. f. 8. Haw. obs. 471.

Var. b, lateum (Haw. l.c.) flowers yellow.—Petiv. gaz. t. 88. f. 8. Humble Fig-marginal. Prostrate. 333 M. argenteum (Burch. voy. 1. p. 343. cat. geogr. 2004.). D. G. Native of the Cape of Good Hope. Allied to M. pareficiatum. Shrub 1-2 feet high, branched, with the trunk for the most part simple. Gymes 8-times dichotomous. Flowers minute, of a testaceous colour.

Tree-formed Fig-marginal. Shrub 1 to 2 feet.

Field Fig-marginal. Shrub 1½ foot.

335 M. laurifolium (Haw. obs. 470. misc. 49. rev. 157.) root fusiform; stem very flexuous; leaves opposite, cuneately obovate. D. G. Native of the Cape of Good Hope. — Petiv. gaz. 88. f. 4. Anthers and petals purple. Perhaps a species of Othôna.

336 M. ? ciliatum (Ait. hort. kew. 2. p. 179.) leaves opposite, connate, semi-terete; stipulas membranous, reflexed, jagged, in the form of cilia. D. G. Native of the Cape of Good Hope. Corolla white. The rest unknown. Stipulas in all other species of Mesembryanthemum are wanting, and it is probably a species of Arenaria.

Ciliated-stipulated Fig-marginal. Clt. 1774. Pl. ½ foot.

337 M. coriaria (Burch. cat. geogr. 2487. ex trav. 1. p. 243.). D. S. Native of the Cape of Good Hope, where it is used in tanning leather. Said to be allied to M. uncinitum. Hide Fig-marginal. Shrub

338 M. ? villosum (Lin. spec. 695.) stem subhairy, thickened at the base; branches prostrate; leaves connate, linear, semi-terete, channelled, pubescent; peduncles trichotonous; flowers petalous. D. G. Native of the Cape of Good Hope. Haw. obs. 222. and 441. misc. 58. syn. 254. rev. 125. Calyx 5-lobed, purple inside. Capsule fleshy, 5-6-celled. Perhaps a species of Aszôn, Tetragonia, or Sesuvium, but the description is not sufficient to decide this point.

Villosus Fig-marginal. Shrub prostrate.

339 M. graminifolium (Haw. misc. 82. syn. 263. rev. 149.) stems expanded, long, suffruticos; leaves distinct, rather triquetrous, ovate grain-formed; stamens collected. D. G. Native of the Cape of Good Hope. Bradl. succ. t. 20. Stems 3 inches high. Leaves 3 lines long. Flowers yellow, yellow. This species is entirely unknown at the present day, having been only known to Bradley. According to Haworth's opinion, it comes in section Cymbopinum.

Cult. This is a vast genus of what are called succulent plants, that is, fleshy-leaved plants. The shrubby kinds should be grown in pots, in a very sandy or gravelly soil; they should be kept almost quite dry, while in a dormant state, but when growing freely and in the flowering season, they require a considerable supply of water. The poorer the soil is, the more dwarf the plants will grow, and bear flowers more abundantly. The shelves in a greenhouse are a good place to preserve them through the winter, however, a good dry frame will answer the purpose equally well, if not better, with a covering of mats in frosty weather. Cuttings of all of them strike root readily, if planted in pots of the same kind of earth recommended for the plants, and kept dry till they begin to grow, when they may have a little water given to them; and under this treatment they will root very soon. There are also several annual and biennial kinds, most of them handsome and curious. The seeds of these should be sown in pots early in spring, and raised in a frame, hot-bed, or greenhouse; and when the plants are of sufficient size, plant them singly in small pots, and set them in the greenhouse, until the warm weather commences, when they may be set out of doors along with the shrubby kinds, where they will flower and seed freely, if the summer proves fine. The same soil and treatment recommended for the shrubby kinds will also suit these well. The ice-plant, M. crassifolium, and also M. pinatifidum do well if planted out on rockwork or among stones, where they will make a very curious appearance.

Lin. syst. Icosindria, Tri-Ocotoporia. Calyx 4-cleft, rarely 3-cleft, with the tube adhering to the ovaryum, and 4-5-horned; lobes coloured on the inside. Petals wanting. Stamens variable in number. Ovarium 3-8-celled. Styles 3-8, very short. Nut bony, winged, or horned, indehiscent, 3-8-celled inside. Seeds solitary in the cells.—Herbs or sub-shrubs. Leaves alternate, flat, fleshy, undivided, usually quite entire. Flowers axillary, pedicellate, or sessile.

1 T. expansa (Ait. hort. kew. 2. p. 178.) herbaceous leaves petiolate, ovate-rhomboid; flowers sessile; fruit 4-horned, 6-8-seeded. H. Native of New Zealand and Japan, also of
Chili, about Concepcion, and Valparaíso. Murr. comm. goett. 1783. t. 5. Seop. inst. t. 14. D. C. pl. gr. t. 114. T. cornuta, Gaertn. fruct. 2. p. 179. f. 3. T. Japonica, Thumb. jap. 268. T. halimifolia, Forst. prod. p. 223. Roth, abb. t. 8. Demidovia tetragoniae. Pall. Hort. dem. t. 1. Stamos 4-5 in each fascicle, 1 fascicle in every recess of the calyx. From all the species this differs in the cells of the pericarp being double the number of calycine lobes, not equal to them in number, as in the rest of the species. The New Zealand spinach is a spreading, rather prostrate plant, with yellow flowers, and leaves an inch and a half long. The whole plant is studded with very minute crystalline dots. It is a native of New Zealand, by the sides of woods, in bushy sandy places, and though not used by the inhabitants, yet, being considered by the naturalist who accompanied Cook, as of the same nature as the Chenopodium, it was served to the sailors boiled every day at breakfast and dinner. It was introduced to this country by Sir Joseph Banks in 1772, and treated as a greenhouse plant; but it has been found to grow in the open garden as freely as the kidney-bean or nasturtium, and has been used as a spinach plant. In the Earl of Essex's family, at Cashibury, no other spinach was used during the whole summer of 1821, and it is now commonly cultivated for that purpose. It grows so fast that a few plants will suffice for a large family. There are three varieties of this species found in Chili: 1. with leaves smooth on both surfaces; 2. with leaves hoary beneath; and 3. a small gramineous variety.

2 T. crystalina (Lher. stirp. nov. 1. p. 81. t. 39.) plant herbaceous, pruinose; leaves ovate, sessile; flowers almost sessile; fruit tetragonal, incurred, 4-seeded. C. or H. F. Native of Peru and Chili, about Valparaíso and Coquimbo. D. C. pl. gr. t. 34. Calyx 3-4-lobed. Stamens 3-4 in each fascicle, 1 fascicle in each recess of the calyx.

3 T. echinata (Ait. hort. kew. 2. p. 177.) plant herbaceous; leaves petiolate, ovate-rhomboid; flowers on short pedicels; fruit echinated, 3-4-seeded. C. or H. F. Native of the Cape Good Hope. D. C. pl. gr. t. 113. Calyx 3-4-lobed. Stamens 3-4, 1 in each recess of the calyx. Calyx beset with crystalline papule.

Sect. II. TETRAGONOCARPUS (from terpa, tetra, four, γωνία, an angle, and capros, karpós, a fruit; in reference to the fruit being usually furnished with 4 wings). Comm. ex D. C. prod. 3. p. 452. Stamens disposed in 1 series at the base of the calycine lobes. Fruit usually winged.—Herbaceous, perennial, or suffruticose plants. Flowers on long pedicels.

4 T. irosutu (Lin. fil. suppl. 258.) plant herbaceous, decumbent; leaves ovate, villous, sessile; flowers 3 together, on short pedicels; fruit tetragonal, with a wing on each angle, 4-seeded. C. or H. F. Native of the Cape Good Hope. Thunb. fl. cap. 408. Stamens numerous, inserted in the middle of the calyx by bundles, as described by Thunberg. Perhaps not distinct from T. villosa, Poir. dict. 7. p. 604.

Hairy Tetragonia. PI. decumbent.

5 T. scopulaca (Lin. fil. suppl. 258.) plant herbaceous, erect; leaves petiolate, glabrous; lower ones ovate; upper ones lanceolate; flowers pedicellate, branched. C. or H. F. Native of the Cape Good Hope. Thunb. fl. cap. 409. where it is called T. racemosa. Pedicels numerous, aggregate.

6 T. herbacea (Lin. spec. 687.) plant somewhat herbaceous, rather decumbent, smooth; leaves ovate, petiolate; flowers on long pedicels; fruit 4-winged, 4-6-seeded; root strumose. C. or H. F. Native of the Cape Good Hope. Thunb. fl. cap. 409. Stamens 3-4 together, nearly an inch long. Flowers 4-cleft, but the terminal ones are 5-cleft. Root fleshy.

7 T. decumens (Mill. dict. no. 2.) plant suffruticose, decumbent, pruinose; leaves on short petioles, obovate-oblong; flowers 3-4 together on short pedicels; fruit 4-5-angled, with a wing on each angle. C. or H. F. Native of the Cape Good Hope. D. C. pl. gr. t. 23. Mill. fig. t. 263. f. 1. Flowers 4-cleft. Styles 4-5. Calyx and anthers of a pale sulphur colour.

8 T. fruticosa (Lin. spec. 687.) shrubby, erect; leaves oblong, on very short petioles; flowers 1 or 3 together, on short pedicels; fruit bluntly 3-4-angled, each angle furnished with a wing. C. or H. F. Native of the Cape Good Hope. Comm. hort. cist. 2. t. 103.—Seba, thes. 2. t. 11. f. 8. Haw. misc. p. 120.—Mill. fig. t. 2. t. 263. f. 2. Calyx green without and yellow within.

9 T. tetragonurus (Haw. misc. p. 121.) plant suffruticose, erect; leaves oblong-lanceolate, nearly sessile; flowers pedicellate, racemose; fruit furnished with large wings, and other 4 alternate small ones. C. or H. F. Native of the Cape Good Hope. Thunb. fl. cap. 403. Plak. amath. t. 220. Nut 4-seeded.

10 T. lineata (Haw. rev. p. 73.) plant shrubby and diffusely decumbent; leaves linear, rather revolute at the sides, engraved above by a dorsal line; flowers terminal, racemose. C. or H. F. Native of the Cape Good Hope. Leaves greenish. Linear-leaved Tetragonia. Fl. Sept. Cl. 1819. Sh. dec.

11 T. obovata (Haw. rev. p. 73.) plant suffruticose, decumbent, pruinose; leaves obovate or oval; petioles winged, semiclasp, somewhat decurrent. C. or H. F. Native of the Cape Good Hope. Leaves unknown. Very like T. decumbens, but one half larger.

Obovate-leaved Tetragonia. Cl. 1821. Shrub dec.

Cult. The same culture, propagation, and treatment as that recommended for Mesembryanthemum will suit the species of Tetragonia. The T. expansa, when wanted for spinach, may be planted out in the open ground, about April or May.

III. SESUVIUM (a name not explained by the author). Lin. gen. 624. Lam. ill. t. 434. D. C. prod. 3. p. 453.

LIN. SYS. Icoadendra, Tri-Pentagynia. Calyx 5-parted, permanent; lobes coloured on the inside. Petals wanting. Stamens 15-30, inserted at the top of the calycine tube, which is short. Ovarium distinct, sessile. Style wanting. Stigmas 3-5. Capsule 3, rarely 4-5-celled, circumscissed, having the placental axis permanent. Seeds numerous. Embryo hooked. Smooth fleshy herbs, inhabitants of the sea-side; with opposite, quite entire, veinless leaves; and axillary, solitary, alternate flowers, which are either sessile or on short pedicels. Calyx purplish inside.

Var. b, sessile; flowers nearly sessile. S. sessile, Pers. ench.
2. p. 39. D. C. pl. grass. t. 9. The plant is very succulent and full of neutral alkaline salt, which may be easily extracted, and would probably answer all the purposes for which the salts of the kali are now used.

2 S. longifolium (Willd. enum. p. 521.) leaves linear-spatulate; joints of stem equal; flowers pedicellate. 2. D. S. Native of South America, by the sea-side. S. Portulacastrum, H. B. et Kunth, nov. gener. 6. p. 86. from Peru and Cuman. Stanmus 70-75 (ex Kunth, l. c.). Leaves nearly 2 inches long with the pedioles.

3 S. revolutifolium (Ort. dec. p. 19.) leaves ovate-oblong, with revolute margins; flowers sessile. 2. D. G. Native of Cuba, by the sea-side. S. Portulacastrum β, Sims, bot. mag. t. 1701. Stanmus very numerous. Stigmas 5-6. Leaves rather glaucous, not deep green, as in S. Portulacastrum.

4 S. repens (Willd. enum. p. 521.) leaves spatulate-lanceolate; joints of stem rooting, filiform; flowers pedicellate. 2. D. S. Native of the East Indies.—Rumph. amb. 5. p. 165. t. 72. f. 1.

5 S. microphyllum (Willd. l. c.) leaves roundish or lanceolate; stems trailing, having equal joints; flowers pedicellate. 2. D. S. Native about the Havannah, by the sea-side. Humb. et Bonp. S. spatulatum, H. B. et Kunth, nov. gener. 6. p. 97. Leaves 5 lines long with the pedioles. Stanmus 30, Stigmas 5.

Small-leaved Sesuvium. Pl. creeping.

6 S. parvifolium (D. C. prod. 3. p. 453.) leaves linear-oblong, flat; flowers sessile. 2. D. G. Native about Monte Video by the sea-side; and of Chili, near Laguna del Arbolito, on the west side of Río Saladillo. Sesuvium, Lam. ill. t. 344. f. 2. Triântema Americana, Gill. ms. ex Arn. in Check. edinb. journ. 1831. p. 324. Perhaps S. Portulacastrum β.

Flowers red, one half smaller than those of S. Portulacastrum.

Small-flowered Sesuvium. Pl. trailing.

Cult. A mixture of loam, pent, and sand will suit this genus of succulent plants; and they require but little water. Cuttings planted (after being dried a little) in the same kind of soil, root freely, in heat.

IV. AIZO'ON (from aiz, aice, always, and zoos, zoom, alive; succulent plant, which will live under most circumstances). Lin. gen. no. 629. Gaertn. fruct. 1. t. 76. Lam. ill. t. 437. D. C. prod. 3. p. 453.—Veslingia, Fabr. helmst. p. 363.—Ficoidae, Dill. Boehr.

Lin. syst. Icosándria, Pentagynia. Calyx 5-parted, coloured, and petaloid inside. Petals wanting. Stanmus about 20, inserted in the bottom of the calyx, and disposed in 3-5 bundles. Ovarium distinct, 5-angled. Stigmas 5, thick, sessile. Capsule 5-celled, opening at the apex by 5 chinks, which are disposed in a stellate manner; cells many-seeded.—Humble herbs or subshrubs. Leaves fleshy, quite entire, alternate or opposite. Flowers sessile in the axils of the leaves or forks of the stems, rarely pedicellate, greenish on the outside.

* Leaves alternate.

Veslingia Heistéri, Fabr. Calyx 5-angled, yellowish inside. Stanmus 2-4 at the fifth lobe of the calyx.

2 A. crassifolium (Lin. fil. suppl. 261.) stems herbaceous, decumbent, hairy; leaves alternate, ovate, petiolate, pubescent; flowers sessile, axillary, hairy. 2. D. G. Native of the Cape of Good Hope. Thunb. fl. cap. 410. Calyx beset with white hairs on the outside, and coloured on the inside; when dry rather rose-coloured. Limb of leaves about equal in length to the pedioles.

** Leaves opposite.

3 A. Hispánicum (Lin. spec. 700.) stems herbaceous, erect, branched; branches spreading and erect, rather papulous at the apex; leaves opposite, linear, lanceolate, glabrous, sessile; flowers solitary, somewhat pedicellate, in the forks of the branches. 2. H. Native of Spain, Calabria, and Barbary, by the sea side. D. C. pl. grass. t. 30.—Dill. elth. 1. f. 143. Aizón sessiliflorum, Moench, meth. Calyx white on the inside, and rather greenish on the outside. The plant from the Cape of Good Hope under this name is different.

4 A. Tomentosum (Lam. dict. 3. p. 418.) stem suffruticosus, tomentose, branched; leaves opposite, tomentose, linear-lanceolate, narrowed at the base, rather spatulate at the apex; flowers sessile in the forks of the stem. 2. D. G. Native of the Cape of Good Hope. A. Hispánicum, Burm. cap. prod. p. 154. Calyx yellowish inside, 5-lobed, rarely 4-lobed. Stanmus 15.

Tomentose Aizoon. Shrub 1 foot?

5 A. Stellatum (Lam. dict. 3. p. 418.) stem suffruticosus, branched, hispid at the apex; leaves opposite, linear-spatulate, hairy; flowers panicked; pedicels and calyxes hairy. 2. D. G. Native of the Cape of Good Hope. Calyx yellowish outside. Stanmus about 20.

Stellate Aizoon. Shrub 1 foot.

7 A. Sarmentosum (Lin. fil. suppl. 260.) stem suffruticosus, erectly diffuse, glabrous, branched; leaves opposite, linear-filiform, rather connate, glabrous; branches rather villous, 3-flowered at the apex, the two lateral flowers are bracteated, and spring from the sides of the middle one. 2. D. G. Native of the Cape of Good Hope. Thunb. fl. cap. 410.—Burm. afr. t. 26. f. 2. good. Mesembryanthemum hexaphyllum, Haw. rev. p. 165. ex syn. Burm. This species differs from all in the inflorescence. The peduncles and fruit of the preceding year are permanent and lateral.

Sarmentose Aizoon. Shrub sarmentose.

8 A. Paniculatum (Lin. spec. 700.) stems herbaceous, decumbent, hairy; leaves opposite, lanceolate, hairy; flowers nearly sessile on trichotomous peduncles. 2. D. G. Native of the Cape of Good Hope. Thunb. fl. cap. 410.

Panicled Aizoon. Pl. decumbent.

† Species not sufficiently known.

9 A. rigideum (Lin. fil. suppl. 261.) stem suffruticosus, decumbent; branches hoary; leaves ovate, acute, covered with glaucous tomentum; flowers sessile, alternate, secund, remote. 2. D. G. Native of the Cape of Good Hope. Thunb. fl. cap. p. 409. In the character of this species it does not say X
whether the leaves are alternate or opposite. The leaves are said to be ovate in the diagnosis, and in the description obvate.

Stiff Aizoön. Shrub decumbent.

10 A. fruticosum (Lin. fl. suppl. 1. c.) stem shrubby, erect, glabrous, stiff; leaves lancelolate, glaucous, attenuated at the base; flowers sessile. ʃ. D. G. Native of the Cape of Good Hope. Thunb. fl. cap. 410. The description does not mention whether the leaves are alternate or opposite.

Shrubby Aizoön. Shrub 1 foot.

11 A. secundum (Lin. fl. suppl. 1. c.) stem herbaceous, hairy, decumbent; leaves ovate, acute, rather petiolate, beset with silky villi; flowers sessile, secund, axillary.—Native of the Cape of Good Hope. Thunb. fl. cap. 409. Leaves a line long; in the diagnosis they are said to be ovate, but in the description obvate.

Secund-flowered Aizoön. Pl. decumbent.

Cult. This genus of succulent plants is not worth growing except in botanical gardens. The culture, treatment, and propagation recommended for the genus Mesembryanthemum will answer well for the species of Aizoön also.

Lin. syst. Icossandra, Pentagynia. Calyx 5-parted, permanent, spreading, coloured. Petals wanting. Stamens 12, inserted in the bottom of the calyx; anthers standing. Ovarium roundish. Style wanting; stigmas 5, linear. Capsules 5, conic, each containing one seed.—A prostrate shrub, with oblong, opposite, crowded leaves; and crowded lateral flowers. This genus differs from Glinus in the petals being absent in the spreading calyx, and in the capsules being 1-seeded.

African Mütus. Shrub prostrate 4 feet long.

VI. GLINUS (a name given by Theophrastus to the maple). Lin. gen. no. 610. Juss. gen. 316. Lam. ill. 413. D. C. prod. 3. p. 455.—Rólofa, Adans. fam. 2. p. 256.

Lin. syst. Dodecandra, Pentagynia. Calyx 5-parted, conniving, permanent, coloured inside, with 3 of the sepals exterior, and the other 2 interior. Petals strap-formed, 2-4-cleft at the apex, from 5 to 20 in number, shorter than the calyx. Stamens about 15. Ovarium distinct. Style very short or wanting; stigmas 5. Capsule covered by the calyx, 5-valved, 5-celled. Seeds numerous, minute, hanging by a very long involute funicle each. Embryo spiral.—Branched procumbent tomentose herbs, with alternate leaves or in unequal pairs. Flowers axillary, almost sessile. The plants have the habit of Aizoön, but the embryo is that of Cargophyllæce.

1 G. lotoides (Lin. spec. 668.) plant clothed with white wool, diffuse, herbaceous; leaves ovate, fascicled, unequal; pedicels 1-flowered, axillary. O. H. Native of Spain, Sardinia, North America, north of Africa, Archipelago, and Senegal, Egypt, Asia, &c. in inundated places; also of Chili, about Buenos Ayres. Smith, fl. græc. t. 472.—Burnl. fl. ind. t. 36. f. 1.—Barrel. icon. t. 336.—Bocc. sic. t. 11. G. lotoides and G. dictamnus, Lam. dict. 2. p. 728. ill. 413. f. 1, 2. Sepals white inside, with red margins. Pedicels aggregate.

Bristle-flowered Glinus. Shrub diffuse.

† Species not sufficiently known.

4 G. ? trianthe'moides (Roth, nov. spec. 231.) plant prostrate, glabrous; leaves ovate, wedge-shaped, rounded, mucronate; panicles loose, terete, opposite the leaves.—Native of the East Indies. This plant differs from Glinus in the petals being wanting. It is therefore perhaps a species of Mütus; but this is still doubtful because the number of the seeds are unknown. Trianthême-like Glinus. Pl. prostrate.

Cult. These plants will grow well in a mixture of sand, peat, and loam; and young cuttings of the shrubby kinds will strike root readily in the same kind of soil. The seeds of the annual species had better be reared on the hot-bed, and when the plants are of a sufficient size, they should be planted out into a warm damp situation.

Decumbent Orygia. Pl. decumbent.

Cult. A gravelly or sandy soil will suit this plant, and cuttings will root readily in the same kind of soil.

Order CXV. NITRARIA'CÆ. (this order only contains the genus Nitraria). Lindl. introd. nat. syst. p. 163.

Calyx inferior, 5-toothed, fleshy. Corolla of 5 petals, which arise from the calyx, inflexed, valvar in aestivation. Stamens 3 times the number of the petals, perigynous; anthers innate, with 2 oblique, longitudinal lines of dehiscence. Ovarium superior, 3 or more celled, with a continuous fleshy style, at the apex of which are as many stigmatic lines as there are cells in the fruit; ovula pendulous, by means of a long funicle. Fruit drupaceous, opening by 3 or 6 valves. Seeds solitary, without albumen. Embryo straight, with the radicle next the hymen.—Shrubs with deciduous, succulent, alternate leaves, which are
Nitraria.  

sometimes in fascicles. Flowers in cymes, or solitary. The affinity of Nitraria with Ficoideae is undoubtedly great, especially with Tetragnôia; but its very different embryo, and the peculiar estivation of the petals, which is much more like that of Rhônuma, remove it from that order.

I. NITRAR'IA (so named by Schreber, who first found it in Siberia, near the nitre works, with other marine plants). Lin. gen. no. 632. Lam. ill. t. 403. Gaertn. fruct. 1. t. 58. D. C. prod. 3. p. 456.

Lin. syst. Dodecândria, Monogyniâ. Character the same as that of the order.

1 N. Schône's (Lin. spec. 638.) leaves cuneate, obtuse, mucronate, quite entire. H. Native of Siberia, about the nitre works; and of the Soongarian desert, in salt fields everywhere, and about Lektwesk, as well as on the borders of the Caspian Sea. Pall. fl.Ross. 1. t. 50. f. a and b. Lam. ill. t. 405. f. 1. Flowers white, disposed in panicles. The Siberian and Caspian varieties are not different, unless in the more luxuriant growth of the Caspian kind, which is owing to its growing in a more humid situation than that of the Siberian variety.

Triâdente-leaved Nitraria. Clt. 1820. Shrub 1½ foot. 3 N. Senegálesis (Lam. ill. t. 403. f. 2. dict. 4. p. 493.) leaves obovate, obtuse, quite entire; drupes trigonal. H. S. Native of Senegal. Flowers white, in panned cymes. This species is easily distinguished from the rest by its pyramidal trinodal drupe.

Senegal Nitraria. Shrub 1 to 2 feet.

† A doubtful species.

4 N. Billârdier'ei (D. C. prod. 3. p. 456.) leaves linear, attenuated at the base, acutish, quite entire; drupes ovate, aequina. H. G. Native of New Holland. Very nearly allied to N. Schôler, Lam. ill. 380. but very different from it in the fruit being ovate conical, as well as from growing in a different part of the world.

La Billârdier's Nitraria. Shrub 1 to 2 feet.

Cult. This is a genus of singular shrubs: they thrive best in a sandy or gravelly soil, and should be occasionally refreshed with salted water, or they will not flourish; they may be increased by layers; or cuttings planted in sand, with a hand-glass over them, strike root readily. The N. Senegalensis, being a stone plant, and N. Billârdier's should be grown in pots, in order that they may be placed in their respective situations.

Calyx 5-parted (f. 31. a.), surrounded externally by imbricating bracts. Petals 5 (f. 31. b.), hypogynous. Stamens definite or indefinite (f. 31.), hypogynous, with or without a hypogynous disk; anthers peltate (f. 31. d.). Ovarium superior. Styles several (f. 31. f.); filiform or subulate. Fruit capsular (f. 31. e.), with 2 or 5 valves, and as many cells, opening in the middle of the cells. Seeds definite, villous. Embryo straight, surrounded by a small quantity of mealy albumen, with the radicle next the hypylum. Shrubs. Leaves fleshy, scale-like or small, and alternate, without stipulas. Flowers solitary. Dr. Ehrenberg suggests (Ann. sc. l. c.) that Reaumuri and Hololâch, both of which have according to him hypogynous stamens, may constitute a little group to be called Reaumuriæ. The order appears to be more nearly related to Hypericiâe than to either Ficoideæ or Nitrariaceæ, and ought perhaps to have followed that order among the Thalâmilore in vol. I. From the former it chiefly differs in its succulent habit, and definite villous seeds, agreeing with Reaumuri, at least even in the obliquity of the veins of the petals, and in the leaves being dotted. From Ficoideæ its hypogynous stamens and seeds distinguish it; from Tamariscineæ, its plurilocular ovary and distinct styles; from Nitrariacæ, its erect villous seeds, distinct styles, and hypogynous stamens. Saline matter is present in these plants in great abundance.

Synopsis of the genera.

1 Reaumuriæ. Calyx 5-parted (f. 31. a.), involucrated by crowded leaves on the outside. Filaments indefinite (f. 38.), joined at the base into 5 bundles.

2 Holola'chna. Calyx 4-5-parted. Stamens 8-10, mono-dendriphal.

Lin. syst. Polyáandria, Pentagyniâ. Calyx 5-parted (f. 31. a.), involucrated by leaves on the outside. Petals 5 (f. 31. b.), furnished with a cliated appendage on each side at the base. Ovarium distinct. Stigmas 5-6, filiform (f. 31. f.). Capsule 3-celled, 5-valved; disseminations easily separated from the valves. Seeds 2 in each cell, very villous.—Oriental shrubs, with fleshy, alternate, glaucous dotted leaves, exuding globules of a saline alkali. Flowers solitary at the tops of the branches.

1 R. vermiculâta (Lam. spec. 754.) leaves subulate, semi-terete, imbricate, crowded on the branches. H. Native of Sicily, Barbary, and Egypt, on the sea shore. Lam. ill. 489. f. 1. Desf. atl. 1. p. 481.—Lob. icon. 380. Flowers white or pale red. Habit of Chenopodium fruticosum. Hairs on the seeds rufous, and very stiff.

II. **HOLOLA'CHNA.** This genus having already been described under the order Tamaricaceae, it is only necessary here to refer to vol. II. p. 728. where all the details of the genus will be found.

**Order CXVII.** CACTÆ (this order contains the genus Cactus, and all the genera recently separated from it). D. C. 

Cult. Elegant little shrubs of easy culture; they thrive best in a mixture of sandy loam and peat; and young cuttings readily strike root under a hand-glass.

**II. Hololachna.** CACTÆ. from tubercles. Flowers very variable, showy, or minute, usually solitary, sessile, rarely in fascicles, ephemeral, expanding by night or by day. It has already been remarked, on more than one occasion in this work, that the state of that remarkable distention or increase of cellular tissue of vegetables, from which the name of succulent is derived, is no indication of natural affinity, but rather to be considered a modification of structure, which may be common to all tribes. Hence the immediate relationship of Cactae is neither with Euphorbiaceæ, nor Laurinæa, nor any other tribe of succulent plants, but with Grossulariæ, in which no tendency whatever to an increase of cellular tissue exists. Through Rhipsalis, which is said to have a central placenta, Cactæ are connected with Portulacææ, to which also the curved embryo of the section of Opuntiaceæ probably indicates an approach. De Candolle further traces an affinity between these plants and Ficiææ.

For an elaborate account of this order, see his Memoir above quoted.

The fruit is very similar in properties to those of Grossularia, some being refreshing and agreeable to the taste, others mucilaginous and insipid; they are all, however, destitute of the excessive acidity of some gooseberries and currants. The fruit of Cactus Opuntia, has the property of staining red the urine of those who eat it. The juice of Mammillaria vulgaris is remarkable for being slightly milky, and at the same time sweet and insipid.

**Synopsis of the genera.**

**Tribe I.**

Opuntiaceæ. *Ovula* and therefore the seeds, fixed to the varieties of the fruit.

1 Mammillaria. Tube of calyx adhering to the ovary; lobes 5-6, coloured, crowning the young fruit. Petals 5-6, hardly distinguishable from the calyx. Stamens disposed in many series. Stigma 5-7-cleft. Berry smooth.

2 Melocactus. Tube of calyx adhering to the ovary; lobes 5-6, petaloid, crowning the young fruit. Petals 5-6, united into a long tube with the sepals. Stamens disposed in many series. Stigma 5-rayed. Fruit smooth.

3 Echinocactus. Sepals numerous, imbricate, adhering to the ovary; outer ones in the form of an involucrum; inner ones petal-formed. Stamens numerous. Style multifid at the apex. Berry seamy from the remains of the sepals.

4 Cereus. Sepals very numerous, imbricate, adnate to the base of the ovary, united into an elongated tube; outer ones shorter and like a calyx; middle ones longer and coloured, innermost ones petal-formed. Style multifid at the apex. Berry areolate, tubercular or seamy from the remains of the sepals.

5 Ephiphyllum. Tube of calyx very long, furnished with remote scales; limb of corolla multifid, rosaceous or ringent. Branches flat.

6 Opuntia. Sepals numerous, leaf-formed, adnate to the ovary; upper ones flat and short; inner ones petal-formed, obovate and expanded, with no tube above the ovary. Stamens numerous, shorter than the petals. Stigmas numerous,
erect, thick. Berry oval, umbilicate at the apex, either tubercled or spiny.

7 *Peregrina*. Sepals leaf-formed, numerous, adnate to the ovary, and usually permanent above the fruit. Corolla rotate, almost as in *Opuntia*. Stamens numerous, much shorter than the petals. Stigmas aggregate, in a spiral manner. Berry globose or ovate.

**Tribe I.**

**Opuntia**. *Ovula*, and therefore the seeds fixed to the central axis of the fruit.

**Tribe II.**

**Rhipsalideae.** *Ovula*, and therefore the seeds fixed to the central axis of the fruit.

8 *Rhipsalis*. Tube of calyx smooth, adhering to the ovary; limb superior, 3-6-parted, short. Petals 6, oblong, inserted in the calyx. Stamens 12-18, fixed to the petals. Stigmas 3-6, spreading. Berry roundish, pellucid, crowned by the dead calyx.

**Cacteae. I. Mammillaria.**

1. *Mammillaria* (from mamma, the nipple; the plants are covered with mammae-like tubercles, spirally disposed, the mammae bearing radiating spines at the apex and deciduous in the axils). *Mammillaria* (Bojer), also known as *Cactus mammillaris*, is a genus of about 85 species of cacti from the southern United States, Mexico, and South America. *Mammillaria* species are known for their characteristic spiny, often spiny-rimmed fruits. They are commonly found in desert areas and are often associated with a variety of other succulent plants.

2. *Corona* (Haw. rev. p. 69.) plant simple, cylindrical, when young clavate; tubercles or mammae large, ovate, woolly, and spiny at the apex; spines stiff, rising from white tomentum, exterior ones white: interior ones brown. *Corona* species are characterized by their large, woolly tubercles that are often surrounded by a white tomentum. They are found in various habitats, including desert regions and rocky cliffs.

3. *Tumida* (D.C. prod. 5.) plant globose, somewhat depressed, almost as in *Opuntia*. Stamens numerous, much shorter than the petals. Stigmas aggregate, in a spiral manner. Berry globose or ovate.

4. *Cactus* (Haw. syn. 177.) D.C. prod. 3. p. 458. *Cactus* species are known for their spiny, often spiny-rimmed fruits. They are commonly found in desert areas and are often associated with a variety of other succulent plants. *Cactus* species are characterized by their large, woolly tubercles that are often surrounded by a white tomentum. They are found in various habitats, including desert regions and rocky cliffs.

5. *Flavescens* (Haw. syn. 177.) D.C. prod. 3. p. 458. *Flavescens* species are known for their spiny, often spiny-rimmed fruits. They are commonly found in desert areas and are often associated with a variety of other succulent plants. *Flavescens* species are characterized by their large, woolly tubercles that are often surrounded by a white tomentum. They are found in various habitats, including desert regions and rocky cliffs.

6. *Fulvissima* (Haw. syn. 177.) D.C. prod. 3. p. 458. *Fulvissima* species are known for their spiny, often spiny-rimmed fruits. They are commonly found in desert areas and are often associated with a variety of other succulent plants. *Fulvissima* species are characterized by their large, woolly tubercles that are often surrounded by a white tomentum. They are found in various habitats, including desert regions and rocky cliffs.

7. *Proliferus* (Haw. syn. 177.) D.C. prod. 3. p. 458. *Proliferus* species are known for their spiny, often spiny-rimmed fruits. They are commonly found in desert areas and are often associated with a variety of other succulent plants. *Proliferus* species are characterized by their large, woolly tubercles that are often surrounded by a white tomentum. They are found in various habitats, including desert regions and rocky cliffs.
and bearing spines; spines setaceous, divaricate, white, 2 of which are erect in each fascicle, and much longer than the rest, spines articulate at the apex. h. D. S. Native of Mexico, on the mountains.

Two-coloured Mammillaria. Clt.? Shrub ½ foot.

10 M. simplex (Haw. syn. 177.) plant simple, obovate; axils gibbrous; tubercles or mamme ovate, bearing stiff, straight, radiating spines at the apex. h. D. S. Native of South America, and the islands. Cact. mammillaries, Lin. spec. 666. D. C. pl. grass. t. 3. Cat. hort. monsp. 83. Plant 6-8 inches long. There are about 18 or 20 series of tubercles, wounding to the left. Spines shortish and red. Tomentum short, deciduous. Axils, when young, rather tomentose. Flowers white. Berry red.

11 M. parvimamma (Haw. suppl. 72.) plant nearly globose, spiny, with prickles, sparingly globose, ½ inch in diameter. There are about 18 or 20 series of tubercles, wounding to the left. Spines shortish and red. Tomentum short, deciduous. Axils, when young, rather tomentose. Flowers white. Berry red.

Native Plant Shrub. D. media. Fl. 10 to 12 inches long. There are about 18 or 20 series of tubercles, wounding to the left. Spines shortish and red. Tomentum short, deciduous. Axils, when young, rather tomentose. Flowers white. Berry red.

11 M. parviflora (Haw. suppl. 72.) plant nearly globose, spiny, with prickles, sparingly globose, ½ inch in diameter. There are about 18 or 20 series of tubercles, wounding to the left. Spines shortish and red. Tomentum short, deciduous. Axils, when young, rather tomentose. Flowers white. Berry red.

Native Plant Shrub. D. media. Fl. 10 to 12 inches long. There are about 18 or 20 series of tubercles, wounding to the left. Spines shortish and red. Tomentum short, deciduous. Axils, when young, rather tomentose. Flowers white. Berry red.

Mammillaria. Native Plant axils

23 M. compresa (D. C. l. c.) Plant simple, cylindrically-clavate; axils when young woolly and bristly; mammae ovate, short, angular at the base, and as if they were compressed beneath, with the areole rather more or less. prickles 4-5 in each fascicle, unequal, white, lower one the longest.  h. D. S. Native of Mexico. Coulter, no. 29. Plant 5 inches high, 1 inch broad. Outer prickles 3-4 lines long; central one 6 lines long.

Conoid Mammillaria. Pl. 1/2 foot.

24 M. cornifera (D. C. l. c.) Plant simple, globose, with naked axils; mammae ovate, thick, crowded, with the areole smooth; outer prickles 16-17, radiating, grey, with a stronger, longer, erect, rather incurved one in the midst of each fascicle.  h. D. S. Native of Mexico. Coulter. Plant 3 inches in diameter, 2 1/4 broad. Ray prickles 5-6 lines long, and the central one 7-8 lines long.

Horn-bearing Mammillaria. Pl. 1/4 foot.

25 M. cruciata (D. C. l. c.) Plant globose, depressed, multiple at the base; axils naked; mammae ovate, thick, with the areole smooth; bristles 15-20 in each fascicle, white, elongated, rather radiating: central prickles yellow, stiff, hooked at the apex, length of the bristles that surround them.  h. D. S. Native of Mexico. Coulter, no. 28. Plant 1 inch high, 1 1/8 inch in diameter. Bristles 8-9 lines long. Var. β, paucisetæ (D. C. l. c.) axils woolly; bristles 8-10 in fascicle. Sometimes the bristles are nearly all deciduous. Coulter, no. 29.

Hairy Mammillaria. Pl. 1 inch.

26 M. cespititia (D. C. l. c.) Plant multiple at the base, tufted, aggregate, globose; axils naked; mammae few, ovate, with the areole smooth; prickles straight, stiff, when young whitish-yellow, but in the adult state greyish: outer ones 9-11 in each fascicle, radiating, with 1-2 longer, erect, central ones.  h. D. S. Native of Mexico. Coulter. Tufts 4 inches broad. Offsets an inch in diameter.

Tufted Mammillaria. Pl. 1/4 foot.

27 M. subangularse (D. C. l. c.) Plant simple or multiple at the base, nearly globose, depressed; axils for the most part woolly; mammae ovate, thick, short, angularly tetragonal from pressing so close against each other, with the areole of the young ones tomentose, prickles 6-8 in each fascicle, erectly diverging, unequal, of a pale grey colour.  h. D. S. Native of Mexico. Coulter. Plant nearly 3 inches high and 1 1/2 broad. Prickles 3-10 lines long.

28 M. macracantha (D. C. l. c. p. 113.) Plant simple, globose, depressed, with some of the axils naked, and some of them bearded with wool; mammae ovate, rather tetragonal, with the areole of the young ones rather tomentose; prickles 1-2, very long, pungent, white, or brownish.  h. D. S. Native of Mexico. Coulter, no. 44. Perhaps the same as M. magnimamma, Haw. 2. Prickles 2 inches long. Plant 1 1/8-2 inches high, and 3-6 inches in diameter. Prickles rather angular.

Long-spined Mammillaria. Pl. 1/4 foot.

29 M. longimamma (D. C. l. c.) Plant simple, or rather multiple at the base, ovate, or nearly cylindrical; axils woolly; mammae ovate-oblong, dense, with the areole tomentose; prickles 9-10 in each fascicle, pungent, of a greenish brown colour.  h. D. S. Native of Mexico. Coulter, no. 30. Plant 3-4 inches high, and 2 inches broad. Prickles 6-9 lines long.

Long-taeteated Mammillaria. Pl. 1/4 foot.

30 M. octacantha (D. C. l. c.) Plant simple, ovate-oblong, nearly cylindrical; axils naked; mammae oblong, shorter, with the areole of the young ones rather more or less. prickles stiff, the outer 7 in each fascicle radiating and white, with a central one, which is stiffer, longer, and of a fuscescent-colour.  h. D. S. Native of Mexico. Coulter, no. 39. Plant 3 inches high, 2 inches broad. Outer prickles 3-4 lines long; central one 6 lines long.

Eight-spined Mammillaria. Pl. 1/4 foot.

31 M. leucacanthæ (D. C. l. c.) Plant multiple at the base, ovate; axils naked; mammae few, ovate-tetragonal, with the areole of the young ones glabrous; prickles 5-6 in each fascicle, stiff, white, sometimes all radiating, and sometimes the one in the centre is erect.  h. D. S. Native of Mexico. Coulter. Plant an inch and a half high, and hardly an inch broad. Prickles 4 lines long.

White-spined Mammillaria. Pl. 1/2 foot.

32 M. divergens (D. C. l. c.) Plant multiple at the base, nearly globose, depressed; axils woolly and bristly; mammae ovate, crowded, with the areole of the young ones woolly; prickles 3-5 in each fascicle, unequal, pungent, white, but brownish at the apex, diverging, and somewhat tetragonal.  h. D. S. Native of Mexico. Coulter. Perhaps only a variety of M. macracantha. Tufts 6-7 inches broad, and 5 inches high.

Diverging-spined Mammillaria. Pl. 1/2 foot.

33 M. tricainantha (D. C. l. c.) Plant simple, obovate, nearly cylindrical, bluntly truncate; axils hardly woolly, but with few bristles; mammae ovate, much crowded, with the areole of the young ones tomentose; prickles 3 in each fascicle, erect, white, lower one the longest, tending downwards, 2 lateral ones very short.  h. D. S. Native of Mexico, Coulter, no. 46. Plant 3 inches high, and 1 1/4 inch broad. Sometimes there is a fourth prickles in each bundle, but when this is present it is very short.

Three-spined Mammillaria. Pl. 1/4 foot.

34 M. sempervivæ (D. C. l. c. p. 114.) Plant simple, attenuated at the base, depressed at the apex, disk-formed; axils woolly; mammae erect, ovate-tetragonal, with the areole smooth; bristles 3-4 in each fascicle, stiff, short, and white; 2 thick, short, diverging prickles.  h. D. S. Native of Mexico. Coulter, no. 57. Plant 2 3/4 inches broad, and 1 3/4 high. Var. β, tetracantha (D. C. l. c.) Plant densely bearded in the axils; bristles none; prickles 4, short, diverging.  h. D. S. Native of Mexico.

Sempervivæ-like Mammillaria. Pl. 1/4 foot.

35 M. dioscoreæ (D. C. l. c.) Plant simple, depressed, disk-formed; axils naked; mammae crowded, short, depressed, tetragonal, with the areole of the young ones rather tomentose, and of the adult ones somewhat unarmed; prickles 5, in each central mamma, stiff, white, erect.  h. D. S. Native of Mexico. Coulter, no. 50. Plant 3 inches high, and hardly an inch high.

Disk-formed Mammillaria. Pl. 1 inch.

36 M. latimamma (D. C. l. c.) Plant simple, depressed, somewhat dissodid: with the younger axils woolly; mammae short, broadly ovate, at length depressed, transversely oblong, with the areole of the young ones woolly; prickles 16-17 in each fascicle, stiff, yellowish, rather fuscescent at the apex, diverging, unequal.  h. D. S. Native of Mexico. Coulter, no. 34. Plant 5 and a half inches in diameter, and hardly an inch and a half high.

Broad-teated Mammillaria. Pl. 1 inch.

37 M. geminispina (Haw. in phil. mag. 63. p. 42. D. C. diss. t. 3.) Plant simple, cylindrically columnar; axils very woolly; tubercles or mammae small, very numerous; spines small, white, interwoven, 2 of which in each fascicle are much longer than the rest.  h. D. S. Native of Mexico. Cactus columnaris, Moc. et Sesse, fl. mex. icon. ined. Plant half a foot high. Flowers
red, a little longer than the tubercles. Haworth’s plant appears
to be different from that of De Candolle.

38 M. vivipara (Haw. suppl. p. 72.) plant multiple; offsets
nearly globose; tubercles or mammæe cylindrically ovate, bearded,
marked by a prolificous furrow above; flowers central, large,
exserted. D. F. Native of Louisiana, on high hills about the
Each tuft of the plant in its native place of growth is 2 or 3 feet in
diameter. Flowers deep red, almost like those of Cércus flagel-
formis. Outer lobes of calyx ciliated. Berries about the size
of grapes, fusiform, greenish.

39 M. glomerata (D. C. prod. 3. p. 450.) plant tufted;
tubercles or mammæe clavate, glaucous, tomentose, furnished with
a stellate bunch of spines each at the apex. D. S. Native of
St. Domingo, in marshes. Plum. ed. Burm. 201. f. 1. Cactus
exclusive of the synonyme of Haworth. Flowers red.

Glomerate Mammillaria. Shrub ½ foot.
40 M. pusilla (D. C. diss. t. 2. f. 1.) plant multiple, round-
ish; axes a little bearded; tubercles or mammæe ovate, bearing
radiating spines at the apex, outer spines hair-formd and white,
inner ones stiff and pale yellow, pubescent when examined under
a lens. D. S. Native of South America. Mill. dict. no. 6.
Cactus pusillus, D. C. cat. hort. monsp. p. 185.—Pluck. phyt. t.
29. f. 2. Plant very small, rather glaucose, hardly 2 inches
high. The tubercles or mammæe are disposed in 5 or 7 series,
which wind to the left. Flowers large, white or pale red, with
the backs of the petals reddish.

41 M. stellata (Haw. in phil. mag. Feb. 1830.) plant irreg-
ularly tufted, beset with radiating fascicles of white pubescent
spines; the lower ones of which are hair-formed, with a few of
the upper ones much stronger and more horizontal, and straw-
coloured at the apex. D. S. Native of South America.
p. 72. Lodg. bot. cab. 79, but not M. pusilla, D. C.

42 M. missouriensis (Sweet, hort. brit. p. 171.) mammæ
or tubercles ovate, terete, bearded; flowers hardly exerted; berries
scarlet, about equal with the mammæ. D. F. Native of
Louisiana, on the high mountains about the Missouri. Cactus
mammillaris, Nutt. gen. amer. 1. p. 295. Flowers white. Ber-
ries scarlet. This is a much smaller plant than M. simplex, to
which it is nearly allied.

½ to ½ foot.

† Species not sufficiently known.

43 M. helicteres (D. C. diss. t. 5.) plant simple, obovate,
glabrous; tubercles or mammæe disposed in numerous, nearly
vertical, regularly spiral series, bearing spreading, straight,
spines at the apex. D. S. Native of Mexico. Cactus Helicteres,
Moc. et Sesse, fl. mex. icon. ined. Plant 3-4
inches high. Flowers rose-coloured, a little longer than the
mammæ.

Scren Mammillaria. Pl. ½ to ½ foot.
44 M. sunda (D. C. prod. 3. p. 460.) plant simple, cylindri-
cal; ascending, glabrous; tubercles or mammæe unarmcd. D. S.
Native of Mexico. Cactus nudus, Moc. et Sesse, fl. mex.
icon. ined. Flowers rose-coloured.

Naked Mammillaria. Pl. ½ to ½ foot.

‡ The following species are hardly known unless by name;
some of these names may, however, be referrible to those described
above.

1 M. mifis. Mill. dict. 2 M. conica, Haw. suppl. 3 M.
caespitosa, Hort. berol. 4 M. canescens, Hort. berol. 5 M.
angulare, Hort. berol. 6 M. chrysanthà, Hort. berol. 7 M.
aurata, Hort. berol. 8 M. fuscata, Hort. berol. 9 M. atrata,
Hort. berol.

The following species were raised in the gardens in 1827
from seeds brought from Chili by Dr. Gillies, but have not yet
been described. The species we have referred to this genus only
from their seedling state, without any knowledge of them when
full grown. The names are under the genus Cactus in Gillie’s
text.

1 M. spinata, Gill. 2 M. quadrotta, Gill. 3 M. caudata,
Gill. 4 M. cocinea, Gill. 5 M. solitaria, Gill.

Cult. Mammillaria is a genus of small singular grotesque
succulent plants. A mixture of sand, loam, and peat, or loam
mixed with brick rubbish, is a good soil for them. The pots
in which the species are grown should be as small as the plants
will allow, and they should be well drained with sherds; they re-
quire very little water. The pots should be placed on shelves
erected for the purpose in a stove, should there be no house for
the purpose of growing succulent plants, called a dry stove.
The plants are increased by offsets.

II. MELOCA’CTUS (from μμολος, melon, a melon, and κακ-
rosis, cactus, a name applied to a spiny plant by Theophrastus;
the plants are in the form of a melon, and the angles are beset
Link et Otto, diss. 1827. p. 8. D. C. prod. 3. p. 460.—Cactus,
Haw. syn. 172. exclusive of some species. Cactus, sect. B.
Link, enum. 2. p. 21.

Lin. syst. Icosanthera, Monogynia. Tube of calyx adhering
to the ovarium; lobes 5-6, peltaloid, crowning the young fruit.
Petals 5-6, united into a long cylindrical tube with the sepals.
Stamens filiform, disposed in many series. Style filiform; stigma
5, radiating. Berry smooth, crowned by the dry lobes of the
corolla and calyx. Seeds imbedded in the pulp. Cotyle-
dons small. Plumule large, nearly globose (D. C. Organogr.
t. 48. f. 3.) Fleshy globose simple roundish shrubs, with
depth funnels, alternating with vertical ribs, which are orna-
mented with confluent tubercles, each tubercle furnished with
a starry fascicle of prickles or spines. Spadix or flowering head
terminal, cylindrical, composed of mammæae, much crowded
tomentose or setiferous tubercles. Flowers immersed in the
wool of the head under its apex.

1 M. Communis (Link et Otto, l. c. diss. p. 8. t. 11. D. C.
diss. t. 6.) plant ovate-roundish, deep green, with 11 or 18
angles; ribs straight; spines strong, pale brown, unequal, 9
in each fascicle; lower one the longest; middle one erect. D.
S. Native of the West India Islands, in salt marshy
places near the sea; and probably on the main land of South
grass. t. 112.—Cactus Melocactus, and C. coronatus, Lam. dict.
p. 537.—Brass. succ. t. 32. Ribs 12-18. Flowers tubular,
red. Fruit red, nearly like those of Mammillaria, but larger,
oblong, and deciduous, protruding from the wool on the head.

Var. B, obsolentus (Link et Otto, l. c.) plant smaller; prickles
weaker, and more red. Stem 6 inches high, and 3½ thick.

Var. γ, macrorcephalus (Link et Otto, l. c.) plant thicker,
14 inches high, and 9 inches broad.

1688. Shrub 1 foot.

2 M. LAMARCKII; plant ovate, flatish at the base, with
14-20 angles at the top, which are rather oblique and bluntest
on the back; spines red, stiff, rather incurved, disposed in approximate fascicles, which are very woolly towards the tops of the angles; cap roundish, furnished with a few red setaceous spines; flowers red. \(\text{C.} \) D. S. Native of South America. Cactus Lamarréii, Coll. hort. ripul. append. 3. t. 7.

Lamarré’s Melon-thistle. Pl. \(\frac{3}{4}\) foot.

3 M. MACRACANTHUS (Link et Otto, diss. p. 9. t. 12.) plant roundish, light green, with 14 angles; ribs straight; spines in fascicles, very thick, whitish, but of a brownish-red colour at the apex: outer 12 radiating, central, 4 large and straight. \(\text{C.} \) D. S. Native of St. Domingo. Cactus macracanthus, Salm-Dyck, obs. 1820. p. 1. Haw. rev. p. 69. Flowers unknown, but the spadix or woolly head is depressed at the top.

4 M. PYRAMIDALIS (Link et Otto, diss. p. 10. t. 25.) plant conical or pyramidal, with 17 angles; ribs rather oblique, crested; spines very long, in fascicles, of a brownish-red colour: outer 14 radiating in 2 series, with 2 or 3 and very long. \(\text{C.} \) D. S. Native of Peru. Cactus pyramidalis, Salm-Dyck, obs. 1829. p. 4. Stem when young crowded with spines. Spadix or woolly head conical, depressed at the apex.

Pyramidal Melon-thistle. Shrub 1 foot.

5 M. PLACENTIFORUM (D. C. prod. 3. p. 460.) plant hemispherical, depressed, green, with 12 or 14 angles; ribs very blunt; prickles 8-12 in a fascicle, unequal, recurved, strong. \(\text{C.} \) D. S. Native of Brazil. Cactus Melocactus, Besl. hort. eyset. 4. ord. f. 1; but not of Lin. C. placentiformis, Lehm. ind. sem. hort. hamb. (1826). Melocactus Besleri, Link et Otto, diss. (1827). p. 11. t. 21. Lehm's name being older than Link's has been here adopted, as being more apt; but Link's figure and description are far better. Spadix or woolly head nearly globose, impressed in the vertex. Flowers reddish. Prickles blackish.

Placenta-formed Melon-thistle. Shrub 1 foot.

6 M. LANGSORDII (D. C. prod. 3. p. 460.) plant oblong, with 17 angles; spines slender, stiff, spreading: top of plant floriferous, very villous and very spiny. \(\text{C.} \) D. S. Native of Brazil? Cactus Langsdorffii, Lehm. in sem. hort. hamb. (1826). Flowers yellow. Stamens purple. The rest unknown.

Langsdorf's Melon-thistle. Shrub 1 foot.

† Species not sufficiently known.

7 M. SELLOLI (D. C. prod. 3. p. 461.) plant globose, depressed, glaucous, woolly and flat in the vertex, with 10 arched ribs; prickles 7 in each fascicle, recurved: the central 5 much the largest. \(\text{C.} \) D. S. Native of Monte Video. Echinocactus Sellowii, Link et Otto, diss. p. 16. t. 22. Melocactus species secundum Salm-Dyck, who confirms that the plant is woolly at the top, and is analogous to \textit{M. placentiformis}. Plant 2 inches high, and \(\frac{1}{2}\) inches thick. Prickles 8-10 lines long, fuscous. Flowers unknown.

Sello’s Melon-thistle. Pl. \(\frac{1}{3}\) foot.

8 M. POLYACANTHUS (D. C. prod. 3. p. 461.) plant oval, glaucous, with a flat woolly apex, and with 21 blunt vertical ribs; prickles 8 in each fascicle: the upper 2 of these smaller than the others. \(\text{C.} \) D. S. Native of Brazil in the province of Rio Grande. Echinocactus polyacanthus, Link et Otto, diss. p. 13. t. 16. f. 1. Stem \(\frac{1}{2}\) inches high, and \(\frac{1}{2}\) inches thick, attenuated at the base, with narrow furrows; prickles cinereous. Flowers unknown.

Many-spined Melon-thistle. Shrub \(\frac{1}{3}\) foot.

9 M. MELOCACTOIDES (D. C. prod. 3. p. 461.) plant globose, with 10 angles, having the tops of the angles beset with a series of woolly tubercles; prickles 7 or 8 in a fascicle, rather recurved, pale, but becoming gradually brownish towards the apex. \(\text{C.} \) D. S. Native of Brazil. Cactus melocactoides, Hoffm. verz. 2. \(\text{f.} \) (1826) 3. p. 24. Habit of \textit{M. communis}.

Melocactus-like Melon-thistle. Pl. \(\frac{3}{4}\) foot.

Cult. A grotesque and singular genus like the last, but of larger growth, and beset with stronger spines, without teats. The culture, propagation, and treatment of the species are the same as that recommended for the last genus.

III. ECHINOCACTUS (from \textit{echinos}, echinos, a hedgehog, and \textit{cactus}, a name given by Theophrastus to the spiny plant; plants beset with spines like the hedgehog.) Link et Otto, diss. p. 11. Salm-Dyck, in litt. D. C. prod. 3. p. 461.—Cactus species of Haw.

LIN. SYST. ICOSANDRIA, MONOGYNYA. Sepals numerous, imbricate, adnate to the base of the ovary, united into a short tube at the base: outer ones in the form of an involucrum: inner ones petal-formed. Stamens numerous. Style filiform, multiliform at the apex. Berry scaly from the permanent remains of the sepals. Cotyledons wanting?—Simple, grotesque, fleshy, ovate or globose, ribbed, leafless shrubs, with the habit of \textit{Melocactus}; ribs as if they were formed from confluent tubercles, bearing on their back fascicles of prickles. The woolly head or spadix, which is present in \textit{Melocactus} is wanting in this genus. Flowers rising from the fascicles of spines at the tops of the ribs very like those of the genus \textit{Cereus}, but the tube is almost wanting.

1 E. GIBBOSUS (D. C. prod. 3. p. 461.) plant ovate or nearly oblong, obtuse; ribs interrupted by tubercles; some of the tubercles rather tomentose at the apex, and tipped with fascicles of stiff straight needle-formed prickles; others in the outer series naked, elongated, and mammaeform, and a little compressed. \(\text{C.} \) D. S. Native of Jamaica. Cactus gibbosus, Haw. syn. p. 173. bot. reg. 137. Plant nearly like that of \textit{Mammillaria tuberculosa}, but is not laccescent. Flowers 2, larger than any other of the genus, quite at the apex of the plant, which is depressed. The tube of the flower is greenish, and the sepals distant, with a white expanded limb: lobes obovate, rather mucronate, disposed in 4 series. Genitals yellow.

2 E. SUBGIBBOSUS (Haw. in phil. mag. Oct. 1831. p. 418.) plant roundish-oblong, very spiny, with the spines intervenen; angles or ribs about 16 in number, and are, as well as the recesses, profuse and acute; fascicles of spines distant. \(\text{C.} \) D. S. Native near Volparoza. Plant 5 inches high, and 3 inches broad, woolly at the base of the fascicles of spines. Spines straight, 12-13 in each fascicle: the lower ones of these are whitish or pale, bristle-formed, nearly half an inch long, horizontal: the upper ones prickie-formed, much larger, nearly an inch long, bulbous, and yellowish at the base, and rufescent at the apex; the middle spine of the ultimate fascicles compared with the rest is straight.

Sub-gibbous Hedgehog-thistle. Clt. 1830. Pl. \(\frac{1}{3}\) foot.

4 E. CORNEGUS (D. C. diss. t. 7) plant subglobose, very obtuse; ribs almost vertical, interrupted by tubercles, somewhat depressed: all prickly at the top; prickles unequal, straight, and needle-shaped: the lower one broad, thick, and a little recurved at the apex. \(\text{C.} \) D. S. Native of Mexico.
Cactaceae. III. Echinocactus.

5 E. crispatus (D. C. diss. t. 8.) plant obovate, retuse at the apex, and rather umbilicate; ribs numerous, from 30 to 60, nearly vertical, undulately curved, and tubercular; prickles in fascicles, unequal, straightish. Fl.S. Native of Mexico. Cactus crispatus, Moc. et Sesse, fl. mex. icon. ined. Flowers smaller than any other of the genus, at the top of the plant, purple; sepals densely imbricated along the tube, oblong-linear, acute, disposed in 2 series in the limb.

Var. ß, harrisi (D. C. mem. cact. in mem. mus. 17. p. 115.) fascicles of spines approximate; prickles stronger, more erect and longer, of a greyish brown-colour.

Curled Hedgehog-thistle. Pl. 1/4 foot.

6 E. ornatus (D. C. mem. cact. in mem. mus. vol. 17. p. 114.) plant nearly globose; with 8 deep compressed vertical ribs, ornamented with transverse rows of flesky down, with 3 fascicles on each rib; prickles 7 in a fascicle, straight, yellow, and one central. Fl. S. Native of Mexico. Coulter, no. 49. Plant 5 inches in diameter. Prickles 8-10 lines long.

Ornamented Hedgehog-thistle. Pl. 1/4 foot.

7 E. tuberculatus (Link et Otto, diss. t. 26.) plant nearly globose, with 8 nearly vertical ribs, and with the recesses narrow; crests very obtuse, tuberculatet at the fascicles, of which there are 8 or 10 on each rib; areoles when young rather velvety; prickles 15-18 in each fascicle, grey, with one central straight strong one, the rest radiating. Fl. S. Native of Mexico. Coulter. Intervals on the ribs between the fascicles of spines 8-9 lines. Prickles an inch long.

Var. ß, spiralis (D. C. l. c.) ribs twisted spirally to the right. Fl. S. Native of Mexico. Coulter. Perhaps merely an older state of the species.

Tubercled Hedgehog-thistle. Pl. 1/4 foot.

8 E. ceriifíormis (D. C. l. c. p. 115.) plant nearly cylindrical, green, with about 13 compressed ribs, with the recesses acute, and the crests bluntish; tuberules 7 radiating, and one central, in each fascicle, greyish, stiff, slender, with 3 fascicles on each rib. Fl. S. Native of Mexico. Coulter. Perhaps a species of Cereus.

9 E. glaucescenis (D. C. l. c.) plant nearly globose, depressed, glaucous, with 11-13 vertical compressed obtuse ribs, with 6 fascicles on each rib; areole oval-oblong, when young velvety; prickles yellow, straight, with 6-7 radiating ones, and one central one in each fascicle. Fl. S. Native of Mexico. Coulter. Flowers solitary on the top of each rib, rising in the front of a fascicle. Scales of calyx imbricated, smooth, oval, acuminate, with membranous ciliated margins. Plant 3 inches high, and 5 inches in diameter. Intervals between the fascicles on the ribs half an inch. Prickles an inch long.

Glaucensae Hedgehog-thistle. Pl. 1/4 foot.

10 E. coulteri; plant nearly globose, depressed, green, with 13-18 vertical ribs, with both the recesses and ribs acute; fascicles 3 on each rib; areole oval, when young velvety; prickles yellow, stiff, with 7-8 radiating ones, and one erect central one, which is nearly twice the length of the others, in each fascicle. Fl. S. Native of Mexico. Coulter, no. 45. E. hystrix, D. C. l. c. but not of Haw. Plant 5-8 inches in diameter, and 3-4 inches high. Prickles an inch long, central ones 2 inches high. Intervals between the fascicles on the ribs 12-18 lines in length.

Coulter's Hedgehog-thistle. Pl. 1/4 foot.

11 E. obvallatus (D. C. diss. t. 9.) plant obovate-globose, depressed and umbilicate at the apex; ribs numerous, vertical; prickles in fascicles, unequal, divergant, long, flower solitary at the top of the plant, surrounded by spines. Fl. S. Native of Mexico. Cactus obvallatus, Moc. et Sesse, fl. mex. icon. ined.—Tepenexcomitl, Hern. mus. p. 410. with a figure. Spines whitish, needle-shaped, diverging, intricate. Flower erect, purple, with the margins of the lobes of the limb white.

Entwined-flowered Hedgehog-thistle. Pl. 1/4 foot.

12 E. texuispinus (Link et Otto, diss. p. 12. t. 19. f. 1.) plant nearly globose, umbilicately retuse at the apex; ribs 12, bluntish; prickles in fascicles, slender, recurved, 3 or 4 of which are a little larger than the rest; flowers girdled by wool. Fl. S. Native of Brazil, in the province of Rio Grande. Plant green, 2 or 3 inches in diameter. Sides of ribs rather impressed. Flowers beyond 2 inches long, yellow; sepals lanceolate, acute; petals dilated, obuse, each mucronated by a red bristle. Style 12-15 parted.

Var. ß, minor (Link et Otto, l. c. f. 2.) plant smaller; spines longer and slenderer, and more bent.

13 E. melanocactiformis (D. C. diss. t. 10.) plant roundish, ovate, obtuse; ribs vertical, about 30 in number; prickles in fascicles, diverging, unequal; flowers numerous, in a kind of whorl beneath the apex of the plant. Fl. S. Native of Mexico. Cactus multangularis, Moc. et Sesse, fl. mex. icon. ined. but not of Wild. Spines brownish. Sepals numerous, purplish on the outside, imbricated, and appressed to the tube; limb expanded; lobes oblong, acute, disposed in 2 or 3 series. Stigmas long, 3-12, exserted above the stamens.

14 E. Langeński (Lehnh. indem. sem. hort. lamb. 1826, p. 17.) plant oblong, with 17 angles; spines slender, stiff, spreading; vertex of plant very villous and spiny, and bearing flowers. Fl. S. Native of Brazil. Plant green. Fascicles of spines approximating, rising from short wool, central spine in each fascicle an inch long, the 6 marginal ones unequal, reflexed, and spreading. Flowers 2-4, terminal, rising from among wool and spines. Calyx tubular. Petals about 20, yellow. Stigma many-parted, radiate, purple.

Langsdorff's Hedgehog-thistle. Shrub 1/4 foot.

† The flowers of the following species being unknown, some of them are probably referrible to the genus Melocactus.

15 E. tephrae'nthus (Link et Otto, diss. p. 13. t. 14. f. 2.) plant globose, glaucous, impressed on the top, not tubercled; ribs 15, acute; prickles 10 in each fascicle, spreading; the 4 central ones the largest. Fl. S. Native of Brazil, in the province of Rio Grande. The plant is hardly an inch high, and hardly the same in thickness. Prickles canescent, hardly an inch long. Flowers unknown.

Recurred Hedgehog-thistle. C. 1796. Pl. 1 foot.

Var. \( \beta \), purpurescens (D.C. prodr. 3. p. 462.) Melocactus purpurescens, striis in spiraem contortis, Plum. spec. 15. miss. vol. 3 t. 8. Cactus nöbils, Lam. dict. 1. p. 537. Native of St. Domingo. The whole plant is purple, with white prickles. Perhaps a proper species, or a true species of Melocactus, ex Salm-Dyck in litt.

18 E. SALMINUS (Link et Otto, diss. p. 14. t. 15.) ribs 14-15, bluntish; 3 central prickles erect, rays ones 15, spreading, in each fascicle. \( \uparrow \). D.S. Native of Curassao. Plant 4 inches long, and 3 1/2 inches thick, with the furrows narrow. Prickles reddish. Top of plant impressed. Perhaps the same as Melocactus pyramidalis, but in a young state. Flowers unknown.

**Salm-Dyck's Hedgehog-thistle.** Pl. 1/2 foot.

19 E. hystricis (Haw. in phil. mag. Feb. 1830. p. 115.) plant roundish, usually with 12 spaces; spines straight, an inch and a half long, fulvous, much longer than the wool from which they rise. \( \uparrow \). D.S. Native of the West Indies. Cactus bystrich, Haw. suppl. p. 73. Ceres bystrich, Sweet. Flowers unknown. Like E. Salminus, but differs in the plant being more oblong, and in the spines being much fewer.

**Porcupine Hedgehog-thistle.** Clt. 1808. Pl. 3/4 foot.

20 E. Turbculatus (Link et Otto, diss. p. 16. t. 26.) plant nearly globose, green, depressed at the top; ribs 8, bluntish; fascicles with 3 central straight prickles, and 7 spreading, rather recurved ray ones, which become gradually smaller from the centre. \( \uparrow \). D.S. Native of Mexico. Plant 4 inches high, and 3 1/2 inches thick, with the furrows narrow. Central prickles of the fascicle an inch long, the ray ones gradually decreasing in length. Flowers unknown.

**Tuberculatet Hedgehog-thistle.** Pl. 1/2 to 3/4 foot.

21 E. Gladiatus (Link et Otto, diss. p. 17. t. 17.) plant oval-oblong, glaucescent, depressed at the apex; ribs 14-22, bluntish; prickles 10 in each fascicle, 3 central ones the largest, flattened, and elongated: middle one of the 3 erect: ray ones spreading much. \( \uparrow \). D.S. Native of Mexico. Plant 5 inches high, and 4 inches thick. Prickles canecent, crowded at the top, larger ones 2 inches long. Flowers unknown.

**Gladiate-spined Hedgehog-thistle.** Pl. 3/4 foot.

22 E. subuliferus (Link et Otto, diss. p. 16. t. 27.) plant subglobose, green, not depressed at the apex; ribs 8-10, blunt, tuberculatet; central prickles large, erectish, recurved, and spreading, and the 4-6 outer ones, divergate, and slender, in each fascicle. \( \uparrow \). D.S. Native of Mexico. Plant 2 1/2 inches high, and 2 inches thick, with the ribs evidently composed of conical tubercles. Prickles hoary brown; the larger ones 2 inches long, and the smaller ones about 4 lines long. Flowers unknown.

**Aur-bearing Hedgehog-thistle.** Pl. 1/2 to 3/4 foot.

23 E. depressus (D.C. prodr. 3. p. 463.) plant nearly globose, depressed at the apex; ribs vertical, about 20 in number, obtuse, and somewhat tuberculatet; fascicles of prickles crowded; prickles rising from fascicles of white tomentum, stiff, very pale brown: central ones in each fascicle 3-4, and 10-12 ray ones: the lower one of these very strong. \( \uparrow \). D.S. Native of South America. Melocactus depressus, Salm-Dyck in litt. Cactus depressus, Haw. syn. 173.

**Depressed Hedgehog-thistle.** Clt. 1798. Pl. 3/4 foot.

24 E. orthacanthus (Link et Otto, diss. p. 18. t. 18.) top of plant depressed; ribs 18, bluntish; prickles 7 in each fascicle: the central one of these strong, large, and straight: the rest spreading. \( \uparrow \). D.S. Native of Monte Video. Plant 2 1/2 inches in diameter, with narrow furrows. Prickles canecent: the larger ones 9 lines long, and the rest about 5 lines long. Flowers unknown.

**Straight-spined Hedgehog-thistle.** Pl. 1/2 to 3/4 foot.

25 E. arcaus (Link et Otto, diss. p. 15. t. 23.) plant subglobose, glaucescant, not depressed at the apex; ribs 20, arched; prickles 7 in each fascicle, spreading, and recurved. \( \uparrow \). D.S. Native of Monte Video. Plant 3 inches high, and 2 1/2 thick, with broad furrows. Sides of ribs not impressed. Prickles of a hoary fuscenscent colour, 4-6 lines long. Flowers unknown.

**Arched-ribbed Hedgehog-thistle.** Pl. 1/2 foot.

26 E. parvispinus (D.C. prodr. 3. p. 463. Haw. in phil. mag. Feb. 1830. p. 114.) plant nearly globose, umbilicate at the apex; ribs 15, compressed; prickles small, white, fulvous at the apex, rising from white tomentum, 7-9 in each fascicle: the central one of these straight, and the ray ones 6-8 in number, and a little recurved. \( \uparrow \). D.S. Native of South America. Melocactus parvispinus, Haw. suppl. 73. Salm-Dyck in litt. Flowers unknown. Very like E. meyocanathus, Link et Otto.

**Small-spined Hedgehog-thistle.** Pl. 1/4 foot.

27 E. intricatus (Link et Otto, diss. p. 19. t. 24.) plant oval, green, with a depressed tubercled top; ribs 20, bluntish; fascicles of prickles crowded, 18-20 in each fascicle: the 4 central ones of these larger and erect, the rest spreading, outermost ones divercat. \( \uparrow \). D.S. Native of Monte Video. Plant 4 inches high, and 4 1/4 broad; ribs usually bent. Prickles yellowish, rising from short wool, 4 lines long. The form of the plant is elongated, and like that of a creeping Cactus. Flowers unknown.

**Less-spined Hedgehog-thistle.** Pl. 1/2 foot.

28 E. denudatus (Link et Otto, pl. rar. hort. berol. t. 9.) plant subglobose, green, with 6-8 bluntish ribs; spines 3-8 in each fascicle, all spreading; involucrum with few leaves. \( \uparrow \). D.S. Native of Brazil.

**Naked Hedgehog-thistle.** Pl.

30 E. tortuosus (Link et Otto, pl. rar. hort. berol. t. 15.) plant nearly globose, depressed at the top, green, with 4 arched ribs; the 4-6 middle spines in each fascicle a little larger and thicker than the rest, which are numerous, but all are nearly equal, spreading, and twisted. \( \uparrow \). D.S. Native of Brazil.

**Twisted-spined Hedgehog-thistle.** Pl.

31 E. erinaceus (Haw. in phil. mag. Feb. 1830. p. 114.) plant globular, usually with 14 angles; spines inclining, 9 lines long, numerous, somewhat recurvedly divergate, fulvous, shorter than the wool from which they originate: fascicles of spines approximate. \( \uparrow \). D.S. Native of South America. Cactus erinaceus, Haw. suppl. p. 74. Very like Melocactus polyacanthus, Link et Otto, in form, but differs from it in the number of the angles, and in the absence of the woolly flowering top; but the fascicles of spines are nearly similar.

† The two following species, from their habit in a seedling state appear to belong to the present genus, but are not described; they are in the gardens of Edinburgh and Glasgow under the name of Cactus, and have been brought from Chili.

1 E. corrugata, Gill. miss. 2. E. flosuia, Gill. miss. Cult. See Mammillaria, p. 160. for culture and propagation. Grotesque plants, with the habit of the last genus.
IV. CEREU.S (from cereus, plant; in reference to the shoots of some of the species). D.C. cat. hort. monsp. 1819.

Lin. syst. Jočuandia, Monogynia. Sepals very numerous, imbricated, adnate to the base of the ovary, united into an elongated tube; outer sepals the shortest, forming the calyx, middle ones longer and coloured, innermost ones petal-formed. Stamens very numerous, united with the tube. Style filiform, multifid at the apex. Berry areolate, tubercular or scaly, either from the remains of the sepals, or from their cicatrices when they have fallen off. Coryledons wanting?—Fleshy grotesque shrubs, with a woody axis, and medulliferous inside; angles vertical, bearing fascicles of spines, regularly furrowed. Angles or wings either numerous or very few. Flowers large, rising from the fascicles of spines or indentures on the angles.

§ 1. Cereætri (an alteration from the generic name). Plants standing without support, never throwing out roots. Stems upright.

* Stems with many angles.

1 C. Multangularis (Haw. suppl. 75.) stem erect, with 18-20 angles; angles very close, blunt; prickles setaceous, yellow, longer than the wood from which they rise. h. D. S. Native country and flowers unknown. Cactus multangularis, Willd. enum. suppl. 33. Perhaps the same as Cactus Kagenkii, Gmel. ex Salm-Dyck in litt.

Broom Torch-thistle. Shrub 1 foot.

3 C. sentis (Salm-Dyck in litt. ex D.C. prod. 3. p. 464.) plant erect, somewhat club-shaped; stem with 20-25 vertical tubercled ribs; fascicles of prickles crowded, naked at the base, each fascicle containing 15-20 radiating hair-formed curled bristles, and a straight stiff central spine. h. D. S. Native of Mexico. Cactus sentis, Haw. in phil. mag. vol. 63. p. 41. Cactus bradyanus, Lehm. ind. sem. hort. hamb. 1825. p. 17. This is a very singular plant, covered all over with dense hair-like bristles; it is of an oblong shape, about 3 inches high, of a greyish-colour, bent, and hanging, like the grey head of an old man, hence the specific name.

4 C. lanatus (H.B. et Kunth, nov. gen. amer. 6. p. 68.) stems erect, branched, with many angles, and clothed with white wool; angles membranous, tubercled, and beset with stellate fascicles of prickles; central prickles 8-times longer than the rest. h. D. S. Native of Quito, near the rivers Aranza and Guancabamba. Stem 10-12 feet high. Central prickles of each fascicle 1 or 1½ inch long. Flowers rising from lateral and longitudinal fissures of the stem, involved in wool. Fruit obovate, red, with a whitish green-coloured pulp. Wolly Torch-thistle. Shrub 10-15 feet.

5 C. microcarus (D.C. mem. cact. in mem. mus. 17. p. 115.) plant dividing into many stems at the base, ovate-oblong, greenish, obtuse, with 13 vertical bluntest ribs, with the recesses broad, but hardly acute; fascicles of spines approximating, with tomentose areole; prickles 3 in each fascicle, short, setaceous, diverging. h. D. S. Native of Mexico. Coulter, no. 56. Perhaps a species of Echinocactus. Plant hardly an inch high and the same in thickness.

Small-spined Torch-thistle. Pl. 1 inch.

6 C. Polylophus (D.C. l.c. 1.) plant quite simple, erect, green, cylindrical, with 15-18 vertical ribs, and with the furrows acute; central prickles rather reaped; fascicles of prickles approximating, with the young areole convex and tomentose; prickles 9-9 in each fascicle, yellow, straight, diverging, but the central one long and erect. h. D. S. Native of Mexico. Coulter, no. 15. Plant 30-40 feet in height, without any branch, according to Coulter.

Many-crested Torch-thistle. Shrub 30 to 40 feet.

7 C. Linckii (Lehm. ind. sem. hort. hamb. 1827. p. 16.) plant oval, green, with 13 angles; ribs obtuse, bearing flowers at the top from the axes of the fascicles of spines; 3 central spines in each fascicle erecely spreading, and the 10 ray ones slenderer, much more spreading; stigmas 8. h. D. S. Native of Mexico. Calyx half an inch long, beset with greenish yellow scales, which are furnished with purple bristles and white cobwebbed wool. Petals numerous, truncate at the apex, yellow, with purple bases. Style yellow. Stigmas purple.

8 C. Leccini (Coll. hort. ripul. append. 5-6. 2. under Cactus) plant ovate, tapering to the apex, with numerous blunt angles; fascicles of spines approximate, woolly at the base; spines white: ray ones spreading; central one long and straight. h. D. S. Native of South America.

* * Stems with 6-12 angles.

9 C. hexagonus (Willd. enum. suppl. 32.) plant simple, erect, large, usually with 6 strong ribs; fascicles of spines middle-sized; prickles short, brown. h. D. S. Native of South America. Cactus hexagonus, Lin. spec. 1. p. 667. Andr. bot. rep. t. 513. Cactus Peruvianus, D.C. pl. grass. t. 58.—Bradt succ. 1. p. 1. t. 1. The plant is about 40 feet high, usually without any branches, varying with 5-6-7 angles. Flowers solitary, 6 inches long; having the sepals along the tube greenish and irregularly imbricated; limb a little expanded, reddish outside and white inside. Stamens greenish. Fruit dark purple, according to Plummer.

Var. abnormis (Willd. enum. suppl. 31.) stem simple, oblong, irregularly furrowed, and tubercled; tubercles oblong, compressed, unequal, bearing prickles at the apex, and rather woolly. h. D. S. Native of South America. C. Peruvianus, monstrous, D.C. cat. hort. monsp. diss. t. 11. Flowers twin, nearly as in C. hexagonus, but more expanded and larger, with the outer sepals reddish, but the inner ones are pure white and serrated; tube striated with green on the outside. Stigmas 9-13, greenish.

Hexagonal Torch-thistle. Fl. Jul. Aug. Clt. 1690. Tr. 40 ft. 10 C. Ottos (Lehm. ind. sem. hort. hamb. 1827. p. 16.) plant oval, green, attenuated at the base, with 10 angles; ribs obtuse, bearing the flowers above from the fascicles of spines; 4 central spines in each fascicle, and 10-14 slender, spreading ray ones; stigmas 14. h. D. S. Native of Mexico. Calyx tubular; scales acute, greenish yellow, furnished with a fascicle of purple hairs, and white, cobwebbed wool. Petals numerous, erossed serrated at the apex and tomentose; Style yellow. Stigmas purple.

11 C. Peruvianus (Haw. syn. 171.) plant large, erect, with usually 8 angles or ribs; angles blunt, smooth, glaucous; spines whitish, rising from white tomentum, the lower one very small, and the central one very strong. h. D. S. Native of Peru and Curassoa. Cactus Peruvianus, Lin. spec. 667. Willd. enum. suppl. 32. Cereus eburneus, Salm-Dyck, in cat. hort. Dyck. 1822. Cactus Coquimbana, Molin. chil. ed. gall. p. 140. ex
Like 2. areolae Native spines Native central D. D. inches long with wool Native with ribs long D. D. prickles c.) prickles Shrub prickles ribs D. fascicle, c.) stigma D. ribs blackish small numerous; is equal thickly spines rather 6 the thickened hystrix, Domingo. 7-angled Shrub Nearly gowing, nymphoid. 16(2). 1830. 20. C. ternus (Salm-Dyck, obs. bot. 1822.) plant erect, greyish green, with 8-9 angles; ribs blunt, crenulate; prickles white, rising from grey tomentum, blackish at the apex, 9 in each fascicle, radiating and equal, and 1 long central one. 7. D. S. Native of South America. C. Royenii, Wildl. suppl. enum. p. 32. Stem rather woolly at the apex; wool grey, at length falling off.

Var. β. plant rather slenderer than the species; and the prickles are shorter. Salm-Dyck, in litt.

Crenulatus Torch-thistle. Clt. 1728. Shrub 2 to 3 feet. 21 C. cinerea (S.C. mem. cact. in mem. mus. 17. p. 116.) plant simple, erect, greyish green, with 8 blunt tubercular ribs, and narrow recesses; areole while young convex and velvety; prickles 14 in each fascicle, white, setaceous, stiff, outer 10 radiating, central 4 erectly diverging, and longer than the ray ones. 7. D. S. Native of Mexico. Coulter, no. 23. Stem 2 inches high, and 2 inches in diameter. Outer prickles 6-9 lines long; central ones 12 lines long; in fascicles, which are 5-6 lines distant from each other.

Var. β, cerradus (D. C. l. c.) stem thicker; fascicles of spines more distant.

Var. γ, tenerus (D. C. l. c.) stems slenderer; ribs more approximate. Very like C. pentalophus, but differs in being 8-angled, not 5-angled.

Greyish Torch-thistle. Clt. 1830. Shrub ½ foot. 22 C. calvus (S.C. l. c.) plant simple, or a little branched at the apex, erect, green, oblong and rather unilobate at the apex, with 7-8 vertical, obtuse ribs, and acute furrows; areoles, white, convex and tetonicous, but at length becoming nearly glabrous; prickles 8-9 in each fascicle, brown, stiff, diverging: the central ones hardly to be distinguished from the outer ones. 7. D. S. Native of Mexico. Coulter, no. 13. Stem 2½ and 3 inches in diameter. Prickles 1-2 lines long. A very distinct species.

Margined Torch-thistle. Shrub.

24 C. albidus (Salm-Dyck, obs. bot. 1822.) plant erect, greyish green, with 9 or 10 angles; ribs obtuse, very prickly; prickles grey, tipped with yellow, rising from grey tomentum, 11 radiating ones and 4 central in each fascicle. 7. D. S. Native of South America. Very like C. crenulatus, but more slender and more woolly. Old plant only woolly at the apex, but the young plant all over; the wool grey. Salm-Dyck, in litt.

White-spined Torch-thistle. Shrub 2 to 3 feet. 25 C. regalis (Haw. suppl. p. 75.) plant erect, 9-angled, furrowed; spines fulvous, elongated, when young about equal in length to the wool. 7. D. S. Native of South America. Fascicles of spines much crowded.

26 C. striatus (Wildl. enum. suppl. p. 32. under Cactus,) plant erect, green, shining, 7-9-angled; ribs rather compressed repand; prickles brown, rising from brown tomentum: each fascicle composed of 8 radiating ones, a small superior one, and 3 central ones, which are much longer than the rest. 7. D. S. Native of South America. There is hardly any wool at the top of the stem; the rest unknown. Salm-Dyck, in litt.
27 C. HAWORTHI (Spreng. syst. 2. p. 495. under Cactus) plant erect, large, 5-angled, with profound furrows; spines numerous, usually an inch long, brown. \( \gamma \). D. S. Native of the West Indies. C. nobilis. Haw. syn. 179. This species is more formidable than the rest in the prickles being very large and numerous. The rest unknown. The Cactus nobilis, Lin. Haw. and Lam. are very different from each other, and constitute 3 distinct species.

Haworthi Torch-thistle. 1811. Shrub 3 to 4 feet.
28 C. AURITUS (Salm-Dyck. in litt. ex D. C. prod. 3. p. 456.) plant erect, green, 7-8-angled; ribs compressed, very prickly; prickles yellow, rising from straw-coloured tomentum, with 8 radiating ones in each fascicle, and some central longer ones. \( \gamma \). D. S. Native country and flowers unknown. Differs from C. Haworthi, in being yellow, and in their fascicles being more closely crowded.

29 C. NIGER (Salm-Dyck. hort. dyck. cat. 1822.) plant erect, blackish, 7-angled; ribs rather compressed; prickles slender, fulvous, rising from white tomentum: with 7 radiating ones in each fascicle, the 3 lowest of these the longest, and 2 or 3 central ones, the lowest one very short. \( \gamma \). D. S. Native of South America. Cactus rufescens. Mill. dict. ed. 8.

31 C. FLAVISPINUS (Salm-Dyck. obs. bot. 1822.) plant erect, pale green, 8-10-angled; ribs rather compressed; prickles slender, yellowish, rising from white tomentum; with 8 radiating ones in each fascicle, the upper ones of these very small, and 3-4 central ones, the upper one of these erect and very long. \( \gamma \). D. S. Native of South America. Cactus Ruyéni, Mill. dict. ed. 8.

Yellow-spined Torch-thistle. Clt.? Shrub 2 to 3 feet.
32 C. CHLOEONUS (Colla. pl. rar. hort. rip. app. 2. p. 342.) plant ovate, erect, 10-angled; angles blunt; prickles pale, pellucid, middle one of each fascicle the strongest; wool very short. \( \gamma \). D. S. Native of Chili. C. Coquimbánus, Hort. but not of Molin.

Chiloe Torch-thistle. Shrub.
33 C. LITURIBRIOIDES (Haw. suppl. p. 75.) plant erect, usually 10-angled; angles strong; spines unequal, nearly naked at the base. \( \gamma \). D. S. Native of tropical America. There are 3 middle-sized spines, 2 about 2 lines long, and 1 about 7 lines long in each fascicle.

Sparge-like Torch-thistle. Clt.? Shrub 2 to 3 feet.
34 C. ROYENI (Haw. syn. p. 102.) plant erect, bluntly 9-angled; spines a little longer than the wool, from which they issue; floral tube unarmed; outer lobes acuminate, inner ones the shortest. \( \gamma \). D. S. Native of the West Indies. Cactus Royenii, Lin. spec. 668.—Royen, lugd. bat. 279.—D. C. pl. grass. t. 143. C. lanuginosus, Mill. dict. no. 7. Floral tube greenish. Calyenic lobes rufescent; inner or corolline ones the longest, acuminate, and white. Stigmas 12. Fruit red, according to Herm.

35 C. LANUGINOSUS (Haw. syn. 182.) plant erect, bluntly 8-9-angled; spines shorter than the wool from which they issue. \( \gamma \). D. S. Native of the West Indies. Herm. lugd. bat. par.

4t. 115. without a flower. C. repandus, Mill. dict. ed. 8. Cactus lanuginosus, Lin. spec. 667. The fruit, according to Herm., is red, not spiny.

36 C. REPANDUS (Haw. syn. 183. D. C. diss. t. 13.) plant long, erect, with 8-9 blunt angles; angles rather undulated; spines longer than the wool from which they issue; floral tube, and consequently the fruit, is unarmed: outer lobes of calyx narrow and much acuminated, almost exceeding the inner ones in length. \( \gamma \). D. S. Native of the Caribbean Islands. Cactus repandus, Lin. spec. 667. Ker. bot. reg. t. 336. Cereus gráculis, Mill. dict. ed. 8. no. 8.—Trew. elert. t. 14. Tube of flower green; inner calycine or corolline lobes white. Stigmas 8-10. Fruit yellow, white inside.

37 C. SUBLITEDUS (Haw. suppl. 78.) plant erect, with 8 angles; angles compressed, repand; prickles strong, of a pale colour; wool very short. \( \gamma \). D. S. Native of the West Indies. Very distinct from C. arenátes.

38 C. PÆTHERS (Haw. in phil. mag. Feb. 1830. p. 108.) plant erect, bluntly 8-angled; angles short; fascicles of spines very black, as well as the short central wool. \( \gamma \). D. S. Native of Brazil. Very like C. repándus, but much more dwarf and simple, and very green; with about 12 spines in each fascicle. This is a singular plant, from its black spines and black beard-like terminal brush.

39 C. POLYGÔNUS (Lam. dict. 1. p. 539. under Cactus) plant erect, branched, with 11 blunt angles, woolly at the apex; prickles setaceous, grey; flowers short, with the limb hardly spreading. \( \gamma \). D. S. Native of St. Domingo. Plume. ed. Burm. t. 196. Flowers white. Fruit reddish brown, tubercled; flesh reddish. Stem 10 feet high, and 6-7 inches in diameter. This species is allied to C. repándus, according to Lamarck, but Spreng: has joined it with C. gríseus.

Many-angled Torch-thistle. Shrub 10 feet.
40 C. MÁGÁNUS (Haw. in phil. mag. Feb. 1830.) plant very strong, simple, with usually 12 deep furrows, and as many ridges; spines unequal, very stiff, dark. \( \gamma \). D. G. Native of St. Domingo. Spines about 12 in each fascicle; fascicles rather distant. Flowers large, white.

Large Torch-thistle. Clt. 1829. Shrub 3 to 4 feet.
41 C. DIVARICÁTUS (Lam. dict. 1. p. 540. under Cactus) plant erect, branched, very spiny, and bluntly 10-angled; branches spreading. \( \gamma \). D. S. Native of St. Domingo. Plume. ed. Burm. t. 193. Flowers lateral, hardly known. Fruit globose, yellow, warty, large by large points, or unarmned; pulp white and sweet.

Diviaricáte Torch-thistle. Shrub.
42 C. CHLOROCAΡUS (H. B. et Künth. nov. germ. 6. p. 68.) plant erect, branched; branches fastigiate, 10-12-angled; angles tubercled; tubercles beset with starry prickles; central prickles in each fascicle 4 times longer than the rest. \( \gamma \). D. S. Native of South America.

Green-fruited Torch-thistle. Shrub 10 feet.
43 C. LÆVUS (H. B. et Künth, loc.) plant erect, pale green, jointed; joints 7-angled; angles tubercled, each tuberle furnished with a fascicle of spines. \( \gamma \). D. S. Native of Quito, near Sondorillo. The rest unknown.

Fruitful Torch-thistle. Shrub.

** Steams with 3-4 or 5 angles, very rarely with 6 angles.
prickles 8 in each fascicle, 4 of which are stiff, conical, and greyish, or blackish, 3 very short and diverging, and 1 large and horizontal. \( \text{f}. \) D. S. Native of Mexico. Coulter. Largest prickles in each fascicle 8–10 lines long, smaller ones hardly 2–3 lines long.

Green Torch-thistle. Shrub.
45 C. anisacanthus (D. C. l. c.) plant simple, erect, deep green; ribs 5–6, with the furrows and crests both acute; fascicles of spines crowded, having the areole convex and velvety white; prickles 4 to 10–20 in each fascicle, rather unequal, outer ones diverging. \( \text{f}. \) D. S. Native of Mexico. Coulter. Varieties

Unfiled

1. Simplex (D. C. l. c.) stems simple, narrow; ribs rather prominent; furrows broad and obtuse; prickles white.

2. Subarticulatus (D. C. l. c.) stem branched, a little articulated, but not rooting; ribs irregular, rather reaped; furrows narrow; prickles yellowish white young.

3. Radicans (D. C. l. c.) stems rooting; ribs broad, short; prickles yellowish white young.

47 C. grandidis (Haw. suppl. p. 76.) plant large, exactly tetragonal, simple, erect; prickles usually an inch long, divergently, almost interwoven among each other. \( \text{f}. \) D. S. Native of Brazil. The rest unknown.

49 C. paniculatus (Lam. dict. l. p. 540. under \( \text{Cactus} \)) trunk erect; branches forming a kind of panicle at the top of the trunk, tetragonal, articulated at the base; spines short, in fascicules; petals rounded at the apex. \( \text{f}. \) D. S. Native of St. Domingo, in wild places.—Plum. ed. Burm. t. 192. Flowers white, lined with red. Fruit tubercled, yellowish. Perhaps this species is referable to \( \text{Jamacaru prima} \), Maccr. bras. p. 125. \( \text{f}. \) 2. but the figure given by him is too rude to determine this point.

Panicled Torch-thistle. Shrub.
50 C. pitayaya (Jacq. amer. 151. under \( \text{Cactus} \)) trunk erect; branches tri高尔; spines in fascicules. \( \text{f}. \) D. S. Native of Carthagena, in bushy places by the sea side. Flowers opening in the night, white, 8 inches long. Fruit scarlet, shining, size and form of a hen’s egg; pulp white. Pitayaya is the vernacular name of the plant.

Pitayaya Torch-thistle. Shrub.
51 C. undulatus (D. C. prod. 3. p. 467.) trunk erect, very spiny, and as well as the branches tri高尔; spines in fascicules, black; limb of flowers spreading. \( \text{f}. \) D. S. Native of St. Domingo. Plum. ed. Burm. t. 194. Cact. Pitayaya \( \text{f}. \), Lam. dict. l. p. 559. Prickles 2 inches long. Flowers white, beautiful. Fruit greenish yellow, about the size and form of an apple; pulp white.

Undulated Torch-thistle. Shrub.
52 C. orbus (Haw. rev. p. 70.) plant erect, pale green, triangular; ribs blunt; fascicles of prickles very remote; prickles tawny, rising from brown tomentum: with 4 radiating ones in each fascicle, and a central, elongated erect one. \( \text{f}. \) D. S. Native country and flowers unknown.

53 C. jamacaru (D. C. prod. 3. p. 467.) plant erect; branches 3–4-angled; prickles in fascicles, straight, flowers cylindrical, with an erect limb; genitils inclosed. \( \text{f}. \) D. S. Native of Brazil. Jamacaru, Pison, hist. nat. bras. p. 100. f. 1. Trunk triangular, beset with spines. Flowers white, scentless. Fruit red, size of a goose’s egg. Perhaps \( \text{Jamacaru quadrata} \) species Maccr. hist. nat. bras. p. 127. f. 5. is the same or a distinct species.

54 C. validus (Haw. in phil. mag. sept. 1831. p. 418.) plant tetragonal, firm, glaucescent at the apex, with the sides nearly flat, or rather convex at first, with the angles very blunt and spiny in the middle. \( \text{f}. \) D. S. Native of South America. Spines brownish.

Strong Torch-thistle. Shrub.

§ 2. Serpentina (from serp., to creep; stems creeping and rooting). D. C. prod. 3. p. 467. Stems jointed, prostrate, rooting or twining.

* Stems with many angles.

55 C. serpentinus (Lag. anal. sc. nat. 1801. p. 261.) plant creeping, flexuous, and somewhat climbing, with 11–12 very blunt angles; bristles in fascicules, much longer than the wool from which they issue, but which at length falls off; floral tube very bristly at the base. \( \text{f}. \) D. S. Native of South America. Willd. enum. suppl. 31. Link, et Otto, abbild. t. 91. D. C. diss. t. 12. Flowers large, beautiful; lobes bluntish; outer ones greenish; middle ones purplish; inner ones white. Stigmas 7. This plant appears to hold a kind of middle station between the erect and creeping species of the genus, and rarely throws out roots from its stems. Bristles 7–8 lines long, purplish, also crowded at the base of the floral tube.

Serpentina Torch-thistle. Clt. 7. Shrub 3 to 4 feet.
56 C. tenuis (Lh. ind. sem. hort. hamb. 1827. p. 16.) plant erectish, articulated branched; joints attenuated at the base, tubercular; tubercles pressed at the apex, woolly and bearing spines; spines coated by a somewhat diaphanous, moveable membrane. \( \text{f}. \) D. S. Native of Brazil. Joints terete when young, 1½ inch long, furnished with fleshy, subulate leaves, which become at length deciduous.

Coated-spined Torch-thistle. Clt. ? Shrub ½ to 1 foot.
57 C. ambiguus (Bomp. tav. n. 36. under \( \text{Cactus} \)) plant erect, with 9–12 blunt angles; bristles spinescent, longer than the wool from which they issue; floral tube bearing bristles at the base. \( \text{f}. \) D. S. Native country unknown. Flowers very like those of \( \text{C. serpentinus} \), of which it is probably only a variety, differing only in the stem being more erect, and in the bristles being shorter.

Ambiguous Torch-thistle. Shrub 2 to 3 feet.
58 C. flagelliformis (Mll. dict. ed. 8. no. 12. Haw. syn. 158.) stems prostrate, with about 10 angles; tubercles crowded, bearing bristles; style rather shorter than the petals. \( \text{f}. \) D. S. Native of South America, and is now to be found in the Arabian deserts, but has been probably introduced there. Cactus flagelliformis, Lin. spec. 668. Curt. bot. mag. t. 17. D. C. pl. grass. 137. This species is very common in gardens, and has trailing stems, unless supported, which are therefore easily trained to any kind of trellising. The flowers are so beautiful, and are produced in such profusion, that the plant is worth being conveyed.
into the house whilst in flower, to adorn any of the rooms: they are red or pink.

59 C. le'ptopus (D. C. mem. act. in mem. mus. 17. p. 117.) plant creeping a little, cylindrical, with 7-8 very blunt, rather repand ribs; areole velvet, but convex in the adult state; prickles 12-15 in each fascicle, stiffish, yellow, radiating, having the 2 or 3 central ones erectish. η. D. S. Native of Mexico. Coulter, no. 32. Habit of C. flagelliformis, but 3 times slenderer.

60 C. Humboldtii (H. B. et Kunth, nov. gen. amer. 6. p. 66. under Cactus) stems procumbent, with 10 or 12 ribs, glabrous; angles tubercled; tubercles bearing stiff bristles; style much exceeding the corolla. η. D. S. Native about Quito, in fields between Sondorillo and San Felipe. Said to be very like C. flagelliformis. Flowers red.

Humboldt's Torch-thistle or Creeping Cereus. Shrub pr.

61 C. rososorus (H. B. et Kunth, l. c.) stems procumbent, simple, usually with 20 angles; angles bearing fascicles of bristles: style length of petals, 8-cleft at the apex. η. D. S. Native of Quito, in dry places near Nabon. According to the authors, this plant is sufficiently distinct from the foregoing. Flowers white.

Twenty-angled Torch-thistle. Shrub proc.

62 C. secundum (H. B. et Kunth, l. c.) stem erect, with 11 angles; angles bearing fascicles of prickles; stamens and style about equal in length, but exceeding the corolla a little; stigma 8-parted. η. D. S. Native of New Andalusia, near Carpe, growing on rotten wood. Very like C. flagelliformis in habit, but both the flowers and fruit are unknown, and therefore the place which it should occupy in this genus is doubtful.

Caripe Torch-thistle. Shrub creeping.

** Stems with 5 or 6 angles.

64 C. grandiflorus (Mill. dict. ed. 8. no. 11. Haw. syn. 184.) stems rooting, diffuse, creeping, 5-6-angled; bristles 5-8 in each fascicle, hardly longer than the down from which they proceed. η. D. S. Native of the West India Islands, and in many parts of the main land of South America. Cactus grandiflorus, Lin. spec. p. 668. D. C. pl. grass. t. 52. Andr. bot. rep. t. 508.—Mill. fig. t. 90.—Trew. ehret. t. 31, 32.—Volk. hesp. 1. t. 234. This species, when of sufficient strength, will produce many exceeding large, beautiful, sweet-scented flowers, like those of most of the species of very short duration, hardly continuing 6 hours full blown, nor do the flowers ever open again when once closed. They begin to open between 7 and 8 o'clock, in the evening, are fully blown by 11 o'clock, and by 3 or 4 o'clock in the morning they fade, and hang down quite decayed; but during their short continuance is hardly any flower of greater beauty, or that makes a more magnificent appearance; for the calyx of the flower, when open, is near a foot in diameter, the inside of which being of a splendid yellow colour, appears like the rays of a bright star, the outside is of a dark brown; the petals being of a pure white add to the lustre; the vast number of recurved stamens in the centre of the flower, make a fine appearance: add to all this, the fine scent, which perfumes the air to a considerable distance; there is scarcely any plant which deserves a place in the hot-house so much as this, especially as it may be trained against the wall, where it will not take up any room. The flowers make a most magnificent appearance by candle-light, sometimes there may be 6 or 8 flowers open upon one plant at the same time; and there will be a succession of them for several nights together, provided the plant is large and healthy.

65 C. spinulosus (D. C. mem. act. in mem. mus. 17. p. 117.) plant a little branched, creeping, and climbing somewhat, nearly terete, with 5-6 hardly exserted, acutish ribs, and with broad, bluish furrows; areolae, when young, velvety; prickles 8 in each fascicle, very short, stiff, when young yellowish, but afterwards becoming brownish, the lateral ones radiating. η. D. S. Native of Mexico. Coulter, no. 27. Habit of the stems like those of C. grandiflorus, but the prickles are very different.

Spinulose Torch-thistle. Shrub cl.

66 C. pentalogus (Lin. hort. cliff. p. 182.) plant erect, jointed, slender, pale green, 5-angled; ribs repand; prickles naked at the base, nearly equal, slender, straw-coloured, with 5-6 radiating ones in each fascicle, and 1 central one. η. D. S. Native of South America. Cactus pentagonus, Lin. spec. 666. Haw. syn. 180. rev. 77. Salm-Dyck. in litt. C. prismatique and C. répans, Willd. enum. suppl. 52. This is a very polymorphous species, varying with 3-4-5 angles, sometimes much compressed, and sometimes the angles are nearly obliterated. The plant never throws out lateral roots. Flowers large, white. Pentagonal-stemmed Torch-thistle. Fl. July. Clt. 1769. Shrub cl. 3 feet.

67 C. radicans (D. C. prod. 3. p. 468.) plant prostrate, jointed, pale green, with 3-5 angles; prickles stiff, slender, russet, naked at the base, with 6-9 radiating ones in each fascicle, and 1 central one, which is rather elongated. η. D. S. Native of South America. Cactus répantus, Salm-Dyck. in litt. not Willd. It differs from C. pentagonus in the stems being prostrate and rooting, not erect.

Rooting Torch-thistle. Shrub creeping.

68 C. rufus (D. C. prod. 3. p. 468.) plant jointed, divaricate, rooting, green, with 4 or 5 angles; ribs much compressed and repand; fascicles of prickles crowded; prickles about equal in length to the white tomentum from which they arise: 8-10 radiating white bristle-formed ones in each fascicle and 3 stiffish straw-coloured, central ones. η. D. S. Native country and flowers unknown. C. graciilis, Salm-Dyck. in litt. not of Haw. Plant humble, with the joints a little elongated and divaricating, deeply furrowed.

Humble Torch-thistle. Shrub.

69 C. aculeiferous (Haw. rev. 77.) plant creeping, green, with 5 angles; prickles bristle-formed, white, stellately expanded, shorter than the rufous wood from which they arise. η. D. S. Native of St. Domingo. The rest unknown.

** Stems with 3-4 angles.

70 C. quadrangularis (Haw. syn. p. 181.) plant creeping, 3-4-angled; angles hardly channelled; spines 5-7 in each fascicle, hardly stellate. η. D. S. Native of the West Indies. —Plum. ed. Burm. t. 199. f. 1. Flowers white, opening at night, beautiful, and sweet-scented.

71 C. tripteris (Salm-Dyck. in litt. ex D. C. prod. 3. p. 468.) plant jointed, erectish, rooting, green, 3-4-angled; ribs much compressed, rather repand; fascicles of spines crowded, with 8 radiating ones in each fascicle, and 3 stiffish central ones. η. D. S. Native country unknown. It differs from C. graciilis,
to which it is nearly allied, in the stems being for the most part 3-angled, rarely 4-angled, and never 5-angled, in being more erect, and in the joints being longer and broader, as if they were winged, and also in the prickles being longer.

79 C. speciosissimus (Desf. mem. mus. 3. p. 190. t. 9. under Cæcūs) plant erect, 3-4-angled; angles toothed; prickles subulate, straight, rising from white tomentum; limb of flower expanded; genitales decussate. ५. D. S. Native of Mexico. Cæcūs speciosissim. Cav. hort. madr. Willd. enum. suppl. p. 31. Cæcūs speciosissim. Ker. bot. reg. 486. herb. amat. t. 391. Flowers large, of a beautiful scarlet colour, somewhat violaceous inside. Genitales white. This is a most splendid plant when in flower, and is now very common in the gardens.

Var. β, bifrons (Haw. suppl. p. 76.) plant dwarfer, more decumbent, and throwing out more roots.

74 C. undatus (Haw. in phil. mag. nov. 1829. p. 109.) plant large, climbing, triangularly furrowed; joints large, rather lobately crenated, sometimes like a chain. ५. D. S. Native of China. Very like C. triangula, but much larger; and the branches are greener and more radicant. Fascicles of spines small.

75 C. seigin (Haw. in phil. mag. nov. 1829. p. 108.) plant erect; branches few, quadrangular; fascicles containing about 20 spines each, ४ of which are linear, radiating, and nearly equal, pale. ५. D. S. Native of Brazil. The habit of the plant is referrible to Stapelis astéras, but taller and the angles more concave; wool at base of spines short.

76 C. triquetra (Haw. syn. 181.) plant jointed, erectish, rooting, green, triangular; angles repand, with the fascicles of prickles remote; prickles rising from fuscous tomentum, rays one sessate and decidueus, central ४, stiff, short, and fuscous. ५. D. S. Native of South America. C. prismático, Desf. hort. par. Prickles dirty yellow, ४-५ lines long, rising from short tomentum. Stem 6-6 feet high, branched. Flowers unknown.

77 C. tenus (Haw. in phil. mag. feb. 1827. p. 125.) plant weak, branched, somewhat articulated, climbing and rooting; branches very slender and triangular; bristles very slender, bent, wool-formed. ५. D. S. Native country known, but probably in some part of South America. Bristles in crowded interwoven fascicles along the angles of the stems, which they hide. Perhaps the same as C. Mosquisus.

78 C. tris (Haw. syn. 181.) plant creeping, triquetrous; angles hardly channelled; prickles ५-७ in a fascicle, stellate. ५. D. S. Native of the West India Islands. Cæcūs triquetra

β, Haw. misc. nat. 199.—Plum. ed. Burm. t. 200. f. 2. Cæcūs triangula. Foliolous, Jacq. amer. 152. ex Lam. dict. t. 1. p. 541. Flowers white (ex Plum.) and the fruit of a violaceous scarlet colour; but the fruit, according to Jacquin, is of a shining scarlet colour; there are therefore probably two species confused under this name.

79 C. prismático (Salm-Dyck. in litt. but not of Wildl. ex D. C. prod. 3. p. 469.) plant articulated, erectish, rooting, green, triangular; ribs repand; fascicles of prickles crowded; prickles nearly equal, fuscous, rising from fuscous tomentum, ५ radiating ones and २ or ३ central ones in each fascicle. ५. D. S. Native country unknown. Plant slenderer and more humble than C. triquetra; prickles smaller and more numerous; and the fascicles are more crowded.

80 C. cocceivus (Salm-Dyck. in litt. ex D. C. prod. 3. p. 469.) plant with long joints, rooting, green, triangular; ribs compressed, repand; prickles rising from violaceous tomentum; radiating ones pilose, white, and ५ rather recurved, stiff, fuscous, central ones in each fascicle. ५. D. S. Native of Brazil, among rocks on the mountains. Flowers said to be numerous, large, and scarlet.

Scarlet-flowered Torch-thistle. Clt.? Shrub cr.
81 C. ex trinwus (Salm-Dyck. in litt. ex D. C. l. c.) plant with long joints, rooting, green, triangular; ribs much compressed, repandly crenated, furnished with an ovate acute scale, and numerous white hairs in the crenatures. ५. D. S. Native of Brazil. This is a very singular plant, with the sides of the joints 2 inches broad, and ५-toothed at the angles, and for the most part margined with red; teeth as in Stapelis, furnished with a hairtless scale or leaf. Flowers small, solitary, when dry persistent, yellow; petals 6-8, acute. Style filiform, ५-७ at the apex. Fruit unknown.

Scaly Torch-thistle. Clt.? Shrub 1 to 2 feet.
82 C. squamulosis (Salm-Dyck. in litt. ex D. C. l. c.) plant erect, jointed, rooting a little, green, triangular; ribs much compressed, repandly crenated, furnished with an ovate acute scale, and numerous white hairs in the crenatures. ५. D. S. Native of Brazil. This is a very singular plant, with the sides of the joints 2 inches broad, and ५-toothed at the angles, and for the most part margined with red; teeth as in Stapelis, furnished with a hairtless scale or leaf. Flowers small, solitary, when dry persistent, yellow; petals 6-8, acute. Style filiform, ५-७ at the apex. Fruit unknown.

Scaly Torch-thistle. Clt.? Shrub 1 to 2 feet.
83 C. mesuri (Salm-Dyck. in litt. ex D. C. l. c.) plant jointed, erect, rooting a little, deep green, triangular; ribs rather compressed, somewhat repand; hairs rising from white tomentum, with ५-७ radiating ones in each fascicle, and in the middle of each fascicle is a central soft prick. ५. D. S. Native of Brazil.

Bristly Torch-thistle. Clt.? Shrub 1 to 2 feet.
84 C. myosurus (Salm-Dyck. in litt. ex D. C. l. c.) plant rather articulated, erect, rooting a little, slender, margined with red, ३-४-angled; ribs crenated, furnished with penicil-like fascicles of white hairs at the crenatures. ५. D. S. Native of Brazil. Sides of stems hardly ५ lines broad. Pilī long erect, especially on the young branches. The rest unknown.

Mouse-tail Torch-thistle. Shrub.
85 C. tenus (Salm-Dyck. in litt. ex D. C. l. c.) plant low, climbing, acutely trigonal, with some roots issuing from the sides; hairs in fascicles along the angles, elongated, soft and adpressed; flowers sessile, usually with ५ sepals and ५ petals. ५. D. S. Native of Brazil. Cæcūs tenuis, Schott. ined. Flowers small, rose-coloured, hardly open, rising from among the fascicles of hairs; tube very short.

Z
§ 3. Opuntiaceae (Plants having the habit of Opuntia). D. C. prod. 3. p. 470. Stems composed of globose joints, the surfaces from diverging prickles. Flowers tubular. Style much exerted, multifid at the apex. Perhaps a proper genus, intermediate between Cactus and Opuntia?

Necklace-formed Torch-thistle. Shrub procumbent.

87 C. serpens (H. B. et Kunth, nov. gen. amer. f. p. 68. under Cactus) plant creeping, branched, rather angular; areoles 6-angled, prickly at the apex; flowers tubular. D. S. Native of Quito, on dry hills on the banks of the river Guaneacamba, near Sondorillo. Flowers flesh-coloured; petals 8–12, acute; stigmas 8, approximate. Perhaps a species of Opuntia.

Creeping Torch-thistle. Shrub cr.

88 C. nanus (H. B. et Kunth, l. c. under Cactus) plant creeping and jointed; joints terete, rather compressed, areolate, prickly, a little branched. D. S. Native of Quito, near Sondorillo, on the banks of the Guaneacamba. The rest unknown.

Dwarf Torch-thistle. Shrub proc. 2 to 3 inches.

89 C. gracilis (Haw. in phil. mag. Feb. 1827. p. 126.) plant erectish, nearly terete; old spines solitary, straight, an inch long, but at first twin or more, white. D. S. Native of South America. Plant with the habit of Euphorbia hookeriana, but less spiny and the spines shorter. It appears to be more nearly allied to C. nanus than to any other species.

Weak Torch-thistle. Clt.? Shrub.

† The following species are in the gardens, but nothing is known of them but the names.

1 C. rosaceus, Hort. berol. 2 C. Déppii, Hort. berol. 3 C. incrustatus, Hort. berol. 4 C. cxérenS, Hort. berol. 5 C. affinis, Hort. berol. 6 C. proteliformis, Hort. par. 7 C. Colvillei, Sweet. 8 C. ovatus, Gill. (under Cactus). 9 C. polyanthophus, Gill. (under Cactus).

Cult. The same kind of soil recommended for Mamillaria, p. 160. will answer the species of this genus; and they are easily propagated by cuttings, which if left to lie a few days after being separated from the mother plant, strike root readily. In order to have several species on one tree, insert them in a plant of Pereskia.

Lin. syn. Acanthaceae, Monogynia. Tube of corolla very long, middle-sized, or very short, furnished with remote, unarmed scales, rising from the crenatures of the branches, among small innocuous spines. Limb of corolla fugacious, deeply multifid, and as if it were polypetalous, rosaceous or more or less of a ringent form. Branched, slender, hardly climbing subshrubs, natives of South America, growing among rocks or on the trunks of old trees; branches much compressed, 2-edged, thin but fleshy, lobately crenated, green, smooth; with a slender, woody, central axis. Flowers solitary, usually large and showy, white, rose-coloured, or scarlet, rarely sweet-scented.

The branches towards the roots are rather angular. The rest in Céucus, of which perhaps it is merely a section.

Sect. I. Nocturna (from nocturnus, nightly, or in the night; in reference to the time at which the flowers expand). Haw. in phil. mag. aug. 1829. p. 107. Corollas fugacious, sweet-scented, white, expanding alone at night; tube very long.

1 E. phyllanthus (Haw. syn. 197.) corolla small, much shorter than the tube, which is nearly a foot in length; stigmas 10. D. S. Native of South America, in Brazil, Guiana, and Surinam, Guadalupe, &c. Cactus phyllanthus, Lin. spec. 670. D. C. pl. grass. t. 145. Opuntia phyllanthus, Mill. dict. no. 9. Céucus phyllanthus, D. C. prod. 3. p. 469.—Dill. elth. t. 64. f. 74. Flowers white, 9–12 inches long, expending at night, sweet-scented.

2 E. Hookeri (Haw. l. c.) corolla middle-sized, much shorter than the tube, which is about half a foot long; stigmas usually 13. D. S. Native of South America. Flowers white, sweet-scented. Cactus phyllanthus, Hook. bot. mag. 2692.

Hooker's Epiphyllum. Fl. June, July. Clt.? Sh. 2 feet.

Sect. II. Diurna (from diurnus, belonging to the day-time; in allusion to the time of the blossoms expanding). Haw. in phil. mag. aug. 1829. Corollas scentless, open day and night; tube middle-sized or very short.

4 E. Vandesi (Hort.) branches flat or striguetous, with no spines in the notches, except when young, when there are a few small ones at the base; branches rather convex. D. S. A hybrid raised in the garden of the Count de Vandes at Bayswater, from the seed of E. phyllanthoideus, impregnated by the pollen of Céuces speciosissimus. The flowers are large, and of a deep red colour, and, upon the whole, it may be considered the most splendid of the genus.

5 E. Jenkinsonii; branches round or striguetous at the base, but always flat at the apex, with the notches more prominent and spiny than in any other species of the genus; the branches are likewise more convex and firm. D. S. A hybrid, raised from the seeds of Céucus speciosissimus, impregnated by the pollen of Epiphyllum speciosissimum. Cactus Jenkinsonii, Hort. The flowers of this hybrid are large, and of a deep scarlet-colour, and are said even to outvie in splendour those of E. Vandesi. There are several other hybrids now in various gardens, raised from the same parents as the present plant, which may prove even superior in splendour to any of the genus, but they have not yet flowered.

6 E. oxypletnum (Haw. l. c.) tube of flower length of the acuminated lobes; flowers sessile; fruit nerves longitudinally.
Native of Mexico. Cereus subquadriflorus, Moc. et Sesse, fl. mex. icon. incd. This is an anomalous species, as from the stems it agrees with Cereus tuberculatus, and from the rotate flowers it agrees with Opuntia. Flowers flesh-colored. Fruit white. Leaves terete, acute, soon falling off.

Rose-coloured Indian-fg. Shrub 2 to 3 feet.

3 O. Imbrica'ta (D. C. prod. 3. p. 471.) plant erect, terete, not furrowed, but superficially ribbed, and rather lobe-formed, somewhat imbricately tesselated in various ways. η. D. S. Native country and flowers unknown. Cereus imbricatus, Haw. rev. 70. Allied to O. cylindrica, but more robust according to Haworth, but according to the Prince de Salm-Dyck it is slenderer.

Imbricate-tesselated Indian-fg. Clt. 1820. Shrub 2 to 3 feet.

4 O. Stapel'iae (D. C. mem. cact. in mem. mus. 17. p. 117.) plant branched, irregularly tufted, deep green; joints ovate or oblone; areole small, tomentose in the axils of the tubercles; prickles 5-6 in a fascicle, stiff, straw-colored, setaceous, when old the epidermis or coat separates from them. η. D. S. Native of Mexico. Coulter, no. 38. Stem hardly an inch high. Habit almost of Stapelia cerniata, but which is without prickles.

Stapelia-like Indian-fg. Clt. 1830. Shrub 1 to 2 inches.

5 O. Extui'vata (D. C. l. c. p. 118.) plant branched, erect, nearly terete; branches furnished with compressed tubercles, and irregular crests, so as to make them nearly pentagonal; areole orbicular, velvety at the axils of the tubercles; prickles 6-12 in a fascicle, stiff, straight, when old the epidermis separates from them. η. D. S. Native of Mexico. Coulter, no. 18. Cactus tunicatus, Hort. berol. ex Salm-Dyck. Trunk a foot high, and 18 inches thick.

Var. β, angú'stior (D. C. l. c.) trunk slenderer; prickles fewer; areole narrower. Coulter, no. 17.

Var. γ, spinò'sior (D. C. l. c.) stem dwarf; prickles longer and more numerous, and more spine-like.

Stripped Indian-fg. Clt. 1830. Shrub 1 foot.

6 O. decipi'ens (D. C. l. c.) plant erect, branched, green; branches cylindrical, attenuated at the base; tubercles few, spirally disposed; areole small; prickles of two forms, the lower one large and spreadingly deflexed: the rest, 3-5 in number, bristle-formed and radiating. η. D. S. Native of Mexico. Coulter, no. 20. Leaves small, ovate-oblong, deciduous. Large prickles an inch long, who the epidermis separates from it. The rest 1-2 lines long. Compare it with O. cylindrica.
Deceiving Indian-fig. Clt. 1830. Shrub 2 to 3 feet.
7 O. Kleine (D. C. l. c.) plant erect, branched, greyish green; branches erect, cylindrical, without tubercles; fascicles disposed in a spiral manner to the left; areolae velvety; prickles of two forms, with numerous bristle-formed whitish brown ones in each fascicle, and one large spreadingly deflexed slender white one at the lower side of the fascicle. h. D. S. Native of Mexico. Coulter, no. 21. Stem more than a finger in thickness, like the stem of Cacalia Kleinei. Leaves small, oblong, deciduous. Large prickles an inch long.
Kleinia-like Indian-fig. Shrub 1 to 2 feet.
8 O. leptocaulis (D. C. l. c. p. 119.) plant erect, branched; branches cylindrical, erect, without tubercles; fascicles disposed in spiral lines to the left; areolae rather tomentose; prickles of two forms, the 3 lower ones in each fascicle setaceous, blackish, spreadingly deflexed, the rest bristly, crowded, and rufescent. h. D. S. Native of Mexico. Coulter, no. 22. Stem the thickness of the small finger. Referrible to the preceding species.
Slender-stemmed Indian-fig. Shrub 1 to 2 feet.
9 O. leucotricha (D. C. l. c. p. 119.) joints oblong, erect, when young velvety; areolae when young convex, velvety; prickles of two forms, 2 or 3 of which in each fascicle are very long, setaceous, unarmed, white, and spreading, and 4-5 very small, bristle-like, straight, yellow ones. h. D. S. Native of Mexico. Coulter, no. 2. Larger prickles 10-12 lines long. Intervals between the fascicles of bristles distant.
White-haired Indian-fig. Shrub.
10 O. Orronis (Link et Otto, pl. rar. hort. berol. t. 16.) stem nearly cylindrical, with 12 bluish ribs; the 3-4 middle spines in each fascicle are erectish, slender, brownish, longer than the rest, which are 10-14 in number, very slender, and spreading; petals acute, rather serrulatus, cuspidate. h. D. S. Native of Brazil. Otto's Indian-fig. Shrub.
11 O. pulvinata (D. C. c. l. c.) joints oval, erect, velvety; areolae convex, pulvinate, the whole occupied by innumerable, straight, crowded, yellow, fragile bristles, without any true prickles intermixed. h. D. S. Native of Mexico. Coulter. A very distinct species. O. macrodasy, Lehmann. hort. hamb. ex Salm-Dyck in litt.
Pulvinata Indian-fig. Shrub.

Sect. II. Divaricatae (from divaricatus, divaricated; branches). Haw. syn. 195. Stems humble; branches diverging; joints linear-lanceolate, thick, nearly terete. Prickles strong, in fascicles.
12 O. longispina (Link et Otto, hort. berol. Haw. in phil. mag. Feb. 1830. p. 109.) joints compressedly terete; spines puberulous, some of them small and fulvous, and a slender terete one (which is when full grown 3 inches long) in each fascicle. h. D. S. Native of Brazil. Long-spined Indian-fig. Clt. 1829. Shrub.
13 O. glomerata (Haw. in phil. mag. Feb. 1830. p. 110.) branches disposed in crowded tufts; central spines solitary in each tuft, linear, acuminate, flat on both sides, very long. h. D. S. Native of Brazil. Branches thick, teretely lanceolate, greenish, hardly half an inch broad.
14 O. foliosa (Salm-Dyck in litt. ex D. C. prod. 3. p. 471.) joints compressed, branched, pale green, when young leafy, when old prickly; prickles 1-2, elongated, pale straw-coloured, rising from yellowish tomentum. h. D. S. Native of South America. O. pusilla, Haw. syn. 195. but not of Salm-Dyck. Cactus foliosa, Willd. enum. suppl. 32. Flowers almost like those of O. vulgaris. Calyx of 5 sepals. Petals 8-10, yellow. Stigmas 3-4, white.

Leafy Indian-fig. Fl. June. Clt. 1805. Shrub 
1/2 to 1 foot.
15 O. curassavica (Mill. dict. no. 7. Haw. syn. 196.) plant erect; joints brittle, cylindrically ventricose, compressed, very much divaricated, deep green; prickles 1-4 in each fascicle, whitish. h. D. S. Native of Curassao. Bradd. succ. t. 4. Cactus Curassavicus, Linn. spec. 670. Flowers yellow, an inch and a half in diameter. Stigmas 3-5.

Var. \( \beta \), longa (Haw. rev. p. 71.) branches more firm, and twice the length of those of the species. h. D. S. Native of Brazil. Perhaps a proper species. There are several other varieties mentioned by Haworth, but they appear to have sprung more from the state of the plants, and the manner of culture.

16 O. fraxinella (Nutt. gen. amer. 1. p. 296. under Cactus.) joints short, oblong, nearly terete, fragile, doubly spinose; fruit dry and prickly. h. H. Native of North America, in sterile places about the river Missouri. Flowers small, yellow, solitary on the tops of the branches. Truly distinct from all the rest, and will perhaps form a distinct section along with two other unpublished species, which are now growing in the garden of the Prince de Salm-Dyck.

Brillte Indian-fig. Clt. 1814. Shrub 1/2 to 1 foot.
17 O. fusilla (Salm-Dyck, obs. bot. 1822. et in litt. 1827.) plant prostrate, divaricate, of a dirty-green colour; joints cylindrical, cuculliferous; fascicles of prickles crowded; prickles setaceous, white, rising from white tomentum, 1 or 2 in each fascicle are more elongated than the rest. h. D. S. Native of South America. Joints rather attenuated at the apex.
Small Indian-fig. Clt. 1817. Shrub prostrate.

Sect. III. Grandispinoae (from grandis, great, and spinosus, full of spines; in reference to the prickles being large and numerous). Haw. syn. 195. Joints compressed, ovate or obovate. Prickles variable, the smaller ones setaceous, and the larger ones much longer and stronger.
18 O. missouriensis (D. C. prod. 3. p. 472.) joints broad, nearly orbicular, very prickly; prickles of 2 forms, larger ones radiating and permanent; flowers numerous; fruit dry and prickly. h. H. Native of North America, in arid places about the Missouri, plentiful. Cactus ferox, Nutt. gen. amer. 1. p. 296. but not of Willd. O. polycantha, Haw. rev. p. 82. Larger than O. vulgaris. Flowers pale yellow, or sulphur-coloured. Stigmas 8-10, greenish. Prickles white.

Missouri Indian-fig. Fl. June, July. Clt. 1814. Sh. 1 ft.
19 O. ferox (Haw. suppl. p. 82.) joints oblong, elongated; prickles strong and setaceous, numerous, whitish, in fascicles, longer than the wool from which they issue, one of which in each fascicle is longer than the rest. h. D. S. Native of South America. Cactus ferox, Willd. enum. suppl. p. 35. but not of Nutt. The rest unknown.

Fierce Indian-fig. Clt. 1817. Shrub 2 to 3 feet.
20 O. spinosissima (Mill. dict. ed. 8. Haw. syn. 193.) joints oblong; prickles yellowish, setaceous, and subulate, very numerous, in fascicles, longer than the wool from which they issue. h. D. S. Native of Jamaica. Cactus spinosissimus, Lam. dict. 1. p. 537. Flowers yellow.

Very-spiny Indian-fig. Fl. July. Clt. 1732. Sh. 6 to 10 feet.
21 O. horrida (Salm-Dyck in litt. ex D. C. prod. 3. p. 472.) plant erect; joints cuneately obovate, repand, tubercled; fascicles of prickles remote; prickles of various forms, yellow, painted with brown, rising from setaceous yellow tomentum, one in each fascicle longer than the rest, about 2 inches in length. h. D. S. Native of South America. O. humilis, Haw. syn. 189. Cactus humilis, Haw. misc. 187. but the name is deceitful, the plant growing to a considerable height. Flowers yellow.
Perhaps Cactus hümílis, Lag. nov. spec. is different from this. The plant often occurs in the gardens under the name of O. Túna. Horrid Indian-fg. Fl. July. Clt. 1735. Shrub 1 to 3 ft. 22 O. Dilleñi (Haw. suppl. p. 79.) plant erect; joints roundish-ovate, undulated, glaucous; prickles strong, divaricated, yellow, but the brush-like bristles by which they are surrounded are much shorter. тяж. D. S. Native of South America. —Dill. elth. f. 382. Cactus Dillénni, Ker, bot. reg. 255. Flowers large, pale yellow. Ovarium shorter than the corolla, furnished at the summit by fascicles of bristles.

Dillenii's Indian-fg. Fl. Oct. Clt. 1810. Sh. 3 to 5 ft. 23 O. Téna (Mill. dict. no. 3. Haw. l. c.) plant erect; joints broadly ovate-oblong; prickles subulate, long, yellow; wool at the base of the spines short. тяж. D. S. Native of South America. Cactus Bonplandii, H. B. et Kunth, nov. gen. amer. 6. p. 69.—Dill. elth. 386. t. 295. f. 386. Flowers of an orange-colour, or iron grey-colour, or dirty red. Stigmas 8-10-eleft. This kind of Indian-fg makes strong fences. When the Island of St. Christopher was to be divided between the English and the French, three rows of the Tuna were planted by common consent between the boundaries. Sloane. Sir James Smith, in his paper upon the irritability of vegetables, informs us that the long and slender stamens of the flower are very irritative; and that if a quill or feather is thrust through them, in the space of 2 or 3 seconds they begin to lie down gently on one side, and in a short time become recumbent at the bottom of the flower. According to Humboldt and Bonpland the fine kind of cochineal is nourished by this plant.

Blackish Indian-fg. Fl. Aug. Clt. 1795. Sh. 2 to 3 feet. 28 O. Máxima (Mill. dict. ed. 8. no. 5.) plant erect; joints ovate-oblong, very thick; spines unequal. тяж. D. S. Native of South America. Perhaps the same as O. Amyclea.

Greatest Indian-fg. Shrub 6 to 8 feet. 29 O. Triacén (Willd. enum. suppl. under Cactus,) joints ovate-oblong; prickles whitish, usually 3 together, strong, longer than the wool from which they issue. тяж. D. S. Native of South America. Very nearly allied to O. polyantha ex Salm-Dyck in litt. but the joints are a little larger, and the prickles are white. Flowers unknown.

Three-spined Indian-fg. Shrub 2 to 3 feet.

Sect. IV. Parvispinosæ (from parvus, small, and spinosus, full of spines; in reference to the spines being small, equal, and numerous). D. C. prod. 3. p. 473. Prickles uniform, hair-shaped, short or nearly wanting.

30 O. decumána (Haw. rev. 71.) joints ovate-oblong; prickles deciduous, length of the wool from which they issue. тяж. D. S. Native of South America. Cactus decumánum, Willd. enum. suppl. 34. O. máxima, Mill. dict. ed. 2. no. 5. Cactus elongáthus, Willd. enum. suppl. 34. There are varieties of this plant with either ovate or lanceolate-oblong joints, almost unarmured or furnished with some white prickles. Flowers yellow. The cochineal bug thrives almost as well on this species as on the next.

Of the particular species of Opúntia which nourishes the cochineal insect much doubt has existed. There is some reason to believe that the Opúntia cochinillifera, Haw. Cactus, Lin is not the plant which produces the best Mexican cochineal. Tolila, on the authority of well informed travellers, states that the cochineal Cactus has no spines, and a fruit imbued with deep red pulp. Clavigero, however, says, "In Misteca, where I was for five years, I always saw the insect upon prickly Nopals. M. de Raynal imagines that the colour of the cochineal is to be ascribed to the red fig on which it lives; but that author has been much misinformed, for does the cochineal feed upon the fruit, but only upon the green part of the plant; nor does that species of Nopal bear red, but white figs. Clavigero adds, "it may be reared upon the species with red fruit, but that is not the proper plant of the cochineal." M. Thierry de Menonville, who procured the cochineal insect, and the Opúntia on which it feeds from Guaxaca in Mexico, and transported them to St. Domingo, and who unquestionably had the best means of determining the kinds of Cacti cultivated for the insect, describes particularly 3 sorts on which it may be reared, and cultivated to advantage. The first is the Cactier Nopal, upon which alone the cochineal is reared in Mexico, both the fine and the common sorts, although there are throughout the country many other kinds of Opúntia. The two following, therefore, it is presumed are employed in St. Domingo. 2. The Cactier splendide, which may be used to equal advantage with the former; and 3. The Cactier de Campeché. Of these the first, as far as can be determined by description, is the Cactus Túna of Lin. which is the Opúntia Túna of Mill. The second appears to be very similar to the former, but larger in its joints, and very glaucous. The third is without doubt the Cactus cochinillifera, Lin. and which he says of it from his own experience, that it may be usefully employed for rearing the Cochillea sylvestre, and may even support a small quantity of the fine kind. Humboldt also, although
he allows that it is the plant upon which the cochineal has often been sent to Europe, asserts that our Opuntia cochinchinifera is not the individual of the Mexican Nopaleries, which he makes a new species under the name of O. Bonplandii, and he quotes under it a mark of doubt the Cactus Tuno of Lin. At Rio Janeiro, when that place was visited by the Chinese embassy under Lord Macartney, there were considerable plantations of Cactus Tuno, now Opuntia Tuno, for rearing the cochineal, which had sometime previously been introduced to Brazil. In St. Vincent the Rev. L. Guilding has a considerable nursery of the Opuntia cochinchinifera inhabited by thousands of the true cochineal; and he is in expectation of sending to the Society of Arts a large quantity of the dried insects. From all that has been said it may be inferred with safety that in Mexico and Brazil the Opuntia Tuno or Bonplandii is the favourite food of the cochineal; and that in the West Indian Islands, where O. Tuno is perhaps less frequent, the O. cochinchinifera is employed by the natives, and answers the purpose sufficiently well.

Like all the species of Opuntia, the plants propagate readily by having the joints stuck into the ground, and the plants love dry and barren spots. If cultivated for the purpose of rearing the cochineal, it must be defended, at least in the rainy Island of St. Vincent, from storms and winds, by sheds placed to windward.

The cochineal insect, which feeds upon the kinds of Opuntia just mentioned, is too well known to need a particular description here; as are also its valuable properties in producing the dye which bears its name, and carmine. It is the Coccus cacti of Linnaeus, a small insect of the order Hymenoptera, having a general appearance not very dissimilar to that of the mealy-bug of our gardens, and equally covered with a white powdery substance. The male is winged. It is originally a native of Mexico, and was cultivated for its precious dye long before the conquest of that country; and these plantations, called Nopaleria, are most extensive in the Misteca and Oaxaca; the latter district alone has exported, according to Humboldt, upon the average 32,000 arobas annually, estimated at 2,400,000 piastrés, above 500,000£ sterling.

In Sloane's Jamaica, vol. 1. t. 9., a representation of a Mexican Nopaleria is given from a drawing made at Guayaxca, by an Indian. In these small plantations or enclosures they cultivated either the fine sort (Granna fina of the Spaniards), or the common kind (Granna sylvestre), which differ by the first having a finer quality and more powdery covering; whilst the latter, less valuable in its produce, has a cottony covering; but whether these two insects be specifically distinct has not yet been determined. The placing of the females, when big with young, is called sowing. The proprietor of a Nopaleria buys in April or May the branches of joints of the Tunas de Castilla (Opuntia Tuno), which are sold in the market of Oaxaca at about 3 francs a hundred, loaded with young cochineals (semlilla). These are kept in cellars for 20 days, when they are exposed to the air, suspended under a shed. So rapidly then is the growth of the insect, that by August or September the females are big with young, and ready for sowing, which is done in small nests, made of the fibrous parts of the foliage of a Tillandia called Paxte. In four months from the time of sowing the harvest commences. The insects are brushed off with a squirrel's or deer's tail by women, who sit during this operation, for whole hours at one Nopal plant; so that were it not for the extreme cheapness of labour in that country, Humboldt says, that the rearing of the cochineal would prove an unprofitable employment. After being gathered, the insects are killed by boiling water, or by exposing them in heaps to the sun, or by means of the vapour baths of the Mexicans (temazcalli); and when dry they are fit for exportation. By the latter method, the powdery substance is preserved, which increases the value of the insects in commerce. Dr. Bancroft has estimated the annual consumption of cochineal in Great Britain only at about 750 bags or 150,000 lbs, worth £275,000. "a vast amount," as the authors of the introduction to Entomology observe, "for so small a creature, and well calculated to show us the absurdity of despising any animals, on account of their minuteness." According to the same writers, the only kind of cochineal that has been conveyed to the East Indies is the sylvestre or wild cochineal from Brazil, and the Court of Directors of the East India Company have offered a reward of 6,000£ to any person who should introduce the more valuable sort. The insects were introduced to the royal gardens at Kew in 1814 from Martinico, by M. Castlenuae d'Auros, late superintendent of the botanic garden on that island. In 1820, the cochineal was introduced to the Apothecaries' botanic garden at Chelsea by W. Princep of Calcutta, from some of the Nopaleria of Mexico.

32 O. Ficus-Indica (Haw. syn. p. 191.) joints ovate-oblong, obtuse at both ends; prickles setaceous, length of the wool from which they rise. D. S. Native of South America. Cactus Ficus Indica, Lin. spec. 670. Wild, even suppl. 54. Joint a foot long. Prickles all setaceous, and very short. Flowers sulphur-coloured. Fruit large, edible, deep purple. This is the most common kind of Indian-fig in Jamaica, and upon the fruit of it a wild kind of cochineal feeds. The plant is to be found in many parts of Asia, but has perhaps been transplanted thither.

33 O. F. Tuno (Salm-Dyck, obs. bot. 1822. et in litt. 1827.) plant erect, branched, light green; joints obovate, compressed, large, thick; fascicles of prickles distinct; prickles yellow, setaceous, collected into brush-like heaps: lower one of each heap strong, and subulate. D. S. Native of South America. Allied to O. Ficus-Indica, but more shining. This species occurs often in gardens under the name of O. Tuno.

False-Tunone. Shrub 2 to 3 feet.

Tomentose Indian-fig. Clt. 1820. Shrub 2 to 3 feet.

35 O. lancerolata (Haw. syn. 192.) plant erect; joints lanceolate; spines uniform, very short. D. S. Native of South America. Cactus lancerolatus, Haw. misc. p. 188. Leaves larger in this species than any of its allies, generally they are more than 3 lines long. Flowers 4 inches in diameter, of a shining yellow-colour. Stigmas 5, sulphur-coloured.

36 O. tuberculata (Willd. enum. suppl. p. 34. under Cacti,) joints ovate-oblong, attenuated at both ends; tubeerec spiny; prickles setaceous, about equal in length to the wool from which they rise. D. S. Native of tropical America. Haw. rev. p. 80. The rest unknown.

Warted Indian-fig. Clt. 1818. Shrub 1 to 2 feet.

37 O. intermis (D. C. prod. 3. p. 473.) plant strictly erect; joints fleshy, ovate-elliptic; spines uniform, very short, hair-formed, very numerous. D. S. Native of South America. Cactus Opuntia, D. C. pl. grs. no. 193. with a figure. Cactus strictus, Haw. misc. 188. but not of Willd. O. stricta, Haw. syn. 191. Flowers yellow on both sides, spreading.
Unarmed Indian-fig. Fl. July, Aug. Clt. 1796. Sh. 2 to 3 ft. 38 O. Amūle'a (Tenore, fl. neap, append. 3. p. 15.) joints orbicular or elliptic, very broad, flat, compressed; prickles strong, diverging, white, without any wool at their base.  h. F. Native of the kingdom of Naples, near Amylea, and at Monticelli and Portella, on calcareous rocks. Joints 10 inches broad, and 15 inches long. Prickles 6-18 lines long, but sometimes wanting altogether. Flowers yellow. Fruit reddish yellow. Perhaps the same as O. máxima, Salm-Dyck.

Amylea Indian-fig. Shrub 2 to 4 feet. 39 O. Rubescens (Salm-Dyck in litt. 1827. ex D. C. prod. 3. p. 474.) plant erect; joints elongated, compressed, reddish green, somewhat tuberculately areolate, unarmed; leaves small, reddish, at the base of the white of theomentum.  h. D. S. Native of Brazil. This plant is very showy when young, being of a reddish-colour, and the stem flat and elongated, nearly as in O. spinosissima, but absolutely without spines.

Reddish Indian-fig. Shrub 1 to 2 feet. 40 O. cra’ssa (Haw. suppl. p. 81.) plant erect; joints ovate or oblong, very thick, full of a fleshy substance; fascicles of bristles minute, unarmed, yellowish.  h. D. S. Native of Mexico.

Common Indian-fig or Prickly-pear. Fl. July, Aug. Clt. 1596. Shrub ½ to 1 foot, but usually prostrate and rooting. 42 O. Hernándezii (D. C. diss. t. 16.) plant erect; joints thick, roundish-ovate, nearly unarmed; flowers expanded; stamens shorter than the style and petals.  h. D. S. Native of Mexico. Cactus cochinillifera, Moc. et Sesé, fl. mex. icon. ned. Nopal Nochita, Hern. mex. 78. with a figure, and 489. f. 1. Nopal sylvestre, Thierry-Menon. voy. Guáx. 2. p. 277. with a figure. According to Thierry, the flowers on the same plant vary from purplish to rose-colour, and greyish lilac. The cochineal thrives well on this species.

Hernández’s Indian-fig. Clt. 1827. Shrub 1 foot.

43 O. Brasiliensis (Willd. enum. suppl. 33. under Cactus) stem terete; joints of branches compressed, flat, ovate; spines strong, solitary.  h. D. S. Native of Brazil. Cactus paradoxo, Horn. hort. hafn. 2. p. 443.—Hoffm. verz. 1826. p. 75. Pis. bras. p. 100. f. 2. Flowers yellow.

Brazilian Indian-fig. Fl. Jul. Aug. Clt. 1816. Sh. 4 to 6 ft. 44 + The following species are only known by name, not having been described.

1 O. leuconpta, Hort. berol. 2 O. aláta, Hort. berol. 3 O. myriacantha, Hort. berol. 4 O. subinérnis, Link. 5 O. sulphúrea, Gill. (under Cactus). 6 O. sericea, Gill. (under Cactus).

Cult. The species of Indian-fig are of very easy culture: the soil recommended for Mammillaria will suit them; and in order to propagate them, the branches should be separated at the joints, and allowed to lie a few days to dry after being so separated, and when stuck into the earth they will soon strike root.

Lin. syn. Icosándria, Monogyñia. Sepals numerous, adnate to the ovary, and often remaining on the fruit, leaf-formed. Corolla rotate, nearly as in Opúnita. Stamens numerous, much shorter than the petals. Style filiform; stigmas collected, in a spiral manner. Berry globose or ovate. Seeds imbedded in the pulp.—Shrubs or trees. Branches terete. Prickles solitary at the axils of the leaves, and in fascicles on the stem. Leaves distinct, flat, larger than those of any other genus in the present order. Flowers somewhat panicked, solitary, terminating the branches, or rather lateral.—Perésscia, Thierry-Menon. voy. guáx. 2. p. 275. is probably a species of Opúnita.

1 P. aculea’ta (Mill. dict. Haw. syn. 198.) leaves elliptic; prickles solitary, in the axils of the leaves, but becoming at length in fascicles on the stems; flowers rather panicked; fruit globose, bearing the foliaceous sepals.  h. D. S. Native of the West Indies, where it is called American or Barbadoes Gooseberry by the inhabitants, and by the Dutch Blood-apple. Plum. gen. t. 26.—Dill. hort. elth. t. 227. f. 294. Cactus Perésscia, Lin. spec. 671. Prickles half an inch long. Buds rather woolly. Flowers white. Fruit yellowish, edible.

Long-spined Barbadoes-gooseberry. Shrub 4 to 6 feet. 3 P. Ble’s (H. B. et Kunth, nov. gen. amer. 6. p. 69.) leaves oblong, acuminated; prickles axillary, 5-6 in a fascicle; flowers 2-4 together at the tops of the branches, each on a short peduncle; petals obovate, retuse.  h. D. S. Native of New Granada, on the banks of the river Magdalena, near Badilla, where it is called Bleo by the inhabitants. Lindl. bot. reg. 1173. Flowers pale red. Stamens also red, but white at the base. Stigma 5-7-cleft.

Bleo Barbadoes-gooseberry. Fl. Oct. Jan. Clt. 1827. Pl. 8 to 10 feet. 4 P. nóráida (H. B. et Kunth, l. p. 70.) leaves oblong, acute at both ends; spines 1-3 together, subulate, in the woolly axils of the leaves; flowers 2-5 together, axillary, pedunculate, rising above the spines.  h. D. S. Native of South America, in the province of Jaén de Bracamoros, on the banks of the Amazon. Flowers small, red. Stigma 3-4-cleft.

Horrí Barbadoes-gooseberry. Shrub or tree. 5 P. portulacéfolia (Haw. syn. 199. in a note) leaves obovate-cuneated; prickles solitary, under the leaves, but at length coming in fascicles on the stem; flowers solitary; petals emarginate; fruit globose, retuse, naked.  h. D. S. Native of the West Indies.—Plum. ed. Burm. 197. f. 1. Cactus portulacéfolus, Lin. spec. 671. Lun. hort. jum. 2. p. 256. About the size of an apple-tree. Prickles blackish. Flowers terminal, purple; petals roundish. Fruit umbilicate, greenish, with white flesh, and numerous black seeds.

6 P. zimílleflóra (D. C. diss. t. 17.) leaves ovate, acute, undulate; prickles axillary, twin; but at length somewhat fasciculate on the stem, about the cicatrices occasioned by the falling of the leaves; flowers solitary, terminal; petals obcordate; ovary bearing the sepals.  h. D. S. Native of Mexico. Cactus zimilléflor, Moc. et Sesé, fl. mex. icon. ned. Flowers of a deep reddish-violet colour, greenish on the
outside, about an inch in diameter. Very like the preceding species.

*Zinnia*-flowered Barbadoes-gooseberry. Tree 10 feet.

7 P. *lychnidiflora* (D. C. diss. t. 18.) leaves ovate, acute; prickles solitary in the axils of the leaves, but perhaps in fascicles on the stems; flowers solitary, terminal; petals cuneated, fringed at the apex; ovary bearing the sepals. \( \gamma \). D. S. Native of Mexico. Cactus *fimbriatus*, Moc. et Sesse, fl. mex. icon. ined. Flowers of a coppery peach colour, about 2 inches in diameter, similar to those of *Lychne coronatus*.

*Lychne*-flowered Barbadoes-gooseberry. Shrub.

8 P. *opuntiiflora* (D. C. diss. t. 19.) leaves oblong, mucronate, usually 2 together; prickles axillary, solitary, very long, but perhaps disposed in fascicles on the stem? flowers usually terminal, or nearly so, solitary; petals ovate, acuminate; ovary bearing fascicles of hairs. \( \gamma \). D. S. Native of Mexico. Cactus *opuntiiflorus*, Moc. et Sesse, fl. mex. icon. ined. Flowers of a dirty scarlet colour, an inch in diameter; petals disposed in 2 series.

*Indian-fig*-flowered Barbadoes-gooseberry. Shrub.

9 P. *rotundifolia* (D. C. diss. t. 20.) leaves roundish, mucronate; prickles axillary, solitary, but perhaps disposed in fascicles on the stem; flowers solitary, lateral? petals broad, roundish, mucronate; ovary bearing the sepals; fruit obovate, full of cactriecies. \( \gamma \). D. S. Native of Mexico. Cactus *rotundifolius*, Moc. et Sesse, fl. mex. icon. ined. Flowers yellow, variegated a little with scarlet, 15 lines in diameter. Berry red, obovate.

Round-leaved Barbadoes-gooseberry. Shrub.

10 P. *grandifolia* (Haw. suppl. p. 85.) leaves oblong-lanceolate, smooth above, beset with rough dots beneath; stem very spiny. \( \gamma \). D. S. Native of Brazil. Cactus *grandifolius*, Link, Enum. 2. p. 25. Spreng. syst. 2. p. 498. Larger spines blackish, 2 inches long.

Great-leaved Barbadoes-gooseberry. CIt. 1818. Sh. 6 feet.

Cult. The species of this genus are very different in habit from the rest of the genera of the present order, from the branches being woody and furnished with proper leaves; but the flowers resemble the other genera of the order. They are of easy culture, growing freely in any light earth; and cuttings of them are readily rooted in mould or sand, under a hand-glass, in heat. A large plant of any of the species has a very grotesque and ornamental appearance, when several species of *Cereus* and *Epiphyllum* has been grafted or inserted on it.

Tribe II.

*RHIPSALIS* deae (this tribe only contains the genus *Rhisp- salis*). D. C. prod. 3. p. 475. Ovula, and therefore the seeds are fixed to the central axis of the berry.

Lin. syst. *Icosandra, Monogyenia*. Tube of calyx adhering to the ovary, smooth; limb superior, 3-6-parted, short; teeth acuminate, membranous. Petals 6, oblong, spreading, inserted in the calyx. Stamens 12-18, fixed to the base of the petals. Style filiform, crowned by 3-6 stigmas. Berry pellucid, roundish, crowned by the marcescent calyx. Seeds imbedded in the pulp, without albumen; radicle of the embryonic thick; cotyledons 2, short, obtuse.—Small shrubs, growing upon trees in the West Indies, usually pendulous, branched, leafless, and terete, naked or bearing rather falcate small bristles; fascicles of bristles, when present, disposed in a quincuncial spiral order. Flowers lateral, sessile, small, white. Berries pellucid and white, nearly like that of *Viscum* or *Mistletoe*.

Var. \( \beta \). Mauritiana (D. C. Prod. 3. p. 476.) plant creeping? branches crowded, jointed. \( \gamma \). D. S. Native of the Mauritius, on the rock called Lapoupe. Cactus pendulinus, Sieb. fl. maur. 2. no. 259. Perhaps this plant has been introduced to the Mauritius from the Brazils, as all the other species of this genus are natives of America. Flowers whitish. Berries white.

2 R. *hookeriata*; plant pendulous; branches verticillate, naked, glabrous; calyx 4-parted; petals 4. \( \gamma \). D. S. Native of the West Indies and Mexico. R. *Cassutha*, Hook. exot. fl. t. 21. R. *Cassutha beta*, Hookeriata, D. C. prod. 3. p. 476. Flowers white. Berries white, about the size of those of a red currant, 12-20-seeded.

*Cassutha*-like Rhipsalis. Shrub 1 foot.

Dichotomous Rhipsalis. Shrub 1 foot.

7 R. *salicornioides* (Haw. suppl. p. 83.) plant erect, branched, proliferous at the joints; joints short, obclavate, terete, and angular, with fascicles of very minute hairs, floriferous at the apex; flowers solitary. \( \gamma \). D. S. Native of South America. Otto et Link. abbl. t. 49. Petals 7-10, acute, yellow, longer than the stamens and style.

8 R. *mesembryanthoides* (Haw. rev. p. 71.) plant glomerately branched; branches erect, terete, straight, bearing joints.
joints lateral, crowded, terete, attenuated at both ends, clouded, bearing the flowers in the middle; fascicles of capillaceous bristles white or pale, but when old and faded black; flowers solitary.\footnote{D. S. Native of South America. Christy, in bot. mag. 3878. C. salicornoides \beta, Haw. suppl. p. 83. Joints at the sides of the branches numerous, crowded, and nearly erect. Flowers solitary, rising from the middle, not from the tops of the joints, white. Fruit a white berry, smaller than those of \textit{R. Cassijtha}.}

\textit{Fig-marigold-like} Rhipsalis. Fl. Ju. Ju. Clt. 1817. Shb. 3 ft. 9 \textit{R. parasitica} (D. C. prod. 3. p. 476.) plant pendulous, branched, glabrous; branches striated, or undulately repand.\footnote{D. S. Native of the West India Islands.—Plum. ed. Burnt. t. 197. E. 2.} Flowers like those of \textit{R. dichotoma}. This species is hardly known, but distinct from the others in the stem being repand in an undulating manner.

\textit{Parasitic} Rhipsalis. Shrub 1 foot. 10 \textit{R.? micrantha} (H. B. et Kunth, nov. gen. amer. 6. p. 65. under \textit{Cactus}) plant glabrous, pendulous, branched; branches with 3-4 angles, or compressedly 2-edged; flowers rising from the angles.\footnote{D. S. Native of Quito, in groves, near Olleros. Flowers white, minute.} Small-flowered Rhipsalis. Shrub 3/4 foot.\footnote{\textit{Cult.} This is a genus of singular plants, but without much beauty. Being parasites, on trees, they grow best in vegetable mould, mixed with a little brick rubbish; and they are easily increased by cuttings.}

\textbf{Calyx superior} (f. 32. d. f. 33. b.); limb 4-5-parted (f. 33. b. f. 32. a.), regular, coloured. Petals 5, inserted in the throat of the calyx (f. 33. c.), and alternating with its segments, equal. Stamens 4-5 (f. 33. c.), very rarely 6, very short, inserted alternately with the petals, equal; filaments conical or cylindrical, distinct; anthers 2-celled, opening lengthwise on the inside; but in the varieties of \textit{Rubrum} they burst laterally and transversely. Ovarium 1-celled, with 2 opposite parietal placenta; ovula numerous. Style one, 2 (f. 32. c. f. 33. e.) -3 or 4-cleft. Fruit succulent (f. 32. c.), nearly globose, umbilicate at the apex from the permanent calyx (f. 32. d.), 1-celled, many-seeded. Seeds arillate, suspended by a long filiform podosperm; outer integument gelatinous or juicy, and membranous: under one a very thin membrane, adhering closely to the albumen; blumish at the extremity opposite the hymen. Albumen horny, conforming to the seed, white. Embryo minute, placed at the sharpest end of the seed, excentral, with a blunt radicle, which is placed next the hilum.—\textit{Unarmed} or spiny shrubs. Leaves alternate, lobed or cut, plaited while in the bud. There is one bractea at the base of each pedicel, which is cut more or less, and two much smaller ones called bracteoles under each ovary. Flowers greenish, white, yellow or red, very rarely unisexual.

This order was formerly confounded with \textit{Cáctae} without the dissimilarity of their appearance they are most closely related; the principal differences between the two orders are, that in \textit{Cáctae} the stamens are indefinite, the seeds without albumen, and the calyx and corolla indistinguishable; while in \textit{Grossulariae} the stamens are definite, the seeds albuminous, and the calyx and corolla distinct. There are spines in both orders, and some of the \textit{Cáctae} have distinct leaves.

The properties of the gooseberry and currant are those of the generality of the order, except that in other species a mawkish or extremely acid taste is substituted for the refreshing and agreeable flavour of the former. Some are emetic. The black currant, which is tonic and stimulant, has fragrant glands upon its leaves and flowers; these reservoirs are also found upon some other species. Malic acid exists in currants and gooseberries. Turner, 634.

\textbf{I. RIBES} (the name of an acid plant mentioned by the Arabian physicians, which has been discovered to be the \textit{Ríbem Ríbes}). Lin. gen. 281. Berlandier, mem. soc. phys. gen. 3. pt. 2. p. 43. t. 1-3 and D. C. prod. 3. p. 477.—Grossularia. Tourn. Gétt.

\textbf{Lin. syst.} Pontändria, Monogjinía. Character the same as the order.

\textbf{Sect. I. Grossulaaria} (a dim. of grossus, thick; meaning a gooseberry bush; the species contained in this section all bear goosseberries). Ach. Rich. l. c. Berlandier, l. c. t. 1. Stems usually prickly (f. 32. ). Peduncles 1-3-5-flowered. Calyx more or less campanulate (f. 32. a.). Leaves plicate.

\* Flowers greenish.

1 \textit{R. oxyacantha} (Lin. spec. 291.) plant prickly and bristly, naked; spines 1 or 3, joined at the base; leaves corolate, 5-lobed, serrated, often pubescent beneath, and on the petioles; peduncles very short, usually 2-flowered; tube of calyx glabrous, hairy inside, with a spreading limb, which is longer than the obovate petals; germs and pedicles naked.\footnote{2. H. Native of North America throughout Canada, and as far as the Saskatchewan, and of Newfoundl. Berlandier, l. c. t. 1. f. 1. The shrub varies much in the aculei and spines, in their number and colour, and in the more or less dense ramifications, and pubescence. Mr. Drummond says, the fruit of this species is much like the common gooseberry, and is equally agreeable, either of a red or green colour.}

\textit{Hawthorn-like} Gooseberry. Fl. May, June. Sh. 3 to 4 ft. R. setosum (Lindl. bot. reg. t. 1257. Hook. fl. bor. amer. 1. p. 230.) branches beset with dense bristles; prickles unequal, subulate; leaves roundish, coriaceous at the base, pubescent, 3-5-lobed, deeply crenated; peduncles 2-flowered, rather bracteate; calyx tubularly campanulate, with the segments linear, obtuse, and spreading, twice the length of the petals, which are entire; berries hispid.\footnote{2. H. Native of North America, on the banks of the Saskatchewan.}

3 \textit{R. trilórum} (Willd. hort. berol. t. 61.) prickles wanting; spines usually solitary; leaves coriaceous, 5-lobed, serrated, glabrous; peduncles elongated, 2-3-flowered; tube of calyx narrow, cylindrical, glabrous, with a spreading limb, which afterwards becomes reflexed; stamens exserted; ovary naked.\footnote{2. H. Native of North America, in mountainous situations to the west of the Rocky Mountains; and of Pennsylvania. Berlandier, l. c. t. 1. f. 4. R. stamineum, Horn. hort. hafn. p. 237. Berry reddish, glabrous. The species seems to be easily distinguished from \textit{R. Cynoabati} by the constantly smooth fruit, very narrow flowers, and exserted stamens.}

A a
Three-flowered Gooseberry. Fl. April, May. Clt. 1812. Sh. 3 to 4 ft.
4 R. Cyno'sbati (Lin. spec. 292.) stem unarmed, rarely prickly; spines usually twin; leaves cordate, 5-lobed, serrated, more or less pubescent underneath, and on the petioles; peduncles elongated, 2-3-flowered; pedicels divaricate; tube of calyx ovate-cylindrical; limb spreading, with the segments extending the petals, which are obovate; stamens hardly exerted; ovarium bristly. h. H. Native of Canada (Michx.) Japan (Thunb.), Berlandier, l.c.t. 1. f. 3. Jacq. vind. 2. t. 123. Berries bristly or prickly. It hardly differs from R. divaricatum, except in the broader tube of the corolla, and the shorter stamens.

Var. β. fruit unarmed. h. H. Native of Hudson's Bay.

Var. γ; branches prickly; peduncles shorter; flowers pubescent, purplish; fruit prickly. h. H. Native about Lake Huron.

Dog-Bramble Gooseberry. Fl. Apr. Clt. 1759. Sh. 3 to 4 ft.
5 R. divaricatum (Dogl. in bot. reg. 1859.) branches divaricate, bristly, at length naked; spines 1-3 together, axillary, deflexed, large; leaves roundish, 3-lobed, deeply toothed, nerved, glabrous; peduncles 3-flowered, drooping; calyx funnel-shaped: with the segments at length spreading, and twice the length of the tube; style and stamens exerted; berries glabrous. h. Native of the north-west coast of America, a common bush on the banks of streams near Indian villages. This species comes nearest to R. triflorum. Berries black, smooth, and spherical, pleasant to the taste. Petals white.

Divericatum Gooseberry. Fl. April. Clt. 1826. Sh. 5 to 7 ft.
6 R. iridi (Dogl. in hort. trans. 7. p. 516. Hook. fl. bor. amer. 1. p. 231.) prickles axillary, tern; leaves cordate, somewhat 5-lobed, toothed, ciliated, piose on both surfaces, nerved; peduncles 3-flowered, beset with glandular pili; calyx campanulate; segments linear, about equal in length to the tube; berries glabrous. h. H. Native of the north-west coast of America, on moist mountain rocks near springs and streams, on the Blue Mountains, and on the banks of the Spokan river. Berries spherical, half an inch in diameter, smooth, juicy, and well flavoured. Apparently closely allied to R. triflorum.

Well-watered Gooseberry. Shrub 3 to 4 feet.
7 R. saxatum (Hook. fl. bor. amer. 1. p. 231.) stem unarmed, rarely prickly; spines wanting, solitary or twin; leaves cordate, 5-lobed, serrated, smoothish; peduncles very short, deflexed, 1-2-flowered, calyx glabrous, with a campanulate tube; segments spreading, but at length reflexed, twice the length of the corolla, and about equal in length to the stamens; ovarium naked. h. H. Native of the north-west coast of America, common on the undulating grounds of the interior among stones; and about Lake Huron, and on the banks of the Saskatchewan; also near Boston. R. saxatile, Doug. mss. R. triflorum, Bigel. fl. bost. ed. 2. p. 90. Fruit resembling a common gooseberry.

Stone Gooseberry. Shrub 3 to 4 feet.
8 R. hirtellum (Michx. fl. bor. amer. 1. p. 479.) spines nearly axillary; branches beset with a few short bristly hairs; leaves small, semi-trifid; lobes few-toothed; peduncles 1-flowered; berry glabrous, red. h. H. Native of North America, in Canada, in stony places by Signey; and on the mountains of Virginia.

9 R. lacustre (Poir. encycl. suppl. 2. p. 856. Pursh. fl. amer. sept. 1. p. 161.) stem very prickly; spines many-parted, slender; leaves cordate, deeply 3-5-lobed, cut; racemes 5-8-

flowered, loose; calyx rotate; teeth and pedicels hispid, and glandular. h. H. Native throughout Canada to Fort Franklin and Bear Lake, near the Arctic circle; mouth of the Columbia; mountains of the Columbia, and of North California; also of Virginia, &c. R. oxyacanthoides, Michx. fl. bor. amer. 1. p. 111. R. echinatum, Doug. mss. This has the flowers of the currant, and the prickly stems of the gooseberry. The fruit is about the size of black currants, in pendulous racemes, purplish black, shining, clothed with hairs, unpleasant to the taste.

Lake Gooseberry. Fl. April, May. Clt. 1812. Sh. 4 to 5 ft.
10 R. rotundifolium (Michx. fl. bor. amer. 1. p. 110.) spines nearly axillary, solitary; leaves nearly orbicular, clothed with very minute down, a little lobed; lobes roundish, obtuse; peduncles 1-flowered; limb of calyx tubular. h. H. Native on the high mountains of Carolina. Berries glabrous.

Round-leaved Gooseberry. Shrub 3 to 4 feet.
11 R. racemosa (Michx. fl. bor. amer. 1. p. 111.) spines nearly axillary, very short, solitary; leaves on slender petioles, lobed; lobes acute, cut; peduncles capillary, erect, usually 2-flowered; calyx glabrous, tubularly campanulate. h. H. Native of North America, on the mountains of Tennessee; and in mountain meadows from New York to Virginia. Berry glabrous, purple or blue, with a very pleasant taste. Leaves pubescent.

12 R. racemosa (Adams, in reliq. Willd. ex Ræm. et Schlult. sylt. 5. p. 507.) prickles stipular, tern; peduncles 1-flowered, erect; leaves 5-lobed, deeply toothed. h. H. Native of Canaceus. Perhaps only a variety of R. Uva-crispa.

13 R. microphyllum (H. B. et Kunth, nov. gen. amer. 6. p. 62.) prickles usually solitary; leaves nearly reiform, small; peduncles very short, 2-flowered; calyx campanulate; segments oblong, obtuse; petals spathulate obovate, retuse at the apex. h. H. Native of Mexico, in mountainous places near El Guada, between Guchila and the city of Mexico; at the elevation of 4800 feet. Ovaries rather turbinate. Flowers red.

Small-leaved Gooseberry. Shrub 4 to 6 feet.
14 R. cuneifolium (Ruiu et Pav. fl. per. 3. p. 233. f. c.) unarmed; leaves cuneiform, cut, trifid; petioles not half the length of the leaves; peduncles solitary, axillary, 2-3-flowered, length of the petioles; bracteas 2, at the base of each flower. h. G. Native of Peru, on the Andes. Berry pale red. Habit of R. Uva-crispa. Perhaps belonging to a separate section.

Wedge-leaved Gooseberry. Shrub 3 to 4 feet.
15 R. cuneifolium (Hook. et Arn. in bot. misc. 3. p. 250.) unarmed; branches glabrous; leaves glabrous, somewhat 5-lobed, roundish-reiform, cuneulate at the base, and cutinate; the lobes lying over each other, acutely and deeply lobed; pedicels a little shorter than the leaves; racemes hardly puberulous, axillary, short, few-flowered; flowers nearly sessile, hardly exceeding the bracteas, which are roundish. h. G. Native of the Cordillera of Chili. Nearly allied to R. cuneiformium, but apparently quite distinct.

Hooded-leaved Gooseberry. Shrub 4 to 5 feet.
16 R. acutiloba (Smith in Rees' cyclo.) very prickly; prickles stipular, 3-5-parted; leaves rather pubescent, nearly orbicular, 3-5-lobed; lobes bluntish, deeply serrated; peduncles usually 1-flowered, bracteolate in the middle; calyx campanulate, smoothish; berries bracteate, and are, as well as the styles, quite glabrous. h. H. Native of Siberia, in stony rocky mountainous places. Led. fl. ross. alt. ill. t. 230. R. Uva-crispa, Sievers in Pall. nord. beitr. 7. p. 274. Pall. fl. ross. 2. p. 37. Stem erect or procumbent. Petals white. Berries glabrous, yellowish or purplish, sweet, with a grateful taste.
Acicular-spined Gooseberry. Shrub.

17 R. grossularia (Lin. spec. p. 291) prickles 2 or 3 under each bud; branches otherwise smooth, and spreading or erect; pedicels 1-2-flowered; leaves 3-5-lobed, rather villous; bracteoles close together; calyx campanulate, with reflexed segments, which are shorter than the tube; petals rounded at the apex, glabrous, but beaded in the throat; style always bent with long down.

H. Native of Europe and Nipaul, in woods and hedges; plentiful in some parts of Britain, in hedges, thickets, and waste ground, as the woods and hedges about Darlington; apparently wild in Hamilton wood, Scotland. Smith, eng. bot. 1292. R. U'va-crispa, Oed. fl. dan t. 546. Grossularia hirsuta, Mill. dict. no. 2. R. U'va-crispa var. spina, D. C. fl. fr. 4. p. 408. Plench. icon. 148. The Nipaul plant has the stem thickly beset with bristles, and the spines strong and 3-parted. It is therefore probably a proper species.

Var. β, U'va-crispa (Smith, engl. fl. 1. p. 333.) plant beset with spines all over; leaves small, rather villous; berries smaller, glabrous.

Var. ε, subèrme (Berl. mss.) plant nearly glabrous; bark smooth, brown; prickles axillary; flowers and leaves small. Native about Geneva. Perhaps a variety of R. reclinatum.

Var. η, macroèrnum (D. C. prod. 3. p. 478.) stigmas often longer than the petals; flowers and berries large.

Var. ϑ, bracteatum (Berl. mss.) berries clothed with 2-4-5 straight coloured, nearly opposite, bracteas and bristles, emulating sepals, which fall off before the berry arrives at maturity.

The gooseberry is called Grosselle à maquerel, in French; Uva-spino in Italian; Stachelbeerstrauß, in German; in Scotland it is called Grosier; in Piedmont, where the gooseberry is found wild, and where the Italian botanists state the berries to be eatable, but astringent and neglected, it is called Grieselle. Some derive our name gooseberry from grosserry, from the resemblance of the bush to gorze; others, as Professor Martyn, from its being used as sauce with young or green geese. Gerard says it is called feaberry (feverberry) in Cheshire; and it has the same name in Lancashire and Yorkshire. In Norfolk this term is shortened to feabes, or, as they pronounce it, fapes. Carberry is another British name for this fruit.

The gooseberry is a low, branching, prickly shrub, bearing pendulous, hairy, or smooth berries, of various colours; it is a native of several parts of Europe, and abounds in the Vallaes, in copsewoods, where it produces a small, green, hairy, high-flavoured fruit. In England it is naturalized in various places, as on old walls, ruins, and in the woods and hedges about Darlington. It is cultivated in greater perfection in Lancashire than in any other part of Britain; and next to Lancashire the climate and treatment of the Lothians seem to suit this fruit. In Spain and Italy the fruit is scarcely known. In France it is neglected and little esteemed. In some parts of Germany and Holland the moderate temperature and humidity of the climate seem to suit the fruit; but in no country is its size and beauty to be compared with that produced in Lancashire, or from the Lancashire varieties, cultivated with care, in the more temperate and humid districts of Britain. Neill observes, that when foreigners witness our Lancashire gooseberries, they are ready to consider them as forming quite a different kind of fruit. Happily this wholesome and useful fruit is to be found in almost every cottage-garden in Britain; and it ought to be considered a part of every gardener's duty to encourage the introduction of its most useful varieties in their humble enclosures. In Lancashire, and some parts of the adjoining counties, almost every cottager, who has a garden, cultivates the gooseberry, with a view to prizes, given at what are called Gooseberry-prize Meetings, of which there is annually published an account, with the names and weight of the successful sorts, in what is called the Manchester Gooseberry Book. The prizes vary from 1l. to 5l. or 10l. The second, third, to the sixth and tenth degree of merit, receiving often proportionate prizes. There are meetings held in spring, to "make up," as the term is, the sorts, the persons, and the conditions of exhibition; and in August to weigh and taste the fruit, and determine the prizes.

Use.—The fruit was formerly in little esteem; but it has received so much improvement, that it is now considered very valuable for tarts, pies, sauces, and creams, before being ripe, and when at maturity, it forms a rich dessert fruit for three months; and is preserved in sugar for the same purpose, and in water for the kitchen. Unripe gooseberries can be preserved in bottles of water against winter; the bottles are filled with berries, close corked, and well sealed; they are then placed in a cool cellar till wanted. By plunging the bottles, after being corked, into boiling water, for a few minutes (heating them gradually to prevent cracking), the berries are said to keep better. —Neill.

Varieties.—The gooseberry is mentioned by Turner, in 1573. Parkinson enumerates 8 varieties; the small, great, and long common, 3 reds, 1 blue, and 1 green. Ray mentions only the pearl gooseberry, but Rea has the blue, several sorts of yellow, the white Holland, and the green. Miller only says, there are several varieties obtained from seed, most of them named from the persons who raised them; but as there are frequently new ones obtained, it is needless to enumerate them. The present list of the London nurserymen contains from 80 to 100 names, but those of some of the Lancashire growers above 300. Forsyth, in 1800, mentions 10 sorts as common; and adds a list of 48 new sorts, grown at Manchester. The following may be considered established varieties, and such as merit cultivation.

List of gooseberries.—Those marked with a star may be considered the best; the rest only second rate.

1. Fruit green.

§ 1. Branches spreading or pendulous.

* Berries smooth, green.

1 Barclay's green champagne. Fruit roundish, middle-sized.

2 Perrins evergreen. Fruit large, oblong.

3 Fame. Fruit large, oblong, ovalate. Branches pendulous.

5 Glory of Kingston. Fruit roundish, middle-sized.

6 Allen's glory of Ratcliff. Fruit oblong, middle-sized.*

7 Horsefield's green gage. Fruit large, roundish.

8 Green globe. Fruit round, middle-sized.

9 Nixon's green myrtle. Fruit large, oblong. Branches pendulous.

10 Berry's greenwood. Fruit large, oblong. Branches pendulous.

11 Massey's heart of oak. Fruit large, oblong. Branches pendulous.*

a a 2
12 Grundy's high sheriff of Lancashire. Fruit obovate, middle-sized. Branches pendulous.
13 Edward's jolly tar. Fruit large, obovate. Branches pendulous.*
14 Minerva. Fruit large, oblong.
15 Taylor's no-brity. Fruit large, obovate. Branches pendulous.
16 Northern hero. Fruit large, obovate.
17 Reformer. Fruit large, oblong.
18 Sabine's green. Fruit small, round.
19 Large smooth green. Fruit large, obovate.*
20 Green Walnut, Belmont's, smooth green, nonpareil. Fruit middle-sized, obovate.*

** Berries green, hairy, or downy.
21 Colonel Anson's. Fruit large, oblong, hairy.
22 Holt's beauty. Fruit large, oblong, downy.
23 Early green hairy, early green, green Gascoigne. Fruit small, round.*
24 Lovart's Eliza. Fruit large, roundish, hairy.
26 Green globe. Fruit small, round, hairy.
27 Green seedling. Fruit small, oblong, hairy. Branches pendulous.*
29 Lovely Anne. Fruit large, oval, downy. Branches pendulous.
30 Gregory's perfection. Fruit large, roundish, downy, late. Branches pendulous.*
31 Prophet's profit. Fruit large, oblong, downy.
32 Early royal George. Fruit middle-sized, oblong, hairy, early.
33 Ryder's triumph. Fruit small, obvate, hairy.
34 Moore's troubler. Fruit large, roundish-oblong, hairy.
35 Unicorn. Fruit large, oval, downy.

§ 2. Branches erect.
* Fruit green, smooth.
36 Pitmaston green-gage. Fruit small, obovate.*
37 Briggs's independent. Fruit large, obvate.
38 Merry lass. Fruit middle-sized, obvate.
39 Midsummer. Fruit small, roundish.
40 Royal George. Fruit middle-sized, oval.

** Fruit green, hairy, or downy.
41 Monck's Charles Fox. Fruit small, ova, hairy.
42 Green oak. Fruit large, roundish, hairy.
43 Greensmith. Fruit middle-sized, roundish, hairy.
44 Hebburn's prolific. Fruit middle-sized, roundish, hairy.*
45 Collier's jolly angler, Lay's jolly angler, Collins's jolly angler. Fruit large, oblong, downy.*
46 Mills's Langley green. Fruit large, roundish, hairy.
47 Late green. Fruit small, obvate, downy.
48 Parkinson's laurel, green laurel, green willow. Fruit large, obovate, pale green, nearly white.*
49 Hopley's Lord Crew. Fruit large, oblong, hairy.*
50 Mignonette. Fruit small, roundish, hairy.
51 Lovart's Mosc. Fruit large, obvate, hairy.
52 Green Rumbullion. Fruit small, round, hairy.
53 Small green. Fruit small, globular, downy.
54 Small hairy green. Fruit small, round, hairy.
55 Bratherston's Wistaston hero. Fruit large, oblong.

II. Fruit yellow.
§ 1. Branches spreading or pendulous.
* Fruit yellow, smooth.
1 Amber, amber yellow, smooth amber. Fruit small, roundish.
2 Diggles's Donny Roger. Fruit large, obvate.
3 Capper's Bunker's Hill. Fruit large, roundish.
4 Hopley's Cheshire cheese. Fruit large, oblong.
5 Forbes's golden chain. Fruit large, oblong. Branches pendulous.
6 Bamford's golden Purse. Fruit large, obvate. Branches pendulous.*
7 Beaumont's smiling beauty. Fruit large, oblong. Branches pendulous.*
8 Beardsell's smuggler. Fruit large, roundish, oblong. Branches pendulous.
10 Mather's victory. Fruit large, obvate. Branches pendulous.
11 Forester's Lord Combermere. Fruit large, obvate.
12 Saunderson's Napoleon. Fruit large, obvate.
14 Large yellow. Fruit obvate, middle-sized, golden yellow, smooth. Branches pendulous.
16 Long yellow. Fruit large, oblong, golden yellow.

** Fruit yellow, hairy, or downy.
17 Capper's bottom sawyer. Fruit large, obvate, downy.
18 Lister's Britannia. Fruit large, obvate, downy.
19 Hopley's globe. Fruit large, round, hairy. Branches pendulous.
22 Jackson's golden orange. Fruit large, oblong, Branches pendulous.
23 Bratherston's golden sovereign. Fruit large, roundish, hairy.
24 Hill's golden gourd. Fruit large, oblong, hairy. Branches pendulous.
28 Sparklet. Fruit small, obvate, downy.
29 Hallon's Trafalgar. Fruit large, oblong, hairy. Branches pendulous.
31 Weedham's delight. Fruit middle-sized, oblong, hairy.

§ 2. Branches erect.
* Fruit yellow, smooth.
32 Yellow ball. Fruit middle-sized, roundish.*
33 Bitthfeld. Fruit small, round, late.
34 Clegg's Tim Bobbin. Fruit middle-sized, oblong.
35 Old dark yellow. Fruit small, roundish.
36 White walnut. Fruit middle-sized, obvate, whitish yellow.
** Fruit yellow, hairy, or downy.

37 Hebburn yellow aston. Fruit small, roundish, hairy.*
38 Yellow champagne, hairy amber. Fruit small, roundish, hairy.
39 Catlow's conquering hero. Fruit large, oblong, coarse, hairy.
40 Heap's conquering girl. Fruit large, oblong, hairy.
41 Golden drop, golden lemon.
42 Part's golden fleece. Fruit large, oval, hairy.
43 Sulphur, rough yellow. Fruit small, roundish, hairy.*
44 Early sulphur, golden ball, golden bull. Fruit middle-sized, roundish-oblong, hairy.
45 Foster's husbandman. Fruit large, obvate, downy.
46 Heywood's invincible. Fruit large, roundish-oblong, downy.
47 Hardcastle's jolly gunner, royal gunner. Fruit large, oblong, hairy.
48 Prophet's regulator. Fruit large, roundish, hairy.
49 Rumbullion, yellow globe, round yellow. Fruit small, roundish, downy.
50 Smooth yellow. Fruit small, roundish, downy.*
51 Williamson's yellow hornet. Fruit small, ovate, downy.
52 Yellowsmith. Fruit small, roundish-oblong, hairy.*
53 Kelk's yellow. Fruit middle-sized, oblong, downy.

III. Fruit white, or greenish white.

§ 1. Branches erect.
* Fruit smooth, white.

1 Cranham's ambush. Fruit large, obvate, white.
2 White Damson. Fruit small, roundish.*
3 Honey white. Fruit middle-sized, roundish-oblong.
4 Hoslam's smiling yellow. Fruit large, roundish-oblong.
5 Cook's white eagle. Fruit large, obvate.*
6 Lovat's Queen Caroline. Fruit middle-sized, obvate.
** Fruit greenish white, hairy, or downy.

7 Large early white. Fruit large, obvate, downy.*
8 Sampson's Queen Ann. Fruit large, oval, downy.
9 Peer's Queen Charlotte. Fruit middle-sized, oblong, hairy.*
10 Morris's Queen Mary. Fruit middle-sized, ovate, downy.
11 Trueman. Fruit large, obvate, hairy.
** * Fruit white, hairy, or downy.

12 Bonny landlady, noble landlady. Fruit large, oblong.
13 Hopley's lady of the manor. Fruit large, roundish-oblong, hairy.
14 White lion. Fruit large, obvate, hairy.
15 Stringer's maid of the mill. Fruit middle-sized, obvate, downy.
16 Marchioness of Downshire. Fruit middle-sized, oblong, hairy.
17 Early rough white. Fruit large, oval, hairy.
18 Saunders royal rock getter, Andrews's royal rock getter. Fruit large, obvate, downy.
19 White royal. Fruit small, round, hairy.
20 Compton's Sheba Queen. Fruit large, obvate, downy.*
21 Wellington's glory. Fruit large, roundish-oblong, downy.*
22 Moore's white bear. Fruit large, obvate, hairy.*
23 Nixon's white heart. Fruit middle-sized, heart-shaped, hairy.
24 White lily. Fruit middle-sized, obvate, downy.
26 Taylor's bright Venus. Fruit middle-sized, obvate, hairy.*
27 White champagne. Fruit small, roundish-oblong, hairy.*
28 Saunders Cheshire lass. Fruit large, oblong, downy.*
29 Hedgehog. Fruit middle-sized, roundish, hairy.*

§ 2. Branches spreading or pendulous.
* Fruit smooth, white.

30 Crystal. Fruit small, roundish.*
31 White fig. Fruit small, obvate.*
32 Parkinson's first rate. Fruit large, oval.
34 Great Britain. Fruit large, oblong, greenish white.
35 White rasp. Fruit small, round.
36 Brundrett's white rock. Fruit large, obvate. Branches pendulous.
37 Diggles's wanton. Fruit middle-sized, roundish, greenish white.
38 Denny's Victoria. Fruit large, obvate, greenish white.
** Fruit greenish white, smooth.
39 Stringer's dusty miller. Fruit middle-sized, obvate.
40 Great Britain. Fruit large, oblong. Branches pendulous.
41 Denny's Vittoria. Fruit large, obvate. Branches pendulous.
** * Fruit white, hairy, or downy.

42 Capper's bonny lass. Fruit large, oblong, hairy.
43 White crystal. Fruit small, roundish, hairy or downy.*
44 Early white. Fruit middle-sized, roundish, downy.*
45 Grundy's fowler. Fruit middle-sized, obvate, downy.
46 Large white. Fruit middle-sized, oval, downy.
47 Smith's radical. Fruit large, roundish-oblong, hairy. Branches pendulous.
48 Irish white raspberry. Fruit small, round, hairy.
49 Cleftworth's white lion. Fruit large, obvate, downy. Branches pendulous.*
**** Fruit greenish white, hairy or downy.

50 Counsellor Brougham. Fruit large, oblong, downy.
51 Bratherton's governess. Fruit large, roundish-oblong, hairy.
52 Princess royal. Fruit large, obvate, hairy. Branches pendulous.*
54 Taylor's speedwell. Fruit large, roundish, hairy. Branches pendulous.

IV. Fruit red.

§ 1. Branches spreading or pendulous.
* Fruit hairy or downy.

1 Alexander. Fruit large, obvate, hairy.
2 Hamlet's beauty of England. Fruit large, oblong, hairy.
3 Waceham's black bullfich. Fruit middle-sized, obvate, dark red, downy.
4 Shipley's black prince. Fruit middle-sized, roundish, downy.
5 Boardman's British crown. Fruit large, roundish, hairy.
6 Williams's conqueror. Fruit large, obvate, hairy.
7 Melling's crown bob. Fruit large, oblong, hairy.*
8 Worthington's defiance. Fruit large, obvate, hairy. Branches pendulous.
10 Early black. Fruit middle-sized, oblong, dark red. Branches pendulous.
11 Early rough red. Fruit small, roundish-oblong.
13 Smith's favourite. Fruit middle-sized, roundish-oblong, hairy.
16 Jackson's slim. Fruit middle-sized, obovate, dark red, downy.
18 Bratherton's Lord of the Manor. Fruit large, roundish, hairy.
19 Knight's Marquis of Stafford. Fruit large, roundish-oblong, hairy.
20 Wright's matchless. Fruit middle-sized, oblong, dark-red, hairy.
21 Miss Bold, pigeon's egg. Fruit middle-sized, roundish, downy, dark red, early.
22 Bratherton's over-all. Fruit large, oblong, hairy. Branches pendulous.
24 Raspberry, nutmeg. Fruit small, roundish, hairy, dark red.
25 Red Mogul. Fruit small, roundish, hairy.
26 Large red oval. Fruit large, oval, hairy. Branches pendulous.
30 Rough red, little red hairy, old Scotch red, thick skinned red. Fruit small, round, hairy.
31 Small dark rough red, small rough red. Fruit small, round, hairy.
32 Royal oak. Fruit middle-sized, roundish, hairy.
33 Small red. Fruit small, round, hairy.
34 Capper's top sayer. Fruit large, roundish, hairy, pale red. Branches pendulous.
36 Lomax's victory. Fruit large, roundish, hairy. Branches pendulous.
37 Red walnut, Murray, Eckert's double bearing, Ashton red. Fruit middle-sized, obovate, downy, early.
38 Warrington red, Aston, volunteer. Fruit large, roundish-oblong, hairy. Branches pendulous. This is one of the best, and hangs late.
39 Knight's warrior. Fruit large, ovate, downy, pale red. Branches pendulous.
40 Wilmot's late superb. Branches large, roundish-oblong, hairy.

** Fruit smooth, red.
41 Gerard's Ajax. Fruit large, roundish.
42 Red ball. Fruit small, roundish.
43 Claret. Fruit small, roundish.
44 Worthington's conqueror. Fruit large, obovate. Branches pendulous.
45 Rival's emperor Napoleon. Fruit large, obovate. Branches pendulous.
46 Whitton's glory. Fruit middle-sized, oblong, dark red.
47 Hooper's great captain. Fruit large, oblong.

48 Amberley hero. Fruit large, oblong, dark red.
49 Jugg's red. Fruit large, roundish. Branches pendulous.
50 Eckert's jolly printer. Fruit large, oblong, dark red.
51 Brannie nutmeg. Fruit small, obovate.
53 Boardman's Prince Regent. Fruit large, roundish, dark red.
54 Red Turkey, smooth red. Fruit small, obovate.
56 Johnson's ringleader. Fruit large, oblong. Branches pendulous.
57 Farron's rearing lion, great chance. Fruit very large, oblong. Branches pendulous.
58 Saint John. Fruit middle-sized, obovate.
59 Rider's scented lemon. Fruit large, oblong, obovate. Branches pendulous.
60 Greaves's Smolensko. Fruit large, obovate. Branches pendulous.
61 Chadwick's sportsman. Fruit large, oblong, dark red. Branches pendulous.
62 Bratherton's whipper-in. Fruit large, oblong, dark red. Branches pendulous.
63 Wilmot's early red. Fruit large, roundish-oblong, dark red. Branches pendulous.
64 Wilmot's seedling red. Fruit large, oblong, dark red.

§ 2. Branches erect.

* Fruit smooth, red.

66 Small red globe, smooth Scotch. Fruit small, roundish.

** Fruit red, hairy or downy.

67 Brundrett's atlas, Brundell's atlas. Fruit large, oblong, hairy.
68 Barton's red. Fruit middle-sized, roundish, hairy.
69 Red Champagne, red Turkey, countess of Errol, Ironmonger of many. Fruit small, roundish-oblong, hairy. A fruit of unequalled richness.
70 Dakin's black. Fruit middle-sized, oblong, dark red. A bad bearer.
71 Large red globe. Fruit large, roundish, hairy.
72 Barton's hairy red. Fruit small, roundish, hairy. A good bearer.
73 Bratherton's huntsman, Speechley's rough red. Fruit large, roundish, hairy. A good bearer.
74 Irish plum. Fruit middle-sized, roundish, hairy.
75 Hopley's jubilee. Fruit large, roundish, hairy, dark red.
76 Allcock's king. Fruit large, roundish, hairy, dark red.
77 Lad Harthorn's Lancashire. Fruit large, roundish, hairy, dark red. A good bearer.
78 Little John. Fruit small, oblong, hairy, dark red.
79 Beaumont's red. Fruit middle-sized, roundish, hairy.
81 Rob Roy. Fruit middle-sized, obovate, hairy.
82 Scarlet transparent. Fruit small, roundish, hairy. A bad bearer.
83 Scotch best jam, dumpling. Fruit small, hairy, roundish.
84 Denny's Shakspeare. Fruit large, roundish, hairy.
85 Mellor's Sir Francis Burdett. Fruit large, obovate, pale red.
86 Hampson's Tantarara. Fruit middle-sized, obovate, downy.
87 Speechley's Yaxley hero. Fruit large, obovate, hairy.
Selection of sorts.—"It must be admitted," Neill observes, "that although large gooseberries make a fine appearance on the table, they are often deficient in flavour when compared with some of smaller size. Many of them have very thick strong skins, and are not eatable unless thoroughly ripened. Some of the large sorts, however, are of very good quality, such as the red Champagne and the green walnut, &c. For culinary use in the month of May, Wilmot's early red is larger and better than most others, the skin not being tough, and the whole berry melting to a fine consistence." Forsyth judiciously recommends cultivating the early and late sorts, in order to prolong the season of this fruit. But the best way of selecting sorts for any particular purpose is from the list given above, where those that are of particular excellence are marked by an asterisk.

Propagation.—The gooseberry may be propagated by all the modes applicable to trees or shrubs, even by pieces of the roots; but the mode by cuttings is usually adopted for continuing varieties, and that by seeds for procuring them.

By seeds.—The scientific mode of impregnating one variety with another has, we believe, not been applied to this fruit. In general the seed of some choice variety, thoroughly ripe, is taken and sown in autumn or early in spring, in beds or pots of rich light mellow earth; when the plants are a year old, they are planted out in nursery rows, to be cultivated and trained there a year or two; in general they will bear the third year. By preparing for the best of these seedlings a very rich soil, and by watering, shading, and thinning the fruit, the largest sorts have been obtained. Not content with watering at the roots and over the top, the Lancashire connoisseur, when he is growing for exhibition, places a small saucer of water immediately under each gooseberry, only 3 or 4 of which he leaves on the tree. This is technically called suckling. He also pinches off a great part of the young wood, so as to throw all the strength he can into the fruit.

By cuttings.—Miller says, the best season for planting gooseberry cuttings is in autumn, just before their leaves begin to fall. The cuttings should be taken from bearing shoots, rather than from those that issue from the main stem. Cut them to such a length as the strength and ripeness of the wood will bear, and cut off all the buds, excepting three, or at most four at top, and train the plants with a single stem of 9 inches or a foot high, from the top of which the branches should radiate upwards at an angle of 45°, or better if 45°. Haynes advises taking off cuttings in July, when the fruit is on the bush, in order to make sure of the sorts. He says, by immediate planting, watering, and shading, as good plants are produced as from ripe wooden cuttings. Treat. of the gooseberry, &c. p. 29.

Soil and manure.—Any good garden soil, on a dry bottom, and well manured, will suit the gooseberry. That which is soft and moist produces the largest fruit. The situation should not be under the drip of trees, over much shaded or confined, otherwise the fruit will be small, ill flavoured, and the plants apt to mindew. Forsyth says, gooseberries should be dugged every year, or at least have a good coat of dung once in two years. Haynes recommends a mixture of peat and loam well manured, and a shaded situation. The last he proposes to effect by planting among his quarters of gooseberries, rows of Jerusalem artichokes in the direction of east and west.

Final planting.—"The season for planting gooseberries is any time during open weather, from October till March. When trees are procured from the public nurseries, choose such as are in some advanced state, about 3 years' growth, with pretty full heads, for immediate plentiful bearers. Let the general supply be in standard bushes, and plant principally in the kitchen garden, in single rows along the boundary edges of the main quarters or outward borders, from 6 to 8 feet apart, or some may be planted in cross rows, to subdivide extensive quarters. When the object is to raise large quantities of fruit, plantations are made in continued parallel rows, 6 or 10 feet asunder, by 6 feet in the row. It would be eligible to plant a few choice sorts against south and other sunny walls or paling, for earlier and larger fruit; and on north walls to ripen late in succession." Abercrombie. Forsyth says, "The market gardeners about London plant them in rows, from 8 to 10 feet apart from row to row, and 6 feet from plant to plant in the rows. In small gardens I would recommend planting them in quarters by themselves, at the distance of 6 feet between the rows, and 4 feet from plant to plant; or you may plant them round the edges of the quarters about 3 feet from the path; you will then have the ground clear for cropping, and a man, by setting one foot on the border, can gather the gooseberries without injuring the crop." Neill says, "In some places gooseberry bushes on the sides of the borders, are trained to a single tall stem, which is tied to a stake; this, though 6 or 8 feet high, occasions scarcely any shade on the border, and it does not occupy much room, nor exclude air; while, at the same time, the stem becomes close hung with berries, and makes a pleasant appearance in that state." Edinb. encyl. art. hort. § 161. Maher observes (Hort. trans. 2. p. 146.) "that as the crop of ripe fruit is often injured by having the largest and earliest berries prematurely gathered, whilst green, for tarts, a sufficient number of trees of such varieties as are earliest should be planted in a separate quarter of the garden, and devoted exclusively to the use of the kitchen, for tarts and sauce."

Mode of bearing.—"The gooseberry produces its fruit not only on the shoots of last summer, and on shoots 2 or 3 years old, but also on spurs or snags arising from the elder branches along the sides; but the former afford the largest fruit. The shoots retained for bearers should therefore be left at full length or nearly so." Abercrombie.

Pruning.—"The bushes will require a regular pruning twice in the year."

Summer pruning.—"Where any bushes are crowded with cross and water shoots of the same year, shading the fruit from the sun, and preventing the access of air, thin the heart of the plant and other tufted parts moderately, pinching off or cutting out close what spray is removed; but do not touch the summer shoots in general. Maher says, it will greatly contribute to the perfection of the fruit, if the very small berries are taken away with a pair of scissors about the middle or end of May; and these small berries will be found quite as good for sauce or gooseberry cream as the larger."

Winter pruning.—"You may proceed to the winter pruning any time from November until the end of February, or until the buds are so swelled, that further delay would endanger their being rubbed off in the operation. Cut out the cross-shoots and water-shoots of the preceding summer, and the superfluous among crowded branches. Prune long ramblers and low stragglers to some well placed lateral or eye; or if any under straggler spring very low, cut it away. Of last year's shoots retain a sufficiency of the best well-placed laterals and terminals in vacant parts, to form succession bearers, and to supply the places of unfruitful and decayed old-wood, which, as you proceed, should be removed. Mostly retain a leading shoot at the end of the principal branch, leaving it either naturally terminal, or, where the branch would thus be too extended, pruning in some competent lateral within bounds. The superfluous young laterals on the good main branches, instead of being taken off clean, may be cut into little stubs of one or two eyes; which will send out fruit-buds and spurs. Of the supply reserved for new bearers, a small number will probably require shortening, where too extended, or curvd incommodiously; leave these from 8 to
12 inches in length, according to strength and situation; those of moderate extent and regular growth will require very little shortening, and many none at all. Observe, too close cutting or general shortening, occasions a great superfluity of wood in summer; for the multiplied laterals thus forced from the eyes of the shortened branches, increase to a thicket, so as to retard the growth, and prevent the full ripening of the fruit; on which account it is an important part of pruning to keep the middle of the head open and clear, and to let the occasional shortening of the shoot be sparing and moderate. Between the bearing branches keep a regular distance of at least 6 inches at the extremities, which will render them fertile bearers of good fruit. Some persons, not pruning the gooseberry bush on right principles, are apt to leave the shoots excessively close and tufted, while they shorten the whole promiscuously; others sometimes clip them with garden shears to close round heads; in consequence of being pruned in these methods, the bushes shoot crowdedly, full of young wood in summer, from which the fruit is always very small, and does not ripen freely with full flavour." Forsyth says, "Many of the Lancashire sorts are apt to grow horizontally, and the branches frequently trail on the ground, which renders them liable to be broken by high winds, especially when they are loaded with fruit. In that case I would recommend 2 or 3 hoops to be put round them, to which the branches may be tied to support them, and prevent their being broken by the wind." S. Jeeves has tried training gooseberries on an arched trellis in the manner of a herculean or arboreum walk. For this purpose he plants in rows, 6 feet apart, and the plants 3 feet distant in the row. He chooses the strongest growing kinds, and trains 4 branches at 9 inches distance from each plant, till they meet at the top. The advantages of this plan are beauty of appearance, fruit not splashed by rain, easily gathered, and the ground more readily cultivated.

Insects and diseases, &c.—The caterpillars of saw-flies (Teenthredinidae, Leach), of butterflies (Papilia, Lin.), and of moths (Phalaena, Lin.), are well known as serious enemies to gooseberries. The larvae of the Tenthredinidae have from 16 to 20 feet, a round head, when touched they will roll themselves together. They feed on the leaves of the gooseberry, apple, and most fruit trees, as well as on roses, and other shrubs and plants. When full grown they make, sometimes in the earth, and sometimes between the leaves of the plants on which they feed, a nest-work case, which, when complete, is strong and gummy, and in that change to the pupa incomplete, which for the most part remains during the winter in the earth. The perfect fly emerges early in the ensuing spring; its serrated sting is used by the female in the manner of a saw, to make incisions in the twigs or stems of plants, where it deposits its eggs. The Caledonian Horticultural Society having requested information respecting the best method of preventing or destroying the caterpillar on gooseberries, received various communications on the subject, and the following are extracts from such as they deemed fit for publication.

J. Gibb describes the large black, the green, and the white caterpillar, with his methods of destroying them:

"During the winter months the large black kind may be observed lying in clusters on the under parts, and in the crevices of the bushes; and even at this season (Feb.) I find them in that state. In the course of 8 or 10 days, however, if the weather be favourable, they will creep up in the daytime, feed on the buds, and return to their nest during the night. Whenever leaves appear upon the bushes they feed upon them till they arrive at maturity, which is generally in the month of June; after which they creep down upon the under sides of the branches, where they lodge till the crust or shell is formed over them. In July they become moths, and lay their eggs on the under side of the leaves and bark. The produce of these eggs, coming into life during the month of September, feed on the leaves so long as they are green, and afterwards gather together in clusters on the under side of the branches, and in the crevices of the bark, where they remain all the winter, as already said. Winter is the most proper time for attacking this sort with success, as their destruction is most effectually accomplished by the simple operation of pouring a quantity of boiling-hot water upon them from a watering-pan, while no injury is thereby done to the bushes."

"The green sort are at present (February) in the shelly state, lying about an inch under ground. In April they come out small flies, and immediately lay their eggs on the veins and under sides of the leaves. These eggs produce young caterpillars in May, which feed on the leaves till June or July, when they cast a blackish kind of skin, and afterwards crawl down from the bushes into the earth, where a crust or shell grows over them, and in that state they continue till the following April. The only method which I have hitherto found effectual for destroying these is, 1st, to dig the ground around the bushes very deep during the winter season, by which means the greater part of them are destroyed, or buried too deep ever to penetrate to the surface; 2ndly, in April, when the flies make their appearance, to pick off all the leaves on which any eggs are observable; this is a tedious operation, but may be done by children. If any of the enemy should escape both these operations, they will be discernible as soon as they come into life, by their eating holes through the leaves, and may then easily be destroyed, without the least injury to the bushes or fruit."

"The white kind, otherwise called borers, are not so numerous as the other kinds, though very destructive; they bore the berry, and cause it to drop off; they preserve themselves during the winter season in the chrysalis state, about an inch under ground, and become flies nearly at the same time with the last mentioned kind; they lay their eggs on the blossoms, and these eggs produce young caterpillars in May, which feed on the berries till they are full grown, and then creep down into the earth, where they remain for the winter in the shelly state." Caled. mem. vol. 1.

Macmurray, in autumn, pours a little cow urine around the stem of each bush, as much as suffices merely to moisten the ground. The bushes which were treated in this manner remained free of caterpillars for two years; while those that were neglected or intentionally passed over, in the same compartment, were totally destroyed by the depredations of the insects. A layer of sea-weed laid on in autumn, and dug in in the spring had the same effect for one year. Caled. mem. vol. 1. p. 95.

R. Elliott says, "take 6 pounds of black currant leaves, and as many of elder leaves, and boil them in 12 gallons of soft water; then take 14 pounds of hot lime, and put it in 12 gallons of water; mix them altogether; then wash the infested bushes with the hand engine; after that is done, take a little hot lime, and lay it at the root of each bush that has been washed, which completes the operation. By these means you completely destroy the caterpillars, without hurting the foliage. A dull day is to be preferred to any other for washing. When the foliage is all off the bushes, wash them over with the hand engine to clean them of decayed leaves; for this purpose any sort of water will do; then stir up the surface of the earth around the roots of the bushes, and lay a little hot lime about them to destroy the eggs. Thus I have never found to fail of success since the first trial, 6 years ago. The above mentioned proportion of leaves, lime, and water, will serve for 2 acres of ground or more, covered with bushes or trees in the ordinary manner, and will cost very little money indeed. The same proportion is
to be observed in making a wash for the rest of the trees or bushes.

J. Machray procured some tobacco and soft or black soap, and boiled a quarter of a pound of tobacco with the one pound of soft soap in about 18 scotch pints of water; and kept stirring the liquid while boiling with a whisk, in order to dissolve the soap; this liquor, when milk-warm, or so cool as not to hurt the foliage, he applied to the bushes with a hand-squirt, in the evening, and in the morning found all the ground under the bushes covered with dead caterpillars. This practice he continued for six years, always when he saw any symptoms of the approach of caterpillars.

J. Tweedie, in the course of any of the winter months, pares all the earth from under the bushes to the depth of about 3 inches, into a flat ridge between the rows; and on the first dry day following, either treads, beats, or rolls these ridges, and trenches the whole down 1½ or 2 spades deep, observing to tread the foot earth into the bottom of the trench.

Foryth's method is as follows: "Take some sifted quick-lime, and lay it under the bushes, but do not at first let any of it touch the branches or leaves; then shake each bush suddenly and smartly, and the caterpillars will fall into the lime; if the bush be not shaken suddenly, the caterpillars, on being a little disturbed, will take some time to crawl as not easily to be shaken off. After this is done, sift some of the lime over the bushes; this will drive down those which may have lodged on the branches. The caterpillars ought to be swept up next day, and the bushes well washed with clear lime-water mixed with urine; this will destroy any caterpillars that may still remain, and also the aphides, if there are any on the bushes."

Of all the methods for destroying caterpillars mentioned above, Gibb's appears to us the only plan on which any reliance can be placed.

**Taking the crop.**—"From gooseberries being useful for different purposes, both in a green and in a mature state, and from the compass of time afforded by early and late sorts, they are in season in great request 4 or 5 months in summer, from April till September. The early sorts on south walls come in for gathering in small green berries for tarts, &c. in April or early in May, and attain maturity in June. From common standard bushes an abundant supply is yielded in May and June of gooseberries in a green state; and in proportion as part is reserved to ripen, a succession, in full size and maturity, is obtained in June, July, and August. Some late kinds, either planted in shady situations, or shielded from the sun in their ripening state, continue good on the bush till September.

**Prolonging the crop.**—In addition to planting late sorts in shady situations, the bushes, whether standards or trained, may be matted over when the fruit is ripe, and in this way some of the reds, as the Warrington, and the thick-skinned yellow sorts, as the Mogul, will keep on the trees till Christmas.

**Forcing.**—The gooseberry may be forced in pots or boxes placed in pits, or in the peach-house or vinery. The plants in pots or boxes, are placed in pits, or in the peach-house in January, and has ripe fruit in the end of April, which is sent to table growing on the bush.

**Common Gooseberry.** Fl. March, April. Britain. Shrub 4 to 6 feet.

* Flowers red.

18 R. speciosum (Pursh. fl. amer. sept. 2. append. 731.) shrub bristly and prickly; spines tripartite; leaves roundish-oval, 3-5 lobed, obtuse; peduncles few-flowered; bracteas broadly ovate; calyx cylindrical, 4-parted, with erect glandular segments; germs and pedicels beset with glandular bristles. ½ H. Native of North California and Monterey, and Mexico. Sweet. R. vol. III.

19 R. stamineum, Smith in Rees' cyc. R. triacantho, Mezzies. R. fuchsioides, Mc. et Sesse, fl. mex. icon. ined. Flowers large, scarlet, pendulous, very like those of a Fuchsia. Stamens much exserted; style long, entire; petals cuneate, inserted on the very short tube of the calyx, the margins involute. Fruit hispid. (f. 32.)

**Showy Gooseberry.** Fl. May, June. Clt. 1824. Sh. 4 to 5 ft. 19 R. Meneziesii (Pursh. fl. amer. sept. 2. append. p. 732.) plant very prickly; spines triplicate; leaves cordate, truncate at the base, 5 lobed, serrated, wrinkled from veins, clothed with pubescence beneath; peduncles usually 1-flowered; calyx cylin-
drically campanulate, deeply 5 parted, glandular; stamens 5, inclosed; style a little exserted; germs and peduncles prickly. ½ H. Native of North California, at Port Trinidad. R. ferox, Smith in Rees' cyc. The present species and the preceding are very showy plants, from their large bright red or crimson glandular flowers, and may be considered as holding the same rank among the gooseberries as R. sanguineum does among the currants.

**Menezies's Gooseberry.** Shrub 4 to 5 feet.

**Sect. II. BOTRYCA’RFUM (from βορυς, botrys, a raceme, and καρπος, karpos, a fruit; fruit disposed in racemes). This is an intermediate section between sect. 1. Grossularia, and sect. 3. Ribesia, having the prickles of the former, and racemose flowers and small fruit of the latter. R. lacistre, no. 9. ought probably to have been placed in this section.

20 R. ORIENTALE (Poir. encycl. suppl. 2. p. 856.) plant rather prickly; leaves 5-5 lobed, orbicular somewhat reniform, cut, hairy; lobes rather deep, obtuse; pedioles hairy; racemes erectish, few-flowered; bracteas longer than the flowers; style bident at the apex. ½ H. Native of Syria. Des. arb. 2. p. 88. Flowers greenish yellow. Fruit like those of the currant.

**Eastern Gooseberry.** Fl. April, May. Clt. 1824. Shrub 4 to 6 feet.

21 R. saxatilis (Pall. nov. act. petr. x. p. 276.) prickles scattered; leaves roundish-cuneiform, bluntly 3 lobed; racemes erect; bracteas linear, shorter than the pedioles; calyx flat, scabrous; petals small, of a livid green colour. ½ H. Native of Siberia. Led. fl. ross. alt. ill. t. 239. R. alpinum, Sievers in Pall. nord. beitr. p. 7. 345.? Flowers small, greenish purple. Petals spatulate. Berries smooth, globose, bractless, dark purple, when mature full of edible pulp, rarely so large as common currants, and like them.

**Rock Gooseberry.** Fl. April, May. Clt. 1819. Shrub 4 to 5 feet.

22 R. DIACA’NTHA (Lin. fil. suppl. p. 157.) prickles twin, spiral; leaves cuneiform, tripartite, quite glabrous, shorter than the pedioles; lobes toothed; racemes long, erect; flowers on long pedicels; bracteas length of flowers; sepals roundish, yellowish; petals small, roundish. ½ H. Native of Tahiti and Siberia. Berl. l. c. t. 2. f. 8. Pall. fl. ross. 2. p. 36. t. 66. append. no. 79. t. 2. f. 2. Berries about the size of currants, red, of a sweetish acid taste.

**Two-spined Gooseberry.** Fl. May, June. Clt. 1781. Shrub 4 to 5 feet.

**Sect. III. RIBE’SIA (an alteration from Ribes). Shrubs unarmed (f. 33.). Racemes for the most part many-flowered (f. 33.) Leaves plicate. Calyx campanulate (f. 33. b.), or cylindrical.
* Flowers greenish or greenish-yellow.

23 R. alpinum (Lin. spec. 291.) leaves 3-5-lobed, obuse, shining beneath, pubescent above; racemes erect, rather crowded; bracteas lanceolate, ventricose, bearing a few glands, usually longer than the flowers; petals minute, almost abortive; anthers more or less nearly sessile; styles joined. _H._ Native of Europe and Siberia, on the Alps; in Britain, in woods, in the north of England; near Bradford, Yorkshire; near Ripon and in Durham; also of Scotland, but rare. Smith, engl. bot. 704. Fl. dan. t. 698. Jacq. aust. 1. t. 47. Flowers greenish-yellow. Berries red, elliptic, mucilaginous and insipid. _Var. a. stérilé_ (Wallr. sched. p. 108.) flowers flat, destitute of the germ, fugaceous; racemes dense, many-flowered; anthers nearly sessile, bearing pollen, acute. _R. diococum_, Meech. meth. p. 683.

_Var. b. baceiferum_ (Wallr. l. c.) flowers somewhat hypocryptiform; racemes few-flowered; anthers distinctly pedicellate, but imperfect; style hardly semi-bifid; germ large. Cultivated in gardens.

_Var. c. pinifolium_ (Lindl. in hort. trans. 7. p. 244.) in every respect the same as the species, but not one-third the size, never exceeding 3 feet.

Alpine Currant. Fl. April, May. Britain. Shrubs 3 to 6 ft. 29 R. salicifolium (Pursh, fl. amer. sept. p. 163.) all parts of the shrub are full of resinous glands; leaves 3-5-lobed, roundish; racemes erect; calyx flat; petals bluntly rhomboidal; bracteas linear, longer than the pedicels. _H._ Native of North America, on the mountains. Sims, bot. mag. 1583. Berl. l. c. t. 2. f. 10. Flowers greenish yellow. Berry hairy, red? Perhaps the flowers are dioecious. Very like _R. alpinum._

Resinous Currant. Fl. April, May. Clt. 1800. Sh. 3 to 5 ft. 25 R. ciliatum (Willd. mm. ex Rom. et Schultes, syst. 5. p. 500.) plant beset with glands; leaves 5-lobed, deeply cordate, doubly crenate-serrate, ciliated, glabrous above, but hairy on the nerves and veins beneath; lobes acute; petals beset with glandular hairs; racemes solitary. _H._ Native of Mexico, on the burning mount Jorullo, at the elevation of 1500 feet. R. Jorullénse, H. B. et Kunth, nov. gen. amer. 6. p. 61. Nearly allied to _R. macrobrotys._

Ciliated Currant. Shrubs 3 to 4 feet.

26 R. macrobrotys (Ruiz et Pav. fl. per. 3. p. 12. t. 202. f. a.) leaves cordate, lobed, deeply serrate; petals ciliated at the base; racemes very long, pendulous, hairy; bracteas linear-subulate, pubescent, nearly the length of the pedicels; calyces pubescent; petals small, red. _G._ Native of Peru, on the Andes, in groves. Berl. l. c. t. 2. f. 17. Berries greenish, hairy.

Long-racemous Currant. Shrubs 4 to 5 feet.

27 R. alibifolium (Ruiz et Pav. fl. per. 3. p. 12. t. 132. f. 6.) leaves rather cordate, deeply serrate; racemes twice the length of the leaves, pendulous; bracteas spatulate, ciliated, length of pedicels; petals roundish, purplish; anthers nearly sessile. _H._ Native of Peru, in groves about Munna. Berl. l. c. t. 2. f. 18. Berries globose, rather hairy. Allied to _R. macrobrotys._

White-leaved Currant. Shrubs 4 to 5 feet.

28 R. bracteatum (Doug. mm. ex Hook. fl. bor. amer. 1. p. 222.) leaves on long petioles, cordate, deeply 5-7-lobed; lobes acuminate, cut, doubly serrated, hispid above, but full of resinous dots beneath; racemes often terminal, at length reflexed; pedicels erectly spreading, pubescent, exceeding the spatulate bracteas; calyx rotate, glabrous; petals minute, roundish; galls and berries full of resinous dots. _H._ Native of the north-west coast of America, at the confluence of the Columbia with the ocean. This is a very remarkable and elegant shrub, with leaves nearly as large as, and resembling, those of _Sycamore_; these, as well as the fructified racemes, have a very strong resemblance to _R. macrobrotys_; but the flowers are widely different. Flowers purplish-yellow. Berries about the size of those of _R. ribrum._

Macrobrotys Currant. Shrubs 5 to 8 feet.

29 R. stipitatum (Humb. et Bppl. in Wild. herb. ex Rom. et Schultes, syst. 5. p. 501.) leaves ovate, rather cordate, 3-lobed, reticulated beneath from hairy nerves and veins, and pale, but blackish green above; lobes deeply serrated, middle one the largest; petioles pilose, glandularious, and somewhat tomentose; racemes reflexed; bracteas dentately ciliated; petals roundish-obovate; styles bifid. _H._ Native of South America, in cold places on Mount Antisanza, at the elevation of 300 feet. Berl. l. c. t. 2. f. 13. R. frigidum, H. B. et Kunth, nov. gen. amer. 6. p. 62. Flowers flesh-coloured. Berries hispid.

Hairy Currant. Shrubs 4 to 5 feet.

30 R. fraîgrans (Pall. nov. act. pet. 5. p. 377. t. 9.) leaves glabrous, on long petioles, 3-5-lobed, greener above than below; racemes erect, stiff; flowers campanulate, white, sweet-scented; bracteas deciduous; petals lanceolate, acute, spreading. _H._ Native of Siberia, on the higher mountains. Berries red, of a very sweet taste. From the under surface of the leaves exudes, in very frequent little yellow drops, a very fragrant balsamic exudate, having a peculiar agreeable odor.

Fragrant Currant. Shrubs 1 to 2 feet.

31 R. procumbens (Pall. fl. ross. 2. p. 35. t. 65.) leaves bluntly lobed; lobes serrated; lateral ones a little cut; racemes erect; peduncles long, setaceous; segments of the limb of the flower pubescent, acute, of a livid purplish colour; anthers hardly rising from the calyx. _H._ Native of Siberia, in moist shady places. Flowers flatish. Berries very grateful to the taste, rufescent when ripe. Ait. hort. kew. 2. p. 41. _R. polycarpum_, Gmel. syst. veg. p. 419.

32 R. prostratum (Lob. st. p. 1. p. 3. t. 2.) leaves deeply cordate, 5-7-lobed, glabrous; lobes acute, cut, doubly serrated, naked on both surfaces; racemes erect, loose, slender; bracteas small, obtuse, much shorter than the pedicels, which are beset with glandular bristles; calyx rotate; galls and berries beset with glandular bristles. _H._ Native of Newfoundland; throughout Canada; and in woods on the Rocky Mountains. Berl. l. c. t. 2. f. 12. R. glandulosum, Ait. hort. kew. ed. 1. p. 12. Bigel. fl. bot. ed. 2. p. 9. _R. glandulosum_, Richards, in Frankl. 1st journ. ed. 2. append. p. 7. R. laxifolium, Richards, in Frankl. 1st. journ. ed. 2. append. p. 7. Berries large, redish. This is a very distinct species.

33 R. trifidum (Mich. fl. bor. mer. 1. p. 110.) leaves smoothish, moderately lobed; racemes loosely many-flowered, pubescent; flowers small; calyx segments rather trifid; berries hairy, red. _H._ Native of North America, near Quebec, and at Hudson's Bay. Lobes of leaves acutish. Racemes weak, nearly like those of _R. ribrum_, but the flowers smaller. Petals purplish, spatulate, rounded at the apex. Perhaps this is the same as _R. prostratum._

34 R. takare (D. Don, prod. fl. nep. p. 208.) leaves cordate, 3-lobed, acuminate, doubly serrated, pubescent on both surfaces, as well as on the branches. _H._ Native of Nipal, in Srinagar. Leaves as large as those of _Sycamore_. Flowers unknown. The bush is called Takare by the Nipalese.

Takare Currant. Shrubs.
GROSSULARIÆ. I. RIBES.

35 R. MULTIFLORUM (Kit. in Röm. et Schultes, syst. 5. p. 492, but not of H. B. et Kuntl.) leaves 5-lobed, cordate, tomentose beneath; racemes very long, pendulous, drooping; bracteas shorter than the flowers; petioles length of leaves; petals wedge-shaped; styles bifid, and sometimes distinctly trident.  H. Native of Croatia. Sims, bot. mag. 2368. Berl. l. c. t. 2. f. 11. R. spicatum, Schultes, oestr. fl. ed. 1. p. 453.

36 R. ACUMINATUM (Wall. cat. no. 6834.) branches glabrous; leaves glabrous above, but with a few scattered hairs beneath, 3-5-lobed; lobes acuminate, serrated; racemes axillary, erect; peduncles pubescent; berries nodding; calyx campanulate; petals rounded at the apex.  H. Native of Nipau, on Sirmore and Emodi. Berries red, about the size of red currants.

Acuminated-leaved Curant. Shrub 4 to 6 ft.

37 R. SPICA'TUM (Robs. in Linn. trans. 3. p. 240. t. 21.) leaves roundish-cordate, 3-5-lobed, covered with soft pile above, and tomentum beneath; racemes erect; flowers more or less pedicellate; bracteas obtuse, tomentose, much shorter than the pedicels; sepals roundish-cuneate; petals oblong; styles bifid.  H. Native of the North of England, in woods, near Richmond, in Yorkshire; and between Piersbridge and Gainford, Durham. Smith, engl. bot. 1290. Berl. l. c. t. 2. f. 16. Berries glabrous, globoso, color and taste of those of R. rubrum. The tree currant affords a fruit rather smaller and more acid than the common red currant; but by crossing and cultivation might, no doubt, be greatly improved; and from its comparatively tree-like habits, might be a more convenient fruit shrub in respect to crops around it.

Spiked-flowered Curant. Fl. April, May. Engl. Sh. 4 to 6 ft.

Stiffish-racemated Fl. April, May. Clt. 1812. Sh. 4 to 6 feet.

40 R. VILLÈSUS (Wall. cat. no. 6832.) branches pubescent; leaves nearly orbicular, cordate, bluntly 3-lobed, villous as well as the petioles; racemes erect, few-flowered.  H. Native of Sinaurug.

Villous Currant. Shrub 5 to 6 feet.

41 R. ALBÈNÈ'RIÈVUM (Michx. l. c.) leaves short, petiolate, deeply and acutely lobed, smoothish, with whiths nerves; racemes recurved.  H. Native of Canada, and on the Catskill Mountains, in the state of New York. Flowers small. Berries red, glabrous.

42 R. RUÈ'BÈU'M (Eschscholtz, pl. calif. p. 281.) leaves cordate, 3-lobed, clothed with white tomentose pubescence be-
GROSSULARIE.  I. RIBES.

188

Var. a, sybœtre (D. C. fl. fr. 4. p. 406.) leaves and berries smaller; lobes of leaves short.

Var. b, hortense (D. C. l. c.) leaves larger, sometimes variegated; berries sweeter and larger than in var. a. Cultivated in gardens.

R. rubrum. Lois. nov. dict. 3.

Var. g, cœnœnus (Berl. mss. ex D. C. prod. 3. p. 481.) leaves rather tomentose beneath; sepals red; cells of anthers distant; berries pale red. R. rubrum domesticœm b, fœcis cœneœis, Wallr. sched. p. 106.

Var. c, variegœtûm (D. C. prod. 3. p. 481.) berries variegated.

Waller. l. c.

The red currant is called Groseille ordinaire à grappes, or d'outre mer, in French; Johannesberge, in German; and Uveta, in Italian. It is a low shrub, with smooth branches, downy leaves, yellowish green flowers, disposed in pendulous racemes, which appear in May, and the fruit ripens in June and July. The berries of this shrub, in its wild state, are red; but cultivation has produced white and pale red berries. Professor Martyn observes, that “The currant does not seem to have been known to the ancient Greeks and Romans, as the southern nations of Europe have not even an appropriate name to it at this day. The old French name, grossesœilles d'outre mer, and the Dutch, beskins overzee, proclaim their having been strangers imported. Our English name of currant is evidently from the similitude of the fruit to that of the Corinth grape, the small grape of Zante, or the common grocers' Corinths or currants. The red currant has been long cultivated in Britain, and very much improved in the size of the bunch and berry.”

Use.—The fruit is acceptable at the dessert, being of an agreeable acid taste. It is much used for jellies, jams, and wines. Forsyth says it is the most useful of all the small fruit, either for the table and kitchen, or for preserving, making wine, &c., and continues longer in succession than any other. According to Withering, the juice forms an agreeable acid to punch; and Professor Martyn says it was a common beverage in Paris in 1768. Its medicinal qualities are similar to those of other sub-acerb fruits, allaying thirst, lessening an increased secretion of the bile, and correcting a putrid and scorbatic state of the fluids.

Varieties.—There are as follows:

* Red currants.

1. Common red, grossieril rouge à petit fruit, grossieril ordinaire à fruit rouge.

2. Red Dutch, large red Dutch, New red Dutch, large red, large bunched red, Morgan's red, red grape, grossieril rouge à gros fruit. This is the best of the red currants for all purposes.

3. Knight's large red.

4. Knight's sweet red currant.

5. Knight's early red currant.

6. Champagne, grossieril à fruit couleur de chair.

7. Striped-leaved currant, and variegated-leaved currant.

8. Large pale red Dutch.

** White currants.

1. Common white currant, grossieril à fruit blanc.

2. White Dutch currant, new white Dutch, Morgan's white, white crystal, white Leghorn, pearl white. This is one of the very best of the white currants.

3. Pearl white, blanc perlé.

4. Sparty's white.

Propagation and nursery culture.—The same as in the goose-berry. With a view to obtaining new improved varieties from seed, Mr. Knight procured cuttings, in the year 1810, of the finest varieties of the red and white currants, which he planted in pots of very rich mould, and placed under a south wall, to which the trees were subsequently trained. At the end of 3 years, within which period the pots had been as often changed, the trees were first suffered to produce blossoms. These were, with the exception of a very small number, removed from the white currant bushes, as soon as their buds unfolded; and those which remained were deprived of their stamens while immature, and subsequently fertilized by the pollen of the red variety. The seeds thus obtained were sown in pots, as soon as the fruit had become perfectly mature, and were subjected early in the following spring to the artificial heat of a forcing-house; by which means, and by proper subsequent attention, the plants grew more than a foot in height the first season. At 2 years old, in the year 1816, several of the plants, and in 1817, the greater part of them, produced fruit of great variety of character and merits; but out of about 200 varieties, only 3 red and 2 white appeared to possess greater merits than their parents.

Final planting.—The season for planting, on a dry soil, is any time in open weather from the fall of the leaf till February or March. Plants expected to bear the following summer, are best moved in October, unless the ground be wet in winter. Allot a competent supply of standard bushes, to be planted chiefly in the kitchen garden, in a single row, round the main quarters, or in the outward borders, or some in cross rows, to divide extensive quarters. Plant them from 5-10 feet distance in the row. To raise large supplies, full plantations are formed in parallel rows, with intervals between the rows of 8 or 10 feet, and between the trees in each row of 6 feet. Where convenient, have also some choice sorts, trained against walls, paling, or trellis-work, of different aspects, to obtain early and late fruit in perfection; some against a south exposure for early production; others on east, west, and north walls for intermediate succession and late fruit. Plant them at 6, 8, or 10 feet distance; letting them occasionally fill up the vacant spaces between other wall-trees. The branches should be allowed to advance from near the bottom, and be trained in a nearly horizontal direction, from 3-6 inches asunder. Before nailing them, cut out superabundant and irregular growths, retaining a competency of regular shoots for orderly training, among which, if any are of very considerable length, prune them to moderate extent. Some may likewise be trained as espaliers, in a detached row in the borders or divisions of the quarters. The bushes so trained may either be left to grow without support, or be tied occasionally to stakes, and the branches thus will not overspread the ground. Being kept moderately thin and regular, they will bear fine large fruit, and make an agreeable appearance.

Mode of bearing.—Currant bushes, in general, bear the fruit both on the young wood of one, two, or three years' growth, and on the older branches from small spurs and snags along the sides, which continue for several years fruitful; but the fruit produced on the last year's shoots are always the finest, especially when the old mother bearers have borne more than 4 years.
Pruning.—The chief part of the future culture is seasonal pruning. After the plants are furnished with full heads, they produce many superfluous and disorderly shoots every summer, crowding the general bearers, so as to require reenforcement and regulation, both in the young growth of the year and older wood. The season for the careful pruning is winter; but a preparatory part is performed in summer, to thin the superfluous shoots of the year where too crowded, excluding the sun and air from the fruit. First as to standards:—

Summer pruning.—In May or June cut out close the most irregular shoots, rising in the centre of the bush with all the cross and water shoots, to admit more freely the essential influence of the air and sun, and promote the growth of the fruit and improve its flavour. Also twist off all root suckers as they appear.

Winter pruning.—This extends both to the old and young wood; the time for it is when the plant is at rest. Of the shoots of the preceding summer, cut out the cross-placed and the otherwise irregular, with those which are not wanted for vacancies; but superfluous good lateral shoots are to be cut down to short stubs or artificial spurs, about half an inch long, so as to leave an eye or two, in order that they may send out fruit-shoots and spurs. With regard to the old bearers, take away those which are naked, or getting unfertile, or of which the fruit is declining in size; reduce any of excessive length, pruning in to some well-placed lateral young shoot, to preserve the head within some regular compass; cut out also any decayed or cankery parts; retain a competency of the finest best-placed new shoots above and below vacant parts, to come in for successive bearers, or to supply the places of defective old wood, and preserve a leading shoot to the principal branches, where within orderly limits, shortening such terminal shoots as are of greatest length to 10, 12, or 15 inches, according to their strength and the situation of the branches, and leaving those of small extent mostly entire. Take care of the small lateral fruit-spurs, and occasionally select short lateral shoots of 1, 2, or 3 inches, for bearing fruit; or similar small shoots may be cut to short snags of an inch or two long, also for fruiting. Thin out spurs of the old branches where very thick. As the old fruit branches decline bearing, or decay, cut them away, taking care to provide young ones in succession; and thus keep the bushes always furnished with full-bearing branches, and advancing young bearers, in a regular open expansion, 6, 8, or 10 inches asunder at the extremities, circumscribing the general head within the height of 3 or 4 feet, or 5 at most.

"Currants of the finest quality," Mr. Neil observes, "are raised by Macdonald, at Dalkeith House. A good deal depends upon the way in which he manages the bushes, especially during the ripening of the fruit. He prunes the bushes at the usual season of mid-summer, shortening the last year's shoots down to an inch or an inch and a half. Next summer the plants show plenty of fruit, and at the same time throw out plenty of strong shoots. As soon as the berries begin to colour, he cuts off the summer shoots to within 5 or 6 inches before the fruit. This is commonly done with the garden shears, with which a man may go over half an acre of bushes in a day. Sun and air thus get more free access, and more of the vigour of the plant is directed to the fruit; the berries are found not only to be of higher flavour, but larger than usual."—Neil, Cal. mem. vol. 2.

To wall-bushes, espaliers, and fan-standards, without support, the same course of summer and winter pruning is applicable, with the obvious variations required by their figure. In training wall-trees, 2 branches are led in an horizontal direction along the bottom of the wall or trellis, perhaps half a foot from the surface of the earth, and the growths from these of all upright shoots, which will admit of being arranged at the distance of 5 or 6 inches from each other, is encouraged. Fan standards are sometimes trained in a manner nearly similar, and sometimes with the branches radiating from the crown of the stem.

Insects, &c.—The red currant is occasionally attacked by the caterpillar, and very frequently by the aphides ribes, Lin. which changes the colour of the leaves to red, pits and pucker them, and causes the fruit to be shrivelled and colourless. Forsyth says, "As currants are very liable to be devouried by earwigs, which take shelter under their leaves and branches, bundles of bean-stalks should be hung up some time before the bushes are covered with mats or nets. If proper attention be not paid to this, the fruit will generally suffer very much from these insects. After the bushes are covered, take the mats off once in 3 or 4 days, and kill the earwigs that have got into the bean-stalks, which it will be necessary still to keep hung up. As there is a sweetness in the inside of bean-stalks which attracts the earwigs, they very regularly take shelter in them from rain."

Taking the crop and preserving.—The ripening fruit comes in for small gatherings in June, advances to maturity in July, and continues in perfection till the end of August; or if trees in a full exposure are timely defended from birds and the full sun, with garden mats, or protected with nets where they grow against walls, the fruit may be continued good till September or October. Gather in a dry state, as in rainy weather they lose their flavour.

Forcing.—To obtain early currants by forcing, let some good bearing trees, in pots, be placed early in January or February, in any common forcing department: they will produce ripe fruit in April or May.

Red and White Currant. Fl. April, May. Brit. Sh. 4 to 6 ft. 50 R. glandulosum (Ruiz. et Pav. fl. per. t. 253. f. 6, but not of Kit.) leaves cordate, bluntly 5-lobed, doubly serrated, rugged; racemes short; calyx glandular, pubescent. H. Native of Chili, on wooded hills. Berl. l. c. t. 2, f. 20.

51 R. cananula'tum (Humb. et Bonpl. in Wildl. herb. ex Rœm. et Schultes, 2. p. 500.) leaves somewhat 5-lobed, doubly crenated, cordate, hairy beneath; lobes obtuse; petals ciliated with glandular hairs; racemes pendulous; calyx campanulate; petals oblong-spatulate; styles bident. H. Native of Mexico, near Moran, at the height of 3900 feet. R. affine, H. B. et Kunth, nov. gen. et spec. amer. 6. p. 60. Flowers white. Hardly distinct from the following species.

Campanulate-calyxced Currant. Shrub 4 to 5 feet.

52 R. kirt'nu (Berl. mss. ex D. C. prod. 3. p. 482.) leaves somewhat 5-lobed, doubly serrated, rather cordate at the base, pubescent; racemes solitary or numerous, crowded, erect; calyx campanulate; petals spatulate, reflexed; stamina 5-6, hardly shorter than the petals; styles 3-4-clerit; stigmas capitate. H. Native of Mexico, along with the preceding. R. multiflorum, H. B. et Kunth, l.c. but not of Kit.

Kint's Currant. Shrub 4 to 6 feet.

53 R. tri'ste (Fall. nov. act. petro. 10. p. 378.) leaves 5-lobed; branches simple, twiggy, bearing leaves and racemes of flowers at the apex; racemes pendulous, both when in flower and in fruit; corolla flat; reddish on the outside, and yellowish inside; petals revolute. H. Native of Siberia, on the Mongol Mountains. Berries small, black, insipid. Root creeping.

54 R. glacia'le (Wall. cat. no. 6833.) branches smooth; glabrous above, but with a few scattered bristly hairs beneath, cordate at the base, 3-5-lobed at the apex; lobes acute, serrated; petals long, serrated at the base; racemes droop-
ING; calyx campanulate; petals longer than the calyx. \( \frac{7}{2} \). H. Native of Nipal, on Emodi and Gosingtan. Flowers white. Berries black.

**Icey Currant.** Fl. April, May. Clt. 1823. Sh. 4 to 6 ft. 55 R. sieratum (Lin. spec. 291.) leaves dotted from glands beneath, 3-5-lobed; racemes loose; bracteas minute, subulate or obtuse, much shorter than the pedicels; petals oblong; calyx campanulate, with reflexed segments. \( \frac{7}{H} \). Native of Europe and Siberia, in woods; plentiful in some parts of Britain about the banks of rivers, in the north of England and in Scotland. Berl. l. c. t. 2. f. 21. Woodv. med. bot. t. 75. Fl. dan. 556. Blackw. Smith, engl. bot. 1291. R. glidum, Mændch. meth. 683. Flowers whitish green; calyx often of a rich brownish red-colour. Stamens sometimes more than 5, and there are fewer petals; so that when there are 10 stamens, there are no petals; this change of petals into stamens is just the reverse of the process by which single flowers become double; but it is the only fact of the kind which has hitherto been observed. Stigmas bifid. Berries globose, black, glabular. The black currant is a shrub with smooth branches, strong smelling leaves, with a solitary 1-flowered pedicel at the base of each raceme. The flowers appear in April, and the fruit ripens in June and July, and changes from a green to a black colour. It is a native of most parts of Europe, especially the more northern parts. It abounds in the woods in the north of Russia, and the subalpine regions of Siberia, where the branches and berries are very large, and sapid. In Britain it is found in wet hedges, on the banks of rivers, in alder swamps, and sometimes in woods.

**Use.**—The fruit, which has a peculiar flavour, and disliked by some, is seldom brought to the dessert; but it is eaten in puddings and tarts, and made into jellies and wines. The Russians put the berries into brandy, and the Irish into whisky, in the same way as the English put cherries: the Russians also ferment the juice with honey, and so form a strong and palatable wine. Many cottagers, who cannot afford to mix green tea with black, substitute one or two dried leaves of the black currant, the flavour produced by which few are so acute as to distinguish from that of the mixture of green and black tea.

**The varieties are as follows:**

1. **Wild black.** 2. Black grape, Ogder's black grape. 3. Black Naples, Cassis of the French; this is one of the best of black currants. 4. Green-fruited black; fruit of a dingy colour, of no value. 5. Russian green.

**Propagation.**—By cuttings. See gooseberry.

**Soil and site.**—A moist soft soil, and shady situation; such as is afforded by borders of north exposure is preferable. Miller says, “the fruit is always best when the plants are placed in an open situation, in light loamy soil.”

**Final planting.**—As only a few plants are in general required for private gardens, these may be placed at the distance recommended for gooseberries, in the margin of a shady border, or against a wall of a north exposure. Mr. Neil says, it produces most fruit as a standard, but the largest berries when trained to a wall.

**Mode of bearing.**—The black currant bears chiefly on the shoots of the preceding year, and also from snags and spurs, which, however, are less abundant, and of smaller size in the black currant than in the gooseberry or red currant.

**Insects and diseases.**—The black currant is seldom attacked by insects, though, like the elder tree, it has its own varied caterpillar, which sometimes reduces it to a state of complete nudity.

**Gathering the fruit.**—See red currant.

**Forcing.**—The black currant may be forced in pots like the gooseberry. In Russia this is often done for the sake of the fragrance of the leaves.

**Black Currant.** Fl. April—May. Britain. Shrub 4 to 6 ft. 56 R. Biebersteinii (Berk. miss. ex D. C. prod. 3. p. 482.) leaves coriace, acutely 5-lobed, sharply and doubly serrated, rather pilose above, and villously tomentose beneath; segments numerous; racemes nodding; petals minute. \( \frac{7}{H} \). Native of Caucasus. R. Caucasicum, Bieberl. f. taur. suppl. 160. but not of Adams. Leaves having a strong scent like those of R. nigrum. Berries black.

**Bieberstein's Currant.** Shrub 4 to 6 ft. 57 R. Huculianum (Richards in Frankl. first journ. ed. 2. append. p. 6.) branches erect; leaves 5-lobed, quite glabrous above, full of resinous dots beneath, and are, as well as the petals, villos; gernments dotted; berries globose, glabrous, black; racemes erect, pubescent; racemes short; segments of the calyx, which is campanulate, spreading. \( \frac{7}{H} \). Native of North America, from Hudson's Bay to the Rocky Mountains, in the west, and as far north as lat. 57°. Flowers small; petals white. The fruit, and peculiar odour of the plant, are that of R. nigrum.

**Var. \( \beta \); racemes longer; calyx smoothish. \( \frac{7}{H} \). Native of the north-west coast of America, on the mountains of the Columbia, about the Kettle Falls. R. petiolare, Doug. in hort. trans. 7. p. 514.

**Hudson's Bay Currant.** Shrub 3 to 4 ft. 58 R. Flordium (Lher. stipr. 1. p. 4.) leaves full of resinous glands, 3 or 5-lobed, cordate, double-serrate; racemes pendulous, pubescent; bracteas linear, longer than the pedicels; calyx tubularly campanulate, glabrous; with the segments obtuse, and at length reflexed; gernments and black berries oval-glabrous, glabrous. \( \frac{7}{H} \). Native throughout Canada; and of Pennsylvania. Berl. l. c. t. 2. f. 22. R. nigrum \( \beta \), Lin. spec. 291. R. Pennsylvanicum, Lam. dict. 3. p. 49. R. recurvatum, Michx. fl. bor. amer. 1. p. 109. according to Torrey.—Ribesium nigrum, &c. Dill. elth. 2. t. 244. & f. 315. This is in many respects allied to R. nigrum, but its more copious, denser flowers, and especially the long bracteas, and more tubular calyx, will always distinguish it; the solitary pedicel too at the base of the flowers is wanting in this species. Petals oblong, rather erose at the apex.

**Flowering Currant.** Fl. April, May. Clt. 1729. Sh. 4 to 6 ft. 59 R. Inebranis (Lindl. in bot. reg. 1471.) leaves roundish, deeply 3-5-lobed, and deeply toothed, truncate at the base, glandular on both surfaces; petioles pubescent; peduncles 3-5-flowered, pendulous; flowers aggregate; calyx tubular, glabrous, with the segments recurved. \( \frac{7}{H} \). Native of North America. Calyx greenish white, with the tube 4 lines long. Leaves smelling like those of R. Flordium. The species was received from Mr. Floy of New York, under the name of intoxicating currant, but without any account of its quality. The berries probably possess some narcotic quality.

**Intoxicating Currant.** Clt. 1827. Fl. April. Shrub 3 to 4 ft. 60 R. Cre'sium (Doug. l. c. t. 7. p. 512. bot. reg. 1263. Hook. fl. bor. amer. 1. p. 234.) leaves small, cordate, lobed, serrated, clothed with glandular pubescence, glabrous, glaucous, full of white glands above; racemes pendulous, rather capitate; bracteas ovate, adpressed to the gernments, which are glabrous; flowers nearly sessile, cylindrical, rather angular; calyx segments small, reflexed. \( \frac{7}{H} \). Native of North West America, on the banks of the Columbia, and its southern tributary streams, from the Great Falls to the Rocky Mountains, in gravelly or sandy soil. In the small foliage, and few-flowered racemes, this species resembles the gooseberry tribe, but without any thorns. The flowers are rather large, pink, with a slight tinge of green, rather downy. White waxy dots like scales cover the upper surface of the leaf, whence the specific name.

**Waxy-leaved Currant.** Fl. April. Clt. 1827. Shrub 2 to 3 ft.
61. Ribes viscous simum (Pursh. fl. amer. sept. 1. p. 153.) leaves cordinate, obtuse, 3-5-lobed, deeply crenated, viscid from glandular pubescence: glands on both surfaces; racemes erect, corymbose; bracts linear-obovate, rather shorter than the pedicels, which are clothed with glandular hairs; calyx tubularly campanulate, with finely spreading oblong segments; gersims and fruit ovate-oblong, clothed with viscid hairs. ð. ñ. Native of North America, on the Rocky Mountains, and in dry plains in partially shaded places towards the sources of the Columbia; also on the summits of the hills near the Spoken and Kettle Falls, at an elevation of 8000 feet above the sea. Hook. fl. bor. amer. 1. p. 234. t. 74. Berries oblong-ovate, black. Flowers large, pale yellowish green. This is a very fine and remarkable species.

**Flowers deep red.**

62. Ribes atropurpureum (Meyer in Led. fl. ross. alt. ill. t. 231. fl. alt. 1. p. 268.) stem erect; leaves pubescent, nearly obicular, cordinate, 3-5-lobed; lobes acute, serrated; racemes drooping; pedicels exceeding the bracts; calyces campanulate, ciliated; berries glabrous, bracteate. ð. ñ. Native of Altaia, on mountains and subalpine places at the river Ural, also at the river Tscharysh. Berries dark purple, size of those of the common currant.

Var. a; flowers deep purple; leaves rather pubescent beneath, but smooth and glabrous above, as well as the branches. Var. b: leaves rather pubescent beneath, but hispid from bristles above, as well as the petioles and stems. Near the river Volshoi Ulegumen.

Var. y; flowers paler; leaves pubescent above, but most so below; branches smooth.

Dark-purple-flowered Currant. Fl. April, May. Shrub 4 to 6 feet.

63. Ribes sanguineum (Pursh. fl. amer. sept. 1. p. 164.) leaves cordinate, somewhat 5-lobed, serrated, veins, smoothish above, but clothed with villous tomentum beneath; racemes drooping, pubescent, twice the length of the leaves; calyx tubularly campanulate, with oblong obtuse spreading segments, exceeding the petals, which are red, and quite entire; bracts ovate-spatulate; berries tubinate, hairy. ð. ñ. Native of the north-west coast of America, in abundance from lat. 38° to 52°, usually growing in rocky situations by the sides of streams. Doug. in hort. trans. 7. t. 13. bot. reg. 1349. Sweet, fl. gard. n. s. t. 109. R. malvaceum, Smith in Rees’ cyc. This is perhaps the most ornamental species of the genus, bearing a profusion of large racemes of deep rose-coloured flowers, and is therefore well adapted for ornamenting shrubbery and pleasure grounds. The berries are brownish black and bitter, completely destitute of the pulpy substance common to most of the species of the tribe.

SECTION V. Symphocalyx (from συμφωνο, symphuo, to join together, and καλυξ, calyx, a calyx; in reference to the calyx being tubular in all the species belonging to this section). Berl. l. c. t. 2.

64. Ribes aureum (Pursh. fl. amer. sept. 1. p. 164.) quite glabrous; leaves 3-lobed; lobes divaricate, with a few deep teeth, shorter than the petioles, which are ciliate at the base; calyxes tubular, longer than the pedicles; tube slender; segments oblong, obtuse; petals linear, much shorter than the calycine segments; bracts linear, length of the pedicels; style entire; berries glabrous. ð. ñ. Native of North-west America, in light gravelly soils, from the Great Falls of the Columbia River to the mountains, and on the southern branches. Berl. l. c. t. 2. f. 23. Flowers golden yellow. Fruit yellow, seldom black, and of an exquisite flavour.

Var. a, præcox (Lindl. in hort. trans. 7. p. 242.) flowers earlier; leaves cuneated at the base, pubescent beneath; lobes deeply serrated; berries copious, earlier, tubinate; racemes bracteate. ð. ñ. Native of North America.

Var. b, villosum (D. C. prod. 3. p. 483.) leaves rather vil- lous. R. longiflorum, Fraser, cat. 1813.

Var. y, serünum (Lindl. l. c.) flowers late; leaves of various forms, smoothish beneath; lobes deeply serrated; berries few, late, round; racemes naked. ð. ñ. Native of North America.

65. Ribes tenuiflorum (Lindl. in hort. trans. 7. p. 242. bot. reg. 1274.) unarmed, quite glabrous; leaves roundish, 3-lobed, mealy; lobes bluntly toothed at the apex; racemes pendulous, many-flowered; calyx tubular, glabrous, longer than the pedicels, coloured; petals quite entire, linear, one-half shorter than the segments of the calyx, which are oblong and obtuse; bracteas linear, length of the pedicels; berries glabrous. ð. ñ. Native of North America, common on the rocky tracts of the Columbia, near the head waters of the Missouri. R. aureum, Colla, hort. rip. append. 3. t. 1. f. A. R. flavum, Berl. in D. C. prod. 3. p. 483. R. Missouriens, Hort. In habit this species is more erect than R. aureum, and has the young wood more thinly clothed with leaves; its whole appearance is also paler during the early part of the season. The flowers are not more than half the size of those of R. aureum, and have entire, not notched petals. The fruit is the size of a red currant, of an agreeable flavour, but possessing little acidity.

Var. a, fructu-nigro; berries changing from yellow to red, and finally acquires a deep blackish purple-colour.

Var. b, fructu-lateo; fruit yellow, always retaining the same colour.

Slender-flowered Currant. Fl. April, May. Clt. 1812. Sh. 6 to 8 feet.

66. Ribes flatum (Coll. hort. rip. append. 3. p. 4. t. 1. f. ß.) unarmed, quite glabrous; young leaves 3-lobed; adult ones usually 5-lobed, deeply toothed, about equal in length to the ciliated petioles; racemes short, 4-5-flowered; calyx tubular, much longer than the pedicels; tube slender; segments rather spatulate, reflexed; petals one-half shorter than the calycine segments; bracts elliptic; berries oblong, glabrous. ð. ñ. Native of North America. R. aureum ã. sanguineum, Lindl. in hort. trans. 7. p. 242. R. palmatum, Desf. hort. par. R. aüreum, Ker, bot. reg. t. 125. but not of Pursh. Flowers yellow.

Yellow-flowered Currant. Fl. April, May. Clt. 1812. Shrub 6 to 8 feet.

Cult. All the species of Ribes grow well in any kind of soil, and all root freely from cuttings planted in autumn, or early in spring. Those species, natives of Chili, Peru, Mexico, and other parts of South America, require shelter in severe weather. Some of the species are well adapted for ornamenting shrubbery and pleasure grounds. But the most ornamental and
most worthy of cultivation are R. speciösum, R. Menziöti, R. sanguineum, R. atropurpureum, and R. auricrum.

Calyx superior, 5-toothed (f. 34. b. f. 35. a.). Corolla of 5 petals (f. 34. c. f. 35. b.), alternating with the calycine segments, from within which they rise, forming by their cohesion a tube (f. 34. c.), but finally separating from each other (f. 35. b.), imbricate in aestivation. Stamens arising from the calyx (f. 35. b.), alternating with the petals (f. 35. b.); anthers bursting lengthwise. Disk conical, epigynous (f. 34. c.), plaited, surrounding the base of the style (f. 34. c.). Ovarium inferior (f. 34. a.), 2-celled, with 2 large polypernous placents (f. 34. f.) in the axis. Style simple (f. 34. d.). Stigma 2-lobed. Fruit capsular, 2-celled, crowned by the style and calyx (f. 34. a. b. c. d.), which are permanent, splitting by the separation of the cells at their base. Seeds numerous, minute, with a transparent membranous integument. Embryo minute, in the apex of an oily albumen, having the radicle pointing to the extremity opposite the hilum.—Shrubs or trees. Leaves alternate, exstipulate, simple, full of resinous glands. Flowers axillary, conspicuous, white, rarely reddish.

This order is distinguished from Grossulariœ by the cohering petals, and by the radicle being at the extremity of the seed, opposite the hyllum; the albumen is also oily, not horny, and the placents are not parietal; from Philadelphœ they are known by their glandular leaves and minute embryo; from Vacciniœ, by the final separation of the petals, and by the anthers.

Synopsis of the genera.

1 Escallonía. Limb of calyx 5-toothed or 5-lobed (f. 34. b.). Stigma peltate, 2-lobed (f. 34. d.). Capsule baccate (f. 34. f.), somewhat 2-celled, opening by pores at the base. Seeds scrobiculate.

3 Forgeșia. Limb of calyx 5-parted. Style finally divisible into 2 parts; stigma 2-lobed. Capsule 2-celled, decising between the parts of the style.

4 Anöterus. Calyx 6-lobed (f. 35. a.). Petals and stamens 6 (f. 35. b.). Stigma bífid (f. 35. c.). Capsule 1-celled, 2-valved (f. 35. d.). Seeds compressed, furnished with a wing at the top.

straight, bearing 1 leaf each, just under the calyx. Petals white, spreadingly reflexed. Stigma peltate.

*Corimbos-flowered Escallonia.* Shrub 6 to 10 feet.

**Twiggly Escallonia.** Shrub 5 to 10 feet.

8 E. punctata (D. C. prod. 4. p. 3.) shrub smoothish; branches erethic; leaves obovate obtuse, or lanceolate acuminate, serrated, full of resinous dots beneath; pedicels 1-flowered, arising from the axils of the upper leaves, each bearing 2 linear bracteoles; lobes of calyx long, denticulated. L. F. Native of South America. Allied to E. virgata, but differs in the leaves being dotted beneath; to E. rubra, but the flowers are on axillaries, solitary, 1-flowered pedicels. In this and in E. rubra the urceolus is conical and pervers at the apex, 10-angled, and 10-toothed, girding the style at the base.

**Dotted-leaved Escallonia.** Shrub 5 to 8 feet.

9 E. florda (Popp. pl. exsic. no. 845. ex D. C. prod. 3. p. 666.) shrub glabrous; leaves linear-lanceolate, acuminate at both ends, with a few serratures, crowded; flowers on short pedicels, arising from the axils of the upper leaves, solitary, collected in an ovate raceme; limb of calyx 5-cleft, with obtuse recesses and acute lobes; petals obovate, on short claws. L. F. Native of Chili, probably on the mountains. Leaves 8-9 lines long, and 1$\frac{1}{2}$ line broad. Petals with obscure veins, which are pinnately disposed.

*Florid Escallonia.* Shrub 4 to 6 feet.

* * * Flowers disposed in terminal racemes or panicles.

10 E. rubra (Pers. ench. 2. p. 235.) shrub smoothish; branches erect, when young clothed with glandular villi; leaves obovate-oblong, acuminate, serrated, full of resinous dots beneath; peduncles 2-7-flowered, bracteate; lobes of calyx denticulate; petals spatulate. L. F. Native of Chili, on the mountains at Colocolo, in the fissures of rocks, and about Valparaíso. Hook. bot. mag. 2890. Stereoxylon rubrum, Ruiz et Pav. fl. perf. 3. t. 236. f. b. Petals red, connivent, but spreading a little at the apex. (f. 34. c.) Var. a, glabríssula (Hook. et Arn. in bot. misc. 3. p. 252.) branches glandular, hardly pubescent; leaves glabrous; flowers red. L. F. Native of Chili, near La Guardia, on the Andes of Chili, and about Valparaíso.

Var. b, albiglória (Hook. et Arn. l. c.) flowers white. L. F. E. glandulósa, Loddd. bot. cab. t. 1291. Native of Chili; and the province of Maule.

Var. c, pubéscens (Hook. et Arn. l. c.) branches hardly glandular, but clothed with villous pubescence; leaves pubescent on both surfaces, but more so beneath; flowers red. L. F. Native of the Andes of Chili. The leaves of all the varieties are spotted beneath with resinous dots.

---

11 E. Peppigiana (D. C. prod. 4. p. 3.) shrub smoothish; branchlets pubescent, rather clammy; leaves oval, acute, tapering into the petiole, serrated, full of resinous dots beneath, rather clammy above; pedicels 1-flowered, disposed in a few-flowered, terminal raceme; calyx glandular, with the tube drawn out beyond the ovaryum; teeth subulate; petals erect, oblong. L. F. Native of Chili. E. ribra, Popp. pl. exsic. no. 81. Flowers red. Like E. rubra, but differs in the peduncles being 1-flowered, in the teeth of the calyx being subulate, in the urceolus not being prominent, and in the style being equal in length to the petals. There is a long-leaved variety of this, or a species, which was collected on the mountains in Chili, where it is called by the natives Ropa.

*Peppig’s Escallonia.* Shrub 4 to 6 feet.

12 E. macrántia (Hook. et Arn. in bot. misc. 3. p. 251.) branches pubescent, glandular; leaves ovate-elliptic, bluish, cuneated at the base, glabrous, full of resinous dots beneath, bluntly crenate-serrate; lower pedicels simple, axillary: upper ones racemose; bracteoles wanting, or very minute; calyceal teeth subulate. L. F. Native of Chile. Petals connivent. The flowers are larger and the leaves broader than in E. rubra.

*Large-flowered Escallonia.* Shrub.

13 E. myrtóidea (Bert. in litt. ex D. C. prod. 4. p. 666.) shrub glabrous; leaves lanceolate, serrated, attenuated at the base; racemes terminal, nearly simple, hardly longer than the leaves; limb of calyx campanulate, 5-cleft; lobes subulate, reflexed; petals obovate, on long claws. L. F. Native of Chili; at the river Cachapul near Rancagua, where it is commonly called Lun. The calyx agrees with that of E. macrántia, but differs in the whole plant being smooth, and in many other points.

*Myrtle-like Escallonia.* Shrub 3 to 6 feet.

14 E. Illiníta (Presl, in relic. Haenk. 2. p. 49. t. 59.) quite glabrous; branches spreading, anointed with resin; leaves petiolate, obovate or oblong, obtuse, crenulated, attenuated at the base, beset with glandular dots above, and clammy; panicle terminal, many-flowered, leafy; calyceal segments acuminate, quite entire; petals on long claws; capsule turbinate, 5-nerved; style furnished with a 10-toothed, 10-angled, pervalvate, cylindrical urceolus at the base, as in most of the species. L. F. Native of the Cordillera of Chili.

Var. a; leaves beset with shining resinous dots on both surfaces, but especially beneath. L. F. Native of Chili, in El Arroyo de Los Lanes, Valle del Rio Tinguiririca, where it is called by the natives Lun.

Var. b; leaves bearing minute glands beneath. L. F. Native of Chili, in La Siente Vieja, and La Cuesta de Chacabuco, and La Laguna near Valparaíso, where it is called by the natives Araca or Arayán. This variety is perhaps a distinct species; the glands beneath sometimes pass into a kind of pubescence.

*Anointed Escallonia.* Shrub 3 to 6 feet.

15 E. Arou’ra (Presl, relic. Haenk. 2. p. 48. t. 58.) quite glabrous; branches erect; leaves obovate or oblong-lanceolate, mucronate, sharply serrated, attenuated into the petiole, discoloured beneath; panicle terminal, many-flowered; racem pubescent; segments of calyx acute, quite entire; petals spatulate, on long claws; capsule turbinate, 10-nerved. L. F. Native of Chili, at San Gabriel, La Guardia, and La Cuesta del Inga; Andes of Chili; and Valle del Rio Claro. Lun is its vernacular name. E. microcarpa, Gill. mss. E. reflexa, Gill. mss. E. myrtóidea, Gill. mss. hardly of Bertero. The race is very compact, and the flowers nearly sessile. Perhaps afterwards it may prove a mere state of M. rubra.

C C
**ESCALLONEÆ.**

207. *Escallonia.* Shrub 3 to 6 feet. Branches erect; leaves oblong, cuneated at the base, acutish, finely serrated, full of resinous dots beneath; petiole terminal, many-flowered, crowded, intermixed with foiliaceous bracteas; lobes of calyx acute, rather denticulated; petals obovate-oblong. F. Native of Brazil, in many places, but especially on the sandy banks and pastures of the Uruguay. *E. floribunda* var. ρξ., Montevideensis, Schlecht. in Linnaea. p. 543. Lindl. bot. reg. 1487. E. bifida. Link et Otto, abbild. t. 28. Flowers white, very like those of the Hawthorn. Style permanent, double the length of the fruit after flowering.

**Monde-Vídeo Escallonia.** Fl. July, Sept. Clt. 1827. Shrub 6 to 10 feet. Leaves obtuse, nearly sessile, obtusely crenated, glandular, pubescent, nearly sessile, whitish beneath; petiole terminal, nearly sessile, whitish beneath; petiole terminal, many-flowered, crowded, intermixed with foiliaceous bracteas; lobes of calyx acute, rather denticulated; leaves oblong, obtuse, finely serrated, full of resinous dots beneath; calyx terminal, many-flowered, crowded, intermixed with foiliaceous bracteas; lobes of calyx acute, rather denticulated; petals obovate-oblong. F. Native of Brazil, in many places, but especially on the sandy banks and pastures of the Uruguay. *E. floribunda* var. ρξ., Montevideensis, Schlecht. in Linnaea. p. 543. Lindl. bot. reg. 1487. E. bifida. Link et Otto, abbild. t. 28. Flowers white, very like those of the Hawthorn. Style permanent, double the length of the fruit after flowering.

**Bundle-flowered Escallonia.** Tree 10 to 20 feet. Leaves when young clanny and shining above. Flowers white. This species is said to come near *E. cuneifolia.*

208. *Caracasa* (H. B. et Kunth, nov. gen. amer. 3. p. 297.) Shrub glabrous; branches scattered, somewhat trigonal; leaves oblong, acute, cuneated at the base, petiolate, finely crenated, membranous; petiole terminal, many-flowered, leafy; teeth of calyx acute; petals obovate-spatulate. F. Native of New Granada, on the Andes. Style length of the stamens. Leaves when young clanny and shining above. Flowers white. Style length of the petals, shorter than in any other species, rather conical at the base, striated.
Discoloured-leaved Escallonia. Clt. 1829. Shrub 6 to 8 ft.
30. \textit{E. revoluta} (Pers. ench. 1. p. 235.) shrub hairy in every part; branches erect, very hairy, but smoothish in the adult state; leaves obovate, dentilicate, revolute; raceme thyrsoid; teeth of calyx subulate; petals linear-spatulate. \textit{F}. Native of Chili, in shady moist places, and on the banks of rivulets about Concepcion, Valparaiso and Quillota, where it is called \textit{Lun} or \textit{Lun} by the inhabitants, and \textit{Siete Canisas}. Stereoxylon revolutum, Ruiz et Pav. fl. per. 3. p. 15. t. 236. a. Flowers white?

\textit{Revolute}-leaved Escallonia. Tree 10 to 20 feet.
31. \textit{E. fulvululesta} (Pers. ench. 1. p. 235.) shrub hairy in every part; branches rather erect, somewhat trigonal; leaves elliptic, obtuse, on short petioles, serrulately, rather cymose above when young; racemes terminal, spike-formed, erect; teeth of calyx spreading; petals obovate. \textit{F}. Native of Chili, between Concepcion and the tract of Carcano, where it is called \textit{Mardognia} by the natives, and about Valparaiso. Poeppl. pl. exsic. no. 79. Cham. et Schl. in Linnaea. 1. p. 541. Stereoxylon pulvululentum, Ruiz et Pav. fl. per. 3. p. 15. t. 237. a. Flowers white, nearly globose, when in the bud. The style is shorter in this than in any other species.

\textit{Powdered} Escallonia. Shrub 6 to 10 feet.
32. \textit{E. Berteroana} (D. C. prod. 4. p. 666.) shrub glabrous, cymose from resin; leaves elliptic, petiolate, serrated, shining above; racemes spicate, terminal, simple, twice the length of the leaves; calyces shining and cymose, 3-leaved; petals elliptic-oblong, sessile. \textit{F}. Native of Chili, on the banks of rivers, and in valleys on the mountains, as at La Guardia del Maypu, banks of Rio Maule, Valle del Rio Tinquiriqui, and Causa Blanca, and in woods near Rancagua. E. resinumum, Bertero in litt. Leaves 1$\frac{1}{2}$ to 3 inches long, and 1$\frac{1}{2}$ broad. Petioles 3 lines long. Vernacular name of the shrub \textit{Corentillo}.

\textit{Bertero's} Escallonia. Shrub 5 to 6 feet.
33. \textit{E. chlorophylla} (Cham. et Schl. in Linnaea. 1. p. 542.) shrub glabrous; branches rather angular; leaves oblong-cuneated, mucronulate, quite entire, of a greyish white colour; racemes terminal, clothed with powdery down; bracteoles about equal in length to the peduncles; petals obovate-spatulate.

\textit{G}. Native of Brazil. Flowers white?

\textit{Green-leaved} Escallonia. Shrub.
34. \textit{E. pendula} (Pers. ench. 1. p. 235.) branches erectly spreading, rather cymose when young; leaves oblong-lanceolate, acute, finely crenulated, hairy beneath, but especially on the nerves; racemes terminal, spike-formed, pendulous, calyx hairy, with the teeth acute; petals linear-spatulate. \textit{F}. Native of Peru, in groves; and on the Andes about Loaxa, near Gonzanama. Stereoxylon pendulum, Ruiz et Pav. fl. per. 3. p. 16. t. 257. f. b. E. pendula, H. B. et Kunth, nov. gen. amer. 3. p. 296. Perhaps the plant from Loaxa is the same as that from Peru. Flowers white.

\textit{Pendulous-racemed} Escallonia. Tree 10 to 14 feet.
35. \textit{E. hiuta} (Willd. in Böasm. et Schultes, syst. 3. p. 329.) leaves obovate-oblong, almost quite entire, glabrous; pedicle terminal; peduncles hairy. \textit{H}. Native of South America, where it is said to have been gathered by Humboldt and Bonpland, but it is not mentioned in the nov. gen. amer.

\textit{Hairly} Escallonia. Shrub.
Cult. All the species of \textit{Escallonia} are very fine ever-green shrubs; they grow best in a mixture of peat, sand, and loam, and cuttings strike readily in mould or sand under a hand glass. Most of the species will probably be found sufficiently hardy to stand in the open air in our climate, provided they are planted in a warm sheltered situation, particularly against a south wall or hot-house; and in winter they may be protected by throwing a mat over them.

\textit{Lin. syst. Pentadria, Monogynia.} Tube of calyx adhering to the ovary, marked by 10 nerves; limb 5-toothed, perennate. Petals 5, obovate. Stamens 5. Style columnar, filiform; stigma peltately capitate, 4-5-lobed. Capsule crowned by the style and calyx teeth, 5-celled, with the dissepiments hardly complete; cells many-seeded. Seeds small, ovate, compressed. — Shrub smooth. Leaves alternate, petiolate, oval, acuminate at the apex, attenuated at the base, quite entire, coriaceous. Panicles terminal, composed of spreading racemose branches. Pedicels spreading, shorter than the fruit.

\textit{Sieber's Quintinia}. Shrub.
Cult. See \textit{Escallonia} above for culture and propagation.

\textit{Lin. syst. Pentandria, Monogynia.} Tube of calyx turbinate, adnate to the ovary; limb 5-parted; lobes lanceolate. Petals 5, inserted in the calyx, linear-lanceolate, approximate at the very base, hardly longer than the calyx, somewhat valvate in adnation. Stamens 5, erect; anthers ovate. Style filiform, finally separable into 2 parts; stigma 2-lobed. Capsule half adnate, crowned by the erect separated styles, 2-celled, many-seeded, opening between the styles. — Tree small, quite glabrous. Leaves alternate, coriaceous, lanceolate, attenuated at both ends, on short petioles, serrated. Racemes terminal, few-flowered, bracteate at the base of the pedicels.

Cult. For culture and propagation see \textit{Escallonia} above.

IV. \textit{ANOPTERUS} (from \textit{anwra}, \textit{ano}, upwards, and \textit{ptesov}, \textit{pteron}, a wing; in reference to the seeds, which are winged at the apex). Labill. nov. holl. 1. p. 86. t. 112. R. Br. in Frankl. narr. journ. 756. vern. schrift. 1. p. 545.

\textit{Lin. syst. Hexandria, Digynia.} Tube of calyx turbinate (f. 35. a.), adnate to the ovary at the base; lobes 6, short, acute, permanent. Petals 6 (f. 35. b.), alternating with the calycine lobes, and inserted in the calyx. Stamens 6 (f. 35. b.), inserted with the petals, shorter, and alternating with them. Style short; stigma bifid (f. 35. c.). Capsule oblong, 1-celled, 2-valved (f. 35. d.); valves opening from the apex to the base, with the placenta at the margins (f. 35. e.). Seed ovate, compressed, furnished with a wing at the top. — Tree, quite glabrous. Leaves alternate, rarely nearly opposite, ovate-oblong, attenuated at both ends, nearly sessile, coriaceous, cally toothed. Racemes simple, terminal. Flowers sometimes 7-cleft.

FIG. 35.
ESCALLONIÆ. V. ITEA. CUNONIACEÆ.

Glandular Anopterus. Tree 25 feet.

Cult. See Escallonia, p. 195. for culture and propagation.

V. ITEA (rzea, itea, is the Greek name of the willow; given to this genus on account of the quick growth of the I. Virginica). Lin. gen. 275. Rich. in Michx. fl. bor. am. 1. p. 156. Garrn. fruct. 3. p. 142. t. 209. f. 4. D. C. prod. 4. p. 6.

Lin. syst. Pentandria, Monogyne. Calyx regular, permanent, campanulate, 5-cleft, with the receptacle obtuse, and the teeth subulate. Petals 5, lanceolate-linear, inserted in the upper part of the tube of the calyx, and alternating with its lobes, valvate in aestivation. Stamens 5, alternating with the petals, and shorter than them; anthers oblong, rather bifid at the base, 2-celled, butting lengthwise. Ovarium oblong, free. Style 1, but at length separating into 2 parts: stigma capitulate, usually divisible in the furrow. Carpels 2, joined into a 2-celled compressed bispulate capsule, which separate at length from each other from the base to the apex. Seeds numerous, disposed in 2 rows along the inflexed margins of the carpels.—Shrubs, with alternate simple exstipulate leaves. Flowers racemose, as in Weimândria, but pentandrous, and as such were simple style. The character of the genus is alone taken from I. Virginica.

1 I. Virociâne(Lin. spec. 282.) leaves lanceolate, acutely toothed; racemes simple, terminal. ½ H. Native of North America, from Pennsylvania to Carolina. Lam. ill. 1. t. 147. f. 1. Lher. strîp. 1. p. 138. Lois. in Duham. abr. ed. 2. vol. 6. t. 9. Sims. bot. mag. 2409.—Trew. chert. t. 98. When this shrub is in vigour it is entirely covered with racemes of white flowers in July and August, and then makes a fine appearance.

Virginian Itæa. Fl. June, Aug. Clt. 1744. Sh. 6 to 7 feet.

† Asiatic shrubs related to Itæa, and referred to the genus by the authors, but will probably constitute 2 or 4 different genera when the parts of fructification are properly examined.

* Leaves alternate.

2 I. ? Umbellâta (Roxb. fl. ind. 2. p. 419.) leaves alternate, broadly lanceolate, entire, smooth; panicles axillary and terminal, composed of simple umbels, on long peduncles. ½ S. Native of the Malay Islands. Capsule 1-celled, 2-valved, with 2 parietal placenta on each side. Flowers white.

Umbellata-flowered Itæa. Shrub 6 to 8 feet.

3 I. ? Macrophylâlla (Wall. in Roxb. fl. ind. 2. p. 419.) leaves alternate, elliptic-ovate, acuminate, callously serrate; racemes axillary, fasciculate, erect, equal in length to the leaves. ½ G. Native of the East Indies, on the Khasee mountains bordering on the province of Silhet. Flowers yellow, fragrant, when young conical, and valvate in aestivation. Ovarium half adhering to the calyx, 2-celled. Style columnar.

Long-leaved Itæa. Tree 20 feet.

** Leaves opposite.

4 I. ? Fragrâns (Wall. in Roxb. fl. ind. 2. p. 420.) leaves opposite, cuneate-lanceolate, entire; racemes terminal; flowers in sessile fascicles, tetrandrous, and pentandrous. ½ G. Native of the East Indies, in the Island of Singapore. Flowers yellow, fragrant. Calyx cup-shaped, 4-5-toothed. Petals 4-5, linear, valvate in aestivation, longer than the stamens. Ovarium adnate to the calyx, 2-celled. Style columnar. This species, with the preceding, will perhaps form a new genus nearly allied to Escallonâia.

Fragrant-flowered Itæa. Shrub 5 to 6 feet.

5 I.? Rosmarinus (Rœm. et Schultes, syst. 5. p. 408.) leaves opposite, filiform, glabrous, hardish; peduncles axillary, 1-flowered. ½ F. Native of the north of Cochín-china, in sandy places, and in China about Macao. Cedrelâ Rosmarinus, Lour. coch. p. 160. Calyx somewhat campanulate, 5-toothed, with the base permanent, and the teeth deciduous. Petals 5, obtuse. Stamens 5, equal in length to the petals. Style 1, capsule 3-celled, 3-valved, dehiscing at the apex, many-seeded. Leaves odoriferous, from containing a quantity of essential cephalic oil. This plant hardly belongs to the order.

Rosmary-like Itæa. Shrub 5 to 6 feet.

Cult. Itæa Virginica is a very pretty hardy shrub, well adapted for decorating the front of a shrubbery. It is increased by layers put down in the autumn. The rest of the species should be grown in pots, in order that they may be protected by a frame in winter, or to be grown against a south wall, where they may be easily preserved from the frost by mats; a light soil is best suited for them, and they may be either increased by layers put down in the autumn, or by cuttings.

Calyx of many divisions (f. 36. a. f. 37. a. f. 38. a. f. 39. a.), valvate in aestivation. Petals equal in number to the divisions of the calyx (f. 36. b. f. 38. b. f. 39. c.), and alternating with them, imbricate in aestivation, sometimes wanting. Stamens inserted in a perigynous disk, definite (f. 37. b.), rarely indefinite; anthers petaloid, 2-celled (f. 38. c. f. 39. d.), bursting lengthwise by a double fissure. Ovarium 2-celled: ovula usually indefinite; styles 2 (f. 36. e. f. 37. d. f. 38. e. f. 39. b.), rarely connate: stigmas 2, simple, obtuse, pruinose. Capsule composed of 2 conflated follicles, which are applied to each other, rarely confluent, 2-celled, 2-valved; for the most part furnished with 2 beaks, and many-seeded; dissepiments double, from the inflexed edges of the valves. Placenta central, composed of fascicles of umbilical vessels. Seeds pendulous, sometimes winged; testa crustaceous or membranaceous. Albumen copious, fleshy. Embryo slender, straight, with the radicle turned towards the umbilicus, usually rather long.—Trees or shrubs, for the most part natives of the southern hemisphere. Leaves usually opposite, but sometimes verticillate, simple or compound. Stipulas interpetiolar, rarely wanting. Flowers usually disposed in spicate racemes or panicles.

The Cunoniææ were first proposed by Dr. R. Brown as a separate family from Saxifragææ, to which they had been referred by Jussieu, and to which they are intimately related, being chiefly distinguished by habit alone. M. Kunth considers them merely as a section of Saxifragææ, but it appears preferable to regard them as a distinct family; for the advantages arising from dividing extensive families and genera are, that the individuals composing these become better understood, and their characters more accurately investigated. The Saxifragææ are almost exclusively confined to the northern, as Cunoniææ are to the southern hemisphere. Some pass beyond these limits, but their number is very small. Both families agree in having entire
and divided petals, and a superior and inferior ovarium. In the series of natural affinities the Philadelphus clearly follow the Cunoniaceae, with which they correspond in habit; and in Bauera and Belangera the stamens are indefinite, and the seeds of Calcluvia have a striking analogy to those of Philadelphus. The styles both in Saxifragaceae and Cunoniaceae are often 3, and in Cornidia of the Flora Peruviana that number is always constant.

A species of Weinmannia is used in Peru for tanning leather, and its astringent bark is employed to adulterate the Peruvian bark. The Indian Weinmannias appear to possess similar astringent qualities.

Synopsis of the genera.

Tribe I.

Tribe II.

Tribe III.

Ba'ueria. Stamens indefinite. Ovarium free.

Tribe IV.

Tribe I.

Cunoniaceae (plants agreeing with Cunonia in having definite stamens). Stamens definite. Ovarium distinct from the calyx.

—Trees, natives of South America and the Mauritius. Leaves compound or simple; pelti'oles articulated. Stipulas undivided, caducous.
Flowers hermaphrodite, racemose, usually white; pedicels in fascicles.

* Leaves simple.

1. **W. ovata** (Cav. icon. 6. p. 45. t. 566.) leaves elliptic-oblong, bluntish, crenated, glabrous on both surfaces, as well as the branches, acute at the base. ♀. S. Native of Peru. Leaves 2-3 inches long, and an inch or an inch and a half broad. Racemes 3 inches long, loose. Hypogynous disk with 8 glands (f. 36 d.).

2. **W. kunthiana** (D. Don in edinb. phyl. journ. April, 1830.) leaves elliptic, crenated, cuneated at the base, membranous, glabrous; racemes elongated; fascicles many flowered. ♀. S. Native of New Granada, near Santa Fe de Bogota. W. ovata. W. racemes. W. racemes. W. Racemes 2-3 inches long, and an inch or an inch and a half broad. Racemes 3 inches long, loose. Hypogynous disk with 8 glands (f. 36 d.).

Kunth's Weinmannia. Tree 10 to 15 feet.

Balbis's Weinmannia. Tree or shrub.

4. **W. laurina** (H. B. et Kunth, l. c. 6. p. 51.) leaves oblong, acute, crenated, glabrous, attenuated at the base; fascicles of racemes many flowered. ♀. S. Native of South America. Leaves 3 inches long or more, puberulous on the veins beneath. Racemes 2 inches long.

Laurel-like Weinmannia. Tree.

5. **W. macrophylla** (H. B. et Kunth, l. c. 52. t. 521.) leaves nearly sessile, ovate, acuminate, serrated, glabrous on both surfaces, as well as on the branches, rounded at the base; fascicles of racemes many flowered. ♀. S. Native of the Andes of Quito, between Loxa and Nabon. Leaves 2-5 inches long, and 2-3 inches broad, shining above. Racemes rather loose. Capsule terete, oblong, glabrous.

Long-leaved Weinmannia. Tree or shrub.

6. **W. latifolia** (Presl, in Hänke, relig. 2. p. 51.) leaves ovate-elliptic, obtuse, acute at the base, crenately serrated, coriaceous, quite glabrous above, hairy beneath; racemes longer than the leaves; stipulas oblong, obtuse, silky outside; urceolus entire. ♀. G. Native of Peru, in mountain woods.

Broad-leaved Weinmannia. Tree.

7. **W. elliptica** (H. B. et Kunth, l. c. 50.) leaves petiolo-elliptic, obtuse, crenated, glabrous on both surfaces, acute at the base; racemes loose. ♀. S. Native of Quito, near Loxa. Leaves an inch or an inch and a half long, coriaceous. Racemes 1½ or 2 inches long. Capsule ovate, glabrous. Flowers purplish.

8. **W. ovalis** (Ruiz et Pav. fl. per. 4. t. 333. f. a. ined.) leaves petiolo-oval, crenated, quite glabrous on both surfaces, as well as the branches, shining, acute at the base; fascicles of racemes many flowered. ♀. S. Native of Peru, on the Andes, in groves at Pillao. Leaves coriaceous, 2 or 3 inches long. Racemes loose, a hand long. Capsule ovate, quite smooth.

Oval-leaved Weinmannia. Tree.

9. **W. crassifolia** (Ruiz et Pav. fl. per. 4. t. 331. f. a. ined.) leaves nearly sessile, oval, coarsely crenated, rather pilose as well as the branches, rounded at the base; fascicles of racemes many flowered. ♀. S. Native of Peru. Leaves 2 inches long, coriaceous, thick, pilose on the rib and veins beneath. Racemes 2-3 inches long. Capsule ovate-oblong, smooth.

Thick-leaved Weinmannia. Tree.

10. **W. subcordata** (Moricand, herb. ex D. C. prod. 3. p. 8.) leaves oval, obtuse, somewhat cordate at the base, dentately crenated, coriaceous, glabrous, shining above; racemes when in flower exceeding the leaves a little. ♀. S. Native of Peru. Flowers on very short pedicels. Leaves 24-30 lines long, and 16-18 lines broad.

Subcordate-leaved Weinmannia. Tree.

* * Leaves simple and ternate.

11. **W. heterophylla** (H. B. et Kunth, nov. gen. amer. 6. p. 52. t. 523.) leaves simple and ternate, ovate-oblong, acute, and coarsely serrated, rather pilose beneath; fascicles of racemes many flowered. ♀. S. Native of New Granada, near Santa Fe de Bogota. Leaves for the most part simple, glabrous above, pilose beneath, particularly at the ribs, 3-5 inches long, and 1½ or 2 inches broad. Petioles half an inch long. Racemes loose, 4 inches long. Capsule ovate, smooth.

Variable-leaved Weinmannia. Tree.

12. **W. cordata** (D. Don in edinb. phyl. journ. April, 1830.) leaves nearly sessile, cordate-ovate, bluntish, coarsely serrated, rather pilose beneath, and on the branches; fascicles of racemes many flowered. ♀. S. Native of Peru. W. heterophylla. Ruiz et Pav. fl. per. 4. t. 331. f. b. Leaves simple or ternate, 2 inches long. Racemes loose, 3 inches long.

Cordate-leaved Weinmannia. Tree.

13. **W. auriculata** (D. Don, in edinb. phyl. journ. April, 1830.) leaves elliptic, with revolute, serrated margins, rounded at the base, hairy beneath and on the branches; fascicles of racemes crowded. ♀. S. Native of Peru, in groves at Pillao. W. ovata. Ruiz et Pav. fl. per. 4. t. 335. f. b. ined. W. crassifolia. D. C. prod. 4. p. 9. Leaves shining and glabrous above, but densely clothed with fulvous hairs beneath, an inch or an inch and a half long, 1-lobed at the base, and sometimes trifoliate. Racemes dense, spicate, 2-3 inches long. Capsule roundish-ovate, and are as well as the styles rather hairy.

Auricled-leaved Weinmannia. Tree.

14. **W. australis** (Cunning. in Field's New south wales, p. 353.) leaves trifoliate; leaflets ovate-lanceolate, deep and equally serrated, sessile; flowers terminal. ♀. G. Native of New Holland, on moist shady rocks, at Springwood.

Southern Weinmannia. Shrub.

* * * Leaves ternate and quinate.

15. **W. pentaphylla** (Ruiz et Pav. fl. per. 4. t. 330. f. a.) leaves ternate and quinate; leaflets 3-5, ovate-lanceolate, acute, serrated, glabrous on both surfaces; racemes loose. ♀. S. Native of Peru. Branchlets pubescent. Leaflets coriaceous, shining above, 2-3 inches long; lateral ones unequal-sided at the base. Racemes loose, a hand long; pedicels longish. Capsule ovate, smooth. Styles sometimes 3, when this is the case the capsule is 3-celled.

Five-leaved Weinmannia. Tree.

16. **W. venezuelana** (Presl in relig. Hänke. 2. p. 51.) leaves of the branches with 2 pairs of leaflets and an odd one, those of the branchlets ternate; leaflets oblong, obtuse, broadly crenated, quite glabrous, coriaceous, terminal one oblong-lanceolate, attenuated at the base; wings of the rachis and petiole semi-ovate; racemes longer than the leaves, and are as well as the branches pubescent; flowers glomerate; segments of the calyx
ciliated; urceolus crenated. ʒ. G. Native of Peru, in mountain woods.

*Weinmannia* Tree.

17 W. M.aurita (D. Don, in edinb. phil. journ. April 1830.) leaves ternate and quiniate; leaflets 3-5, obvate, or elliptic, obtuse, crenated, smoothish; racemes crowded. ʒ. Native of the Mauritian, where it is called *La Lou*. W. triflora, Linn. dict. 7. p. 579. ill. t. 313. f. 2. exclusive of the synonyme. Smith, in Rees’ cyclo. exclusive of the synonymes of Linn. Thunb. and Willd. W. Madagascariensis, D. C. prod. 4. p. 9. Leaflets coriaceous, pubescent beneath, ʒ. 1 or 1 inch long. Racemes loose, 2 inches long; fascicules few-flowered.

*Mauritian* Weinmannia. Tree.

18 W. margina (Moricand, mss. ex D. C. prod. 4. p. 10.) leaves with 3-5 leaflets; leaflets ovate-lanceolate, acute, serrated, attenuated at both ends: extreme one the largest; petiole margined; capsule glabrous. ʒ. S. Native of Quito, near Loxa. Leaves with sometimes only 2 leaflets; leaflets small, cuneate-ovate, crenated, quite glabrous, shining, ʒ. 3 lines long. Capsule ovate, glabrous. Small-leaved Weinmannia. Shrub.

**•••• Leaves impari-pinnate.**

20 W. glabra (Linn. fil. suppl. p. 228.) leaves with many pairs of leaflets; leaflets obovate or oblanceol. crenated, rather pilose beneath; racis with rhomboid joints; racemes loose. ʒ. S. Native of the Islands of Santa Cruz and Martinique; and of Mexico, near San Salvador and Chiconquila. Willd. spec. 2. p. 456. exclusive of the synonyme of Linn. W. pinna, Linn. spec. 1. p. 515. exclusive of the synonyme of Browne, Jam. Flowers numerous, white.

21 W. trichosperma (Cav. can. 6. p. 45. t. 567.) leaves with many pairs of leaflets; leaflets oblong, acutely toothed, rather pilose beneath; joints of racis exactly rhomboid. ʒ. S. Native of the Island of San Carlos de Chiole; and of Peru. W. dentata, Ruiz et Pav. fl. per. 4. t. 334. f. c. W. pinna, Linn. and Cav. mss. Leaflets obliquely cuneate at the base, naked and shining above, but rather pilose on the nerves and veins beneath. Racemes loose. Capsule roundish-ovate, ribbed, glabrous.

*Hair-seeded* Weinmannia. Shrub.

22 W. hirta (Swaitz. prod. p. 63. fl. ind. occid. 2. p. 691.) leaves with 3 pairs of leaflets; leaflets elliptic, serrate, hairy beneath as well as the branches; joints of racis cuneate. ʒ. S. Native of Jamaica, St. Domingo, and Brazil. Windmánna fruticos, &c. Browne, Jam. p. 212. Leaflets hairy, at length smoothish above, coriaceous. Racemes loose, very copious, 2 inches long.

23 W. nitida (D. Don, in edinb. phil. journ. April, 1830.) leaves with usually 3 pairs of leaflets; leaflets obvate, crenated, glabrous, and shining on both surfaces; joints of racis cuneate. ʒ. S. Native of Jamaica. Weinmannia hirta, var. Smith, herb.

*Shining-leaved* Weinmannia. Tree.

24 W. glomerata (Presl, in relig. Hænk. 2. p. 52.) leaves with 4-6 pairs of leaflets; leaflets oblong, obtuse, coriaceous, toothed towards the apex, hairy on the middle nerve beneath: terminal leaflet oblong-lanceolate, acute at both ends; wings of racis semi-obovate; racemes spicate, longer than the leaves, and are as well as the branchlets and pedioles very hairy; flowers glomerate, sessile; calyx smoothish; urceolus entire. ʒ. G. Native of Peru, on the mountains.

*Glomerate-flowered* Weinmannia. Tree.

25 W. tintoria (Smith, in Rees’ cyclo.) leaves with many pairs of leaflets; leaflets oblong, serrated, smoothish; joints of racis spatulate; fascicules of racemes many-flowered. ʒ. S. Native of the Island of Bourbon. W. glabra, Linn. dict. 7. p. 578. ill. t. 313. f. 1. W. macrostachya, D. C. prod. 4. p. 10. The tree is called *Tan rouge* by the inhabitants of Bourbon, where it is used for drying red.

*Dyers’* Weinmannia. Tree.

26 W. fagaroides (H. B. et Kunth, nov. gen. amer. 6. p. 54. t. 524.) leaves with many pairs of leaflets; leaflets obvate or elliptic, crenated, glabrous on both surfaces, shining above; joints of racis obcordate. ʒ. S. Native of Peru, at Pillao, and at Loxa. Branchlets with annular chinks, pubescent. Leaflets from 5-15, coriaceous, pilose on the joints beneath, 3 lines long. Racemes 2 inches long; fascicules many-flowered. Capsule ovate-oblong, glabrous.

*Fagara-like* Weinmannia. Tree.

27 W. farfifolia (Ruiz, mss. ex D. Don, in edinb. phil. journ. April, 1830.) leaves with many pairs of leaflets; leaflets oblong, serrated, pilose beneath; joints of racis obvate-oblong; racemes short. ʒ. S. Native of Peru, at Pillao, where it is commonly called *Macho* and *Arbol del Peregrin* by the inhabitants. W. microphylla, Ruiz et Pav. fl. per. 4. t. 334. f. a. Branchlets densely pilose. Leaflets from 9-15, contiguous, naked and opaque above; 3-5 lines long. Racemes dense, cylindrical, hardly an inch long; fascicules many-flowered, crowded. Capsule roundish, ovate, glabrous.

*Small-leaved* Weinmannia. Tree.

28 W. reticulata (Ruiz et Pav. fl. per. 4. t. 332.) leaves with many pairs of leaflets; leaflets elliptic, crenated, clothed with rusty tomentum beneath; joints of racis obvate-oblong; fascicules of racemes crowded. ʒ. S. Native of Peru, at Pillao and Acomaya. W. pubescens, Ruiz, mss. Branchlets densely clothed with rusty tomentum, usually with annular chinks. Leaflets 9-17, pilose above and shining, reticulately veined, half an inch long. Racemes dense, cylindrical, 2 or 3 inches long; fascicules many-flowered, very pilose. Styles rather pilose at the base. Capsule ovate, smooth.

*Reticulated-leaved* Weinmannia. Tree.

29 W. lentiscifolia (Presl, in relig. Hænk. 2. p. 52.) leaves with 3-5 pairs of leaflets; leaflets oblong, obtuse, toothed, coriaceous, hairy on the nerves, racemes, and petioles: terminal one oblong-lanceolate, acuminate at both ends; wings of petiole and racis semi-obovate; flowers on long pedicels; segments of the calyx ciliis; urceolus angular and crenated. ʒ. G. Native of Peru, on the mountains.

*Lentiscus-leaved* Weinmannia. Tree.

30 W. tomentosa (Linn. fil. suppl. p. 277.) leaves with many pairs of leaflets; leaflets oval, with revolute margins, quite entire, clothed with hoary tomentum beneath; spikes cylindrical, much crowded. ʒ. S. Native of New Granada. H. B. et Kunth, nov. gen. amer. 6. p. 55. t. 555. Leaflets size of those of box leaves, 9-15, approximate, very blunt, convex and pubescent above, but at length green. Joints of racis obvate, with revolute margins. Spikes cylindrical, obtuse, an inch long; fascicules many-flowered, much crowded; peduncles short, densely clothed with tomentum.

*Tomentose* Weinmannia. Tree.

31 W. cineerea (Ruiz et Pav. fl. per. 4. t. 332. f. b.) leaves with usually 3 pairs of leaflets; leaflets elliptic, serrated, reticulated, smoothish; joints of racis cuneate-oblong; racemes
CUNONIACEÆ.  I. WEIMANNIA. II. LEIOSPERMUM. III. CALDCLUVIA. IV. PLATYLOPHUS.

32. *W. subesseliiformis* (Ruiz et Pav. fl. per. 4. t. 334. f. b.) leaves with many pairs of leaflets; leaflets oval or oblong, serrated, smooth, lappetted, elliptically, cylindrical; styles pubescent; capsule silky; h. S. Native of Peru, in the Andes, at Pillaio.  W. polystálychá, Ruiz, mss.  Leaflets 11-15, 1/2 or 1 inch long, while young concescent on both surfaces.  Joins of rachis obovate.  Spike narrow, 3-4 inches long; fascicles crowded, many-flowered.  Pedicels and calyxes silky.  *Subesseliiformis* Weimannia.  Tree.

34. *W. pubéscens* (H. B. et Kunth, nov. gen. amer. 6. p. 56.) leaves with many pairs of leaflets; leaflets elliptic-oblong, serrated, pilose on both surfaces; capsule ovate, tomentose.  h. S. Native of New Spain, on Mount Avila, near Caracas.  Leaflets 4-6 pairs, 6-10 lines long.  Racemes loose, 3-4 inches long.  *Pubescent Weimannia*.  Tree.

37. *W. polyphyllá* (Moricand, ex D. C. prod.  4. p. 11.) leaves with 8-15 pairs of leaflets; leaflets elliptic, obtuse, serrated, glabrous: outer one lanceolate; joints of rachis triangular; branchlets, petioles, and the nerves on the under side of the leaves pilose; racemes exceeding the leaves.  h. S. Native of Peru, near Guayaquil.  Leaves 4 inches long; leaflets 4-8 lines long, and 2-4 lines broad.  *Many-leaved Weimannia*.  Tree.

38. *W. paulilíneófólia* (Pohl, in litt. ex D. C. prod.  4. p. 11.) leaves glabrous, except the rachis, which is hairy; leaflets 7-9, oblong, cuneate at the base, serrately toothed at the apex; joints of rachis oblong; racemes length of leaves.  h. S. Native of Brazil.  *Paulilíneófólia* Weimannia.  Tree.

39. *W. producta* (Moricand, mss. in D. C. prod.  4. p. 10.) leaves with 6-7 pairs of leaflets; leaflets small, ovate, coarsely toothed, rather coriaceous, glabrous on both surfaces: outer one elongated, acute, cuneate at the base; joints of rachis semi-obovate; racemes dense, much longer than the leaves.  h. S. Native of Peru.  W. sessilífofon, Pav. in herb. Moricand.  Branches pubescent.  Extreme leaflet an inch and more long, the rest 4-5 lines long, but the lower 2 are hardly 2 lines long.  Flowers white.  Pedicels length of flowers, and exceeding the bracteas.  *Drawn-out-leaved Weimannia*.  Tree.

*Cult.* The species of *Weimannia* will grow in any light rich soil; and cuttings will strike root in the same kind of soil, under a hand-glass, in heat.  None of the species are worth cultivating for ornament.

II. LEIOSPERMUM (from λειος, leios, smooth, and σπέρμα, sperma, a seed; in reference to the seeds being smooth).  D. Don, in edinb. phil. journ. April, 1830.—Weimannia, species of authors.

2 L. parvifólium (D. Don, l. c.) petioles jointed at the base; racemes corymbose.  h. G. Native of New Zealand.  Weimannia parvifólium, Forst. prod. p. 29.  Leaves elliptic, recurved at the apex, an inch and a half long.  Racemes numerous, 1 1/2 or 2 inches long.  Flowers 3 times smaller than those of the first species.

*Small-flowered Leiospermum*.  Tree.

*Cult.* For culture and propagation see *Callicoma*, p. 201.  Not worth growing, unless in botanic gardens.

LIN. SYST.  *Octandria, Digynia*.  Calyx membranous, 4-parted, deciduous.  Petals 4, unguiculate.  Stamens 8.  Hypogynous glands 8, alternating with the stamens; cells of ovary many-ovulate, 20-30.  Styles 2, rarely 3, thickish.  Capsule opening from the top at the disseminates; cells many seeded, usually 5-10.  Placenta tetragonal.  Seeds fusiform, glabrous; testa larger than the nucleus, membranous, loose, elongated, and subarillate at the base.—A tree, native of Chili, with simple, serrated, glabrous leaves; jointless pedicels; twin, subfalcate, toothed, caducous stipulas; terminal panicked flowers; woody capsule, and the seeds nearly as in *Philadelphus*.

*Cult.* For culture and propagation see *Callicoma*, p. 201.

IV. PLATYLOPHUS (from πλατυς, platys, broad, and λόφος, lophos, a crest; the capsule is so much compressed at the apex as to appear winged).  D. Don, in edinb. phil. journ. April, 1830.—Weimannia species of Lin.

LIN. SYST.  *Octo-Decandria, Digynia*.  Calyx 4, but sometimes 5-cleft, permanent.  Petals 4, rarely 5, permanent, trifid;
segments linear, acute, sometimes undentate. Stamens 8 or 10. Disk hypogynous, urceolate, entire; cells of ovary bivolute. Styles very short. Capsule membranous, reticulately, flattened into a bipyramidal inflation at the apex, ventricose at the base, 2-celled; cells 1-seeded. Seed large, arched, with a smooth carunculate testa.

—An elegant tree, native of the Cape of Good Hope. Leaves petiolate, ternate; leaflets sessile, lanceolate, acuminate, sharply serrate, coriaceous, glabrous, reticulately with many veins. Flowers terminal, panicled.

1. P. trifoliata (D. Don, l. c.) 7. G. Native of the Cape of Good Hope, where the tree is called white ash by the English colonists. Weinmannia trifoliata, Lin. fil. suppl. 227. Thunb. prod. p. 77. exclusive of the synonyme of Lamark.

Trifoliate Platyphylus. Clt. 1820. Tree. Cult. For culture and propagation see Callicoma, below.

—Osterdyckia, Burm. afr. 259. t. 96.

Lin. syst. Decadria, Digynia. Calyx 5-cleft; segments deciduous. Petals 5, entire. Stamens 10. Disk hypogynous, small. Capsule opening from the base at the dissepiments; seeds many seeded. Seeds oblong, compressed, smooth, winged, with a rather loose membranous testa. Cotyledons somewhat foliaceous.—Smooth trees, with impari-pinnate leaves, serrated coriaceous leaflets, large caducous interpetiolar stipules, and with the flowers disposed in axillary racemes or panicles.

1. C. Carissa (Lin. spec. p. 569.) shrub; leaflets 5-7, lanceolate, coriaceous, serrate; racemes spicate, opposite; pedicels numerous, in fascicles. 7. G. Native of the Cape of Good Hope. Lam. ill. t. 371. Lodd. bot. cab. t. 826. Flowers white.

2. C. indica (Blum. bijdr. p. 867.) shrub; leaves somewhat ternately pinnate; leaflets ovate-oblong, acuminate, obliquely subulate at the base, nearly sessile; panicles axillary, clothed with rusty tomentum. 7. S. Native of Java, in woods on the higher mountains.

Indian Cunonia. Shrubs 6 to 8 feet.

3. C. Celebica (Blum. l. c.) arboreous; leaflets ovate-oblong, acuminate, serrated; lateral ones oblique at the base; panicles coriaceous, axillary. 7. S. Native of the Celebes, on the mountains.

Celebes Cunonia. Tree 20 to 30 feet. Cult. See Callicoma for culture and propagation.

1. A. pinna'ta (Blum. l. c.) leaves with 4-5 pairs of lanceolate, bluntly serrated coriaceous leaflets; stipulas deciduous; racemes usually twin. 7. S. Native of Java, in mountain woods, where it is called Kiringiti. Spiræa pinna'ta, Blume, cat. hort. Butl. p. 76.

Pinnate-leaved Arnoldia. Shrub.

2. A. heterophylla (Blum. l. c.) lower leaves with two pairs of leaflets, and an odd one: upper ones ternate or simple; leaflets lanceolate, distinctly serrulate; racemes twin or tern. 7. S. Native of Java, in mountain woods in the province of Bantam.

Variable-leaved Arnoldia. Shrub.

Cult. For culture and propagation see Weinmannia, p. 200.

VII. PTEROPHYLLA (from πτερον, pteron, a wing, and φυλλον, phyllon, a leaf; so called in reference to the large foliaceous stipules). D. Don, in edinb. phil. journ. April, 1830.

1. P. traxi'nea (D. Don, l. c.) 7. S. Native of the Island of Honimao, one of the Moluccas. Weinmannia? fraxinea, Smith, herb.

Ash-like Pterophylla. Tree.

Cult. See Weinmannia, p. 200. For culture and propagation.

VIII. CALYCOMIS (from καλος, kalos, beautiful, and σωμη, soma, body; in allusion to the tufts of flowers). R. Br. in gen. rem. p. 17. D. Don in edinb. phil. journ. April 1830.

1. C. verticillata (D. Don, l. c.) 7. G. Native of New Holland, among the mountains on moist rocks.

Whorled-flowered Calycomis. Shrub.

Cult. For culture and propagation see Callicoma.

IX. CALLICOMA (from καλος, kalos, beautiful, and σωμη, soma, body; appearance of tufted heads of flowers). Andr. bot. rep. t. 566.

Lin. syst. Octo-Decadria, Digynia. Calyx 4-parted, rarely 5-parted (f. 37. a.), permanent. Petals wanting. Stamens 8, rarely 10 (f. 37. b.). Disk hypogynous, small. Ovarium distinct; cells many-ovulate. Styles 2, setaceous (f. 37. d.). Capsule inclosed in the calyx, which is permanent, dehiscent at the dissepiments; cells many-seeded from abortion. Seeds obovate, scarious from minute papillae on every side, like those of Saxifraga; with a crustaceous testa.—Trees, natives of Australia. Leaves simple, petiolate, serrate; petioles jointless. Stipulas membranous, bidentate, caducous. Flowers capitate; heads terminating the tops of the branchlets, pedunculate, globose.

1. C. serratifolia (Andr. l. c.) leaves lanceolate, acuminate, hoary beneath, attenuated at the base. 7. G. Native of New Holland, where the tree is called black wattle by the English colonists. Delaun. herb. amat. t. 239. Sims. bot. mag. 1811. Codin serratifolia, Ser. ms. ex D. C. prod. 4. p. 7.

D d
Flowers yellow. The twigs are used for making baskets in New Holland. Perhaps the flowers are dioecious. (f. 37.)

2 C. FERRUGINEA (D. Don, in edinb. phil. journ. April, 1830.) leaves oblong, acute, cuneate at the base, clothed with rustyomentum beneath, and on the branchlets. G. Native of New Holland. Leaves simple, petiolate, elliptic-oblong, acute, serrated, coriaceous, glabrous, with the veins numerous and reticulated beneath: petals articulated at the base. Stipulas undivided, caducous. Flowers small, white, panicled. Panicle terminal, much branched. 1 S. ovata (D. Don, l.c.) G. Native of New Holland.

Ovate-leaved Schizomeria. Fl. 1825. Shrub 8 to 10 feet. Cult. For culture and propagation see Callicoma above.

X. CERATOPETALUM (from κέρας, keras, a horn, and πεταλον, petalon, a petal; the petals are jagged so as to resemble a stag's horn). Smith, nov. holl. 1. p. 9. t. 3.

Lin. syst. Decandria, Digyna. Calyx with a 5-parted permanent limb (f. 38 a.). Petals 5 (f. 38 b.), linear, multifid, stiff, permanent, or wanting. Stamens 10; anthers cordate, terminated by a beak-formed process (f. 38 c.). Ovarium half inferior, 2-celled, few-ovulate. Capsule 1-seeded from abortion, dehiscing at the apex. Seed round, with a thick crustaceous testa. —Trees, natives of New Holland, with ternate or simple serrated glabrous leaves, standing on petioles, which are jointed at the apex. Stipulas undivided, rather foliacious, caducous. Flowers terminal, panicled.

* Leaves ternate; flowers with petals.

1 C. Gummi'ferum (Smith, nov. holl. t. 3.) G. Native of New Holland, where it is called red gum-tree by the English colonists. (f. 38.)

Gum-bearing Ceratopetalum. Cilt. 1820. Tree 60 feet.

** Leaves simple; flowers apetalous.

2 C. Apetalum (D. Don, in edinb. phil. journ. April, 1830.) leaves lanceolate. G. Native of New Holland. Ceratopetalum monopetalum, Caley, mss. Perhaps the flowers are sometimes furnished with one petal.

Apetalous Ceratopetalum. Tree.

3 C. Montana'num (D. Don, l. c.) leaves linear-lanceolate. G. Native of New Holland, on the mountains.

Mountain Ceratopetalum. Tree.

Cult. For culture and propagation see Callicoma above.

XI. SCHIZOMERIA (from σχίζω, schizo, to cut, and μέρος, meris, a part; in reference to the cut petals). D. Don, in edinb. phil. journ. April, 1830.

CUNONIACEÆ. XIII. Belangeria. XIV. Bauera. XV. Geissois. GALACINÆ.

Cunicate-leafletted Belangeria. Tree.
3 B. tomentosa (Cambess. l. c. p. 205. t. 116.) leaves trifoliate; leaflets oblong, acuminate, sharply serrated, tomentose beneath; capsule clothed with white tomentum. f. S. Native of Brazil, in the province of Minas Geraes, near Tejucu, Barbacena, &c., and near the town of St. Paul. Polysémon triphyllus, D. Don, in edinb. phil. journ. April, 1830.

Tomentose Belangeria. Tree.
4 B. speciosa (Cambess. l. c. p. 206. t. 117.) leaves of 5 leaflets; leaflets ovate-elliptic or lanceolate, acute, sharply serrated, glabrous. f. S. Native of Brazil, in that part of the province of Minas Geraes called Minas Novas. Polystémon pentaphyllus, D. Don, in edinb. phil. mag. April, 1830.

Beautiful Belangeria. Tree.
Cult. See Weinmannia, p. 200., for culture and propagation.

XIV. BAUERA (named in honor of Francis and Ferdinand Bauer, two celebrated German draughtsmen). Salisb. in ann. bot. p. 512. t. 10.
Linn. syst. Icosandria, Trigynia. Calyx 6-10-parted (f. 39. a.). Petals 6-10 (f. 39. c.). Stamens numerous, disposed in a double order; anthers peltate (f. 39. d.); cells connate, bursting lengthwise. Styles 2 (f. 39. b.,) glabrous; stigma simple, obtuse. Capsule superior, 2-celled, 2-valved, opening at the apex by a transverse chink; cells few-seeded; disseminat placentiferous. Seeds oblong-cylindrical, erect, branched, leafy, roughish from resinous atoms.—Small shrubs, natives of New Holland. Leaves 6 in a whorl, approaching by threes, and therefore as it were opposite and ternate, exstipulate. Flowers rosaceous, axillary, solitary, pedunculate.
2 B. humilis (Sweet, hort. suburb. p. 124.) leaves oblong, crenated; flowers poly-petalous. f. G. Native of New Holland. Loud. bot. 1197. Calyx 8-10-cleft. Corolla 8-10-petalled, red, one half smaller than those of B. rubifolia, and the plant is altogether much smaller.
3 B. Billardierii (D. Don, in edinb. phil. journ. April, 1830.) leaves lanceolate, nearly quite entire; flowers with 6 petals.
4 B. Native of Van Diemen's Land. B. rubioides, Labill. miss. Habit of the rest.
La Billardier's Bauera. Shrub 1 to 2 feet.
4 B. microphylla (Sieb. pl. exsic. nov. holl. no. 289. D. Don, in edinb. phil. journ. April, 1830.) leaves elliptic-oblong, quite entire; flowers with 6 petals. f. G. Native of New Holland. Leaves like those of Thymus serpyllum. Flowers smaller than those of B. rubifolia, red.
Small-leaved Bauera. Shrub 1 to 2 feet.
5 B. capitata (Ser. miss. in D. C. prod. 4. p. 13.) leaves oblong, 3-lobed at the apex; flowers terminal, capitate, sessile.
6 B. Native of New Holland, on the western coast.
Capitate-flowered Bauera. Shrub.
Cult. The species of this genus are very pretty little shrubs, which flower nearly the whole year through; they are therefore very desirable plants for a greenhouse or conservatory. They are rather hardy, and easily cultivated. An equal mixture of sandy loam and peat is the best soil for them; and young cuttings root freely in the same kind of soil, under a bell glass.

Tribe IV.

SYMPHYOGENYNE (from symphyos, symphyo, to join, and γυνη, gynæ, a style; styles joined). Stamens definite. Ovarium free. Styles connate.

XV. GEISSOIS (from geissos, geisson, the house-eaves; seeds imbricated like the tiles on a house). Labill. sert. cal. p. 50. t. 50. D. Don, in edinb. phil. journ. April, 1830.
Linn. syst. Octandria, Monogynia. Calyx deciduous. Petals wanting. Stamens 8. Style 1, with the base remaining; stigmas 2, simple. Capsule compressed, 2-celled, 2-valved; cells many-seeded. Seeds compressed, winged, with a membranous testa.—A tree, with opposite, petiolate, quinate leaves; elliptic, obtuse, quite entire leaflets, which are pubescent beneath; oblong, ribbed, undivided, caducous stipulas; and axillary, many-flowered racemes, which are either solitary or by threes.
1 G. racemosa (Labill. sert. caled. p. 50. t. 50.). f. G. Native of New Caledonia.
Racemose Geissois. Tree.

Calyx 4-5-parted, permanent. Petals 4-5, hypogynous, caducous, alternating with the calycean segments; stamens 8-10-16, hypogynous, joined into a tube, which is toothed at the apex, or distinct; filaments or alternate teeth antheriferous. Ovarium composed of 3 or 4 follicles, which are joined, therefore 3-4-celled; ovula indefinite; stigma composed of 3-4 joined ones, undivided or 4-lobed. Capsule 3-4-celled, 3-4-valved; valves bearing the disseminations in the middle. Central placenta none. Seeds numerous, minute, scobiform, inserted in the inner angle of the cells; outer testa loose, membranous, cellular: inner one very thin, closely adhering to the albumen. Albumen copious, fleshy, Embryo erect, terete, with short cotyledons, and a long cylindric centripetal radicle.—Perennial American herbs. Leaves radical, simple, lyrate, pinnatisect or serrated; the teeth tipped each by a gland. Flowers terminal, copious, disposed in spicate racemes; pedicels 1-flowered, propped each by a permanent bracteole.

This order differs from Saxifragaceæ by the presence of sterile stamens, alternating with the fertile ones; in the absence of a central placenta; and in the frequent quaternary arrangement, in the parts of the calyx and corolla.

Synopsis of the genera.

1 Galax. Calyx 5-parted. Petals 5. Stamens joined into a tube, which is 10-toothed: the alternate teeth antheriferous; anthers 1-celled. Stigma entire. Capsule 3-celled.
2 Francoa. Calyx 4-parted. Petals 4. Stamens distinct,
16. of which are fertile; anthers 2-celled. Stigma 4-lobed. Capsule tetragonal, 4-celled.

Lin. syst. Pentandroa, Monogynia. Calyx 5-parted. Petals 5. Stamens joined into a tube, which is 10-toothed at the apex: the alternate teeth bearing anthers; anthers 1-celled; cell transverse. Stigma of 3 joined ones, therefore trigonal, 3-furrowed. Ovarium villous. Capsule 3-celled, destitute of any central column. Seeds mucronate at both ends, as in Acispora of De Candolle.—A small herbaceous plant; with radical corollae stiff crenated leaves; and naked scapes (f. 40. c.), bearing a loose, spicate raceme of small white flowers at the apex.

Cult. This is a pretty little plant; succeeds best in peat soil, and if planted out in a moist situation, will grow and flower freely. It is increased by dividing at the roots.

Lin. syst. Ocantandra, Tetragyna. Calyx 4-parted. Petals 4, spathulate, with their nerves pinnate and branching towards the apex. Stamens 16, only 8 of which are antheriferous, these are subulate or setaceous, and tapering at the apex; the 8 sterile ones are flattened, obtuse, shorter and broader; anthers corollae, 2-celled, 2-lobed at the base: cells confluent at the apex. Ovarium bluntly 4-sided, 4-celled, with 4 furrows, which are opposite the dissepiments. Style very short, or wanting; stigma 4-lobed: lobes dilated, obtuse, and pruinose. Capsule tetragonal, having the angles drawn out a little at the apex into 4 tubercles, 4-celled, 4-valved; cells prominent, debasing by a longitudinal suture, many-seeded; dissepiments formed from a double lamina. Seeds ovate-oblance, fuscous, smooth, mucil.—Perennial herbs, natives of Chili, beset with simple, deciduous hairs. Leaves lyrate, nearly like those of the turnip, reticulately veined; lobes roundish, toothed: terminal one large, corollae, obtuse, sinuate-toothed; teeth terminated each by a gland. Flowers red, terminal, copious, in spicate racemes, which are disposed in a panicle; pedicels 1-flowered.

1 F. Appendixulata (Cav. in ann. sc. nat. mattr. 4. p. 275. icon. 4. p. 76. t. 596.) stemless; leaves petiolate; racemes loose, second; calyce segments lanceolate, acute; lobes of stigma cuneate, emarginate. 2 F. Native of the island of San Carlos de Chiloe. D. Don, in Sweet, fl. gard. new ser. t. 151.—Herb hairy. Leaves petiolate, lyrate. Spike nearly simple. Petals pale red, marked each by a deeper spot in the middle. Fertile filaments 3 times longer than the sterile ones.

FIG. 40.

3 F. Ramósia (D. Don, in edinb. phil. journ. Oct. 1826.) plant caulescent; leaves petiolate; racemes spicate, erect; calyce segments lanceolate, obtuse, nerveless; lobes of stigma cuneate. 4 F. Native of Chili, near Santiago. Herb erect, branched, hairy. Stem furnished with small, petiolate, simple, deeply-toothed leaves. Radical leaves not seen, but they are probably lyrates. Flowers smaller and more numerous than in the rest of the species, neither are they secund, but disposed on every side of the racemes, erect; petals obovate, obtuse. Fertile filaments 4 times longer than the flatter, obtuse, sterile ones. Style distinct, but very short; stigma 4-lobed; lobes cuneate, emarginate, or 2-lobed, thick, with revolute margins.

Cult. The species of Francoa are beautiful plants when in flower, and deserve a place in every garden. A mixture of pot and sand is the best soil for them; they should be grown in pots, well drained with sherd, to prevent their rotting. The protection of a frame is sufficient for them in winter; or they may be planted out in the open ground, in a warm sheltered situation, where they will probably survive the winter by a little protection. They are only to be increased by seeds.

Lin. syst. Octandria, Diphyma. Calyx 4-parted; lobes ovate, equal. Petals 4, the 2 superior ones roundish-ovate, large; the 2 inferior ones small, oblong. Stamens 8. Ovarium ovate, clothed with glandular pubescence. Styles 2, very short, smoothish, slender. Capsule 2-celled, dehiscing at the apex at the dissepiments, many-seeded.—A smoothish slender herb. Radical leaves on long petioles, orbicular, profusely corollae, with the recess closed, palmately 3-nerved, sinuate-toothed; recesses broad, obtuse, mucronulate. Spike erect, naked, simple. Racemes elongated; pedicels short, 1-flowered, longer than the bracteae; larger petals cream-coloured, red at the base, smaller ones red.

1 T. hydrocotylepflora (D. C. l. c.). 2 F. Native of Chili, at Concon, in the mountains of Leone, where it is called Tetilla by the natives.

Hydrocotyle-leaved Tetilla. Pl. 1 to 2 feet.

Cult. This is a curious and beautiful plant. Its culture and propagation are the same as that recommended for the species of the genus Francoa.

Calyx either superior or inferior, of 4 or 5 sepalae (f. 42. a. f. 43. a.), which cohere more or less at their base. Petals 5 (f. 42. b. f. 45. d.) or wanting, inserted between the lobes of the calyx. Stamens 5-10, inserted either into the calyx or beneath the ovary; therefore they are either perigynous or hypogynous; anthers 2-celled, bursting lengthwise. Disk either hypogynous or perigynous, sometimes obsolete, sometimes annular and notched, rarely consisting of 5 scales. Ovarium inferior, or nearly superior, usually consisting of 2 or 5 carpels (f. 42. d. f. 46. c. f. 48. c.) or follicles, cohering more or less on the inner side, but distinct at the apex; sometimes 2-celled, with a central placenta; sometimes 1-celled, with parietal placentae, rarely 4-5-celled. Styles none; stigmas sessile on the tips of the lobes of the ovary (f. 42. c. f. 52. c.). Fruit generally a membranous 1-2-celled capsule, with 2 bracteas, rarely a 4-5-celled 4-5-valved capsule, and sometimes a 4-celled berry. Seeds numerous, very minute, usually with long hexagonal reticulations on the side of a transparent testa. Embryo terete, in the axis of a fleshy albumen, with the radicle next the hilum.—

Shrubs or herbs, variable in habit. Leaves simple, either divided or entire, alternate, without stipules. Flower-stems simple, often naked.

The plants of this order agree in some respects with the herbaceous part of Rosaceae, with which they agree in habit, and from which they differ in their polyspermy partially concreta carpella, albuminous seeds, and want of stipules. From Cunoniaceae they are divided by their habit, and by the want of stipules. To Caryophylleace their habit allies them; but they differ in the insertion of their stamens, the situation of the embryo, and otherwise. Grossulariace agree very much in the structure of the flowers, but differ from them in the capsular fruit, usually 2-celled ovary, in the seeds being without aril, furnished with a short podosperm, not gelatinous on the outside, and in the more fleshy albumen and habit. From Grossulariaceae they differ in the fewer carpella, which are joined together, and usually with the calyx; and in having no glands on the inner side of the carpella. From Umbelliferae they are easily distinguished in the carpella or cells of the ovary being dehiscent and many seeded, not indesinient and 1-seeded, in the form of the petals, in the absence of vine, and in habit. From Viagnnea, to which the tribe Hydrangeae comes very near, in the fruit being capsular, not baccate, and in the styles being exerted, not wanting, &c. From Vacciniaceae, Campanulaceae, Ericaceae, Gentianaceae, in the corolla being polyptalous, not gamopetalous. The genus Drummionia has the stamens equal in number to the petals, and opposite them; thus indicating some analogy to the monopetalous Primulaceae.

According to De Candolle the whole order is more or less astringent. The root of Heuchera Americana is a powerful astringent, whence it is called in North America alum-root, Barton, 2. p. 162. Otherwise they possess no known properties; for the old idea of their being lithontripic appears to have been derived from their name, rather than their virtues.

Synopsis of the genera.

Tribe I.

§ 1. Stamens twice the number of the petals or sepalae.

1 Saxifraga. Calyx 5-parted (f. 41. a. f. 42. a.). Petals 5 (f. 41. b. f. 42. b. f. 46. c.), on short claws, entire. Stamens 10 (f. 42. c. f. 46. d.), Capsule adnate to the calyx or nearly so, composed of 2 carpella (f. 42. d.), which are usually joined to the ovary, many seeded (f. 42. f.).

2 Erigynia. Calyx 5-cleft. Petals 5, hardly unguiculate. Stamens 20, monadelphous at the base. Ovary 4-6, free, connected together by dense wool. Carpels distinct, 4-6, free from the calyx, many seeded.

3 Leftera. Calyx 5-parted (f. 47. a.). Petals 5 (f. 47. b.), entire, on short claws. Stamens 10; anthers (f. 47. c.), 1-celled, 2-valved. Capsule composed of 2 carpellae (f. 47. c.), which are joined at the base, many seeded.

4 Chrysosplenium. Tube of calyx adhering to the ovary; limb 4-5-lobed. Petals wanting. Stamens 8-10. Styles 2. Capsule 2-valved and 2-beaked, at length 1-celled and many seeded.

6 Tellima. Free part of the calyx inflated, 5-toothed (f. 49. b.), the adhering part conical. Petals 5 (f. 49. c.), jagged. Stamens 10 (f. 49. a.). Styles 2-3, distinct. Capsule (f. 49. f.), 1-celled, 2-valved at the apex.

§ 2. Stamens equal in number to the petals, or fewer, and alternating with them.

Tribe II.

Hydrange'æ (plants agreeing with Hydrângēa in being shrubby). D.C. prod. 4. p. 13.

17 Cian'tis. Limb of calyx 5-toothed. Petals 5, rather fleshy. Stamens 10. Styles 3-5; stigmas obtuse. Berry crowned by the teeth of the calyx, somewhat 3-5-celled, many seeded.

19 Broussai'sia. Calyx 5-parted, hemispherical, free from the ovary. Petals 5, oblong, acuminate, with the acumen reflected as in umbelliferous plants. Stamens 10, hypogynous. Ovarium roundish, crowned by the short style and truncate stigma, 5-celled; cells many seeded.

Tribe I.

§ 1. Stamens twice the number of the petals and sepals.

Lin. syst. Decândria. Dijg'nia. Calyx 5-cleft (f. 41. a. f. 42. a. f. 46. a.). Petals 5 (f. 42. b. f. 46. c.), entire, unguiculate. Stamens 10 (f. 42. c. f. 46. d.); anthers 2-celled. Styles 2 (f. 42. c.), permanent. Capsule (f. 42. d.) 2-celled, 2-valved, 2-beaked, opening within the beak by an orbicular hole, many seeded. Seeds minute, smooth.

1 S. crassif'olia (Lin. spec. 575.) leaves oval or obovate, very blunt, glabrous, serrulatad; petals elliptic-oblong. 2. H. Native of Siberia, on the Alps. Curt. bot. mag. 196. Gmel. fl. sib. 4. p. 166. t. 56. Megâsea crassif'olia, Haw. enum. sax. 6. Flowers large, red. The root is stiptic or astringent when chewed.

Var. b, Haw'orthiana (Ser. in D. C. prod. 4. p. 36.) leaves somewhat orbicularly cordate, flat, hardly crenated. 2. H. Native of Siberia. Megâsea média, Haw. enum. sax. 7.

Var. b, minor (Wall. mss.) leaves much smaller; flowers more loose, and distant.

Petals white or pale red, furnished at the base with red and yellow spots.

Var. $\gamma$, crenata (Haw. l. c.) hairy; leaves reniform, round, bluntly crenated. $\gamma$. H. Robertsonia crenata, Haw. l. c. S. crenata, Loud. hort. brit. p. 53.

Var. $\delta$, polia (Haw. l. c.) hairy; leaves reniform, roundish, sharply toothed, with the surface naked and smooth. $\gamma$. H. Native on the mountains of Scotland. Robertsonia polia, Haw. l. c. S. polia, Loud. hort. brit. p. 176.

Saxifraga, Fl. May, July. Ireland. Pl. 1 foot.

Var. $\beta$; leaves roundish, cordate, glabrous on both surfaces.

Var. $\gamma$, sphaeroidea (Haw. enum. sax. p. 54.) leaves broadly oval, somewhat cordate, bluntly crenated, with the surface naked. $\gamma$. H. Native of the Pyrenees. Robertsonia sphaeroidea, Haw. syn. 32%. S. sphaeroidea, Loud. hort. brit. 176.

Saxifraga, Fl. May, June. Ireland. Pl. $\frac{1}{2}$ to 1 foot.

Shady Saxifrage, None-so-pretty, or London-pride. Fl. April, June. Ireland. Pl. $\frac{1}{2}$ to 1 foot.

7 S. cuneifòlia (Lin. spec. p. 574.) leaves cuneiform, re-

Wedge-leaved Saxifrage. Fl. May, June. Clt. 1768. Pl. $\frac{1}{2}$ to $\frac{1}{4}$ foot.

8 S. paucifòlia (Sternb. rev. sax. suppl. 1. p. 6. t. 4. f. 2.) root tufted; leaves roundish or ovate-roundish, toothed, cuneated at the base, running down the petiole, which is short: petals ovate, unguiculate, longer than the calyx. $\gamma$. H. Native of Siberia and Kantschatka. Petals spotted.

Few-flowered Saxifrage. Pl. $\frac{1}{2}$ foot.

9 S. specifòla (D. Don, in Lin. trans. 13. p. 354.) leaves on long petioles, orbicularly cordate, sharply serrated, veiny, pilose; petioles dilated at the base; raceme elongated, spike-formed; calyces segments very short. $\gamma$. H. Native of Sledge Island, on the west coast of America. S. gèum, Pursh, fl. amer. sept. 1. p. 311. but not of Lin. Plant tufted. Petals elliptic-oolong, dotted, 3-nerved, with the nerves branched.

$\gamma$. H. Native of the western coast of America. Flowers white, size of those of S. stellàris. A beautiful species.

Nelson's Saxifrage. Pl. $\frac{1}{2}$ to 1 foot.

$\gamma$. H. Native of the western coast of America. Flowers white, size of those of S. stellàris. A beautiful species.

Sharp-cut-leaved Saxifrage. Pl. $\frac{1}{2}$ foot.

Var. $\beta$, elàta (D. Don, in Lin. trans. 13. p. 357.) scapes numerous, a foot high. $\gamma$. H. Native of Siberia.

Var. $\gamma$, angustifòlia (D. Don, l. c.) leaves narrower and longer, with few teeth at the apex. $\gamma$. H. Native of Siberia.

Var. $\delta$, Schleichèri (D. Don, l. c.) leaves obovate, re-panidly crenated; scapes humble, flexuous. $\gamma$. H. Native of Switzerland, on the Alps. S. stellàris, Schleich. in litt.

Var. $\epsilon$, Bellàrdì (D. Don, l. c.) plant stemless; leaves roundish, re-panid; flowers sessile. $\gamma$. H. Native of the Alps of Piedmont. S. Bellàrdì, Allion. pedem. no. 1536. t. 88. f. 1.
Var. ë, dissimilis; leaves with deep broad teeth. ë. H. Native of Scotland, on the western Highlands. S. dissimilis, G. Don, in Loud. hort. brit. p. 176.

Var. ë, stellata (D. C. fil. fr. 4. p. 379. var. a.) plant very minute; leaves 1-flowered. ë. H. Native of Switzerland, on the Alps. S. stellaris β, pumila, Gaudin, fl. helv. 3. p. 100.

Var. ë, acaulis (Hall. fl. in Meiss. anz. 1818. p. 76) flowers sessile, in the heart of the leaves. ë. H.

13 S. Foliolata (R. Br. in Parry's 1st voy. app. p. 275.) radical leaves cucumed, a little toothed; scape divided; branches bearing 1 flower at the apex, covered below by a fascicle of small leaves; calyx inferior, ovate; segments of the petals cordate-lanceolate. ë. H. Native of Lapland, Melville Island, and other arctic islands. S. stellaris γ, Lin, fl. lapp. ed Smith, p. 144. t. 2. f. 3. S. stellaris β, comosa, Willd. spec. 2. p. 644.

Leafy Saxifrage. Pl. 1 foot.

Var. β; plant clothed with pubescent tomentum. ë. H. Native of the north-west coast of America, on Dundas Island, in Queen Charlotte's Sound.

15 S. Melaleuca (Fisch. in Sternb. rev. sax. suppl. 3. t. 3.) leaves roundish ovate, acutish, somewhat dentilicate, tapering into the petiole, glabrous; scape few-flowered, also glabrous; flowers disposed in a somewhat paniculate corymb; calyxine segments ovate, acute; petals unguiculate. ë. H. Native of Altai, on the Alps in the river Tschulyschm, and at Lake Teletskoje Osero. S. elongāta β, glabra, Sternb. rev. sax. p. 9. Petals ovobate, pale sulphur coloured, suffused with violet on the outside; filaments of a pale violet colour. Leaves greenish yellow; upper part of plant of a deep violet colour.

Black and white Saxifrage. Fl. ½ to 2 foot.

16 S. Strigosia (Wall. cat. no. 448.) lower leaves sessile, somewhat roundish, oblangu-lanceolate, few-toothed, mucronate at the apex, clothed with strong hairs; calyces leaves lanceolate-linear, acute, entire, much smaller than the lower ones; stem simple, few-flowered, and is as well as the pedicles bent with numerous capitulate hairs; sepals lanceolate, acute; petals 3-nerved, obtuse; styles very short; stigmas thickish. ë. H. Native of Nipaul, on the Emodi mountains at Gosainthth, and at Kamoone. Leaves almost the same and form of those of Arabis alpina. Filaments flat.

Strigose Saxifrage. Pl. ½ foot.

17 S. Sarmentosa (Lin. fil. suppl. p. 240.) stolons or runners creeping; leaves orbicularly cordate, lobately crenated, pilose, red beneath; petals unguiculate, the 2 outer ones large and flaccid. ë. F. Native of China and Japan, in moist places on mountains, among stones. Schreb. mon. dion. p. 16. t. 2. f. 3. Curt. bot. mag. 92. S. stolonifera, Jacq. icon. rar. 1. t. 80. Ligularia sarmentosa, Duval, pl. sec. p. 11. ex Haw. env. sax. p. 50. Diptera sarmentosæ, Borkh. in Rœm. mag. 1. p. 29. S. ligulata, Mohr. comm. 1781. p. 26. t. 1. S. Chinensis, Lour. cochl. p. 281. Petals white: 3 inner ones cordate; of these the 3 lateral ones are marked by a yellow spot at the base; and the central one by 2 scarlet spots at the base: but the 2 outer petals are large, flaccid, and 3-nerved.

Var. β, cuscuseformis (Ser. in D. C. prod. t. 4. p. 43.) plant more slender; stem usually 2-flowered; leaves ovate-roundish, coarsely and simply toothed; flowers less irregular; petals more acute. ë. F. Native of China. S. cuscuseformis, Lodd. bot. cab. t. 186. Ligularia minor, Haw. env. sax. p. 151. The stolons or runners resemble dodder very much.

Var. β; leaves hairy.

19 S. huasta (Haw. env. sax. p. 47. under Aulaxis) leaves naked, doubly and deeply toothed. ë. H. Native country unknown.

Naked-leaved Saxifrage. Fl. May, Ju. Clt. 2. Pl. ½ to 1½ foot.

Sect. III. Léuconyx (from λευκος, leios, smooth; and γυνη, gyné, a female; in reference to the stigmas being beardless). D. Don, in Lin. trans. 13. p. 344. Calyx deeply 5-cleft (f. 41. a.) Petals (f. 41. b.) sessile in most of the species. Stigmas inserted in the throat of the calyx (f. 41. c.); filaments subulate. Styles straight; stigmas orbicular, flatish, beardless. Capsule free from the calyx (f. 41. d.). Seeds roundish. —Humble herbs, rarely subshrubs. Roots fibrous, but in many of the species they are granular. Stems flexuous, usually many-flowered and many-leaved. Leaves in all reniform and lobed. Flowers white or yellow.

21 S. hybrida (Sternb. env. sax. p. 17. t. 8. f. 3.) radical leaves petiolate, roundish-cuneated, crenated: cauline ones minute, entire; stem panicked. ë. H. Native of the Pyrenees. Very like S. rotundifolia, but differs in the smaller stature and slenderer habit; in the leaves being acute at the base, not cordate, and in the cauline ones being minute, entire, and nearly sessile.

Hybrid Saxifrage. Pl. 1 foot.

22 S. diversifolia (Wall. cat. no. 452.) leaves thickish, more or less pilose, of many forms; lower ones cordate, petiole: cauline ones petiolate, or sessile and stem-clasping, entire; of a different colour beneath, reticulately veined, marked above by small depressed dots; flowers in panicked corymbbs; bractees and calyces more or less ciliated with short, capitulate
Saxifraga.

Var. a. lanceolata (Ser. in D. C. prod. 4. p. 44.) leaves lanceolate; lower ones not seen; but the middle ones are attenuated at the base, and acutish; calyceine lobes oblong, beset with glandular hairs. 2. F. S. diversifolia, Wall.

Var. b. pannsanifolia (Ser. l. c.) radical leaves cordate, obtuse, on long petioles; cauline ones cordate, stem-clasping, obtuse; calyceine lobes oblong, beset with glandular pilis. 2. F. S. pannsanifolia, Wall. cat. no. 451.

Var. v. Moorecroftiana (Ser. l. c.) lower leaves elliptic; calyceine lobes crenated, ovate-oblong, numerous; flowers larger; calyceine lobes more ciliated with glands. 2. F. S. Moorecroftiana, Wall. cat. no. 452.

Diverse-leaved Saxifrage. Pl. 1 foot.

29 S. parviflora (Div. stipr. rar. fasc. 4. p. 1 t. 3.) stem branched at the base, or simple; leaves reniform, 5-lobed; superior ones 3-lobed: uppermost ones entire, lanceolate; peduncles spreading, opposite the leaves; petals ovate, longer than the calyx. 2. F. Native of Sicily, in the mountains, on mossy rocks.—Cup. panph. 3. t. 36. Flowers white, almost like those of Stellaria media. Stigmas very short, diverging; stigmas spatulate, papillosc. Capsule bladdery, slender.

Var. a. ramosa (Ser. in D. C. prod. 4. p. 44.) stem branched at the base, few-flowered; lower leaves 5-lobed, crenated; superior ones 3-lobed. 2. F. Native among rocks, on Mount Moronis, near the monastery of St. Martini de Scalis. Bernardi, l. c. t. 3.

Var. b. Bocconiana (Ser. l. c.) stem purple, erect, 2-flowered; lower leaves 3-lobed, or lanceolate, entire. 2. F. Native on the mountains, about Palermo. (ex Guss. Bocc. cent. 2. p. 4. t. 45. f. 2.)

Small-flowered Saxifrage. Pl. 1 foot.

24 S. cymbalaria (Lin. spec. 579.) lower leaves reniform, on long petioles, very bluntly 5-lobed: upper ones 3-lobed or undivided; calyceine segments oblong, obtuse; petals ovate, acute, with branched nerves. 2. H. Native of the Levant, on Parthassus Delphius and other Grecian mountains. Smith, fl. grce. 378. S. hederacea, Bieb. fl. taur. 1. p. 317. exclusive of the synomymes. Lobara cymbalaria, Haw. Enum. sax. t. 18.

Buxb. cent. 2. p. 40. t. 45. f. 2.—Vaill. itin. ed. gall. t. 362. Flowers small, golden yellow. Stems numerous, leafy, slender, flaccid, creeping at the base.

Cymbalaria-like Saxifrage. Pl. cr.

Oriental Saxifrage. Pl. dec.

27 S. Russi (Presl, del. prag. p. 140.) radical leaves petiolate, repandly crenated, cordate at the base, somewhat 5-lobed: cauline ones sessile: lower ones 3-lobed, middle lobe the longest; uppermost leaves lanceolate, entire; sepals ovate; petals lanceolate, 3-nerved, twice the length of the calyx. 2. H. Native of Sicily, on rocks and among stones, about Giuliana. Plant 2-8 inches high, beset with short glandular hairs. Flowers white.

Russo’s Saxifrage. Pl. 4 foot.

28 S. Jamesii (Torrey, in ann. lyc. new york 2. p. 204.) plant beset with glandular pubescence; lower leaves on long petioles, reniform, crenately lobed; upper leaves tapering into the petiole, cuneated, nearly sessile; lobes of calyx triangularly ovate, acute; petals spatulate, acute, on long claws; racemes second; bracteae lanceolate; pedicels of calyxes glandular. 2. H. Native of North America, among the Rocky Mountains. Hook, fl. bor. amer. 1. p. 247. t. 74. Flowers about the size and colour of those of S. oppositifolium (fig. 41.)

James’s Saxifrage. Pl. ½ foot.

29 S. Richardsonii (Hook, fl. bor. amer. 1. p. 247.) stem glandular, leafy, pubescent above; leaves on long petioles, orbicularly cordate, crenately lobed, veiny, with the margins and veins glandular beneath; glands pedicellate; racemes rather compound; bracteae lanceolate, and are as well the pedicels glandular; petals ovatelliptic, on short claws, very acute, nerv'd, about twice the length of the calyceine segments, which are acuminated; stamens 5. 2. H. Native of the Arctic Sea shore, between the Mackenzie and Coppermine rivers; and of Kotzebue’s Sound. S. Nelsoniana, Hook. et Arn. in bot. Beech. p. 124. t. 29. but not of D. Don. This and the preceding are very elegant plants.

Richardson’s Saxifrage. Pl. ¾ foot.

30 S. nudicaulis (D. Don, in Lin. trans. 13. p. 366.) leaves reniform, palmate, glabrous: lobes ovate, mucronate; stem erect, naked, terete; flowers panicked; lobes of calyx triangularly ovate, acute; petals ovate, a little longer than the calyx. 2. H. Native of the north-west coast of America, Behring’s Straits. S. gracilis, Steph. in Sternb. rev. sax. suppl. p. 7. t. 56. f. 1. Flowers panicked, white, size of those of S. rivularis. Naked-stemmmed Saxifrage. Pl. ½ foot.

31 S. hetera'nta (Hook. fl. bor. amer. 1. p. 252. t. 78. b.) plant rather pubescent; radical leaves on long petioles, reniformly cordate, membranous, veiny, many-lobed: lobes short, somewhat tridentate: teeth acute, mucid; scape naked; flowers panicked, usually abortive: some of the filamentae, and others petal-formed; ovary free; calyxes reflexed; branches of panicle sometimes bearing bulbs below. 2. H. Native of North America, common on moist rocks of the Columbia, from its source to its confluence with the sea. The leaves resemble those of S. rotundifolia, but they are furnished with a long, membranous, sheathing base, and altogether radical.

Variable-flowered Saxifrage. Pl. ½ foot.

32 S. granulata (Lin. spec. p. 576.) plant hairy; radical leaves reniform, crenately lobed: cauline ones petiolate; calyceine segments lanceolate, obtuse; petals spatulate; root granular. 2. H. Native of the north and middle of Europe, in dry fields and the borders of woods; plentiful in some parts of Britain. Fl. dan. t. 514. Lam. ill. t. 272. f. 1. Smith, engl. bot. t. 500. Stem leafy, many-flowered; pedicels elongated, E e
1-flowered, and are as well as the calyxes clothed with clammy down. Flowers snow-white; nerves of petals branched.

Var. β, plena; flowers double. Common in gardens.

Var. γ, multicaulis (Lapeyr. fl. pyr. t. 27.) stems numerous, short; lower leaves lobed, broadly crenated: upper ones obovate, acuminate, entire, rarely 1-2-toothed; peduncles many-flowered.

Var. δ, Corsicana (Ser. in D. C. bot. gall. 1. p. 211.) plant very small; stem 1-4-flowered; leaves small, crenately lobed; flowers hardly smaller than those of the species. 2. H. Native of Corsica. S. rivulatis, Pr. Th. exsic.

Var. ε, penduliflora (Ser. in D. C. bot. gall. 1. p. 211.) leaves reniform, broadly crenated; flowers somewhat umbellate, pedunculous; peduncles 1-flowered, weak. 2. H. Native of Auregniæ. S. penduliflora, Bast. in journ. bot. 1814. p. 17. and D. C. fl. fr. 5. p. 519.

Var. η, sessiliflora (Ser. in D. C. prod. 4. p. 36.) stems quite simple; leaves reniform, crenated; flowers sessile, sub capsules. 2. H. In dry places.

Var. ζ, bulbillaris (Ser. l. c.) stem more or less branched; flowers numerous, sessile, abortive, transformed into little bulbs, which rise from the axils of the leaves. 2. H. Native of Sicily. S. granulata gemmifera, Haw. enum. sax. p. 23.

Granular-rooted Saxifrage. Fl. May. Brit. Pl. 54 to 1 ft.

33 S. odontophylla (Wall. cat. no. 454.) leaves reniform, bluntly lobed, rather pubescent; stem few-leafed, many-flowered, and as well as the pedicels and calyxes clothed with glandular pubescence; petals obovate, unguiculate; stigma nearly sessile, 5-lobed. 2. H. Native of Siberia, Alps, and of the Alps of Caucasus, among rather humid shaded rocks, or among stones; also of Labrador and Newfound-land. Sternb. sax. p. 23. t. 25. f. 1. Gmel. sib. 4. p. 162. no. 74. S. granulata β, Steven de sax. cauc. in mem. mosq. 4. p. 77. no. 8. S. granidiflora, Sternb. sax. t. 12. f. 4. ? S. cymbalophora, Bibb. fl. taur. 5. p. 292. no. 780. Lobes of calyx ovatelinear. Petals white. Stem beset with viscid hairs.

37 S. bracteata (D. Don, in Linn. trans. 15. p. 367.) radical as well as cauleine leaves on long petioles, reniform, and deeply lobed; flowers in crowded corymbs, bracteate; stem leafy, glabrous, and beset, clothed with viscid villa. 2. H. Native of Eastern Siberia. Flowers white, like those of S. cernua, but a little larger; calycine segments broadly ovate, obtuse. Petals obovate, a little longer than the calycine segments.

BRACTEATED-FLOWERED SAXIFRAGE. Pl. 54 to 1 ft.

38 S. rivulatis (Lin. spec. p. 577.) stem short, without leaves, on long petioles, glabrous; flowers usually by three, sessile, bracteate. O. H. Native of the higher Alps of Europe, as in Lapland, Norway, as well as of Siberia. It is also found in North America, as in Labrador, Arctic Sea shore and Islands, Kotzebue's Sound, and in elevated places among the Rocky Mountains. In Scotland about Alpine rivulets, and in wet fissures of rocks, as on Ben Nevis, near the lake in the ascent: also on Ben Lawers, and at Loch Rannoch. Fl. lin. lapp. no. 174. t. 2. f. 7. Fl. dan. t. 118. Smith, engl. bot. 2275. Sternb. sax. p. 19. t. 13. f. 3. Plant annual. Stem weak, ascending, few-leaved, furnished with viscid hairs above. Leaves 5-6-lobed; lobes obtuse. Flowers small, white, bracteate. Calycine segments ovate, very blunt, obtuse, conniving. Petals ovate, obtuse, triple nerved.

39 S. hypberborea (R. Br. in Parry's first voy. append. p. 274.) stem woolly, 2-flowered; leaves glabrous; calyxes ovate, to long petioles; petals 1-nerved. 2. H. Native of Ireland, and Arctic America. S. rivulatis β, Hook. fl. bor. amer. 1. p. 246. Flowers white. Perhaps only a variety of S. rivulatis.

Northern Saxifrage. Pl. 2 inches.

40 S. nu'tana (D. Don, in Linn. trans. 13. p. 268.) stem rather pubescent, decumbent at the base, jointed in the middle, and furnished with one leaf at the joint: raceme drooping, few-flowered: leaves simple, on long petioles, reniform, deeply and coarsely toothed, with a few scattered stiff hairs on both sur-
SAXIFRAGACEÆ. I. SAXIFRAGA.

1.) Saxifraga. 2.) H. Native of the west coast of North America, in the Island of Unalaska. Flowers white, size of those of S. bulbifera; calyce segments lanceolate, acute; petals obotate, with branched flexuous nerves. Pedicels and calyces beset with crowded glandular hairs.

**Nodding-flowered Saxifrage.** Pl. ½ foot. 41 S. ranunculifolia (Hook. fl. bor. amer. 1. p. 246. t. 83.) plant clothed with glandular pubescence, slender; lower leaves on very long petioles, reniform, 3-parted; segments broadly cuneate, deeply lobed; calyce leaves few; flowers corymbose, pentandrous; petals obotate, twice the length of the calyx; calyx beset with glandular hairs: segments acute. 2.) H. Native of North America; common on the high grounds around the Kettle Falls of the Columbia, and on the Rocky Mountains. Flowers white, size of those of S. stellarius. Petals obotate, ungluticate.

**Crow-foot-leaved Saxifrage.** Pl. ¾ foot. 42 S. exilis (Steph. in Sternb. sax. suppl. p. 8. t. 3. f. 1.) root tufted; radicles capillary; radical leaves palmately 5-lobed, petioles long, cauline ones linear, entire; petals obotate-oblong, much longer than the 5-cleft calyx. 2.) H. Native of Siberia, and probably of Kotzebue's Sound. Stem weak, 2-flowered.

**Slender Saxifrage.** Pl. ½ foot. 43 S. Laurentiana (Ser. in D. C. prod. 4. p. 35.) plant with many stems; radical leaves on long petioles, reniform, 5-7-lobed, crenated, reticulately veined lengthwise, glabrous; stems and peduncles ornamented with long intricate hairs; flowers few, somewhat capitate, involucrated by 3-4 crenately lobed bracteas; lobes of calyx ovate, obtuse, shorter than the petals; petals 3-nerved towards the middle. 2.) H. Native of the Island of St. Laurence in Behring's Straits. S. Channissii, Sternb. inded. but not S. Chamissoi, Sternb. Flowers white.

**St. Laurent Saxifrage.** Pl. ½ foot. 44 S. Stephaniiana (Sternb. suppl. sax. 1. p. 8. t. 6. f. 2.) plant tufted; stem usually 4-flowered, pilose; radical, as well as the cauline leaves, petiole, and palmately many-lobed, pilose; bracteas nearly linear; sepals linear, obtuse; petals obotate, many nerved. 2.) H. Native of Siberia, Steph. S. palmata, Steph. in litt. ex Sternb. l.c. Flowers white.

**Stephan's Saxifrage.** Pl. ½ foot. 45 S. altiflora (Haw. enum. sax. p. 24.) leaves deeply and palmately 3-parted; segments profoundly 3-5-cleft; peduncles subascemose, divaricate. 2.) H. Native country unknown. S. adscendens, Haw. exclusive of all the synonyms. Very rarely allied to S. granulata, but truly distinct, and differs in the fissures of the leaves, and in the more decumbent stems.

Flowers white.

**Deep-cleft-leaved Saxifrage.** Fl. May, June. Pl. ½ foot.

[Sect. IV. Hirculus (a name given by the ancients to a kind of spikenard or valerian, which has nothing to do with the present plant). Tausch, hort. canel. fasc. 1. Haw. enum. sax. p. 40. Kingstonia, Gray, brit. fl. 2. p. 531. Calyx deeply 5-cleft (f. 42. a.), not adhering to the ovarium. Petals sessile (f. 42. b.) in most of the species. Stamens inserted in the throat of the calyx (f. 42. c.); filaments subulate. Styles straight; stigmas cartilaginous, flatissimus, capsuleless. Carpel free from the calyx (f. 42. d. a.). Seeds oblong, wrinkled from dots.—Humble herbaceous evergreen plants. Stems leafy, stoloniferous. Leaves alternate, narrow, petiole, entire, but usually ciliated with stiff hairs, marcescent. Flowers white or yellow.]

46 S. hirculus (Lin. spec. 376.) leaves lanceolate, obtuse, not ciliated; calyce segments lanceolate, obtuse, usually ciliated; petals obotate, many nerved; styles almost wanting; stigmas spatulate, when young deflexed, afterwards divaricate. 2.) H. Native of Sweden, Switzerland, Lapland, Siberia, Caucasus, Germany, and in England, in boggy places. It is also found in North America, from the Saskatchewan to the Arctic sea shore and Islands, where it seems most abundant; Behring's Straits, Cape of Good Hope, Kotzebue's Sound, &c. 2.) H. Native of Siberia, in humid subalpine places at the rivers Ursul and Tschuha. S. Hirculus, Ledeb. fl. alt. 2. p. 121.

**Hirculus Saxifrage.** Fl. Aug. England. Pl.½ to 1 foot. 47 S. myosotifolia (D. Don, in Lin. trans. 13. p. 373.) plant tufted, without any stolons or flagellae; leaves ovate, acute, mucous, bristly; pedicels elongated, and are as well as the calyces beset with glandular pili; stem nearly naked, usually 3-flowered; calyce segments broadly ovate, acute; petals roundish, ungluticate, 5-nerved. 2.) H. Native of Siberia. Sucreli very short, erect, crowded. Stem 2-3-flowered, beset with stiff hairs. Leaves ciliated with hairs on the margins, and on both surfaces. Flowers cream-coloured; filaments compressed, yellowish. Styles short, thick.

**Mouse-ear-leaved Saxifrage.** Pl. 2 inches. 48 S. flagellaris (Sternb. sax. p. 25. t. 6.) stolons or flagellae filiform; stems erect, simple, 1-5-flowered, and are as well as the calyces clothed with glandular pubescence; radical leaves as well as lower cauline ones obvately spatulate: superior ones rather villous; petals permanent, longer than the capsule, which is semi-superior. 2.) H. Native of the Alps of Caucasus; and of north-west America, at Cape Newhun, in Melville Island, Baffin's Bay, Behring's Straits, Arctic Islands, summits of the Rocky Mountains, Kotzebue's Sound, &c. Hook. fl. bor. amer. 1. p. 253. t. 77. S. setigera, Pursh. fl. amer. sept. 1. p. 312. S. âspera, Bibb. fl. taur. 1. p. 314. exclusive of all the synonyms. Hirculus flagellaris, Haw. enum. sax. p. 41. Stem leafy, 1-5-flowered. Radical leaves crowded, all ciliated on the margins, with cartilaginous spinales: calyx and pedicels clothed with glutinous down. Flowers yellow, size of those of S. Hirculus (f. 42.).

**Var. b.** stem 1-flowered; ovarium adhering to the calyx at e e 2.

Flagellae-bearing Saxifrage. Fl. May, July. Cl. 1819.

Pl. 1/2 foot.

49 S. Brunoniana (Wall. cat. no. 441.) tufted; stems 1-4 flowered, bearing a few glandular hairs; stolons or surculi capillary, without any tuft of leaves at the points, rising from the axis of the leaves, as in S. flagellaris; leaves linear, with cartilaginous ciliately serrate edges, and terminated by a stiff mucrone; cauline leaves fewer, shorter; sepals ovate, very blunt; petals obovate-oblong, 5-nerved, yellow, much longer than the calyx; stigmas small. 2. F. Native of Nipaul, in Emodi, and Kamaon. Flowers yellow. Pedicles slender, elongated.

Brown's Saxifrage. Pl. 1/4 to 1/2 foot.

50 S. Brachyphoda (D. Don, in Lin. trans. 13. p. 378.) plant tufted; stems dense, simple, gemmiferous; leaves dense, linear, spreading, ciliated with bristles, 1-nerved, full of pellucid dots, of a different colour beneath; flowers solitary, terminal; pedicels clothed with unequal glandular hairs; sepals lanceolate, mucronate, ciliately serrulate, 3-nerved; petals obovate, 5-nerved, bluish; stigmas thick, diverging. 2. F. Native of Nipaul, in Emodi, Gosaingathan, and Kamaon. S. glandulosa, Wall. cat. no. 442. Pedicels nearly the length of the flowers. Leaves glaucous beneath, quite glabrous, very numerous, with revolute edges. Buds echinate. Flowers yellow.

Short-peduncled Saxifrage. Pl. 1/4 foot.

51 S. Fimbriata (Wall. cat. no. 443.) stem simple, gemmiferous, very leafy, bearing scattered glandular hairs; leaves lanceolate, very acute, of a different colour beneath, ciliated with stiff bristles, marked above with fine parallel wrinkled lines: nerves 5-7, nearly parallel, reticulated and pellucid; flowers small, sub-racemose, but often solitary; pedicels short, rather hispid; sepals lanceolate, rather cartilaginously serrulate, mucronate. 2. F. Native of Nipaul, at Gosaingathan and Kamaon.

Fringed-leaved Saxifrage. Pl. 3/4 foot.

53 S. bronchialis (Lin. spec. 572.) sputaneous; leaves crowded, linear-subulate, triquetrous, mucronate, ciliated with stiff spinules; calycine segments ovate, many flowered. 2. H. Native of Siberia; north-west coast of America, Beling's Straits, Kotzebue's Sound, height of land at the portage of the Columbia river, on the west side of the Rocky Mountains. Ciliaria bronchialis, Haw. rev. sax. 43.—Gmel. sib. 4. p. 164. t. 63. f. 2. Surculi numerous, erect, branched. Panicle terminal, few or many flowered. Flowers small, cream-coloured; petals obovate-oblong, 3-nerved, with numerous minute copper-coloured dots; anthers copper-coloured. This is very nearly allied to S. tricuspidata, but differs in the want of the lateral points to the leaves.

Var. β, Lenænis (D. Don, in Lin. trans. 13. p. 377.) surculi shorter; leaves longer, spreading; panicle larger, spreading, fastigate. 2. H. Native of Siberia, at the river Lena.

Bromchial Saxifrage. Fl. May, June. Cl. 1819. Pl. 1/4 ft.

54 S. Tenuula (Wulf. in Jacq. coll. 3. p. 144. t. 17.) plant tufted; leaves crowded, linear-subulate, flat, pungent, ciliated; stems slender, few-leaved, few-flowered; calycine segments linear-lanceolate; petals obovate. 2. H. Native of Carinthia, on the Alps. S. nitida, Wulf. in Jacq. coll. 3. t. 10. f. 4. Surculi numerous. Stems numerous, erect. Leaves imbricated, keeled below, glabrous. Peduncles by threes, long, capillary, 1-flowered, beset with glandular hairs, as well as the calyces. Flowers white, spotless; anthers yellow.

55 S. Filicaulis (Wall. cat. no. 445.) stems filiform, much branched, beset with capitate hairs; branches filiform, 1-flowered; leaves linear, sessile, full of pellucid dots, nerveless, ciliated by capitate bristles; sepals lanceolate-oblong, bluish, petals obovate, obtuse, 3-nerved; styles much elongated; stigmas thickish, arched. 2. F. Native of Nipaul. Branchea dense. Flowers golden yellow. Perhaps distinct from S. brachypoda.

Thread-stemmed Saxifrage. Pl. 1/4 foot.

56 S. Krushianæa (Fisch. in litt. ex D. C. prod. 4. p. 46.) plant tufted; leaves dense, imbricate, ovate, ciliated, nerveless; flowers by threes; sepals lanceolate-obtuse; petals elliptic, much longer than the calyx, with pinnate nerves; capsule somewhat hemispherical; styles arched. 2. H. Native of Siberia, near Ijiga, where it was found by Krush, according to Fischer. This species is very distinct from S. áspera, in the leaves being oval, not linear-ovate, in being nerveless, not 3-nerved, and in the petals being feather-nerved, &c. S. glandulosa, Willd. herb. ex Stev. in litt. 1821.

Krush's Saxifrage. Pl. 1/4 foot.

57 S. STELLERIANA (Merk ex Fisch. in litt. ex D. C. prod. 4. p. 46.) plant tufted; leaves of the surculi or sterile branches small, numerous, oblong, ciliated and mucronate, hardly petiolate: cauline ones distant; uppermost ones acute, not ciliated; stems branched, 5-7-flowered; flowers distantly ciliated; pedicels and calyces glabrous; calycine lobes oblong, acute; petals oblong, 3-nerved, exceeding the calyx; ovarium conical; styles hardly diverging, length of the petals. 2. H. Native of Eastern Siberia.

Steller's Saxifrage. Pl. 1/4 foot.

58 S. Multiflora (Ledebo. dec. pl. in mem. acad. des. science. peterb. 5. p. 532. no. 18. fl. ross. alt. ill. t. 332.) leaves lanceolate-linear, scattered, cuspidate, remotely and saccately ciliated, and covered with cobwebbed villi; corymb terminal, many flowered; calycine segments ovate, obtuse; petals elliptic, bluish, 1-nerved, more than thrice the length of the calyx; stamens exceeding the corolla. 2. H. Native of Altaia. It differs from S. áspera and S. bronchialis, and all the nearly
alloyed species, in the many flowering corollas, in the surfaces of the leaves and margins, &c.

Many-flowered Saxifrage. Pl. ½ foot.

59 S. a'spéra (Lin. spec. 575.) leaves flat, lanceolate-linear, scattered, pungent, remotely ciliate with spinules, glabrous; stem branched, few-flowered; calyce segments ovate, cuspitate; petals broadly elliptic, rounded at the apex, 3-5-nerved, twice the length of the calyx, and a little longer than the stamens. ½. H. Native of Switzerland and the Pyrenees; also of Siberia. Jacq. auct. 5. appendix. 31. Sternb. sax. 29. t. 8. f. 1.—Scheuch. alp. 142. t. 21. f. 2.—Col. echr. 2. p. 66. t. 67. f. 1-2. S. a'spéra var. a elongata, Gaudin, fl. helv. 3. p. 108. S. intermédia, Heg. fl. helv. 1. p. 258. Ciliária a'spéra, Haw. enum. sax. p. 42.—Moris. hist. 3. p. 479. sect. 12. t. 10. f. 25. Plant grey; calyce elongated, decumbent, villous. Stem branched, reddish, brittle, hispid from short hairs. Pedicules longish, stiff, 1-flowered, furnished with glandular-hairy, as well as on the calyces. Nerves of petaliferous branches. Flowers large, cream-coloured.

61 S. cheliceroides (D. Don, in Lin. trans. 13. p. 382.) tufts of leaves on the tops of the surculi globose; leaves densely imbricated, spatulate, mucronate, ciliated; calyce segments semi-ovate, obtuse; petals obovate, 3-nerved; stems filiform, many-flowered. ½. H. Native of Kamschatka. S. bryoides, Pall. miss. Plant tufted. Stems ascending, 4-5-flowered, with a few small adpressed leaves. Flowers corolline, cream-coloured, much smaller than those of S. bryoides. Pedicels 1-flowered, furnished with a few scattered glands, as well as the calyces.

Chekereria-like Saxifrage. Pl. ½ foot.

62 S. hispidula (D. Don, in Lin. trans. 13. p. 380.) plant tufted, and hispid; stems filiform; leaves ovate, mucronate, bristly, with one tooth on each side; flower terminal, nearly sessile; calyx bristly; petals nearly orbicular, triple-nerved; nerves simple, straight. ½. H. Native of Nipaul, on the Alps. Flowers yellow, on short pedicels, drooping in the bud. Styles incurved at the apex.

Rather-hispid Saxifrage. Pl. ½ foot.

63 S. evolutoides (Wall. cat. no. 447.) stems very simple, 1-flowered, ornamented by long capitade spreading leaves; hairs ovate-lanceolate, acute, furnished with 1 or 2 teeth, nerveless, sessile, covered with striigorose pilus; sepals ovate, mucronate by a bristle, and bearing strigose hairs; petals roundish-obovate, opaque, hardly longer than the calyx. ½. H. Native of Nipaul, at Gosainghthan and Kamaon. Perhaps distant from S. hispidula. Leaves small, superior ones broader. Pedicels filiform, nearly twice the length of the flowers. Flowers yellow. Evolutoides-like Saxifrage. Pl. ½ foot.

64 S. lęk's (Bieb. fl. taur. 1. p. 314. suppl. 291. but not of Haw.) stems decline, few-flowered; calyce oblong, acutish, crowded, naked, unarmed, glaucous; flowers termina, sessile; petals obovate-oblong, longer than the calyx. ½. H. Native of the Alps of Caucasus. Flowers yellow. Very nearly allied to S. aizoides, but differs in the flowers being smaller and sessile.

Smooth Saxifrage. Pl. ½ to ¾ foot.

65 S. spinulosa (Adams, in mem. soc. mose. 5. ex Spreng. neue. entd. 5. p. 225.) stem nearly naked, many-flowered; leaves imbricate, undivided, erect, linear-lanceolate, flat, ciliated, spiny. ½. H. Native country unknown.

Spinulose Saxifrage. Pl. ½ foot.

66 S. Chami'ssò (Stern. rev. sax. suppl. 1. p. 12. t. 10. f. 1.) plant tufted; stem generally 4-flowered; lower leaves cuneated, cuspitate trifid, ciliated; calyce leaves linear-lanceolate, quite entire; sepals small, obtuse; petals oblong, minute, hardly longer than the sepals. ½. H. Native of the Island of Unalaschka; and the subalpine regions of Mount Hood. S. tricuspidata β, Hook. fl. bor. amer. 1. p. 254. Flowers minute, white.

Chamisson's Saxifrage. Pl. ½ to ¾ foot.

67 S. tricuspidata (Retz. prod. fl. scand. ed. 2. no. 552.) stems straight, thick; lower leaves dense, coriaceous, cuneiform, tricuspidate, with the margins finely ciliated; flowers somewhat corolline; peduncles short and stiff; calyce segments ovate; petals oblong or lanceolate, 3 times longer than the calyx; capsule conical, ending in diverging styles; stigmas subcapitate. ½. H. Native of Greenland, and of North America; from Lake Winepeg in lat. 50° to the Arctic sea and islands; and from Hudson's Bay to the Rocky Mountains; Kotzebeue's Sound, Newfoundland, &c. Rotb. in act. hafn. 10. p. 446. t. 6. Fl. dan. t. 976. Leptisca tricuspidata, Haw. enum. sax. p. 40. Plant densely tufted, glabrous; calyce very short. Stems ascending, many flowered. Superior leaves undivided. Pedicels elongated, glandular, as well as the calyces. Flowers yellow, size of those of S. Hirculus. Petals spotted, triple-nerved; nerves simple.

Var. a, Steeveníána (Ser. in D. C. prod. 4. p. 23.) flowers crowded into an ovoid spike.

Var. β, Adamsíána (Ser. 1. c.) flowers disposed into a capitate corrymb, emululating that of Lychnis alpina, Sternb. sax. p. 31. t. 10. a middle figure.

Juniper-like Saxifrage. Pl. ½ to ¾ foot.

Sect. V. Porphy'reon (from πορφυρίς, porphyros, purple; colour of flowers). Tausch, hort. canali. fasc. 1. D. C. prod. 4. p. 17.—Antiphylle species, Haw. enum. sax. p. 43.—Calliçymum, Gaudin, fl. helv. 3. p. 94. Calyx 5-cleft, with a long, erect, permanent tube (f. 43. c.), joined to the ovarium or free from it. Petals sessile, perigynous. Stamens perigynous (f. 48. b. c.); filaments flat, gradually attenuated. Stigmas
spreading, flat, spatulate, bearded with short down (f. 43. c.). Capsule covered by the calyx. Seeds angular, smooth or wrinkled.—Tufted evergreen herbs, with small opposite coriaceous or thick permanent leaves. Flowers red or violaceous. Elegant little plants.

69 S. oppositifolia (Lin. spec. 575.) stems 1-flowered; leaves imbricated, ovate or obovate, flat, obtuse, ciliate; segments of the calyx broadly ovate, obtuse; petals obovate, 5-nerved; gynaeceum shorter than the corolla. 2. H. Native of Lapland, Switzerland, Spitzbergen, Pyrenees, Scotland, and England, on alpine rocks and precipices; also of North America, as in Newfoundland and Labrador; Antecosti, in the Bay of St. Lawrence; Rocky Mountains, near the highest summits, between lat. 52° and 56°; Arctic sea shore and islands; Bay of Eschscholtz, &c. In England on the west side of Ingleborough, Yorkshire; on Snowden plentifully; and on Ben Lomond and other Scottish mountains. Lin. fl. lapp. p. 179. t. 2. f. 1. Fl. dan. t. 34. All. pedem. 1529. t. 21. f. 3. Lapeyr. pyr. sax. p. 36. t. 16. Smith, ingl. bot. t. 9. Hohenwart in Reiner, itin. 1. p. 132. t. 3. S. coriaceae, Pers. ench. 1. p. 488. Antiphylia coriacea, Haw. enum. sax. p. 43. Plant forming a broad flat tuft; surculi short, prominent, reddish. Leaves usually perforated at the apex by 1 or 2 pores. Flowers large, of a beautiful lilac red.

Var. b, distans (Ser. in D. C. prod. 4. p. 18.) leaves of the sterile branches loose and distant. 2. H. Native of the Alps of Switzerland and the Pyrenees.

Two-flowered Saxifrage. Fl. April, June. Clt. 1820. Pl. 1 to 2 inches.

72 S. Esciscro'tzii (Sternb. rev. sax. suppl. p. 9. t. 10. f. 2.) plant small, densely tufted; leaves closely imbricated, ob-
Var. ë, submána; flabelliform; stem single. Lapeyr. l. c.

Var. ð, neglectá (Ser. in D. C. l. c.) tufts of leaves globeose; raceme simple, few-flowered, somewhat cylindrical; petals rose-coloured, dotted with purple. 2. H. Native of Italy.—Sedum Barrel. icon. 1310. ex Tenore. S. neglectá, Tenore, append. prod. fl. neap. p. 19. S. Aizóon and S. érectá, Tenore, fl. neap. prod. p. 25. There is a variety of this with a sessile corymb of flowers in the tufts of leaves; peduncles and calyx are quite glabrous, and the stem 1-flowered.

76 S. intácta (Willd. hort. berol. 2. p. 75. t. 75.) leaves linear, acute, straight, sharply and silvery serrated; calyx and pedicels sparingly glandular: with obtuse segments; petals oval.

Untouched Saxifrage. Fl. May, July. Pl. ½ to 1 foot.

77 S. australís (Morie. fl. ven. 1. p. 431.) plant quite glabrous; stem angular; leaves of the tufts oblong-spataulate, ciliate at the base, with cuneate margins; cauleine leaves oblong, somewhat denticulated, acutish; panicle branched, many-flowered; petals ovate, obtuse, much longer than the calyx; styles straight, ascending. 2. H. Native of Virgin Mount, near Naples. S. Aizóon, Guss, in litt. S. pyramidalís, Tenore, fl. neap. prod. 1. p. 25. Petals yellow, as seen in a dried state. Flowers very like those of S. Cotyledon, and the leaves like those of S. Aizóon.

Southern Saxifrage. Pl. 1 foot.

78 S. cartiláginoa (Willd. in litt. ex Sternb. sax. p. 5. t. 3. c.) leaves of the tufts and stems lanceolate, acute, cartilaginously serrated; flowers panicled, somewhat corymbose; lobes of calyx ovate, about equal in length to the campanulate tube; calyx and peduncles beset with glandular pili; petals obvate, contiguous at the base, spotless; styles diverging.

Cartilaginous-edged-leaved Saxifrage. Pl. 1 foot.

79 S. margináta (Sternb. rév. sax. suppl. 1. p. 1. t. 1. f. 1.) radical leaves lingulate, ciliated at the base, having pitted dots within; flowers somewhat corymbose; petals ovate, twice the size of the calyx. 2. H. Native of Naples. S. Cotyledon, Tenore, cat. hort. neap. append. alter. p. 60. and S. Aizóon, longiófíia, and récta, Tenore, fl. neap. prod. p. 25. ex Moretti, tent. sax. p. 35.

Marginate-leaved Saxifrage. Pl. 1 foot.

80 S. floribúnda (Moretti, tent. sax. p. 9.) radical leaves tufted, lanceolate, mucronate, ciliated: cauleine ones linear; stem fuscous, bearing flowers from the base to the apex; flowers disposed in a racemose thyrse, white, or cream-coloured. 2. H. Native of the mountains about Nice.

Bundle-flowered Saxifrage. Pl. 1 foot.

Flowers paniced, copper-coloured, marked with deeper-coloured dots. Peduncles and calyxes densely clothed with rusty clanny down (f. 44.).

Var. ß, macropétala (Ser. in D. C. prod. 4. p. 20.) petals ovato-oblong, spotted. 2. H. Native of Switzerland. Hall. hist. no. 979. t. 16. f. 2.

§ 2. Leaves lingulately-spatulate, apiculated, with quite entire cartilaginous margins.

radical ones rosulate, glabrous; cauline leaves cuneate, clothed with glandular hairs. Pedicels 1-flowered, and are as well as the calyces clothed with viscid hairs. Petals obovate, dark purple. Genital inclosed in the calyx.

**Middle Saxifrage.** Pl. 3 to 4 foot.

83. **Lapeyrensia** (Don, in Lin. trans. 13. p. 397.)

radical leaves aggregate, articulate, quite entire, with cartilaginous margins; flowers paneled; petals obovate, quite entire, connivent, longer than the calyx. Ζ-H. Native of the Pyrenees, on calcareous rocks. Lapeyrensis, nap. 29. t. 14. S. ambigua, D. C. Peduncles and calyces clothed with purple down. Very like S. media, but differs in the flowers being paneled, and citron-colored. Said to be a hybrid between S. media and S. aretioides.

**La Peyrouse's Saxifrage.** Pl. ½ to 3 foot.

84. S. aretioides (Lapeyrensis, nap. p. 28. t. 13.) leaves aggregate, linear-lingulate, upright, mucronate, keeled, glaucous, with cartilaginous margins; stem clothed with clammy tomentum; petals linear-spatulate, crenulated at the apex. Ζ-H. Native of the Pyrenees, on calcareous rocks. Lapeyrensis aretioides, Haw. enum. nap. 14. Plant densely tufted. Leaves imbricate, ciliately toothed at the base, with a few perforated dots near the margin. Flowers by threes, golden yellow. Pedicels and calyces clothed with clammy down. Calyces segments ovate, acute. Very like the two preceding species, but the plant is much smaller.

**Arethia-like Saxifrage.** Pl. May, Clt. 1826. Pl. ½ ft.

§ 3. **Leaves triquetrous, obtuse.**

85. S. diapensioides (Bellardi, in act. acad. taur. 5. p. 287.) stems, peduncles, and calyces glandular; leaves linear, erect, keeled, aggregate, imbricated, ciliate, glaucous; stem many-leaved, few-flowered; calyces segments elliptic-oblong. Ζ-H. Native of the Alps of Piedmont and Switzerland. Lapeyrensis append. fl. pedem. p. 21. t. 3. Sternb. nap. 35. t. 9. Chondrosore diapensioides, Haw. enum. nap. 13. S. caesia β, Lam. dict. 4. p. 676. Plant densely tufted. Leaves with cartilaginous margins, ciliated at the base, and with 1 or 2 perforated dots at the apex, which is obtuse. Flowers 3-5 or 5, campanulate, white, disposed in a terminal head. Petals narrow at the base, with an orbicular, 5-nerved limb.

86. S. squarrosa (Sieb. in fl. 1821. p. 99. and fl. austr. excis. no. 133.) stem pubescent below, usually 3-flowered; leaves linear-elliptic, rather retuse, stiff, squarrosely imbricated, permanent, when young powdery; branches diffuse, ciliate; peduncles and stems glabrous. Ζ-H. Native of the Alps of Tyrol. Flowers white, larger than those of S. caesia. Lobes of calyx broader than in S. caesia and S. diapensioides.

**Squarrosa-leaved Saxifrage.** Pl. ½ foot.

87. S. ramelosa (Wall. cat. no. 446.) plant densely tufted; stems 1-flowered, very short; leaves of the barren stems or sparsely acute and flattish at the apex, lined with rough dots; the upper surface of the leaves have a regular marginal, double line of dots; margins of leaves thin and cartilaginous; lobes of calyx acute; styles nearly parallel, longer than the calyx; stigma thick, capitate. Ζ-F. Native of Nipaul, at Bhuddrith. Very nearly allied to C. caesia, but perfectly distinct.

**Branched Saxifrage.** Pl. 1 inch.

**Var. β, pätens** (Ser. in D. C. fl. fr. 5. p. 517.) peduncles and calyces very clamy, and beset with glandular hairs; leaves of the surculi and stems flat at the base, but more or less triquetrous at the apex, with the upper surface marked with dots, which are disposed without order. Ζ-H. Native of the Alps of Lyons, on the hill called Lacroix, near Abries and Pignerol; and on Mount Cenis. S. rupesistris, Thomas, exsic. S. caesia, var. Wildl. spec. 2. p. 642. in a note. S. caesia γ, Moretti, tent. sax. p. 12. Flowers white, corymbose; peduncles short. Leaves dense, short.

§ 4. **Leaves triquetrous, mucronately pungent.**

92. S. nitida (Schreb. in litt. ex Sternb. rev. sax. p. 32. t. 10.
floral leaf; 2. H. Native of the Alps of Carinthia, Carniola, and of the Carpathian mountains; and also about Prague. Chondrosea tenella, Haw. enum. sax. p. 15. Plant tufted; surculi decumbent. Leaves crowded, imbricate, deep green, keeled beneath. Flowers panicled, white. Calyx beset with glandular hairs.

**Sand-wort-like Saxifrage.** Pl. 1½ foot.

95 S. Busseriana' (Lin. spec. 572.) stem beset with glandular hairs; leaves aggregate, subulate, pungent, smooth, glaucous; stems usually 1-flowered; segments of the calyx ovate; petals roundish, with curled edges, and branched nerves. 2. H. Native of the Alps of Carinthia and Carniola; and in Upper Italy, on the mountains. Wulf. in Jacq. misc. 1. p. 152. t. 5. f. 2. Stem. sax. p. 33. t. 10. f. 1-2, and in Sturm, deutschl. fass. 33. no. 10. f. a. b. c. d.—Seguier, pl. rar. 3. p. 201. t. 5. f. 2. Chondrosea Busseriana, Haw. enum. sax. 15. Plant densely tufted. Surculi short, erect. Leaves rosalate, trilobed.

**Var. β, subbiflora** (Sternb. 1. c. t. 10. β.) stems usually 2-flowered.

**Vandelli's Saxifrage.** Pl. 1½ foot.

**Var. β, capitellata** (Ser. in D. C. prod. 4. p. 39.) flowers few, somewhat capitulate; leaves nearly entire; scape length of leaves. 2. H. Native of the Carpathian mountains, and the Island of St. Lawrence. Micranthes hirta, Haw. enum. sax. p. 45. S. uliginosa β, attra, Fisch. in litt.

98 S. Pennsylvanica (Lin. spec. 571.) leaves lanceolate, without petioles, sinuate, denticulate, very hairy on both surfaces; scape branched; flowers disposed in coriaceous heads, the whole forming a branched panicle; calycine segments ovate, acutish; petals linear, longer than the calyx. 2. H. Native of North America, in the states of New York and Virginia, in humid meadows; also of Canada, but rare. S. Caroliniana and S. Marylandica, Hortul. S. palustris, Hort. engl. Link. enum. 1. p. 412. Micranthes Pennsylvanica, Haw. enum. sax. p. 45.—Dill. elth. 337. t. 253. f. 328. Leaves attenuated at the base. Scape beset with viscid hairs, and the pedicels with calyces and glandular ones. Flowers of a squill-like white colour.

**Var. β, corymbifera** (Michx. fl. bor. amer. 1. p. 269.) panicle long; flowers coriaceous, distant.

99 S. semipubescent (Sweet, hort. suburb. p. 97.) leaves without petioles, oval-oblong, obtuse, quite glabrous, denticulate; scape branched; flowers disposed in corymbose heads, the whole forming a panicle; calycine segments ovate, acutish; petals oval, about equal in length to the calyx. 2. H. Native of North America. Micranthes semipubescent, Haw. syn. succ. append. 46. S. Marylandica, Hortul. Micranthes hirta, Haw. enum. sax. p. 46. Stem beset with glandular hairs, as well as the calyces and pedicels. Flowers small, yellowish.

**Semi-pubescent Saxifrage.** Fl. May, June. Clt. 1800. Pl. 1 to 1¾ foot.

101 S. versalis (Wildl. hort. berol. t. 43.) leaves oblong or

**F**
SAXIFRAGACEÆ. I. SAXIFRAGA.

... leaves bracteas flowers calycine. 2. H. Native of Canada, and to the mountains of the Columbia, and from Fort Vancouver to the Kettle Falls. S. Virginianæsis, Torrey, fl. unit. stat. 1. p. 444. Flowers small, white, forming an imperfect coryst or thyrse. This species differs from S. Virginianæsis in the disposition of the flowers.

Var. a; flowers loosely panicked; scape longer. 2. H.

Var. b; flowers compact, rather thyroid. 2. H. Native on the banks of the Saskatchewan. General habit of S. niveïs.

Spring Saxifrage. Fl. May, June. Ch. ? Pl. ½ foot.

102 S. reflêxa (Hook, fl. bor. amer. 1. p. 249. t. 85) plant clothed with hoary down; leaves ovate, rather cariosceous, opaque, deeply serrated, tapering into the petiole; scape naked; panicle quite glabrous, compact, corymbose; petals obovate, bimaculate; calyx reflexed. 2. H. Native of North America, on the shores of the Arctic Sea, between the Mackenzie and Coppermine rivers. Together with the harsh and rigid foliage of S. niveïs, the present species has a panicle more resembling that of S. ver-violis; but the petals have 2 orange spots, similar to those of S. leucaenthemïs. The pubescence gives a whitish or hoary appearance to the whole plant, the panicle excepted; but as the pubescence is very variable in all the species of the present section, it cannot be depended upon. (f. 45.)

Reflected-calyxed Saxifrage. Pl. ½ foot.

103 S. integrifolia (Hook. fl. bor. amer. 1. p. 249. t. 86) the whole plant clothed with ammny pubescence; leaves radical, ovate, rather membranous, very blunt, quite entire, or sinuately crenated, reticulately veined; scape elongated, naked, panicled, at the apex; panicle loose, broad or contracted, bracteate; petals obovate, twice the length of the calyx, which is at first spreading, but at length reflexed; stamens short; styles diverging. 2. H. Native of the north-west coast of America, near the mouth of the Columbia. The leaves are short, in proportion to the height of the plant.

Entire-leaved Saxifrage. Pl. ½ to 1 foot.

104 S. niveïs (Lin. spec. p. 573) leaves ovate or obovate, cariosceous, undulately crenated, tapering into the broad petiole; scape naked, simple; flowers in crowded heads; calyce segments erect, obtuse; petals obovate, permanent, hardly one half longer than the calyx. 2. H. Native of Scotland, north of England, Lapland, on the loftiest mountains; in North America, on the Arctic Sea-shore and islands, abundant; Labrador, Canada, Spitzbergen, and the Rocky Mountains. In Britain, upon Snowden, and on the summits of several hills about Snowden; on Ben Lawers, Clova, and other Highland mountains of Scotland; and near the top of Ben Lomond. Light: fl. scot. with a figure. Smith, engl. bot. t. 440. Sterm. in Stürmer, nach Drachl. fl. with a figure. S. congesta, Haw. Dermæsa niveïs, Haw. syn. sax. p. 9.—Lin. fl. succ. p. 176. t. 2. f. 5, 6.—Ray. angl. 3. p. 354. t. 16. f. 1.—Oed. fl. dan. t. 28. Leaves glabrous above, villous beneath. Scape clothed with viscid hairs. Flowers disposed in crowded bracteate heads; bracteas ciliated. Pedicels and calyces clothed with viscid down. Petals white, but becoming reddish as they fade, triple-nerved; nerves simple.

The American specimens of this plant are very variable in habit, and in many instances so closely approach the varieties of some of the preceding species, as hardly to be distinguished. It is therefore most easily to be recognised by its stiff and rigid habit, by the broad permanent petals, which remaining amongst the deep purple capsules form a singular contrast with them.

Var. β, lazίfora; heads of flowers loose, branched.

105 S. longiscâpæ (D. Don, in Lin. trans. 13. p. 388) leaves ovate, serrated, on long petioles; thyrse of flowers ovate; segments of the calyx ovate, acute; petals ovate, hardly longer than the calyx. 2. H. Native of Siberia. Leaves hairy. Scape filiform, beset with glandular hairs. Pedicels and calyces downy. Flowers white. This plant scarcely differs from S. niveïs var. γ, tenus.

Long-scaped Saxifrage. Pl. ½ foot.

106 S. lena (Wall. cat. no. 450) plant quite glabrous; leaves lanceolate, obtuse, obscurely crenated, petiolate; bracteae linear; flowers few, disposed in a loose panicle; pedicels filiform, longer than the fruit; petals obovate, longer than the calyx; calyce lobes lanceolate, length of tube, each terminated by a sessile gland? filaments clavate? capsule rather bladdery, nerved, marked by minute elevated dots; stigmas sessile, thickish. 2. F. Native of Nipal, at Goshaingthan, Emodi, and Kamaon.

Pale Saxifrage. Pl. ½ foot.

107 S. dahl'riæ (Wild. spec. 3. p. 465) plant quite glabrous; leaves cuneiform, on long petioles, attenuated at the base, coarsely and deeply serrated at the apex; flowers in loose panicles; calyx segments ovate, acute; petals elliptic, acute. 2. H. Native of Dahluria, on the tops of the Alps, near the limits of perpetual snow. In North America, at Breich's Straits; alpine rivulets of the Rocky Mountains, Kotszebue's Sound, and Bay of St. Lawrence. Leaves said to be pubescent; the scape beset with glandular hairs, and the pedicels and calyces clothed with ammny downy. Petals white, marked with 2 yellow spots at the base. The broadly cuneate, or rather flabelliform leaves are very remarkable.

Dahrian Saxifrage. Pl. ½ foot.

Sec. VIII. SAXIFRAGE-ÆRE (this section contains what are considered the true species of the genus). D. Don, in Lin. trans. 13. p. 345.—Dactyloïdes, Tausch, hort. canali. fase. 1. D. C. prod. 4. p. 23.—Musæaria and Saxifraga, Haw. enum. sax. p. 22-29.—Triplinervium, Gaudin, fl. helv. 3. p. 116. Calyx 5-leaflet (f. 46. d.), erect, permanent, with the tube adhering to and involving the ovary (f. 46. b.). Petals sessile, perigonous (f. 46. c.). Stamina perigonous (f. 46. d.). Filaments flat, gradually attenuated. Stigmas spreading (f. 46. e.). Flat, spatulate, bearded with short down. Capsule covered by the calyx (f. 46. b.), and closely adhering to it. Seeds obovate.—Perennial rarely annual, humble, densely tufted herbs, for the most part bearing auriculae. Leaves alternate, variously parted, rarely simple, usually green; with the margins neither cartilaginous nor dotted. Stems leafy, few, or many-flowered. Flowers white or yellow, rarely red.

§ 1. Perennial. Surculi numerous. Leaves undivided, rarely tridentate at the apex.

108 S. frarnassifoliæ (D. Don, in Lin. trans. 13. p. 405) stem erect, leafy, 3-4-flowered; leaves cordate, stem-clasping,
SAXIFRAGACEÆ. I. SAXIFRAGA.

219

Var. β, trifida (Gaudin, in Meisner, aniz. p. 66. fl. helv. 3. p. 114.) of the same leaves tridif. 2. H. Native of Vallais, in the valley called Bagnes.

Tender Saxifrage. Fl. May. Jul. Clt. 1819. Pl. 1/4. foot. 113 S. depresse (Sternb. rev. sax. 42. t. 11. a. 5.) stem roughish, few-flowered, furnished with 2 leaves, one of which is a little stem-clasping; leaves spatulate, entire, and cuneately tridentate at the apex, running into the petiole at the base, rather scabrous beneath; petals hardly exceeding the calyx, which is campanulate; calyx lobes triangular, broad. 2. H. Native of Italy, on Mount Alpi. Haw. enum. sax. p. 31. It differs from S. androsacea, to which it is nearly allied, in the leaves running into the petiole at the base, and in the lower surface of the leaves being roughish from short stelliferous hairs, not pilose. Perhaps the same as S. androsacea β, tridentata.

Depressed Saxifrage. Fl. May, June. Clt.? Pl. 1/4. foot. 114 S. M. skii (Fisch. in Sternb. rev. sax. 1. p. 1. f. 3.) stems tufted, usually 3-flowered; calyx segments ovate; petals obvate-roundish, longer than the calyx; capsule rather bladdery; styles parallel; radical leaves rosulate, ovate or spatulate, entire, ciliated, glabrous; cauleine ones smaller, few. 2. H. Native of Siberia, in humid places on Mount Jablonoi. Habit nearly of S. androsacea, but differs in the capsule being bladdery, much longer than the calyx. Flowers white.

Merk's Saxifrage. Pl. 1/4 foot. 115 S. croceà (Gaudin, syn. sax. in Meisner, aniz. 1818. p. 70. fl. helv. 3. p. 133.) stems tufted, 3-5-flowered, covered with short pubescence; terminal peduncle sessile: lateral ones very long, filiform; leaves linear-oblong, obvate, or tridentate; calyx segments oblong-narrow, blunted, clothed with pubescence, longer than the tube; petals elliptic, blunted, hardly equal in length to the calyx. 2. H. Native of Savoy, in the southern Alps. Muscaria croceà, Haw. enum. sax. p. 38. Flowers copper-colored.

117 S. geranioides (Lin. spec. 578.) leaves reniform, 3-5lobed, pubescent, on long petioles: segments cuneate, deeply toothed; paniculate coarctate, many-flowered; calyx segments linear-lanceolate, obtuse, reflexed; petals oblong, flat. 2. H. Native of the Pyrenees. Lapryer. pyrr. sax. p. 66. t. 43. S. paniculàta, Schleich. cat. 1821. S. quinquèfida, Lam. fl. fr. 3.
SAXIFRAGACEAE. I. SAXIFRAGA.

Var. \( \beta \), obtusiflora (Ser. in D. C. prod. 4. p. 30.) plant hardly pilose; lobes and lobules of leaves hardly toothed; flowers subumbellate; bracteas linear. 2. H. Native of Switzerland. S. geranioides, Schleich. cat. 1822, p. 63.

121 S. visciosa (Haw. in misc. nat. 164. enum. sax. p. 26.) stems hairy; radical leaves pedatifid; of the surculi, which are erect, 5-3-cleft: cauline ones trifid and lanceolate, 3-nerved. 2. H. Native country unknown. Allied to S. geranioides and S. pedatifida, but much smaller and more cymally. Flowers white.

Clammy Saxifrage. Fl. May. June. Pl. 4 f. 1 to 1 foot.

122 S. catalonia'lica (Dryander, in hort. kew. 3. p. 70.) surculi woody; leaves 3-5-parted, petiolar, stiff, glabrous; segments subulate, with horny mucrones; stems cymally; calyx brownish, glabrous, with ovate segments, which are furnished each with a recurved mucron at the apex; petals obovate. 2. H. Native of Spain. Sims, bot. mag. 1651. S. triplinervis, Schrad. hort. goet. fasc. 1. p. 13. t. 7. S. petrae'a, Pavon. hairs. Plant densely tufted, quite glabrous. Stems reddish at the base, covered with viscid juice. Petioles naked, channelled above. Flowers snow white, disposed in a loose branched panicle. Pedicels and calyces covered with clammy juice.

123 S. obtusifida (D. Don, in Lin. trans. 13. p. 416.) surculi woody; leaves 3-parted, stiff, and smooth, as well as the very narrow petioles; segments linear, very blunt; calyces pubescent, with ovate obtuse segments; petals obovate. 2. H. Native of Spain. Plant densely tufted, quite glabrous, deep green. Stems few-leaved. Lateral segments of leaves lengthened and, usually bifid. Pedicels 1-flowered, pubescent. Flowers campanulate, white. Petals triple-nerved: nerves 2-3-forked at the apex.

124 S. ajugae'follia (Lin. amic. acad. 4. p. 271.) surculi procumbent; leaves 5-parted: segments linear-lanceolate, mucronate; stem branched; calycine segments ovate-mucronate; petals flat, obovate. 2. H. Native of Provence, on the mountains, and of the Pyrenees. Lapeyr. pyr. sax. p. 56. t. 31. Sternb. sax. p. 46. Plant green, furnished with a few viscid hairs, which are more dense on the petioles: densely tufted at the time of flowering, but growing in a loose manner afterwards. Surculi long, reddish, as well as the base of the stems. Leaves glabrous, but ciliatus: cauline ones undivided, lanceolate. Flowers large, campanulate, white. Calyx beset with glandular hairs.

Petals triple-nerved: nerves simple.

Var. \( \beta \), atonis (Haw. enum. sax. p. 29.) leaves of the prostrate stolons 5-3-cleft, somewhat pedate; segments linear-lanceolate, avened, twice the length of the petioles. 2. H. Native of the mountains of Provence. S. ajugae'follia, Ait. hort. kew. ed. 2. vol. 3. p. 70. S. ajugae'follia \( \beta \) longipes, Haw. l. c.

Var. \( \gamma \), funibrita (Ser. in D. C. prod. 4. p. 28.) sepals and petals jagged. 2. H. Native of the Pyrenees. Ramond, in D. C. fl. fr. 4. p. 372. in a note.

125 S. affinis (D. Don, in Lin. trans. 13. p. 418.) surculi procumbent; leaves 5-parted: segments linear, mucronate; calycine segments, linear, avened; petals oblong, with inflexed edges. 2. H. Native of Ireland, as on the top of Brandon mountains, county of Kerry. Plant beautiful green, furnished with soft and viscid hairs, densely tufted before flowering, but afterwards loose. Surculi elongated, reddish. Stems shining, smooth, few-flowered. Leaves of the surculi for the most part 3-parted. Pedicels and calyces clothed with viscid down. Flowers white, smaller than those of S. ajugae'follia. Petals triple-nerved: nerves simple.

126 S. capitata (Lapeyr. fl. pyr. p. 55. t. 30.) stems thickish, prostrate, hardly pilose; leaves cuneate, 3-5-cleft, rather fleshy, nerved, crowded towards the tops of the surculi: lobes ovate, rather parallel; calycine lobes ovate-lanceolate, bluntish, length of tube when in flower; petals obovate, much longer than the calyx; styles very long, spatulate. 2. H. Native of the Pyrenees. S. ajugae'follia \( \beta \), D. C. fl. fr. 4. p. 371. Sternb. rev. sax. p. 26. Petals white, 3-nerved above the base, lateral nerves confluent. Very like S. ajugae'follia, but differs in the leaves being thickness and denser.

Capitate-flowered Saxifrage. Fl. May, June. Pl. 4 f. 1 foot.

127 S. pentadac'tylus (Lapeyr. fl. pyr. sax. p. 64. t. 40.) surculi short, erect; leaves on long petioles, glabrous, 5-parted:
Saxifraga adscendens, filaments petals native calycine radical foot. Plant flowered, disposed in loose panicles.

**Var. β. corymbosa** (Ser. in D. C. prod. 4. p. 30.) flowers numerous, in dense corymb; peduncles more rigid and shorter.

**Var. γ. capitellata** (Ser. l.c.) flowers somewhat capitate; peduncles very short.

**Five-fingered-leaved Saxifrage.** Fl. May, June. Ct. 1815. Pl. 3 to 4 foot.

128 **S. LATIFIDA** (D. Don, in Lin. trans. 13. p. 420.) surculi erect, short; radical and surculine leaves broadly cuneate, glabrous, 3-5-lobed; lobes broadly oval, calyx glabrous, with ovate-lanceolate mucronulate segments; petals spatulate, with simple nerves. Φ. H. Native of Spain. S. adscendens, Pavon, herb. Plant quite glabrous, pale green, tufted. Stems many leaved, many flowered. Lower calyx leaves like the radical ones, but more profusely lobed: lobes lanceolate; upper calyx leaves undivided. Peduncles elongated, 2-flowered. Flowers white.

**Broad-cleft-leaved Saxifrage.** Pl. 4 foot.

**Deceiving Saxifrage.** Fl. May, June. Wales. Pl. 4 foot.

130 **S. hiæta** (D Hann. cand. ed. 5. p. 107.) plant very villous; radical leaves 5-cleft: surculine ones trifid: segments ovate-lanceolate, acute; calyce segments triangularly ovate, acute; petals obovate. Φ. H. Native of Ireland, among alpine rocks, western highlands of Scotland, and Wales; as on the Galty mountains, Tipperary; in the west part of Scotland; near Twill du in Owain Idwell, also on the walls of Dolwyddelan castle, between Capel Cory and Llanddewi, North Wales. Smith, engl. Bot. 2291. Plant canescent, densely tufted before flowering, but afterwards loose, with the surculi decumbent and flexuous. Stem many leaved, few-flowered, clothed with viscid hairs. Petioles dilated. Lower calyx leaves 3-parted, with linear segments: upper ones undivided. Flowers white, smaller than those of S. decipiens. Pedicels and calyces clothed with glandular hairs. Petals triple-nerved: nerves simple.

**Hairy Saxifrage.** Fl. May, June. Ireland. Pl. 3 to 3 foot.

131 **S. platifuætata** (Smith, in Lin. trans. 10. p. 591.) plant villous; surculi elongated, prostrate; leaves 3-5-parted: segments linear, acute, and awned; calyce segments ovate, mucronate; petals orbicular. Φ. H. Native of the Alps of Scotland and Wales; as upon Snowdon in Wales; and the Cova mountains in Angus-shire, Scotland. Smith, engl. Bot. 2276.

**Broad-petalled Saxifrage.** Fl. June. Britain. Pl. 3 foot.

**Incurved-leaved Saxifrage.** Fl. May, June. Ireland. Pl. 4 foot.

**Naked Saxifrage.** Fl. May, June. Scotland. Pl. 3 foot.

**Sternberg's Saxifrage.** Fl. May, June. Pl. 1 foot.

**Neat Saxifrage.** Fl. May, June. Cl. 1818. Pl. 1 foot.

136 **S. tridentætæ** (D. Don, in Lin. trans. 13. p. 426.) plant glabrous; radical leaves 5-cleft, surculine ones on long petioles, acutely tridentate; calyce segments triangularly ovate, mucronate; petals spatulate. Φ. H. Native country unknown. Herb densely tufted, quite glabrous before flowering, but fur-

Tridentate-leaved Saxifrage. Fl. May, June. Pl. ½ foot.

Ades Saxifrage. Pl. ½ foot.

138 S. caspites (Lin. spec. 578.) radical leaves aggregate, 5-3-parted or undivided; segments linear-lanceolate, obtuse; stems few-leaved, few-flowered; calyce segments ovate, obtuse; petals obovate-roundish, connivent. 2. H. Native of the Alps of Lapland, Sweden, Switzerland, and the Pyrenees; also of the north-west coast of America, Kotzebue's Sound, Arctic sea-shore, and of Greenland. In Wales and Ireland on the loftiest mountains; on the rocks of Trolt, Cyn Iddwell, North Wales; on the lofty summits of Brandon mountains, county of Kerry. Gunn. fl. nov. t. 1047. t. 7. f. 3. Smith, engl. bot. t. 794. S. Groenlandica, Lin. spec. p. 578. Gunn. fl. nov. p. 689. t. 7. f. 1. Lepery, pyr. sax. p. 39. t. 19.—Dill. elth. p. 357. t. 353. f. 329. Muscária caspites, Haw. enum. sax. p. 37. Plant densely tufted, beset with glanduliforous hairs. Saxifragi short, very leafy. Stems 1-3-flowered, but in cultivation usually 4-flowered. Lower cauline leaves palmate, upper ones for the most part 3-parted. Pedicels and calyces clothed with viscid down. Flowers rather large, milk-coloured; filaments yellow; petals triple-nerved; nerves simple: lateral ones curved.

139 S. uniflora (R. Br. in Parry's first voy. appendix. p. 275. but not of Sternb.) radical leaves aggregate, trifid; cauline ones linear, undivided, distant; stem one-flowered, and is, as well as the inferior ovarium, viscid; down glandular, very short; calyce segments obtuse; petals obovate-oblong. 2. H. Native of the Arctic Islands. S. caspites, R. Br. in Ross voy. ed. 2. vol. 2. p. 192. S. caspitas / uniflora, Hook. fl. bor. amer. 1. p. 244. S. venosa, Haw. enum. sax. p. 25. Flowers milk-coloured.

One-flowered Saxifrage. Pl. ½ foot.

Stellate Saxifrage. Pl. 1 inch.

Var. β, Heâ'nei; leaves densely glandular, 3-5-lobed: lobes ovate; surculi nearly globose; corymb 6-10-flowered. 2. F. Native in valleys on the Cordillera of Peru. S. Cordilleriana var. γ Heâ'nei, Presl, in Hœk. reliq. 2. p. 55.

Var. γ, λáxa; stems elongated; leaves densely glandular, 3-5-lobed, loosely imbricated; lobes ovate; surculi cymbral, loose; corymb many flowered. 2. F. Native of the Cordillera of Peru, in valleys. Petals white. S. Cordilleriana / λáxa, Presl, in Hœk. reliq. 2. p. 55.

Bonpland's Saxifrage. Pl. 1 inch.

Var. a, integrifolia (Ser. in D. C. prod. 4. p. 24.) leaves spatulate, usually entire: upper ones puberulous: lower ones glabrous.

Var. β, trîloba (Ser. l. c.) leaves all cuneate, 3-lobed at the apex, clanny. 2. F. S. Magellanica, Sternb. rev. sax. p. 39. t. 11. f. 1.

Magellan Saxifrage. Pl. ½ foot.

143 S. lanceola (Haw. syn. succ. p. 324. enum. sax. p. 240.) leaves glabrous, ciliated; those of the surculi palmately 7-cref: those of the stolons, which are very short and erect, 3-5-cref: calyce leaves lanceolate; petals roundish, obovate. 2. H. Native of the Alps of Europe. Flowers white.

Var. β, minor (Haw. enum. sax. p. 24.) leaves trifid and entire: lower cauline ones lanceolate-spataulate; petals oblong-cuneiform, distinct. 2. H. Two or three times smaller than the species, and the leaves and petioles are very different.

Haw. l. c.

Var. γ, obtûsa (Haw. l. c. p. 24.) leaves cuneiform at the base or obovate: those of the rousle deeply 1-5-toothed, and brownish: those of the stolons usually abortive: lower cauline leaves elliptic; petals orbicularly obovate. 2. H.

144 S. dichotomus (Willd. in Sternb. sax. rev. p. 51.) radical leaves reniformly cordate, palmately parted: segments linear; cauline leaves nearly sessile, cuneate, 3-5-parted; flowers in dichotomous panicles; peduncles and calyces plicate; calyce lobes lanceolate, acute, length of the tube. 2. H. Native of Spain. Haw. enum. sax. p. 27. Flowers white.

Dichotomous Saxifrage. Pl. ½ to ½ foot.

145 S. exarata (Vill. dauph. 4. p. 674. t. 45.) plant pubescent; radical leaves 5 or 3-parted: those of the surculi 3-parted: segments linear, very blunt, engraved above; stem many flowered; calyce segments ovate-oblong, obtuse; petals obovate, with simple nerves. 2. H. Native of the Alps of Dauphiny, Savoy, Piedmont, and the higher Pyrenees; also of North America: frequent on the rocky Mountains between lat. 55° and 56°. S. nervosa, Lapeyr. pyr. sax. p. 63. t. 39. S. hynoïdes, All. pedem. no. 1598. t. 21. f. 4. S. intermedius, Gaudin, fl. helv. 3. p. 122. S. striata, Hall. fil. in herb. Gaulin, l. c. p. 1297. Plant densely tufted before flowering, afterwards...
loose and surculose, densely clothed with glandular down. Surculi stiffish. Cauline leaves broadly 3-parted, with the lateral segments generally bifid. Petioles linear, flat. Pedicels filiform, 1-flowered, furnished each with a tripartite bracteal at the base. Flowers white; filaments yellow.

146 S. Payont (D. Don, in Lin. trans. 13. p. 434.) plant pubescent; leaves 3-parted; segments linear, acute, nerved; petioles linear, dilated, ribbed beneath; calyce segments linear-lanceolate, acute; petals obvolute, with simple nerves. 2. H. Native of the Alps of Peru, in very cold places. Herb growing in dense flat tufts. Surculi short. Stems few-leaved, 3-5-flowered, covered with short glandular hairs. Upper cauline leaves simple, linear, all the rest tripartite. Petioles linear, dilated. Peduncles and calyxes densely clothed with short glandular down. Flowers milk-coloured, fading to a yellowish colour.

*Pawon* S. moschata. Pl. 1 to 3/4 foot.

148 S. quiunqueum (Haw. syn. succ. p. 625. and enum. sax. p. 36.) naked; leaves of the twiggy surculi 3-5-cleft, remote, length of the internodes; lobes subulate, awned, equal in length to the petioles, which are ciliated; petals orbicular. 2. H. Native country unknown.

*Five-toothed-leaved* S. moschata. Fl. May, June. Pl. 3/4 to 1 foot.

149 S. paniculata (Hort. madr. ex Horn. hort. hain. p. 1. p. 402.) leaves glabrous, 3-parted; leaves trifid, linear; cauline leaves tripartite, with entire lobes; stems ascending. 2. H. Native of Spain.

*Paniced* S. moschata. Pl. 1/2 foot.

150 S. moschata (Wulf. in Jacq. misc. 2. p. 128. t. 31. f. 2.) plant pubescent; radical leaves trifid: surculine ones trifid or un-divided, nerved; segments linear, acutish; stems filiform, somewhat racemose; petals narrow-ovate, hardly exceeding the calyx. 2. H. Native of the Alps of Carinthia, Carniola, Savoy, Salis-
leaves deeply tripartite; segments cuneate, multifid; peduncles many-flowered; calydic segments ovate-oblong, blunting; petals oval, entire; stem ascending, panicked.  

2. H. Native of the Pyrenees, in springs. S. petraea, Gouan. ill. p. 29. t. 17.  

S. aquatica, Lap. pyr. sax. p. 53. t. 28. Stem. sax. p. 48. t. 19. f. 1 and 2. Plant tufted. Cercus short, leafy. Stems ascending, a foot or more high, beset with glandular hairs. Radical leaves 5-lobed, glabrous; lobes deeply toothed. Petioles dilated at the base. Flowers disposed in corymbose panicles, white. Peduncles many-flowered, and are as well as the calyces clothed with glandular down. Nerves of petals simple, reddish. Filaments yellow. This is the largest species of the whole section.

153. S. Terkešniss (Bunge, in Ledeck. fl. ross. alt. ill. t. 398. fl. alt. 2. p. 123.) plant small, tufted; radical leaves much crowded, cuneate, trifid; segments oblong-linear, obtuse, ciliated with a few glands; caulis leaves few, trifid or entire; stem few-flowered, glandular; petals oblong, twice the length of the calyx.  

2. H. Native of Altai, in rough stony places on tops of mountains, between the rivers Ursul and Koksun. Flowers pale yellow. Allied to S. moschata, but differs in the flowers being twice the size, and in the petals being obvolute-oblong.

Terek Saxifrage. Pl. 1 to 2 inches.

154. S. secunda (Moretti, tent. sax. p. 20.) plant very villous; radical leaves aggregate, cuneiform, 3-5-cleft lobes obtuse; stems few-leaved, rather corymbose; flowering shoots green; petals of calyx ovate, obtuse; petals obvolute, longer than the calyx.  

Second-flowered Saxifrage. Pl. 1 foot.

155. S. venosa (Haw. enum. sax. p. 28.) plant almost stemless; leaves simple and trifid, nerved; scapes 1-flowered, furnished with linear entire leaves.  

2. H. Native of Melville Island. Perhaps only a variety S. muscoides, uniflora, or csilpita.

Fein-leaved Saxifrage. Pl. 1 to 2 inches.

156. S. glabra (Bertol. virid. bonn. 1824. p. 80.) surculi densely leafy; stems few-flowered, glabrous; leaves all undivided, linear or spatulate, glabrous; peduncles and calyces puberulous, viscid; petals obvolute, obtuse, length of the calyx, 3-nerved; capsule short, somewhat globose, inclosed in the calyx; styles short, diverging; seeds obvolute, echinated, dark.  

2. H. Native of Abruzzo, on humid grassy rocks. Said to be nearly allied to S. exarata, Tenore, append. 4. fl. neap. p. 19.

157. S. quinquifida (Haw. in misc. nov. p. 153. enum. succ. p. 26.) surculi erect; leaves cleft into 5-11 parts, pedate; segments linear-lanceolate, furrowed by a line on the upper side.  

2. H. Native of Scotland, on the mountains. Perhaps the same as S. petaloides.

158. S. sileniflora (Cham. ex Hook. fl. bor. amer. 1. p. 245.) plant tufted; surculi short; leaves stiff, rosulate, dense, 3-5-7-parted, shining, and as if they were varnished, many nerved, pubescent: segments linear, acutish; foliaceous stems elongated, clothed with glandular down; flowers panicled, rather large; ovarium adhering to the tube of the calyx, which is clothed with glandular down; calydic segments obvolute; petals obvolute, 3-nerved, twice the length of the calyx.  

2. H. Native of Behring’s Straits. The inflorescence of this plant a good deal resembles S. hypnoides.

Var. β, uniflora (Hook. l.c.) stem 1-flowered.

Catchfly-flowered Saxifrage. Pl. 1 to 2 feet.

159. S. adscendens (Vahl. in act. nat. hist. hafn. 2. 1. p. 12.)
pyr. sax. p. 57. t. 32. Smith, engl. bot. t. 454. S. elongella, platinpétala, densa, curvata, densifolia, Schleich. cat. 1821. Herb densely tufted before flowering, quite glabrous, but afterwards becoming loose, succulose, and villous. Surculi reddish as well as stems, which are erect, shining, brittle, and 2-4-flowered. Surculine leaves furnished with ovate, acute buds in the axils. Cauline leaves few, linear-lanceolate, undivided. Peduncles elongated, 1-flowered, clothed with viscid down as well as the calyces. Petals white, triple-nerved, rose-coloured on the outside at the apex; nerves simple.

Var. ζ, pulchella (D. Don, 1.c.) plant more robust; surculi thicker and stiffer, and more rigid; buds obtuse, more crowded; surculine leaves broader, with a furrow on the upper surface. ɣ. H. Native of the Alps of Scotland.

Longish-stalked Saxifrage. Fl. Apr. May. Scot. Pl. ½ ft. 165 S. leptophylla (Pers. syn. 1. p. 490.) surculi proscopum, very long, slender; radical leaves 5-parted: surculi ones 3-parted or undivided: segments linear-lanceolate, very acute, divaricate; calyce segments oblong-ovate; petals spatulate, quite entire. γ. H. Native of the Alps of Switzerland, and on the mountains of Wales. S. retrolinexa, Hortul. Plant quite glabrous, and densely tufted before flowering, but afterwards loose, diffuse, and surculose, and beset with villous stigmas. Stems numerous, flexuous, smoothish, shining, many-flowered. Leaves without any buds in the axils. Segments of leaves awned. Flowers drooping, white. Peduncles elongated, and are as well as the calyces beset with glandular pili. Calyce segments ending in a reflexed mucrone each. Petals triple-nerved, with the nerves simple.

Var. β, angustifolia (D. Don, in Lin. trans. 13. p. 450.) plant slenderer; segments of leaves narrower. ɣ. H. Native of Wales, on the mountains.

Slender-leaved Saxifrage. Fl. May, Ju. Wales. Pl. ½ ft. 166 S. leptophylla (D. Don, in Lin. trans. 13. p. 451.) surculi proscopum, elongated; leaves 5 or 3-parted: segments linear, acute; calyce segments lanceolate, mucronate; petals spatulate, emarginate. ɣ. H. Native of the Alps of Scotland, on the loftiest rocks, in moist situations, in Angusshire and Aberdeenshire, and on the hills to the north of Loch Lomond. Herb pale green, densely tufted before flowering, and quite glabrous, but afterwards becoming loose, diffuse, and surculose, and beset with long scattered villi. Surculi destitute of buds in the axils. Stems erect, few-leaved, usually 5-flowered, rarely 1-flowered. Radical leaves 5-parted: surculi ones 3-parted: lower calypere ones 5-parted: upper calyce ones undivided, lanceolate, and acuminate. Flowers campanulate, white, drooping while in the bud. Petals triple-nerved; nerves simple, green.

§ 3. Annual or biennial plants, without surculi. Roots fibrous. Petals usually emarginate.

diffusely branched, furnished with glanduliferous hairs. Stems erect, branched at the base; branches elongated, fastigate. Radical leaves on long petioles, somewhat reniform at the base; lobes obtuse; cauleine leaves all petiolate: upper cauleine leaves undivided, acute at both ends; lower cauleine ones triplicate; lobes acute. Peduncles and calyxes clothed with viscid down. Flowers white, much larger than those of Saxifraga decandra. Petals triple-nerved; nerves simple.

Var. β, exilis (Gaudin, fl. helv. 3. p. 116.) leaves all oblong-spatulate; stem simple, few-flowered. H. Native of Switzerland, Italy, France, &c. S. exilis, Poll. veron. 2. p. 31.

Three-fingered-leaved or Wall Saxifrage. Fl. April, May. Britain. Pl. ½ to ¾ ft.

Var. β, littoralis (Ser. in D. C. prod. 4. p. 34.) plant small, very leafy; leaves usually quinqued; petals entire. H. In humid places on the banks of Lake Leman, S. petraeà littoralis ε, Gaudin, fl. helv. 3. p. 117.

Contrary-turn Saxifrage. Fl. May, Ju. Clt. 1800. Pl. ½ ft. Cult. Saxifraga is a most extensive genus of pretty alpine plants, the greater part of which are well adapted for rockwork, or to be grown on the sides of naked rocks to hide the surface. Many of the more rare and tender kinds require to be grown in pots, in light sandy soil, and placed among other alpine plants, so that they may be protected by a frame in winter. The species belonging to sections Mieranthes and Hircalus grow best in a peat soil, which should be kept rather moist. The species belonging to the section Pyrola belong to the genus Pyrola and those of Saxifraga belonging to section Miracanthes; inhabitants of cold places of North America. Scapes naked. Flowers disposed in racemose panicles. Leaves coriaceous, permanent, entire, coarsely serrated; petioles broad and sheathing.

I. ERIOGYNIA (from εριος, erion, wool, and γυνη, gynae, a female; in reference to the ovaries being woolly). Hook. in fl. bor. amer. 1. p. 255. t. 88.

Lin. syl. Icosandria, Tetra-Hezagynia. Calyx turbinate, 5-cleft. Petals 5, hardly unguiculate. Stamens 20, inserted in the mouth of the tube, monadelphous at the base; anthers 2-celled, roundish. Ovaries 4-6, distinct from the calyx, and from each other, but connected by dense wool. Styles elongated, deciduous, filiform. Carpels 4-6, distinct, oblong, acute, recurved at the apex, opening lengthwise inside. Seeds dust-formed, pendulous, inserted towards the tops of the valves at the margins. Albumen wanting.—A perennial herb, native of North America, with the habit almost of Saxifraga cervatothylla; stoloniferous. Leaves very stiff, coriaceous, 1-nerved, quite glabrous, trifid; segments trifid or quadrifid: lobules linear. Flowers white, disposed in racemes, for the most part bracteate; pedicels 1-flowered.

1 E. pectinata (Hook. 1. c.). 2 H. Native of Behring's Straits; height of land upon the Rocky Mountains, on the west side, near the sources of the Columbia. Saxifraga pectinata, Pursh, fl. amer. sept. 1. p. 312. Sterile stems tufted, decumbent, stiff, stoloniferous. Lower leaves rosulate, with 3 trifid segments: lower cauleine ones with 3 bifid segments: upper cauleine ones or bracteas trifid.

Pectinated-leaved Eriogynia. Pl. ½ foot.

Cult. This is a beautiful alpine plant. It should be grown in pots, in a mixture of peat and sand; and will be easily increased by dividing, or by cuttings.

Lin. syl. Decandria, Digynia. Calyx campanulate, short, 5-cleft (f. 47. a.), with a broad tube. Stamens 10, inserted in the throat of the tube; anthers 1-celled (f. 47. c.), 2-valved. Petals 5 (f. 47. b.), linear. Ovaries 2 (f. 47. c.), free, tapering into the styles, which are permanent. Stigmas obtuse. Carpels 2, opening lengthwise on the inside (f. 47. d.). Seeds scobiform, erect, inserted in the margins of the valves.—Herbs with a habit between Pyrola and those species of Saxifraga belonging to section Mieranthes; inhabitants of cold places of North America. Scapes naked. Flowers disposed in racemose panicles. Leaves coriaceous, permanent, entire, coarsely serrate; petioles broad and sheathing.

1 L. Pyrolifolia (R. Br. in Parry's 1st voy. append. p. 273. Hook. 1. c.). 2 H. Native of the Island of Unalaska, Behring's Straits, height of land on the west side of the Rocky Mountains, in lat. 59°. L. amplexi-

**Pyrola-leaved Leptarrhena.** Pl. ½ to 1 foot. Cult. See Erégrénia above for culture and propagation.

### IV. CHRYSSOSPLENIUM (from χρυς, chrysos, gold, and σπλήν, spleen, the spleen; in reference to the golden colour of the flowers, and the supposed virtue of the plant in diseases of the spleen). Tourn. inst. t. 60. Lin. gen. 558. Gärtn. fruct. 1. p. 208. t. 44. f. 7. D. C. prod. 4. p. 48.

#### Fig. 48.

**Cult.** See Erégrénia above for culture and propagation.

1 C. Alternifólium (Lin. spec. 569) leaves alternate, reniformly cordate, crenately lobed; flowers corymbose, dichotomous. 2 H. Native of Europe, in moist shady places, and by the borders of shady rivulets, in Siberia and North America; in the woody and principally the barren country of British North America; to the extreme Arctic Islands, and on the Rocky Mountains; also in Kotzebue's Sound. In many parts of the north of England, but not so common as C. oppositifólium, as in Yorkshire, Portland Heath, near Norwich, in Worcestershire; and in lowlands of Scotland. Smith, engl. bot. t. 54. Fl. dan. t. 366.—Moris. hist. p. 477. sect. 12. t. 8. f. 8. Stems usually 3-cornered. Flowers yellow. Roots having offsets, but not creeping.

2 C. Ováliifólium (Bieb. herb. ex Led. fl. ross. alt. ill. t. 404. fl. alt. t. 2. p. 115.) stems with many scattered leaves; leaves ovate-orbicular or elliptic, tapering into the petiole, crenately serrated or entire; corymbs dichotomous, loose. 2 H. Native of the Altai region. Root creeping. Stem pilose below. Flowers yellow, solitary in the forks of the corymbs.

**Oval-leaved Golden Saxifrage.** Fl. April, May. Pl. ½ foot.

3 C. Oppositifólium (Lin. spec. p. 569.) floriferous stems erect; leaves opposite, reniformly sub-cuneated, crenated; flowers corymbose. 2 H. Native of Europe and America, in moist shady places, and by the sides of rivulets. In Britain, in many places in like situations. Curt. lond. 2. t. 27. Smith, engl. bot. 490. Gärtn. fruct. 1. t. 44. f. 7. Oed. fl. dan. t. 863. Root creeping. Stems quadranular. Flowers yellow.

Var. β, Scouleri (Hook. fl. bor. amer. 1. p. 242.) leaves profoundly crenately serrated. 2 H. Native of the north-west coast of America, on the banks of the Columbia river.

Double-stemmed Golden Saxifrage. Fl. April. Pl. ½ foot. 6 C. Nipaul'ense (D. Don, prod. fl. nep. p. 210.) leaves opposite, orbicularly subcordate, crenately serrated, glabrous. 2 H. Native of the Alps of Nipaul. Very nearly allied to C. oppositifólium, but differs in the leaves being more reniform, less manifestly crenated, and in the seeds being opaque, not shining. Leaves like those of Bétula nána, but membranous. Flowers yellow.

Nipaul Golden Saxifrage. Fl. Apr. Ma. Cult. 1820. Pl. ½ ft. 7 C. nudica'ule (Bunge, in Led. fl. ross. alt. ill. t. 405.) cauline leaves wanting: radical ones reniformly orbicular, and as well as the floral ones, which are reniform, petiolate, and deeply lobed; flowers densely glomerate. 2 H. Native of Altaia, near springs at the foot of the Alps, about Chasin, near Tschetchulicha, at the river Tscharysh. Root creeping, furnished with thick brown fibres. Plant quite glabrous, except sometimes on the under side of the leaves. Flowers greenish, much larger than those of C. alternifólium.

Naked-stemmed Golden Saxifrage. Pl. ½ to 3 ½ foot.

2 H. Native of Kamtschatka.

Kamtschatka Golden Saxifrage. Pl. ½ foot.

Cult. A moist shaded situation is the best for the species of Chrysopogon, as under the shade of trees or bushes, or behind a north wall; and they thrive best in peat soil. Easily propagated by dividing.

#### Fig. 48.

**Cult.** A moist shaded situation is the best for the species of Chrysopogon, as under the shade of trees or bushes, or behind a north wall; and they thrive best in peat soil. Easily propagated by dividing.

1 M. diphy llama (Lin. spec. p. 580.) radical leaves cordate, somewhat 3 or 5-lobed, dentately serrated, on long petioles; cauline leaves 2, opposite, smaller, and nearly sessile; capsule joined with the calyx only at the base; petals pinnafiled fringed. 2 H. Native of North America, in the United States; and Canada, about Quebec, Lake Huron, &c. Lam. ill. t. 373. f. 1. Gärtn. fruct. 1. t. 44. f. 6. Schkuhr, handb. t. 190. Ker. bot. reg. t. 166.—Mentz. pag. t. 10. Flowers white.
Two-leaved Mitella. Fl. Apr. May. Clt. 1731. Pl. 1/2 to 3 ft. 2 M. nuda (Lin. spec. 380.) plant usually stoloniferous; radical leaves reniformly cordate, thin, bluntly lobed, crenated, and somewhat ciliate; scapes slender, leafless; calyx spreading; petals pectinately jagged; ovary joined to the calyx only at the very base. 2 H. Native of North America, from Lake Huron to the Arctic Sea; and from Hudson's Bay to the Rocky Mountains; and of Siberia, at the river Lena. M. reniformis, Lam. ill. t. 373. f. 2. M. cordifolia, Lam. dict. 4. p. 196. ill. t. 373. f. 3. Michx. fl. bor. amer. 1. p. 270. M. prostrata, Michx. fl. bor. amer. 1. p. 270. —Gmel. sib. 4. t. 68. f. 2. Flowers white. The plant here characterised is the acknowledged M. cordifolia of all American botanists. A comparison of it with the figure of Gmelin will show that it is the same with his species, and consequently the M. nuda, Lin., and among the numerous specimens gathered by travellers in North America, many throw out runners, which again bearing leaves and scapes, the plant becomes the M. prostrata of Michx.

Naked-stemmed Mitella. Fl. Apr. Ju. Clt. 1738. Pl. 2½ to 3½ ft. 3 M. TRIFIDA (Graham, in edinb. phil. journ. June, 1829. Hook. fl. bor. amer. 1. p. 241. t. 82.) radical leaves cordate, bluntly lobed, crenated; scapes leafless; flowers pentandrous; calyx campanulate, with a spreading limb; petals trifid; ovary adhering to the calyx only at the base. 2 H. Native of North America, in alpine rivulets north of the Smoking River, on the east side of the Rocky Mountains, in lat. 56°, but rare. Plentiful in woody situations, on the low ridge of the Blue Mountains of Lewis and Clark's River, west of the Rocky Mountains, in lat. 46°. M. parviflora, Doug. miss. Flowers white. This species has the petals similar to those of Tellima parviflora. Differs from the rest of the species in the petals being trifid, and in the stamens being only 5 instead of 10, opposite the lobes of the calyx. Perhaps a species of Drummondia.

Trifid-petalled Mitella. Fl. May. Clt. 1829. Pl. 3 to 1 ft. Cult. The species of Mitella are pretty plants, well suited for the front of flower-borders, or to grow on rockwork. They are readily increased by dividing. Any light soil suits them, although they grow most luxuriant in a peat soil.

Lin. syst. Decandria, Digynia. Calyx adnate to the ovary at the very base, having the free part inflated, ovate, and 5-toothed (f. 49. b.), and the adhering part conical. Petals 5 (f. 49. c.), inserted in the calyx, jagged. Stamens 10 (f. 49. a.). Styles 2-5, distinct from the base: stigmas subcapitate, angular. Capsule adnate to the calyx at the base: the other half superior and furnished with the petaloid flower, 1-celled, 2-valved at the apex; placentas parietal, many seeded (f. 49. f.). This is an intermediate genus between Heuchera and Vâlia; it differs from Mitella in the styles being distinct, and the different habit. Perennial herbs. Leaves all radical, roundish, cordate, bluntly lobed, in T. parviflora compound, toothed, and hispid. Flowers of a dirty red-colour, rather large, disposed in racemose spikes.

1 T. grandiflora (Doug. in bot. reg. t. 1178.) leaves cordate, lobed, dentately serrated; racemes elongated; petals oblong-linear, pinnatifidly jagged; styles 2. 2 H. Native of the north-west coast of America, in shady pine woods, near springs along the shore. Mitella grandiflora, Pursh. fl. amer. sept. 1. p. 314. This is a fine plant, with leaves as large as those of Mitella rotundifolia. Flowers reddish. Stem and pedicels generally thickly clothed with fulvous hairs.

2 T. parviflora (Hook. fl. bor. amer. 1. p. 239. t. 78. A.) plant scabrous from hairs; leaves ternate; leaflets deeply pinnatifid; racemes short; petals unguiculate, trifid; styles 3. 2 H. Native of North California. Abundant in light gravelly soils, under the shade of sapping pines, near Fort Vancouver; plentiful in low hills at the grand rapid of the Columbia; and also at Spokan river. Root small, rather fusiform, more or less fibrous, and bearing tubers; tubers granular. Racemes terminal, curved. Flowers middle-sized, red. This is a curious and distinct plant, with something of the habit of slender specimens of Saxifraga granulata.

VII. DRUMMONDIA (named after Thomas Drummond, who accompanied Capt. Franklin and Dr. Richardson in their last journey in North America). D. C. prod. 4. p. 49. —Mitella species, Graham.

Lin. syst. Pentandria, Digynia. Calyx with an obconical tube (f. 50. b.), adhering to the capsule a considerable way: limb 5-cleft: lobes triangular, valvate in aestivation (f. 50. a.), and at length reflexed. Petals 5, pectinately pinnatifid (f. 50. c.), alternating with the calycine lobes. Stamens 5, in front of the claws of the petals, nearly sessile. Stigmas 2, spreading, 2-lobed. Capsule 1-celled, 2-valved at the apex, bursting long before the seeds are mature (f. 50. d.). Seeds numerous, disposed along 2 opposite placentas. —An herb, with a habit between Mitella and Heuchera. It differs from Mitella in the capsule adhering a greater length to the calyx, in the stamens being 5, not 10, and in the stigmas being spreading, not erect, and 2-lobed, not entire; and from Heuchera in the calycine lobes being valvate, not imbricate in aestivation.

Lin. syst. Decandria, Digynia. Calyx 5-parted, permanent, adhering at the base to the ovary: lobes obtuse. Petals 5, unguiculate, entire, inserted in the calyx, and alternating with the calycine lobes. Stamens 10. Styles 2, distinct. Ovarium 2-celled. Capsule 1-celled, adnate to the calyx at the base, mem-
branous, 2-valved; valves unequal, opening between the styles (one of the valves or carpels usually abortive). Seeds fixed to the bottom of the capsule, along the margins of the carpels or valves.—Perennial herbs, with the habit of *Milélla*. Stems erect, naked, or few-leaved. Leaves for the most part radical, petiolate. Racemes terminal, simple; flowers distant, pedicelate; pedicels incurvously pendulous when bearing the fruit. A very heterogeneous genus, which may probably be hereafter divided.

§ 1. Leaves simple.

*Cordate-leaved* Tiarella. Fl. April, May. Clt. 1731. Pl. $\frac{1}{2}$. t. 2. *T. unifòlia* (Hook. fl. bor. amer. p. 228. t. 81.) plant smooth; stems furnished with one leaf; leaves all petiolate, triangularly cordate, bluntly toothed; teeth mucronate; petiole loose; flowers drooping, calyx campanulate; petals abortive. 2. H. Native of North America, on the height of land on the Rocky Mountains, near the source of the Columbia, and at Portage river. Stems rather pubescent above. Leaves 3-5-lobed; lobes acutely toothed. This species has much the habit of *Heuchéra glàbër*, and is probably a decandrous species of that genus. The petals, if any exist, must be very fugacious, as none has been seen.

One-leaved Tiarella. Pl. 1 foot.

4. *T. alternifòlia* (Fisch. in litt. ex D. C. prod. 4. p. 59.) stem leafy; lower leaves cordate: upper ones truncate at the base, all having 5-7 short lobes, and these lobes are lobed again, sharply and coarsely toothed; lobes of calyx oblong, erect. 2. H. Native of the north of Asia, in the island of Sitka. Radical leaves on long, upper ones on short petioles. Flowers twice the size of those of *T. polyphylía*.

Alternate-leaved Tiarella. Pl. 1 foot.

Many-leaved Tiarella. Fl. April, May. Clt. 1820. Pl. $\frac{1}{2}$ to 1 foot.

§ 2. Leaves compound.—Blondia, Neck. elem. 2. p. 115.

6. *T. trifòlia* (Lin. amen. acad. 2. p. 351. spec. p. 580.) stem furnished with 1 or 2 leaves, rarely naked; leaves all trifoliolate; leaflets rhomboid-ovate, deeply toothed: teeth mucronate; petiole loose; flowers drooping; calyx small, campanulate; petals ovate, lanceolate. 2. H. Native of the north of Asia, and the north-west coast of America; common on the coast, and on the Rocky Mountains, on the west side of the ridge. The specimens from the Rocky Mountains are glabrous, and many of those from the coast, while others are more or less pubescent. Two panicles are often produced on the same stem.

Trifoliata Tiarella. Pl. 1 foot.

7. *T. laciniàta* (Hook. fl. bor. amer. p. 239. t. 77.) plant rough and hairy; stems usually furnished with 3 leaves; leaves trifoliolate: middle leaflet trifid; lateral ones bident, all broadly lanceolate, and pinnatifidly jagged; panicle loose; flowers drooping; calyx short, campanulate; petals wanting? 2. H. Native of the north-west coast of America. Roots rather horizontal. The petals, if any, must be very fugacious, as none have been seen.

Jagged-leaved Tiarella. Pl. $\frac{1}{4}$ to 1 foot.

8. *T. stegmàvata* (Presl, in reliq. Henk. 2. p. 45.) stems 1-leaved, and are, as well as the branches, clothed with glandular pubescence; radical leaves unknown: calyx one trifoliolate: leaflets glabrous, deeply lobed, mucronately toothed, acute: lateral leaflets obliquely ovate, middle one acute at the base; petals subulate, very narrow; capsules erect, dotted. 2. H. Native of Nootka Sound. Panicle many flowered.

Narrow-petalled Tiarella. Pl. 1 foot?

Cult. For culture and propagation see *Milélla*, p. 228.

Lin. syst. Octo-Decandria, Digynía. Calyx deeply 4-5-parted, coloured; segments oval, obtuse, concave. Petals wanting. Stamens 8-10, opposite the calyceous lobes; filaments subulate; anthers spherical, 2-celled. Styles 2; stigmas 2, truncate, pruinose. Capsule superior, bistratose, many seeded.—Perennial robust pilose herbs, with the appearance of *Spírä'a Arúnacu*. inhabiting the banks of rivulets. Leaves large, binate; leaflets coarsely serrated; petals much dilated at the base. Flowers small, of a greenish yellow-colour, in spicate racemes, which are disposed in panicles.

1. *A. rivuláris* (Hamilt. l. c.) flowers 4-cleft, octandrous; leaves binate; leaflets ovate, doubly serrated, villous beneath, and on the petioles. 2. H. Native of Nipaul, at Narainhetti. Bracteas usually jagged at the apex.

Rivulet Astilbe. Pl. 3 feet.

2. *A. déca'n'dra* (D. Don, prod. fl. nep. p. 211.) flowers 5-cleft, decandrous; leaves binate; leaflets cordate, deeply lobed and serrated, beset with glandular pill beneath, and on the petioles. 2. H. Native of North America. Tiarella bibernáta, Vent. malm. t. 54. The petals are said to be 5, and linear, in this plant, not as in the first species wanting. Leaflets ovate, broadly and bluntly serrated.

§ 2. Stamens equal in number to the petals, or sometimes fewer, alternating with the petals.

Lin. syst. Pentándria, Digynía. Calyx permanent, 5-cleft (f. 51. a.), imbricate in aestivation. Petals undivided (f. 51. a.), nearly equal. Stamens 5. Styles 2 (f. 51. c.), very long, distinct, length of stamens: when young approximate and almost concrete, but afterwards diverging. Capsule crowned by the dry calyx, and adnate to it at the base, opening between the styles (f. 51. d.), 1-celled; placenta 2, adnate, many seeded. Seeds rough from dots or wrinkled.—Herbs. Leaves mostly radical, platyly lobed, toothed. Stems mostly leafless. Flowers paniculate or racemose.

1. *H. america'ca* (Lin. spec. 328.) plant clothed with clammy pubescence, scapes and leaves roughish; leaves on long petioles, somewhat 5-7-lobed, toothed; thryse elongated, panicled; calyx lobes short, obtuse; petals lanceolate, length of the calyx;
stamens much exserted. 2. H. Native of shady places from New England to Carolina, in the Illinois region; New Spain and Peru. Schkuhr, handb. t. 58. H. viscida, Pursh; fl. amer. sept. 1. p. 187. H. cortos, Michx. fl. bor. amr. 1. p. 171. There is a variety of this species having 2 of the petals longer than the rest. Flowers reddish. Perhaps H. reniformis and H. glabra, Rafin. med. fl. 1. p. 244. are not distinct from this.

Var. β. glabrisetula (Schultes, syst. 6. p. 216.) leaves smoothish; panicle rather crowded.

Var. γ. foliosa (Moricand, mss.) scapes furnished with a few long distant leaves. Native of Peru.

2 H. divaricata (Fisch. in litt. ex D. C. prod. 4. p. 51.) scapes naked, glabrous; leaves glabrous, somewhat 5-lobed: lobes toothed; teeth mucronate; branches of panicle divericate; teeth of calyx bluntish; petals lanceolate, acute. 2. H. Native of the north of Asia, in the islands of Kadiak and Sitka; also in Kamtschatka.

Divaricate Heuchera. Pl. 1½ foot.

3 H. purpurea (Pursh, fl. Amer. sept. 1. p. 187.) plant covered with powdery down; lower part of scape and under side of leaves glabrous; leaves somewhat acutely lobed, toothed; teeth roundish, mucronate; branches of panicle short, crowded with flowers; calyx broad, campanulate; petals spatulate, longer than the calyx; stamens exserted. 2. H. Native from Pennsylvania to Virginia, on the Blue Mountains. H. pulvulinata, Rafin. med. bot. 1. p. 213. Petals pale red, variegated with yellow. Flowers larger than in other species.

4 H. hispida (Pursh, fl. Amer. sept. 1. p. 188.) plant hispid and scabrous; scapes, petioles, and under side of leaves glabrous; leaves acutely lobed, toothed, hispid from villi above; teeth short, rather retuse, mucronate; branches of panicle few-flowered; calyx middle-sized, with acutish lobes; petals spatulate, length of calyx; stamens exserted. 2. H. Native of Virginia and Carolina, on high mountains. Flowers reddish.

5 H. micrantha (Doug. in bot. reg. 1302.) lower part of scape and petioles beset with long fulvous hairs; leaves roundish-cordate, nearly naked, bluntly lobed, crenate: crenate mucronate; lower bracteas falciforme, cut; upper ones setaceous; panicle loose; petals linear, one-half shorter than the long exserted stamens. 2. H. Native of the north-west coast of America, on the steep rocky banks of the Columbia, near the Grand Rapids. Flowers greenish-yellow.

6 H. villosa (Michx. fl. bor. amer. 1. p. 172.) lower part of scape and petioles beset with deflexed soft hairs; leaves cordate, acutely lobed, mucronately serrated, a little cut, nearly naked above, but very villous on the nerves beneath; panicle loose; peduncles capillary, dichotomous; bracteas linear, ciliated; flowers small; petals very long, narrow-spatulate, and are, as well as the stamens, much exserted. 2. H. Native of Upper Canada, and on the higher mountains of Virginia and Carolina. The leaves are very different from those of H. Americana, the flowers are smaller, and the petals regularly long and narrow, white.

7 H. glabra (Wild. in Schultes, syst. 6. p. 216.) scape leafy; leaves cordate, acutely lobed, glabrous, unequally and acutely toothed; lower stem ones or bracteae toothed; panicle loose; flowers small; calyx pubescent; petals linear; stamens exserted. 2. H. Native of the north-west coast of America; Nootka, in the vicinity of the Columbia river; Rocky Mountains, at Providence and Portage rivers. Hook. fl. bor. amer. 1. p. 236. t. 79. Tiarella colorans, Graham, in edinb. new. phil. journal. July, 1829. Petals white. Stipulas adnate, as in the genus Ross, but free at the top.

8 H. caulescens (Pursh, fl. Amer. sept. 1. p. 188.) plant suffrutescematous at the base; lower part of scape and petals pilosae; leaves glabrous above, but pilose at the nerves beneath, acutely lobed, ciliated, toothed; teeth acute, mucronate; calyx short, villous; petals linear, twice the length of the calyx; stamens exserted. 2. H. Native of Carolina, on the mountains, and of Kamtschatka. Petals white.

9 H. barbarossa (Pestl, in Relg. Henk. 2. p. 56.) plant suffrutescematous at the base; floriferous stems clothed with rufous villi; petioles very villous from rufous hairs; leaves roundish-cordate, bluntly lobed, mucronately toothed, ciliated, puberulous; panicle loose, many flowered; petals linear-oblong, longer than the calyx; stamens exserted. 2. H. Native of Nootka Sound. Plant small.

Barbarossa Heuchera. Pl. ¾ foot.

10 H. cylindrica (Doug. mss. ex Hook. fl. bor. amer. 1. p. 236.) scapes naked, and are, as well as the petioles, hairy; leaves cordate, deeply and roundly lobed, crenate, ciliated; truncate at the base, smoothish above, but very pilose at the veins beneath: teeth piliferous; panicle compact, cylindricall, rather spatiate; flowers rather large, apetalous; stamens inclosed. 2. H. Native of North America, on the declivities of low hills, and on the steep banks of streams on the west side of the Rocky Mountains. Like H. Richardsoni, but differs from it in the truncate base of the leaves, and in the spicate panicle, by having less oblique calyces, very short stamens, and by the absence of petals.

Cylindracea-spiked Heuchera. Pl. 1 to 1½ foot.

11 H. Richardsoni (B. R. in Franklin, 1st journal ed. 1. append. p. 766. t. 29.) scapes and petals rather pilose; leaves cordate, with a deep recess, bluntly lobed, crenate, rather pilose on both surfaces: teeth piliferous; panicle loose, thyssoid; flowers large; mouth of calyx oblique; petals obvolutely cuneate, hardly longer than the calyx; stamens a little exserted. 2. H. Native of North America, on the dry banks of rivers from lat. 54° to 64°.

12 H. Menziei (Hook. fl. bor. amer. 1. p. 257. t. 80.) plant hispid from pili; stems leafy; leaves cordate, acutely lobed, deeply serrated; flowers racemose, apetalous; calyx cylindrically funnel-shaped; stamens exserted; ovary free. 2. H. Native of the north-west coast of America; at Bank's Isles, and from the coast of Columbia to Puget's Sound. Tiarella Menziei? Pursh. fl. Amer. sept. 1. p. 313. Racemes terminal, elongated, solitary, many flowered. Stamens 3, exserted. Petals 5, linear, reflexed. (f. 51.)

Var. β. plant less hairy. 2. H. Native along with the species, in shady woods. H. triandra, Doug. mss. ex Hook. l.c. Menzie's Heuchera. Pl. 1 to 2 feet.

13 H. bracteata (Ser. in D. C. prod. 4. p. 52.) plant pubescent; scapes racemose; leaves orbicular cordate, serrately cut; teeth mucronate; flowers bracteate; petals narrow, hardly

14 H. Longipes (Moc. pl. nont. ined. with a figure, ex D. C. prod. 4. p. 52.) scape pubescent; panicle secund; petals linear, revolute at the apex, longer than the calyx. 15. H. Native of the north-west coast of America. Lobes of leaves broad, rather distinct, acutely toothed. Petals and styles white. Long-petalled Heuchera. Pl. 1 foot.

15 H. Acetifolia (Rafin. med. fl. 1. p. 211. t. 49.) petioles hairy; leaves smooth, glaucous beneath, acutely 7-lobed, unequally toothed; teeth mucronate; scapes smooth; panicle elongated, loose; petals short; stamens exerted. 16. H. Native of North America, on hills and in the fissures of rocks, in Kentucky, Tennessee, and west of Virginia, Maryland, and Ohio, &c.

Maple-leaved Heuchera. Pl. 1 foot.

Cult. The species of Heuchera thrive in any light garden soil, and are readily increased by dividing at the roots. None of the species are showy.

Lin. syst. Triandria, Trigynia. Tube of calyx turbinate, adnate to the ovary; limb truncate, with 2 triangular acuminate nearly opposite teeth. Bracteoles linear, adnate to the tube of the calyx. Petals 9 (f. 52. c.), (8-10 ex Forst.) linear-oblong. Stamens 3 (f. 52. f.), short, alternating with the petals. Styles 3 (f. 52. b.) -5, filiform. Ovarium 2-3-celled. Ovula numerous, fixed to the top of the cells. Fruit capsular.—A nearly stemless herb, with the habit of Saxifraga cespitosa. Stems tufted. Leaves alternate, linear, obtuse, permanent, imbricated, thick, glabrous, woolly in the axils. Flowers terminal, sessile, solitary, white. Perhaps the petals are 6, and the stamens 6, of them antheriferous, and the other 3 converted into petals.

1 D. Magellanica (Forst. l. c.) £. F. Native of the Straits of Magellan, on humid rocks. Lam. ill. t. 51, Polyéodon Magellanicum, Lin. fil. suppl. 115. Magellan Donatia. Pl. ½ ft.

Cult. This plant will require to be grown in a small pot, well drained, in a mixture of sand, peat and loam; and placed among other alpine plants. It will be easily increased by dividing.

XII. LEPUROPETALUM (from lepuropon, lepuriun, a little scale, and πεταλον, petalon, a petal; in reference to the small scale-formed petals). Elliot, sketch 1. p. 370. D. C. prod. 4. p. 53.
Tomentose Vahlia. Pl. ¾ to ½ foot.

**Asiatic species.**

6 V. Oldenlandie (D. C. prod. 4. p. 54.) stem erect; leaves linear, pubescent; peduncles axillary, 2-flowered, shorter than the leaves. Q. F. Native of Tranquebar. Oldenlandia pentandra, Retz, obs. 4. p. 22. Heuchera dichotoma, Murr. comm. goett. 1772, p. 64. f. 1. Oldenlandia dichotoma, Spreng. pug. 2. p. 36. Flowers white. Perhaps Oldenlandia biflora, Roth, nov. spec. 97. but not of Lin. is sufficiently distinct from this; there are varieties of it with 4-5-parted flowers.

Oldelandia's Vahlia. Pl. ½ foot.

Sessile-flowered Vahlia. Pl. decumbent.

Obs. The Oldenlandia depressa of Willd. and Smith will probably make an eighth species to this genus when properly examined.

Cult. The seeds of all the species should be reared on a hot-bed; and in the month of May, when the plants will have obtained a considerable size, they may be planted out in the open border, in a warm sheltered situation. The V. Capensis, being a herbaceous perennial shrub, will require the treatment of other green-house plants.

XIV. CRYPTOPETALUM (from κρυπτος, cryptos, hidden, and πεταλον, petalon, a petal; petals minute, inclosed in the calyx). Hook. et Arn. in bot. misc. 3. p. 254.

Linn. syster. Pentandria, Trigynia. Calyx tubinate, 5-cleft, green; segments ovate, acute, spreading. Petals 5, inserted in the tube of the calyx, and alternating with its segments, inclosed, minute, spatulate. Stamens 5, inserted in the tube of the calyx, small, and almost inclosed, alternating with the petals; filaments filiform; anthers minute, roundish, orange-coloured, 2-celled. Ovary subglobose, with the lower part adhering to the calyx: upper part free, 1-celled; placenta free, parietal, linear, divaricately bilamellate, many ovulate; ovula very slender, membranous. Styles 3, short, hardly united at the base; stigmas minutely papillate. Capsule globose, inclosed in the permanent calyx, 1-celled, opening at the cells, and 3-valved in the free part; each of the valves terminated by a permanent style. Seeds numerous, pale, oval, obtuse at both ends, dotted;albumen thin, fleshy. Embryo straight, central.—A small annual smooth herb, about half an inch high. Stems erect, dichotomous, branched; branches divaricate. Leaves alternate, spatulate, quite entire, fleshy, hardly nervated. Flowers terminal, large for the size of the plant, emulating those of Chrysosplenium.

1 C. rusillum (Hook. et Arn. 1. c.) Q. H. Native of Chili, at Quintero. This curious plant is placed at the end of Saxifragaceae, because it seems more nearly allied to that order than to any other; it agrees with Chrysosplenium in many particulars.

Small Cryptopetalum. Pl. ⅔ inch. Cult. Sow the seed in a small pot filled with a mixture of peat and sand.

Tribe II.

HYDRANGEAE (plants agreeing with Hydrangea in being shrubby). D. C. prod. 4. p. 13. Shrubs, with opposite simple extipulate leaves. Flowers disposed in corymbs, having 5 petals, 10 stamens, and 2-3 styles; outer ones, and sometimes all, are often sterile; these sterile ones are more ample and dilated than the fertile ones.

XV. HYDRANGEA (from ὑδραγος, hydor, water, and αγγειον, aggeion, a vessel; some of the species grow in water, and the capsule has been compared to a cup). Lin. gen. 557. Gartn. fract. 1. p. 150. t. 80. f. 7. Lam. ill. t. 376. D. C. prod. 4. p. 13.—Hydrangea and Hortensia, Juss.

Linn. syster. Decadria, Di-Trigynia. Flowers usually diffused (f. 53. a. b.); but some of them are fertile and hermaphrodite (f. 53. b.). Tube of calyx hemispherical, 10-ribbed, rather truncate, adnate to the ovary: limb permanent, 4-toothed (f. 53. b.). Petals 5, regular. Stamens 10. Styles 2 (f. 53. c.), distinct. Capsule 2-celled, with introflexed valves, crowned by the teeth of the calyx and styles (f. 53. b. c.), flat-tish at the top, opening by a hole between the styles. Seeds reticulated, numerous.—Shrubs, with opposite leaves. Flowers corymbose, red or yellow, but usually white: the marginal ones sterile, and large, in consequence of the teeth of the calyx being dilated into broad petal-like coloured segments, the rest of the flower having the other parts abortive.

* Species natives of America.*

1 H. Arboreascens (Lin. spec. p. 568.) leaves ovate, rather cordate: superior ones lanceolate, coarsely toothed, pale and puberulous beneath; corymbs flatish; flowers nearly all fertile; alabastra obtuse. H. H. Native from Pennsylvania to Virginia. Flowers white, small, having an agreeable odour.

Var. a, vulgaris (Ser. in D. C. prod. 4. p. 14.) nerves of leaves puberulous.

Var. b, discolor (Ser. 1. c.) leaves almost white beneath from tomentum.

2 H. Cordata (Pursh, fl. amer. sep. 1. p. 209. exclusive of the synonyme of Michx.) leaves broadly ovate, acuminate, rather cordate at the base, coarsely toothed, glabrous beneath; flowers all fertile. H. H. Native of Carolina, on the mountains, and on the banks of the Missouri above St. Louis. Wats. dendr. brit. t. 42. Flowers small, white, sweet-scented. According to Torrey, this is merely a variety of H. arboreascens.

3 H. Peruviana (Moric. ms. with a figure, ex D. C. prod. 4. p. 14.) leaves oval, loosely serrated, coarcescent, reticulately veined, glabrous, rusty beneath, at the nerves, and on the petioles; young branches and peduncles clothed with purplish tomentum; outer flowers of the corymb large and sterile: inner ones hermaphrodite and petalous. H. G. Native of Peru, near Huayaquall. Perhaps a species of Cornia, and probably C. Peruviana.

Peruvian Hydrangea. Shrub 4 to 6 feet.

Var. b, glabella (Ser. in D. C. prod. 4. p. 14.) leaves nearly glabrous beneath; flowers all fertile. H. H. This variety has probably originated from culture.

5 H. queretfolia (Bartram, trav. ed. germ. p. 356. t. 7. ex Willd. spec. 2. t. 684.) leaves large, ovate, sinuately lobed, and toothed, pilose beneath; corymbs rather panicked, flattish; sepals of sterile flowers entire; alabastra depressed. H. Native of Florida. Sims, bot. mag. t. 975. H. radiata, Smith, icon. pict. p. 12. but not of Walt. Flowers white; sterile or outer ones of the corymb large.

**Species natives of Asia.**

6 H. altissima (Wall. tent. fl. nep. 2. t. 50.) leaves ovate, acuminate, serrated, smoothish; corymbs flatish; sterile flowers few, on pilose peduncles; alabastra of fertile flowers conical. H. F. Native of the mountains of Nipaul. Flowers white; sepals of sterile flowers obovate, very blunt, quite entire. Styles 2, thick, diverging.

**Tallest Hydrangea.** Shrub 4 to 6 feet.

7 H. vesiculosa (Wall. tent. fl. nep. 2. t. 49.) leaves ovate-lanceolate, acuminate, sharply serrated, almost glabrous above, but clothed with white tomentum beneath, as well as on the branches; corymbs flatish, large; peduncles villous; sterile flowers few, glabrous; alabastra of fertile flowers nearly globose. H. F. Native of Nipaul, on the mountains. Flowers white, rather large. Sepals of sterile flowers serrated. (F. 53.)

**Clathrate Hydrangea.** Shrub 4 to 6 feet.

8 H. aspera (Hamilt. ex D. Don, prod. fl. nep. p. 211.) leaves lanceolate, acuminate, sharply serrated, pubescent above, but densely clothed beneath with hoary tomentum, as well as on the branches; corymbs panicled; diffuse; peduncles villous; rays or sepals of sterile flowers ovate, mucronate, sharply serrated, pubescent; alabastra of fertile flowers globose. H. F. Native of Nipaul, in wetaty places at Narainkhet. Hortensia aspera, Hamilt. Leaves a hand long, and 2½ inches broad. Sterile flowers not near so large as those of the preceding species, white.

9 H. oblongifolia (Blum. bijdr. p. 920.) leaves oblong, acuminate, doubly toothed, glabrous above, but clothed with white tomentum beneath, as well as on the branches; corymbs divaricate; sepals of sterile flowers oval, glabrous, serrated; fertile flowers containing 3-4 styles. H. G. Native of the western parts of Java, in woods on the higher mountains. Very like the two preceding species, but differs in the teeth of the leaves being unequal, and not so sharp.

**Oblong-leaved Hydrangea.** Shrub 4 to 6 feet.

**Variform-surfaced-leaved Hydrangea.** Clt. 1821. Shrub 4 to 6 feet.

11 H. anomalata (D. Don, prod. fl. nep. p. 211.) leaves ovate, acuminate, nearly naked, sinuately crenated; pedioles and nerves pilose; cymes terminal, hairy; flowers uniform; rays or sepals of sterile flowers wanting. H. F. Native of Nipaul. Leaves 4 inches long, rounded at the base; pedioles an inch long. Flowers small. Styles very short, thick, recurved.

**Anomalous Hydrangea.** Shrub 3 to 6 feet.

12 H. hortensis (Sims. in act. bonn. 14. p. 688. D. C. prod. 4. p. 15.) leaves broadly ovate, serrated, acuminate; flowers disposed in ample corymbs or cymes, all diffused, with 4-5 segments; segments obovate-roundish, quite entire; fertile flowers very few, containing 2-3 styles. H. F. Native of China and Japan, but now cultivated almost every where in gardens for the sake of its beauty. Hortensis opuloides, Lam. dict. 3. p. 136. Dum. Cours. bot. cult. ed. 2. vol. 4. p. 345. Duham. ed. nov. 3. p. 97. t. 24. Hydrangea hortensis, Smith, icon. pict. 1. t. 12. Curt. bot. mag. 428. Hortensis speciosa, Pers. Primula mutabilis, Lour. coch. p. 104. Viburnum serratum, Thumb. fl. jap. p. 124. ex Rom. et Schultes, or Viburnum tomentosum, Thumb. ex Curt. but the descriptions of neither of these two plants agree with the present. The plant is called Temerithana, i.e. globe-flower, by the Japanese; and Fun-Dan Kwa by the Chinese. Flowers varying from rose-coloured to blue according to the soil in which the plant is grown; the sterile flowers are nearly always 4-cleft; but the fertile flowers are small and perfect. The plant is much valued on account of the great profusion of its very elegant flowers, which are monstros, in the same manner as the Snow-ball Guilder Rose. It was introduced by Sir Joseph Banks in 1790. The plant was first called Pectiaia by Commerson, in honour of Dæ Hortense Lapeaute.

**Hortensis's or Common Hydrangea.** Fl. April, Sept. Clt. 1790. Shrub 2 to 3 feet.

13 H. Azisai (Sims. in act. bonn. 14. p. 689.) leaves ovate, acuminate, attenuated at the base, crenately serrated; flowers disposed in cymes, diffused; corolline segments 4. H. F. Native of Japan, along with the preceding species. The cymes of flowers are very ample. Flowers for the most part greenish, rarely white. The plant is called Azisai by the Japanese, and Zu-hats-sen by the Chinese. There is a variety of it with variegated leaves, called Fiuri-Azisai by the Chinese.

**Azisai Hydrangea.** Shrub 2 to 3 feet.

14 H. Japonica (Sims. l. c. p. 689.) leaves ovate-oblong, acuminate, finely and glandularly serrated, quite glabrous on both surfaces; cymes crowded; flowers diffused; corolline segments 6-10, unequal, ovate-rhomboid. H. F. Native of Japan, where it is called Kakoosu. An elegant shrub, cultivated by the Japanese, about the size of the last.

**Flowers red. Benakau.**

Var. A; flowers grey. Konkaku.

**Japanese Hydrangea.** Shrub 2 to 3 feet.

15 H. Tsuberatai (Sims. l. c. p. 689.) leaves oblong, serrated, entire at the base, pale beneath; cymes crowded; flowers diffused; corolline segments 4-8, broadly obcordate, constantly of a greyish lilac-colour. H. F. Native of Japan, on the highest mountains. Viburnum serratum, Thumb. jap. p. 124. H. serrata, D. C. prod. 4. p. 115. Shrub climbing. The plant grows in the mountains of Aiva and Sonaki, where the natives use the dried leaves instead of tea, and is called by them Amatsja, i.e. sweet tea; and Do-Snoo-San by the Chinese. According to the Japanese, there is a variety with bitter leaves, which they call Kakoosoo.

Hh
Thunberg’s Hydrangea. Shrub cl.  

Green Hydrangea. Shrub 2 to 6 feet.  
17. H. paniculata (Sbl. l. c. p. 691.) leaves elliptic, acuminate, glandularly toothed, scabrous, torn on the floriferous branches; panicle branched, rather second; flowers discolored, very numerous; corolla segments 3-4, obovate, white.  y. F. Native of Japan. Shrub climbing, 5 feet high. The plant is called Tsurumani by the Japanese, and Too-sinkine by the Chinese. There is a variety with very pale red flowers, cultivated near the town of Posaka, very like the species, but does not climb, called Jamadai by the Japanese. Perhaps Viburnum pilicatum, Thum. is only a variety of H. paniculata.  

Panicled-flowered Hydrangea. Shrub 5 feet.  
18. H. involucrata (Sbl. l. c. p. 691.) leaves ovate, acuminate, glandularly serrated, reticulately veined, hispid on both surfaces; cymes involucrated before flowering (involucrum caducus, 2-3-leaved), crowded; flowers discolored; corolla segments 8, nearly orbicular.  y. F. Native of Japan. Plant sultriformly, hardly a foot high.  

Var. a; corolla lilac. Gimbaisoo of the Japanese; cultivated near the town of Osaka.  

Var. β; corolla yellow. Kinbaissao of the Japanese.  

Involute-flowered Hydrangea. Shrub 1 foot.  
19. H. alternifolia (Sbl. l. c. p. 692.) leaves alternate; flowers cymose, polyandroous, discolored; corolla segments 2-6, of which are constantly ovate and acute.  y. F. Native of Japan, where it is called by the natives Kusasimoto-ke.  

Alternate-leaved Hydrangea. Shrub 1 foot.  
20. H. sitiscan (Sbl. l. c. p. 692.) leaves ovate, acuminate, acutely serrated, with the veins pubescent beneath; flowers cymose, discolored, double; corolla segments elliptic, of a fine rose-colour.  y. F. Native of Japan. Shrub 2 feet high. Cultivated about the town of Mikao, where it is called Sitiscan by the natives. Perhaps only a double flowering variety of H. Hortensia.  

Sitsitan Hydrangea. Shrub 2 to 4 feet.  

† Species natives of Japan, but hardly known.  

Long-leaved Hydrangea. Shrub.  
22. H. nizada (Sbl. ex flora, 1828, nov. 21.) leaves ovate, serrated, villous; petioles and peduncles hairy; umbels terminal, not radiating; stigmas 2-lobed.  y. F. Native of Japan. Viburnum hirtum, Thum. fl. jap. 124.  

Hay Hydrangea. Shrub.  
Cult. The hardy species, or those natives of North America, are dwarf shrubs, and therefore proper for the front of shrubbery.  

1. H. quercifolia does best against a south wall. Those species natives of Asia will require protection in winter, either by placing them in a frame or greenhouse. Cuttings of all the species root readily if planted under a hand-glass.  

2. H. Hortensia is in general cultivation for the sake of its showy flowers; the blue-flowered variety is in greatest request, which may be obtained by planting out the common pink variety in a bed of peat soil, and letting it remain there 2 or 3 years; for the longer it remains the deeper blue the flowers will become: the plants may then be potted before the buds begin to burst, and they will then flower in perfection, and the flowers will be of a beautiful blue colour.  

† Corn. Tri-Pentagynia. Calyx superior, 4-toothed, equal, deciduous. Stamens 3; filaments linear; anthers ovate, 2-celled, dehiscing longitudinally inside. Ovarian inferior, nearly globose, 3-celled, rarely 4-celled, many ovulate. Styles 3, rarely 4, thick, fleshy, at length divaricate; stigmas obtuse, oblique. Capsule nearly globose, crowned by the permanent calyx and styles, dehiscing between the styles, 3-celled, rarely 4-celled, many seeded; dissepiments entire, placentaefull. Seeds cylindrical.—Shrubs, with glabrous opposite serrated leaves, and involucreted cymes or corymbes of white flowers, with the habit of Hydrangea.  

1. H. peruviana (Ruiz et Pav. fl. per. 1. c.) leaves oval or ovate, acuminate or obtuse, coriaceous, serrated at the apex; corymbs terminal, many rayed, involucreted by 4 large deciduous bracts.  y. F. Native of Peru, on the mountains. Sarcostyles Peruviana, Presl, in reliq. Hort. 2. p. 54. t. 60.  

Peruvian Cornideia. Shrub.  
2. C. integrifolia (Hook. et Arn. in bot. misc. 3. p. 244.) leaves roundish-elliptic, glabrous, hardly acute at the base and apex; corymbs numerous, disposed in a terminal raceme, which much exceeds the leaves.  y. F. Native of Chili, about Valparaiso, and near Bustamente. Hydrangea scánden, Poepp. ex D. C. prod. 4. p. 666.  

Entire-leaved Cornideia. Shrub cl.  
3. C. serratifolia (Hook. et Arn. l. c.) leaves obovate-oblong, acute, obtuse at the base, serrated upwards; floral ones or rameal ones smaller, ovate, with a few denticulations; corymbs numerous, disposed in a terminal raceme, which hardly exceeds the leaves.  y. F. Native of Chili. Closely allied to the last species, but apparently distinct. Both, but especially the present, have several decussate, patent, concave, stiff bracteas, along the stalks of the corymbs.  

San-leaved Cornideia. Shrub.  
Cult. The culture and propagation of the species of Cornideia are the same as that recommended for the species of Hydrangea. They require to be protected in winter by placing them in a frame or greenhouse.  

Lin. sys. Decándria, Tri-Pentagynia. Tube of calyx adhering to the ovary: limb 5-toothed. Petals 5, rather fleshy, inserted in an epignous disk. Stamens 10; anthers oblong, erect, dehiscing at the sides. Styles 3-5, spreading: stigmas obtuse, adnate. Berry crowned by the teeth of the calyx, half 3-5-celled, many seeded; dissepiments incomplete, inflamed, fleshy, seminiferous.—A subshrub, with opposite, pectolate, ob-long-lanceolate, smoothish leaves, which are serrated from the middle to the apex; and panicled terminal cymes of flowers, with trifid branches.  

1. C. sylvatica (Reinv. l. c.) cymes nearly undivided, on short peduncles, disposed in a coarctate panicle.  y. S. Native of Java, on the mountains, where it is called by the natives Tisere-gil-gil. Flowers probably white.  

Var. β, paniculata (Blum. mss.) cymes branched, on long peduncles, disposed in an elongated panicle.  y. S. Native of Java. Perhaps distinct from the species.
Var. γ, corimbosæ (Blum. mss.) cymes branched, on long peduncles, disposed in somewhat fastigate corymb. Ἔ. S. Native of Java. Perhaps a proper species.

Wood Cianitis. Shrub 2 to 3 feet.

Cult. A mixture of loam, peat, and sand will suit these plants; and cuttings will root readily in the same kind of soil, under a hand-glass.

XVIII. ADAMIA (in honour of John Adam, some time Governor-General of India; a promoter of natural history). Wall. tent. fl. nep. p. 46. t. 36. D. C. prod. 4. p. 16.

Lin. Syst. Decândria. Pentagynia. Tube of calyx adnate to the ovarium; limb with 5 short teeth, having the recesses between the teeth broad and obtuse. Petals 5, alternating with the teeth of the calyx, surrounding the top of the ovary. Stanens 10. Styles 5, ending in rather clavate, somewhat 2-lobed stigmas. Berry crowned by the limb of the calyx, somewhat 5-celled, many seeded. Embryo terete, straight, in a fleshy albumen, with the radicle turned towards the hilum.—A smooth branched shrub. Leaves opposite, exstipulate, petiolate, oblong-lanceolate, serrated. Panicle corimbosse, terminal, much flowered. Flowers bluish. Berries blue. Perhaps not distinct from Cianitis.

1 A. cyanea (Wall. l. c.) Τ. G. Native of Nipaul, in rocky places, on mountains near the Great Valley, where it is called Bansook by the natives. Hook. bot. mag. t. 3046. Wall. pl. rar. asiat. 3. t. 215. Blue-berried Adama. Fl. June, July. Clt. 1829. Shrub 4 to 6 feet.

Cult. See Cianitis above for culture and propagation.

Lin. Syst. Decândria. Monogynia. Calyx 5-parted, hemispherical, distinct from the ovary: lobes ovate-deltoid, bluntish, equal. Petals oblong, acuminate, with a reflexed point (nearly as in umbelliferous plants) twice the length of the calyx, valvate in pistil ation. Stanens 10, hypogynous, surrounding the base of the ovary; filaments subulate, distinct; anthers ovate. Ovarium roundish, crowned by the short style and truncate stigma, 5-celled; cells many seeded.—A shrub, with opposite ovate petiolar sharply serrated leaves, and corymb of fleshy flowers. The shrub has the habit of Hydrangea, but differs in the ovary being distinct from the calyx, in the style being short and solitary, not 2, and in the fruit being 5-celled.

1 B. arguta (Gaud. l. c.) Τ. G. Native of the Sandwich Islands, at the altitude of from 1200 to 1500 feet above the level of the sea. A middle-sized tree.

Sharp-serrated-leaved Broussaisia. Tree.

Cult. See Cianitis above for culture and propagation.

Calyx with the tube adhering to the ovary (f. 55. F. h. f. 55. C. e.); limb 5-toothed (f. 55. F. c.), or entire (f. 55. G.-f.): lobes or teeth deciduous or permanent. Petals 5 (f. 57.-c. f. 59.-g.), inserted in the top of the tube of the calyx, and alternating with its lobes, either entire (f. 57.-c.), emarginate (f. 61.-b.), or 2-lobed, sometimes plain at the apex, but usually drawn out into a replicate or involute point (f. 61.-f. f. 63.-c. f. 55. C. i.), somewhat imbricate in aestivation, rarely valvate; the outer flowers of the umbel or ray of the umbel sometimes larger than the rest, the rest equal among themselves, rarely abortive. Stanens 5 (f. 55. C. b. &c.), alternating with the petals, and inserted along with them, and therefore opposite the calycine teeth or lobes, always distinct, replicate in aestivation (f. 59.-g. &c.); anthers ovate, 2-celled, somewhat didymous, opening by a double longitudinal chink. Ovarium inferior, 2-celled (f. 55. E. c. f. 55. D. d. &c.), (very rarely, and probably from abortion, 1-celled), adnate to the calyx; styles 2, distinct (f. 55. F. i. f. 55. G. i. f. 59. e. &c.), when young erect, but at length thickened at the base into stylopodium (f. 64.-a.), which covers the whole disk, forming a sort of crown to the fruit, diverging more or less, usually permanent, the outer one directed to the outside of the umbel, and the inner one tending to the centre. Fruit (called Diacchæa, Polache'a, and Cremocarp by many botanists) consisting of 2 carpelli (called mericarps because (f. 55. D. d. f. 55. C. h. &c.) they adhere to the calyx the half of their length, and therefore cannot be carpella or achenia in the strict sense of those terms), separable from a common axis (called a carpophore) to which (f. 56. G. a. f. 56. C. a. b. &c.) they adhere by their face (called a commissure); the fruit or carpocarp traversed by 10 elevated primary ridges, of which the 5 that represent the middle of the sepals are called carinal, because they are drawn out into calycine teeth at the apex: the other 5, alternating with the first-named are called natural, because they indicate the sutures where the divisions of the calyx are joined, and therefore tend to the recesses between the calycine teeth; besides these there are others which are apparent in some called secondary, because they alternate with the 10 primary nerves, and therefore indicate the sides of the divisions of the calyx: all the sutural, carinal, and secondary ribs are either fliform, winged, or crested; these ridges or nerves are separated by channels or furrows called valleculae, below which, but usually in the channels, are placed in the substance of the pericarp, certain linear receptacles of coloured oily matter, called vitices, which are directed from the apex to the base: they are solitary, twin, or numerous, rarely wanting, and sometimes they are inclosed in a proper membrane, which is probably a true pericarp. Seeds solitary in each carpel, hanging from the top of the axis or carpophore, inclosed in a proper membrane, the spermiderm, which is but rarely separable from the pericarp. Albumen large, fleshy, or rather horny, more or less convex on the out-
side. Embryo minute, hanging from the top of the carpopithe, and therefore the radicle is superior; cotyledons 2, oblong, changing into seminal leaves through germination.—Herbs or shrubs. Roots various, but often fusiform. Stems cylindrical or angular, simple or branched, annual or perennial, with the bark or skin usually full of aromatic resinous gum; medulla in some, as in Čerula, large, with medullary fibres in its substance, similar to the stems of monocotyledonous plants. Leaves alternate, very rarely opposite, except the seminal ones, usually divided into various segments; petioles usually sheathing at the base; in some, as in the genus Euphorbium, the petioles are changed into phyllodia, as in the section of Actaea called Phylodineae. Flowers umbellate, white, yellow, pink, or blue, often with either the styles or stamens abortive, monoecious, dioecious, or polygammon, and some of them sterile. Umbels usually perfect, both general and partial, in both the rays are numerous, the general umbel usually surrounded by an involucrem, and the partial ones by an involucler.

FIG. 54.

Umbelliferæ hardly differs from Araliaceæ, the next order. With Saxifragaceæ it agrees in habit, if Hydrocotyle is compared with Chrysosplenium, and if the sheathing and divided leaves of the two orders are considered. To Geraniaceæ, De Candolle remarks, that they are allied in consequence of the cohesion of the carpella around a woody axis, and of the umbellate flowers, which grow opposite the leaves, and also because the affinity of Geraniaceæ to Vitis, and of the latter to Araliaceæ, is not to be doubted. The arrangement of this order has only within a few years arrived at any very definite state; the characters upon which genera and tribes could be formed, were for a long while unsettled; it is, however, now generally admitted, that the number and development of the ribs of the fruit, the presence or absence of the reservoirs called vittæ, and the form of the albumen, are leading peculiarities, which require to be attended to. The plants are chiefly extra-tropical, inhabiting groves, thickets, plains, marshes, and waste places.

The properties of this order require to be considered under two points of view; firstly, those of the vegetation; and secondly those of the fructification. The character of the former generally is suspicious, and often poisonous in a high degree; as in the case of hemlock, foal's-parsley, water-hemlock, and others, which are deadly poison. Nevertheless, the blanched petioles and stems of celery, the leaves of parsley and samphire, the roots of skirret, the carrot, the parsnip, the arracacha, and the tubers of Anethum pimpinelloides, and Bànium bulbocâ-
tanum, are wholesome articles of food. The fruit, vulgarly called the seeds, is in no case dangerous, and is usually a warm and agreeable aromatic, as caraway, coriander, dill, anise, &c.

From the stem, when wounded, sometimes flows a stimulant, tonic, aromatic, gum-resinous concretion, of much use in medicine; as opopanax, which is produced from Opúpanax Chiróinum in the Levant, and asafetida from the Čerula of that name in Persia. Gum ammoniac is obtained from Dérêma Ammoniacum. It is a gum resin of a pale yellow colour, having a faint, but not unpleasant, smell, with a bitter nauseous taste. Internally applied, it is a valuable deobstuent, and expectorant. It is said by Dr. Paris to be, in combination with rhubarb, a useful medicine in mesenteric affections, by correcting viscid secretions. (Ainslie i. p. 160.) The substance called galbanum is produced by Gálbanum officinale, a plant of this order. It is a stimulant of the intestinal canal and uterus, and is found to allay that nervous irritability, which often accompanies hystera. (Ainslie i. p. 143.) Eðhüs cynápiun has been found by Professor Ficinus, of Dresden, to contain a peculiar alkali, which he calls Cynapiun. (Turner, p. 654.) The fruit of Ligásticum Ajaván of Roxb. the Pcychótis Ajavan of D. C. is prescribed in India in diseases of horses and cows. (Ainslie i. p. 38.) The Prángos palbária is a valuable fodder-plant in Thibet.

Synopsis of the genera.

Suborder I. Orthospermeæ. Albumen flat or flattish inside, neither involute nor convolute.

§ 1. Umbels simple or imperfect. Fruit destitute of vittæ.

Tribe I.

Hydrocotylea. Fruit contracted from the sides; mericarps convex or acute on the back: with the 5 primary ribs at length obsolete: lateral ones margining or in the commissure, which is flat; intermediate usually more than carinal. Petals entire.

1 Hydrocotyle. Margin of calyx obsolete; and the tube rather compressed. Petals ovate, with a straight point. Fruit biciculate. Mericarps with 5 filiform ribs: carinal and lateral ones often obsolete: the 2 intermediate ones joined.—Involucrem few-leaved.

2 Crañtza. Tube of calyx subglobose; limb very short, hardly any. Petals roundish, obtuse. Fruit roundish. Mericarp unequal, with 3-5 filiform ribs. Vittæ 1 in each furrow and 2 in the commissure.—Involucrem 5-6-leaved.

3 Dimétópai. Teeth of calyx obsolete. Petals oval-oblong. Styles short. Fruit didymous. Mericarps somewhat contracted at the commissure, unequal, one maculated with tubercles, and the other echinate with conical prickles.—Involucrem of 5 linear leaves.

5. Microple'u'ra. Margin of calyx obsolete. Petals equal, acute. Fruit deeply 2-lobed at the base, and emarginate at the apex; mericarps obliquely ovate, 7-ribbed; ribs curvilinear, ventricose at the base, marginal 2 straight. Commissure narrow.

6. Did'fusus. Margin of calyx obsolete. Petals oval, bluntish, imbricate in aestivation (f. 57. c). Fruit didymous, emarginate at the base. Mericarps rough from pilose stripes, 5-ribbed: 2 middle ribs approximating the commissure.—Involucrem of many leaves which are concretes at the base (f. 57. a).

8. Astra'tricha. Margin of calyx hardly 5-toothed. Petals oval, acute, permanent (f. 58. b), velvety on the outside from stellate down. Styles thickened at the base (f. 58. c). Mericarps contracted at the commissure, having 3 primary dorsal ribs, and 2 acute nearly obsolete marginalizing ones, and 4 secondary ones. Commissure furnished with 2 vitre, which are covered by a spongy pellicle, but none in the furrows.—Involucrum of a few linear leaves.

10. Böwe'sia. Margin of calyx 5-toothed; tube compressedly somewhat tetragonal. Petals elliptic, entire, acute. Fruit ovate, much contracted at the raphis, turgid, somewhat tetragonal, flattened on both sides at the back. Mericarps marked with an oval impression on the back, having 5 obsolete ribs: 2 lateral ribs flat, seated in the commissure.

13. Pectophy'tum. Margin of calyx entire. Petals unequal, with an acute inflexed point. Fruit ovate-elliptic; mericarps rather convex on the back, semi-oval, having 5 filiform ribs; commissure flatish.—Flowers in crowded fascicles at the tops of the branches, solitary in the axils of the bracteas.

Tribe II.

Mulíneæ. Mericarps contracted at the commissure, flat or flatish on the back, without vitre, hence the fruit is square or parallelly bicusitate. Petals entire.

14. Bôlax. Margin of calyx entire. Petals oval. Fruit tetragonal; mericarps with 5 nerve-formed ribs, 1 dorsal, and the 2 middle ones form the corners of the angles of the fruit, and the 2 inner ones are filiform; commissure very narrow.—Involucrem of 4 leaves, equal in length to the pedicels.

15. Muli'num. Margin of calyx 5-toothed, permanent. Petals oval-oblong, acute. Fruit 4-winged; mericarps furnished with 5 ribs: middle one dorsal: 2 lateral ones nerve-formed: 2 intermediate ones expanded into lateral ample wings.—Involucrem of many leaves, shorter than the pedicels.

16. Lare'tia. Margin of calyx 5-toothed. Petals ovate, entire. Fruit elliptic, square, flatly compressed from the back: mericarps lenticular, with dorsal ribs and 2 lateral marginal ones, destitute of vitre. Seed flat.

17. Dru'sa. Margin of calyx entire. Petals oval. Mericarps furnished with 5 ribs: the dorsal one and the 2 inner ones linear and hardly prominent: but the 2 intermediate ones are drawn out into marginal wings, which are repandly sinuated, having the angles expanding in a stellate tuft of uncinate spines.—Involucrem wanting.

20. Spana'nthe. Margin of calyx 5-toothed. Petals elliptic, acutish, with a straight point. Fruit ovate, much compressed at the rachis; mericarps having 5 slender equal ribs: 3 intermediate ones dorsal: and the 2 lateral ones seated in the flat commissure.—Umbels rather compound. Involucrem of many leaves.

21. Homalo'ca'rus. Margin of calyx 5-toothed; teeth subulate. Petals ovate, concave. Fruit roundish-ovate; mericarps having 5 filiform ribs, hidden in the substance of the pericarp, 1 dorsal: 2 lateral ones near the rachis: 2 middle ones forming the angles.

22. Pozo'la. Margin of calyx 5-toothed, permanent. Fruit prismatic, tetragonal, 5-ribbed, emarginate at the apex; mericarps concave and channelled on the back; ribs lateral, dense, straight.—Involucrem crenately lobed, obliquely toothed.

23. Astéris'chum. Calyx 5-toothed, permanent; teeth ovate. Petals emarginate, with an inflexed point and a callous recess. Fruit compressed, tetragonally prismatic; mericarps with 5 ribs: the 2 intermediate ribs expanded into wings: the carinal one and the 2 placed near the raphis stripe-formed: commissure very narrow.—Involucrem of many leaves.

Tribe III.

Sanicu'lee. Fruit ovate-globose. Mericarps destitute of vitre, with 5 primary ribs; secondary ribs wanting or obliterated by being covered with scales. Petals erect, emarginate, from being bent back from the middle by a point.
24 Actinotus. Tube of calyx contracted at the apex; limb 5-lobed: lobes oval-oblong. Petals wanting. Styles thickened and villous at the base. Fruit ovate, crowned by the lobes of the calyx, villous, 5-striped.—Involucrum of many radiating leaves, which are longer than the flowers.

25 Petaonia. Flowers dioecious, having the calyces different in the distinct sexes. Styles filiform. Fruit ovate, compressed, 8-nerved, vacant inside, 1-seeded.—Umbelles 5-flowered: central flower hermaphrodite, sessile; lateral ones male, pedicellate; pedicles rather concrete at the base, with the calyx of the female flower.

26 Sanicula. Tube of calyx echinated; lobes foliaceous (f. 59. c.), permanent. Petals connivent, obovate, emarginate, with an inflexed point (f. 59. g.). Fruit nearly globose, echinated; carpophore not distinct.—Umbels compound. Leaves of involucrum few, divided; of the involucrel numeros, linear.

27 Hacquetia. Tube of calyx 10-ribbed; lobes foliaceous, permanent. Petals obovate, emarginate, with a bent in point. Fruit contracted from the sides; mericarps gibbously convex; ribs 5, filiform, with a deep channel on the inside.—Involucrum of 5-6 obovate toothed leaves, which are longer than the umbel.

28 Astrantia. Tube of calyx 10-ribbed, tuberculately plicate; lobes 5, foliaceous. Petals erect, connivent, oblong-ovate, with an inflected point. Fruit rather compressed from the back; mericarps with 5 elevated, obtuse, plicately toothed, inflated ribs, inclosing in the cavity a smaller stiltar rib. Carpophore not distinct.—Involucrum variable: involucel of many leaflets.

29 Aepidea. Tube of calyx minutely tubercular. Petals inflexed. Mericarps without ribs, and without vittae. Carpophore adnate the whole length of the seeds.—Habit of Eryngium, but the umbels are like those of Astrantia.

31 Eryngium. Tube of calyx rough from scales or vesicles; lobes foliaceous. Petals erect, connivent, oblong-ovate, emarginate, with an inflected point. Fruit obovate, scaly, or tubercular; mericarps semi-terete, without ribs, and without vittae; carpophore adnate its whole length to the seeds.—Flowers crowded into dense heads; the lower bractees forming an involucrum to them.

32 Actinaanthus. Flowers monoecious: female ones capitulate: male ones in capitule umbels, with the receptacle destitute of pales. Teeth of calyx permanent. Petals oblong, complicated at the apex, and rather cirrhose. Fruit compressed from the sides; mericarps with 5 alternate, stronger, sutural ribs; vittae 1 in each furrow, and 2 in the commissure. Carpophore adnate.—Involucra wanting; involucels of many leaves.

§ 2. Umbels compound or perfect. Vittae on the fruit variable, rarely wanting.

* Fruit having only primary ribs present.

Tribe IV.

Ammi. Fruit compressed from the sides or didymous; mericarps with 5 filiform ribs, which at length become a little winged; lateral ones margining, all equal. Seeds terete or gibbously convex, flattish in front.

33 Rumia. Margin of calyx 5-toothed. Petals ovate, entire, with a short, coarctate, incurved point. Fruit roundish or ovate, plicately wrinkled; mericarps solid, with 5 thick, very obtuse, twisted plicate ribs, covering the furrows, which are ornamented with plicate tubercules, and furnished with 1 vitta each. Carpophore bipartite.—Involucrum wanting or few-leaved; involucels of 3-8 leaves. Flowers yellow.

34 Cicutaria. Margin of calyx 5-toothed, foliaceous. Petals obcordate, with an inflexed point. Fruit roundish, contracted from the sides; mericarps with 5 flatish ribs, having the furrows between the ribs furnished with 1 vitta each, and the commissure 2 vittae; vittae filling the furrows, a little more elevated than the ribs, all concealed under a loose membrane. Carpophore bipartite.—Involucrum wanting, or few leaved; involucels of many leaves.

35 Zizia. Margin of calyx obsolete, or with 5 very short teeth. Petals elliptic, tapering into a long inflexed acumen. Fruit contracted from the sides, roundish or oval; ribs filiform, rather prominent; furrows furnished with 1 vitta each, and the commissure with 2; carpophore bipartite.—Involucrum wanting; involucel of few leaves, variable. Flowers yellow, rarely white or dark purple.

36 Pentakrypta. Calyx unknown. Petals equal, lanceolate, with an inflexed point. Fruit oblong-elliptic; the 3 dorsal ribs elevated, acute; furrows furnished with 1 vitta each. Albumen with 5 roundish angles. Flowers polygamous, dark purple.

37 Apium. Margin of calyx obsolete. Petals roundish, entire. Stylopodium depressed. Fruit roundish, contracted from the sides; ribs filiform; furrows furnished with 1 vitta; outer ones with 2-3 vittae. Carpophore undivided.—Involucrum and involucel wanting. Flowers greenish white.

38 Petroselium. Margin of calyx obsolete. Petals roundish, incurved, hardly emarginate, with an inflexed point at the apex. Stylopodium short, conical, suberemulose. Styles diverging. Fruit ovate, contracted from the sides; ribs filiform; furrows furnished with 1 vitta; outer ones with 2-3 vittae. Carpophore bipartite.—Involucrum few-leaved, and the involucel of many leaves. Flowers white or greenish.

39 Weydania. Margin of calyx obsolete (f. 60. a.). Petals ovate-lanceolate, entire, with an incurved point (f. 60. c.). Fruit ovate, crowned by the short stylopodium and reflexed styles (f. 60. b.). Mericarps somewhat semi-terete, with contracted margins; ribs filiform, bluntish; furrows broad, furnished with 1 vitta each, and the commissure with 2.—Involucrum wanting, or of 1 leaf; involucel of many leaves. Flowers white.

40 Trias. Margin of calyx obsolete. Flowers usually dioecious from abortion. Petals of the male flowers lanceolate,
ending in an involute point; of the hermaphrodite flowers ovate, with a short inflexed point. Fruit ovate; ribs filiform, rather prominent; furrows without vittæ, or furnished with 1 vitta each. Carpophore flat, bifurcate from the base.—Umbels disposed in a panicle or thyrse, without any involucra; involucels usually wanting.

41 Helioscladum. Margin of calyx 5-toothed, or obsolete. Petals ovate, entire, with a straight or inflexed point. Styles short. Fruit ovate or oblong; ribs filiform, rather prominent; furrows furnished with 1 vitta each. Carpophore entire. Involucra variable in the different sections.

42 Discopleuræ. Teeth of calyx 5, subulate, permanent (f. 61. e). Petals ovate, emarginate (f. 61. b.), with a replicate point (f. 61. f.). Fruit ovate (f. 61. c). Three dorsal ribs filiform, exerted, and acutish: 2 lateral ones somewhat con-crete with the thick accessory margin, forming a disk on both sides of the fruit; furrows furnished with 1 vitta each. Carpophore bifid.—Involucels of a few linear setaceous leaflets (f. 61. g.).

43 Leptocaulis. Margin of calyx obsolete (f. 62. a.). Petals elliptic, entire. Styles permanent. Fruit ovate (f. 62. a.); ribs hardly prominent; furrows furnished with 1 vitta. Carpophore bifid at the very apex.—Involucra wanting; involucels short, few-leaved.

44 Pycho'tis. Margin of calyx 5-toothed. Petals obovate, bifidly emarginate, furnished by a transverse plait in the middle, which emits a little segment. Fruit ovate or oblong; ribs filiform; furrows furnished with 1 vitta each. Carpophore bifid.—Involucrum variable; involucels of many leaves.

45 Falca'ria. Margin of calyx 5-toothed; tube wanting in the sterile flowers, but cylindrical in the fertile ones. Petals obovate, curved, having a broad emarginate recess, with a re-flexed point. Styles divaricate. Fruit oblong; ribs filiform; carpophore distinct, bifid; furrows furnished with 1 filiform vitta each.—Involucrum of many leaves. Involucel somewhat di-midiate from the inner leaflets being small on one side.

46 St'son. Margin of calyx obsolete. Petals roundish, curved, deeply emarginate, with an inflexed point. Styles very short. Fruit ovate; ribs filiform; vittæ 1 in each furrow, short, rather club-shaped; carpophore bipartite.—Involucra and involucels of few leaves.

47 Schu'lia. Margin of calyx obsolete. Petals elliptic, with a short inflexed point. Stylopodium conical. Styles erect, somewhat capitata at the apex, permanent. Fruit cylindrically prismatic; ribs filiform; vittæ 1 in each furrow. Carpophore undivided.—Involucra and involucels of many multifid leaves.

48 A'mi. Margin of calyx obsolete. Petals obovate, with an inflexed point, marginately 2-lobed; lobes unequal, irregular; those on the outside of the umbels the largest. Fruit ovate-oblong; ribs filiform; vittæ 1 in each furrow. Carpophore distinct, 2-parted.—Involucra of many trifid or pinnatifid leaves; involucels of many leaves.

49 Ægopo'dium. Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point. Stylopodium distinct, conical, terminated by the long deflexed styles. Fruit ovate; ribs filiform; furrows without vittæ; carpophore setaceous, forked at the apex.—Involucra and involucels wanting.

50 Ca'rum. Margin of calyx obsolete. Petals regular, obovate, emarginate, with an inflexed point. Stylopodium depressed; styles deflexed. Fruit ovate or oblong, contracted from the sides; ribs filiform; vittæ 1 in each furrow, and 2 in the commissure, which is flat; carpophore distinct, forked at the apex.—Involucra and involucels variable in the different species.

51 Chamaescladum. Margin of calyx toothed a little. Petals ovate-lanceolate, quite entire, with an oblique or inflexed point. Stylopodium depressed; styles at length deflexed. Fruit ovate-oblong; mericarps solid; ribs filiform; vittæ 3-4 in each furrow, and 4-6 in the commissure; carpophore adnate, bifid at the apex.—Involucra and involucels of many leaves.

52 Bu'ium. Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point. Fruit linear-oblong; ribs filiform, obtuse; vittæ 2-3 in each furrow, and 2 in the commissure, all superficial. Carpophore distinct, bifid.—Involucra variable in the different species; involucels of few leaves.

53 Cryptole'a'nia. Margin of calyx obsolete. Petals obovate, nearly entire, narrowed into an inflexed point. Fruit contracted from the sides, linear-oblong, crowned by the short stylo-podium and straight styles; ribs filiform, obtuse: 2 lateral ones placed in front of the margins; vittæ numerous in the furrows, covered by a corky pericarp, and are not visible, unless when the pericarps are cut transversely.—Involucra wanting; involucels few-leaved.

54 Pimpine'lla. Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point. Fruit ovate, contracted from the sides, linear-oblong, crowned by the short stylo-podium and styles, which are reflexed and somewhat capitata at the apex; ribs filiform; vittæ numerous on the furrows; carpophore distinct, bifid.—Involucra and involucels wanting.

55 St'um. Margin of calyx 5-toothed, but at length obsolete. Petals obovate, emarginate, with an inflexed point. Stylopo-dium pulvinate, with a depressed margin. Styles divergingly reflexed, somewhat capitata at the apex. Fruit compressed or contracted from the sides, crowned by the stylopodium and styles; ribs filiform, blunter; vittæ many, both in the furrows and commissure. Carpophore bipartite, having the mericarps adhering to its parts.—Involucra of many leaves, rarely of 1 leaf; involucels of many leaves.

56 Bu'lle'rum. Margin of calyx obsolete. Petals roundish, entire, closely involute, ending in a broad retuse segment. Fruit crowned by the depressed stylopodium; ribs winged, acute, filiform, or obsolete; furrows either with or without vittæ, smooth or granular.—Involucra variable in the different species. Flowers white, yellow, and greenish.

57 Heteromó'phæa. Margin of calyx 5-toothed. Petals roundish, entire, closely involute, ending in a broad retuse point. Fruit obovately pear-shaped, 3 winged; mericarps of 2 forms: outer one 2-winged: inner one 3-winged; the wings running from the teeth of the calyx; vittæ 1 in each furrow, and 2 in
the commissure.—A shrub with yellow flowers and ternate leaves. Involucra and involucels of many short leaves.

**Tribe V.**

**Seeliseae.** *Fruit terete, or nearly so, with a transverse section; or the mericarps are rather compressed on the back, with 5 filiform or winged ribs: the lateral ones marking, equal to the others, or broader. Seeds teretely convex on the back. Raphe marginal or submarginal.*

58 *Lichtenstei*nia. Margin of calyx acutely 5-toothed. Petals elliptic, with a long, inflexed point. Fruit nearly terete, crowned by the conical stylodium and short styles; ribs filiform, equal; vittæ large solitary under the ribs, but none in the furrows nor commissure.—Involucra and involucels of many short leaves. Flowers yellow.

59 *Ortia.* Margin of calyx obsolete. Petals equal, with an inflexed subulate point. Styles arched, capitate at the apex. Fruit oblong, rather compressed at the commissure; ribs membranous.—Involucra and involucels none. Flowers polygamous.

60 *Cnansethia.* Margin of calyx 5-toothed, permanent. Petals obovate, emarginate, with an inflexed point. Stylodium conical. Fruit cylindrically ovate, crowned by the long erect styles; ribs rather convex, obtuse, marginalizing ones rather the broadest; vittæ 1 in each furrow; carpophore indistinct.—Involucra variable in the different species, sometimes wanting; involucels of many leaves.

61 *Annesorhi*za. Margin of calyx 5-toothed, permanent. Petals elliptic, with an inflexed point. Fruit primitively quadrangular, crowned by the calyx and reflexed styles; mericarps of 2 forms, one 3-winged, and the other 4-winged from the ribs; vittæ 1 in each furrow and 2 in the commissure. Carpophore bipartite.—Involucra and involucels of many leaves.

62 *Scieroscia*gium. Calycine teeth 5, conical, permanent (f. 56. F. h.). Petals obcordate, with an inflexed point (f. 56. F. b.), which is bi or tridentate at the apex. Stylodium conical; styles filiform (f. 56. F. e.). Fruit ovate-globose, solid (f. 56. F. g. h.); ribs much elevated, bluntest, equal; vittæ 1 in each furrow and 2 in the commissure; carpophore distinct, undivided (f. 56. F. k.).—Involucra almost wanting; involucels of 5-7 leaves.

63 *Dasyloma.* Margin of calyx obsolete. Petals unknown. Stylodium depressed; styles short. Fruit ovate; mericarps not separating at maturity; ribs corky, cellular: 3 dorsal ones small; 2 lateral ones large and obtuse; furrows narrow, and furnished with 1 vitta each, but the commissure is flat, and furnished with 2; carpophore indistinct.—Involucra and involucels wanting.

64 *Cynoscia*gium. Calycine teeth 5 (f. 63. c.), subulate, permanent. Petals obovate, or nearly elliptic, entire, with an inflexed point (f. 63. c.). Stylodium conical; styles short, reflexed (f. 63. d.). Fruit oval-oblong or ovate (f. 63. b.), tapering at the apex; ribs thick, corky; vittæ 1 in each furrow, and 2 in the commissure.—Involucra and involucels of many leaves (f. 63. f. g.).

65 *Aethusa.* Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point; outer petals radiating. Fruit ovate-globose; ribs elevated, thick, acutely keeled: lateral ones rather the broadest; vittæ 1 in each furrow, and 2 arched ones in the commissure; carpophore bipartite.—Involucrum wanting or of 1 leaf; involucels of 1-3-5 leaflets, on one side of the umbellule.

66 *Fennelulum.* Margin of calyx tumid, obsolete. Petals roundish, entire, involute, with a rather quadrate retuse point; ribs rather prominent, bluntly keeled: lateral ones rather the broadest; vittæ 1 in each furrow, and 2 in the commissure.—Involucra and involucels wanting, or nearly so. Flowers yellow.

67 *Kundmania.* Margin of calyx 5-toothed. Petals roundish, entire, involute, with a broad retuse point. Stylodium conical. Fruit terete, 10-furrowed; mericarps with 5 filiform, obtuse, equal ribs; vittæ many, both in the furrows and commissure; carpophore undivided.—Involucra and involucels of many filiform reflexed leaves.

68 *Deverra.* Margin of calyx obsolete. Petals ovate, with an inflexed acumen. Styles short. Fruit ovate or roundish, hispid from scales or hairs; mericarps semi-terete, with obsolete ribs; vittæ 1 in each furrow, and 2 in the commissure. Carpophore bipartite.—An aromatic almost leafless shrub.—Involucra of 4-6 leaves; involucels of 4-6 ovate-lanceolate leaves.

69 *Soranthus.* Margin of calyx obsolescently toothed. Petals broadly ovate, acuminate, permanent, with an inflexed point. Fruit a little compressed from the back; crowned by the divericate styles; mericarps with 5, hardly prominent ribs; vittæ 1 in each furrow, and 4 in the commissure. Carpophore bipartite.—Involucra nearly wanting; involucels of 5-7 spreadingly reflexed leaves.

70 *Seelie.* Margin of calyx 5-toothed; teeth short, thickish. Petals obovate, emarginate or nearly entire, with an inflexed point (f. 55. E. i.). Fruit (f. 55. E. d. F. 55. D. a. b.) oval or oblong, crowned by the reflexed styles (f. 55. E. b.); ribs filiform or elevated, rather prominent, thick, corky: lateral ones a little broader than the rest; vittæ 1 in each furrow, sometimes 2 in the outer furrows, but always 2 or 4 in the commissure.—Involucra almost wanting; involucels of many leaves.

**FIG. 55.**
71 Libanotis. This genus agrees in every respect with Sêzu, but differs in the lobes of the calyx being slender, subulate, elongated (f. 55. G. c.), and coloured, deciduous.—Involucre and involucels of many leaves.

72 Cenolophium. Margin of calyx obsolete. Petals oblong, emarginate (f. 55. G. b.), with an inflexed point (f. 55. G. L.); ribs equal, sharp, a little winged, hollow inside; vittae 1 in each furrow, and 2 in the commissure.—Involucre wanting, or of 1 leaf; involucels of many leaves (f. 55. G. a.).

73 Cni'dium. Differs from Cenolophium in the ribs of the fruit being furnished with membranous wings.—Involuca variable in the different species; involucels of many leaves.

74 Petúta. This genus differs from Sêzu and Libanotis by the margin of the calyx being entire; and from Cni'dium in the petals not being emarginate, and in the ribs of the fruit not being winged.

75 Endré'ssia. This genus differs from all the rest in the present tribe, in the fruit being compressed from the sides, in the ribs being obtuse and filiform, not winged; vittae 6 in the commissure, and 3 or 4 in the furrows.

76 Thasphium. Margin of calyx 5-toothed. Petals elliptic, with a long inflexed acumens. Fruit nearly elliptic; ribs winged; vittae 1 in each furrow, and 2 in the commissure.—Involuca wanting; involucels of 3 leaves on one side.

77 Tsóchisán'thes. Margin of calyx 5-toothed. Petals on long claws, spatulate, obvate, with a triangular inflexed segment; ribs sharp, rather winged, equal; vittae 3-4 in each furrow, and 8 in the commissure. Carpophore bipartite.—Involuca wanting, or of 1 leaf; involucels of 2-5 leaves.

78 Athama'ntha. Margin of calyx 5-toothed. Petals obvate or entire: with a very short, inflexed, unguiculated point; graft attenuated into a neck; ribs filiform, wingless, equal; vittae 2-3 in each furrow.—Involuca few-leaved; involucels of many leaves.

79 Lio'vesticum. Margin of calyx 5-toothed or obsolete. Petals obvate, acute, emarginate, with an inflexed point; ribs short, rather winged, equal; vittae many, both in the furrows and commissure.—Involuca variable; involucels many-leaved.

80 Sia'fus. Margin of calyx obsolete. Petals obvate-oblong, entire, or rather emarginate, with an inflexed point; ribs sharp, rather winged, equal; vittae many in each furrow, and so close together as to appear one; commissure furnished with 4-6 vittae.—Involuca wanting or of few leaves; involucels of many leaves. Flowers cream-coloured or greenish.

81 Wallro'thia. Calycine teeth 5, ovate-lanceolate, acute (f. 56. A. b.). Petals elliptic, entire, acute at both ends (f. 56. A. d.). Mericarps with rather prominent, equal ribs; vittae numerous in the furrows.—Involuca of 1-3 unequal leaves; involucels of 5-8 unequal leaves.

82 Me'tum. Margin of calyx obsolete. Petals entire, elliptic, acute at both ends. Mericarps with rather prominent, equal, keeled ribs; vittae many in each furrow, and 6-8 in the commissure.—Involuca wanting; involucels of many leaves.

83 Ga'ya. Margin of calyx obsolete. Petals obvate, more or less emarginate, with a broad inflexed point. Fruit oval, a little compressed; ribs elongated, wing-formed, contiguous at the base, at equal distances, obtuse; vittae none. Carpophore bipartite.—Involuca few-leaved.

84 Conioselín. Margin of calyx obsolete. Petals obvate or obovate, with an inflexed point. Styles at length reflexed. Fruit compressed or convex from the back; ribs winged: lateral ones twice the breadth of the rest; vittae 3 in each furrow, but in the dorsal furrows sometimes only 2; and 4-8 unequal ones in the commissure; carpophore bipartite.—Involuca wanting, or of few leaves; involucels of 3-7 linear-subulate leaves.

85 Chês'hum. Margin of calyx obsolete. Petals roundish, entire, involute, with an obvate point. Mericarps with 5 elevated, sharp, somewhat winged ribs: the lateral ribs a little broader than the rest; pericarp spongy from large cells.—Involuca and involucels of many leaves. Seed semi-terete, constituting a distinct nucleus, covered with copious vittae.

TRIBE VI.

Angélicée. Fruit compressed from the back, girded by 2 wings on each side, from the raphe being central, or nearly so; mericarps furnished with 5 ribs: the 3 dorsal ribs filiform or winged: and the 2 lateral ones always expanded into wings, and broader than the dorsal ones. Seed rather convex on the back, and flattish in front.

86 Le'ésticum. Margin of calyx entire. Petals incurved, roundish, entire, with a short point. Mericarps with 5 wings: wings of the lateral ribs the broadest; vittae 1 in each furrow, and 2-4 in the commissure. Carpophore bipartite.—Involuca and involucels of many leaves.

87 Selín. Margin of calyx obsolete. Petals obvate, emarginate. Mericarps with 5 membranous wings: the wings of the lateral ribs twice the breadth of the rest; vittae 1 in each furrow, but in the outer ones usually 2, and always 2 in the commissure. Carpophore bipartite.—Involuca of few leaves; involucels of many leaves.

88 Oste'éricum. Calyx 5-toothed; teeth broad. Petals unguiculate, obvate, emarginate, with an inflexed point. Mericarps with 5 ribs: the 3 dorsal ones elevated and filiform: the 2 lateral ones dilated into wings, much broader than the rest; vittae 1 in each furrow. Carpophore bipartite.—Involucra of few leaves; involucels of many leaves.

89 Angélica. Margin of calyx obsolete. Petals lanceolate, entire, with a straight or incurved point. Mericarps with 5 ribs: the 3 dorsal ones filiform and elevated: and the 2 lateral ones dilated into membranous wings, which are broader than the rest; vittae 1 in each furrow. Carpophore bipartite.—Involuca of few leaves; involucels of many leaves.

90 Archangé'lica. Margin of calyx with 5 short teeth. Petals elliptic, entire, with an incurved point. Mericarps with 5 thickish, keeled ribs: the 3 dorsal ones elevated: and the 2 lateral ones dilated into wings. Seed not adhering to its covering, but constituting a free nucleus, covered all over with copious vittae. Carpophore bipartite.—Involuca nearly wanting; involucels of many leaves, unilateral.

TRIBE VII.

Peuced'aa. Fruit compressed from the back, or lenticularly
compressed, girded by a smooth, winged, flattened, or rather convex, dilated, entire margin. Mericarps with 5 filiform ribs, rarely winged; lateral ribs contiguous to the dilated margin, or lost in it. Raphe marginal, hence the fruit is only furnished with 1 wing on each side, not with 2 wings, as in the last tribe, where the raphe is central. Seed flattened, or rather convex on the back.

91 Opópanax. Margin of calyx obsolete. Petals roundish, entire, involute, with an acutus point. Stylodopodium broad, thick; styles very short; mericarps with 3 dorsal, filiform, very slender ribs: the 2 lateral ones wanting, or not distinct from the margin; vittae 3 in each furrow, and 6-10 in the comissure. Seed flat. —Involucra and involucels of many leaves. Flowers yellow.

92 Fé'rule. Margin of calyx with 5 short teeth. Petals ovate, entire, with an ascending or incurved point. Fruit girded by a dilated flat margin; mericarps with 3 dorsal filiform ribs: the 2 lateral ones very obsolete, or not distinct from the dilated margin; vittae 3 or more in the dorsal furrows, and 4 or more in the comissure. Seed flat. Carpophore bipartite. —Involucra and involucels variable. Flowers yellow.

93 Dore'ma. The large, cup-shaped, epigynous disk, and the solitary vitte in the furrows of the fruit, distinguish this genus from Férule and Opópanax. The flowers being completely sessile is also a remarkable character.

94 Erosy'raph. Calyx bluntly 5-toothed. Petals ovate, entire, with a short, incurved point (f. 56. E. f.). Fruit compressed (f. 56. E. k.) from the back, girded by a thickish margin: the 3 dorsal ribs filiform: and the 2 lateral ones running into the thickish margin, which is spongy inside; furrows broad, 2-3-striped, bearing 2-3 vittae in each; and the comissure is without vittae, but marked with a middle nerve and 2 marginal ones, rather hollow and tomentose between the nerves. Seed flatish. —Involucra and involucels wanting. Flowers yellow.

95 Pal'mía. Margin of calyx obsolete. Petals elliptic, with an acute inflexed point. Fruit oblong or oval. Mericarps compressed from the back: with 5 filiform, bluntish ribs: 2 marginal ones a little broader than the rest; vittae 3 in each furrow, and 2 broad ones in the comissure. Seed oblong, free, striped. —Involucrum few-leaved or wanting. Flowers cream-coloured.

96 Peucéd'ànum. Margin of calyx 5-toothed. Petals obovate, emarginate, or entire, with an inflexed point. Fruit girded by a flat margin; the 3 dorsal ribs filiform: and the 2 lateral ones more obsolete, contiguous to the dilated margin; vittae in each furrow usually 1, and in the comissure 2. Carpophore bipartite. Seed flat in front. —Involucra variable in the different species; involucels of many leaves.

97 Impé ratsiá. All as in Peucédànum, but the margin of the calyx is obsolete. —Involucra wanting; involucels of few leaves.

98 Call'sace. Margin of calyx rather 5-toothed, or nearly obsolete. Petals oval, with an incurved point. Fruit nearly orbicular, emarginate at the base, with a winged margin; the 3 dorsal ribs obtuse and nerve-formed: the 2 lateral ones expanded into wings, which lie over the whole surface: vittae 1 in each furrow, and 1 on each side of the comissure. Forks of carpophore adhering to the mericarps. —Involucra wanting, or of few leaves; involucels of many setaceous leaves.

99 Bu'bon. Margin of calyx obsolete. Petals obovate, entire, with an acute involute point. Fruit girded by a flattened, dilated margin; the 3 intermediate ribs filiform, and the 2 lateral ones going into the margins; vittae covering the whole seed, 4 dorsal and 2 in the comissure. Carpophore bipartite. Seed flat in front and convex on the back.—Cape shrubs. Involucra and involucels of many leaves. Flowers greenish yellow.

100 An'stium. Margin of calyx obsolete. Petals roundish, entire, with a rather square retuse point. Fruit girded by a flat margin; the 3 intermediate ribs acutely keeled, and the 2 lateral ones more obsolete, and running into the margin; vittae broad, solitary in the furrows, and filling them, and twin in the comissure. Seed rather convex on the back. —Involucra and involucels wanting. Flowers yellow.

101 Córtia. Teeth of calyx elongated, acute. Petals lanceolate, acuminate, entire. Stylodopodium conical; styles diverging. Fruit elliptic, rather retuse at both ends; ribs winged: lateral one the broadest; vittae 1 in each furrow, and 2 in the comissure, which is flat. Seed flatish. —Involucra of 2-3 multifid leaves; involucels of 5 linear, entire, or 2-3-cleft leaves.

102 Capsophyl'ium. Margin of calyx obsolete. Petals oblong, rather emarginate, tapering into an inflexed acumen. Fruit girded by a flat, dilated margin; the 3 intermediate ribs thickish, keeled, rather flexuous, tubercular: the 2 lateral ones going into the dilated margin; vittae 1 in each furrow, and 2 in the comissure. Seed rather convex on the back. —Involucra and involucels of 3-6 leaves.

103 Tedemánia. Margin of calyx 5-toothed (f. 64. a). Petals acuminate, reflexed. Fruit nearly ovate (f. 64. c.); mericarps with 5 filiform, subcarinated, approximate ribs: lateral ones dilated into a membranous margin, which is nearly the breadth of the fruit; vittae solitary in the furrows, and filling them, and twin in the comissure. Carpophore bipartite. Seed flat. —Involucra and involucels of 4-5 subulate leaves.

104 Achemó'ra. Margin of calyx 5-toothed. Petals obcordate, with an inflexed point. Fruit compressed from the back, oval or obovate; mericarps with 5 filiform, rather keeled, approximate ribs: lateral ribs dilated into a broad membrane; vittae solitary in the furrows, and filling them, and twin in the comissure. Carpophore bipartite. Seed flattened. —Involucra wanting or few-leaved; involucels of many leaves.

105 Pasti'na. Margin of calyx obsolete, or minutely denti culated. Petals roundish, entire, involute, with a broad retuse point. Fruit compressed from the back, girded by a flat dilated margin: the 3 intermediate ribs filiform, equidistant: lateral ones contiguous to the dilated margin; vittae linear, acute, hardly shorter than the ribs, solitary in the furrows, and twin or more in the comissure. Carpophore bipartite. Seed flattened. —Involucra and involucels wanting or few-leaved. Flowers yellow.

106 Leiotolúus. Teeth of calyx obsolete. Petals roundish, entire, involute, with a broad retuse segment. Fruit compressed, with a thickened dilated smooth margin; the 3 intermediate ribs approximate, and the 2 lateral ones marginal and remote; vittae 1 in each furrow, filiform, distant in the comissure. Involucra wanting; involucels of a few very fine leaves.
107 Astyd'ämia. Margin of calyx 5-toothed (f. 56. D. a. d. f). Petals obovate, entire, with an inflexed point. Stylopodium thick; styles very short (f. 56. D. g.). Fruit compressed from the back (f. 56. D. k.), girded by a thick dilated margin; the 3 dorsal ribs crested, approximate: the 2 lateral ones running into the margin; dorsal vittae very few, the commissural ones wanting or covered.—Involucra and involucels of many leaves. Flowers yellow.

108 Symphytólóma. Margin of calyx obsolete. Petals equal, emarginate, with an inflexed point. Stylopodium without a margin; styles reflexed. Fruit elliptic, compressed from the back; mericarps closely connate by their margins; with 5 filiform ribs: 3 dorsal ribs equi-distant; lateral ones more remote, margi- nating; vittae wanting or obsolete. Seed flattened. Carpophore none. Flowers red.

109 Heracle'üm. Calyx 5-toothed. Petals obovate, emarginate, with an inflexed point: exterior petals usually radiating and bifid. Fruit compressed from the back, girded by a flat, dilated margin; mericarps with very fine ribs: 3 dorsal ones equi- distant: 2 lateral ones remote, contiguous to the dilated margin: vittae on the back, solitary in the furrows, but usually with 2 in the commissure, all shorter than the fruit, and usually club-shaped; carpophore bipartite. Seed flat.—Involucra caducous, usually of few leaves; involucels of many leaves.

110 Zo'é'mia. Calyx 5-toothed. Petals obovate, emarginate, with an inflexed point. Fruit compressed from the back, rather convex in the middle, hairy, girded by a smooth, thickened, dilated margin; ribs very thin: dorsal ones at equal distances: 2 lateral ones more remote, contiguous to the dilated margin; vittae covering the whole seed, solitary in the furrows, and twin in the commissure. Carpophore bipartite. Seed flat.—Involucra and involucels of many leaves.

111 Polytén'ia. Calyx 5-toothed. Petals oval, emarginate, with an inflexed point. Fruit oval, compressed on the back, convex in the middle, glabrous; with a smooth tumid margin, and a depressed furrow on the back; ribs very slender, hardly distinct; vittae between the ribs, but 6 in the commissure; carpophore indistinct. Seed flat.—Involucra none; involucels setaceous.

112 Johre'nia. Teeth of calyx obsolete, very blunt. Petals unknown. Stylopodium short, conical, furrowed a little. Styles short, diverging. Fruit oval, lenticularly compressed on the back (f. 56. C. b.), quite glabrous; with a smooth tumid margin, and a flat, dorsal, coloured furrow; mericarps with 3 dorsal, filiform ribs, which probably contain vittae: 2 lateral ones running into the dilated margin, hardly distinct, usually rufous, and the form of vittae; commissure spongy, furnished with 2 lines, but without vittae. Carpophore 2-parted (f. 56. C. b. a.). Seed flat.—Involucrum wanting, or of 1 leaf; involucels of 4-5 linear, setaceous leaves.

Tribe VIII.

Tordyl'íne. Fruit lenticularly or flatly compressed from the back, girded by a thickened, nodulose, or plaited, dilated margin. Mericarps with 5 very fine or obsolete ribs: lateral ones contiguous to the dilated margin, or forming the same. Seeds flattened. This tribe differs from Peucedànéa in the margin of the fruit being plaited or nodulose, not smooth and entire.

113 Hasselqui'stia. Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point; outer petals radiating and bifid. The outer fruit of the umbel are compressed, girded by an accessory, winged, thickened margin, which is hardly wrinkled; those of the disk dissimilar: one of the mericarps contracted into an hemispherical urceolus around the other, which is abortive; ribs very slender: the 3 dorsal ones equi- distant: and the 2 lateral ones contiguous to the thickened margin, or hidden by it; vittae 1 in each furrow, and 2 in the commissure. Carpophore bipartite. Seed flat.—Involucra of many leaves.

114 Tordyl'ium. All as in Hasselquista, except that the vittae are either solitary or numerous in the furrows, and either 2 or more in the commissure; and in the fruit being equal, and girded by a tubercularly wrinkled, accessory, thickened margin.—Involucra of many leaves.

115 Tordylórias. Margin of calyx 5-toothed; teeth acute: outer teeth the largest, dilated at the base, and cuspidate at the apex. Outer petals of umbels larger, and obcordately 2-lobed: the rest smaller, ovate, and cuspidate, usually entire, rarely somewhat 2-lobed. Stylopodium conical. Styles erect, elongated. Fruit hairy.—Involucra and involucels of 5-6 lanceolate-linear leaves.

** Fruit furnished with both primary and secondary ribs. **

Tribe IX.

Sileríne. Fruit lenticularly compressed from the back. Mericarps with 5 primary ribs: the lateral ones marginating; and usually with 4 secondary, less prominent ones; all filiform and wingless. Seeds flatish in the front.

116 Krube'ra. Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point. Mericarps with 5 plicately crenated, thick ribs: the 3 intermediate elevated, obtuse, and keeled: 2 lateral marginating and roundish, keeled near the raphe; vittae none. Carpophore bifid.—Involucra 2-5-leaved; involucels 4-5-leaved.

117 Lanchylé'rum. Margin of calyx obsolete, or minutely denticulated. Petals permanent; those of the inner flowers obovate-oblong, emarginate, with an acute, inflexed point; those of the ray flowers of 2 forms: the 8 inner, ovate, hardly emarginate, with an acute inflexed point: 2 outer nearly orbicular, and profoundly emarginate, also with an inflexed point. Mericarps with elevated, thick, and corky ribs: the lateral ones marginating, and a little broader than the others; vittae none.—Involucra and involucels of many leaves.

118 Asy'llis. Margin of calyx obsolete. Petals lanceolate, incurved. Fruit oval. Mericarps with 5 primary ribs: the 2 lateral ones placed in front of the accessory margin; the secondary ribs hardly visible. Seeds furnished with 8-10 dorsal vittae, and 5-6 commissural ones.—Involucra wanting; involucels of many setaceous leaves.

119 Stenocc'élium. Margin of calyx 5-toothed. Petals obovately orbicular, somewhat emarginate, with an inflexed
point. Mericarps with 5 rounded, thick, equal ribs; vitæ 1 in each furrow.—Involucra and involucels of many leaves.

120 Siler. Margin of calyx 5-toothed. Petals oblong, emarginate, with an inflexed point. Ribs filiform, elevated, obtuse: primary ones 5; lateral ones of these marginating: secondary ones 4, less prominent; vitæ 1 in each furrow, under the secondary ribs.—Involucra none, or few-leaved, caducous.

121 Galium. This genus differs from Siler in the absence of dorsal vitæ to the fruit, and the commissure being furnished with only 2.

**Tribe X.**

**Cuminum.** Fruit contracted from the sides; mericarps with 5 filiform, primary ribs: the lateral ones of these marginating; 4 secondary more prominent ones; all wingless. Seed straight, flatish in front.

122 Cuminum. Calyx with 5 lanceolate, unequal, permanent teeth. Petals oblong, emarginate, with an inflexed point. Primary ribs minutely muricated: secondary ones prickly; vitæ 1 in each furrow under the secondary carpels. Carpophore bipartite. Seed concave in front, and convex on the back.—Involucra of 2-4 simple or divided leaves; the involucels dimidiate, of 2-4 reflexed leaves.

123 Trefoicarpus. Calyx with 5 subulate teeth, which fall off at length. Petals obcordate, inferfully emarginate. Fruit pyramidal angular, nearly terete; mericarps convex on the back; primary ribs margined with a fuscous, vitæ-formed line on each side; secondary ones furnished with 1 vitta on their inner side; commissure thick, furrowed in the middle, and furnished with vitæ inside. Seed straight, rather compressed on the back.—Involucra 1-3-leaved; involucels dimidiate, of 4-5 linear, unequal leaves.

**Tribe XI.**

**Thapsie.** Fruit compressed from the back; mericarps with 5 filiform primary ribs, which are now and then bristly: lateral ones seated in the flat commissure; secondary 4; inner ones of these filiform, and the outer ones or all are winged: wings undivided, hence the fruit is either 8-winged, or furnished with 2 wings on each side. Seed flatish, or teretely convex, flat in front.

124 Thapsia. Margin of calyx 5-toothed. Petals elliptic, entire, with an inflexed or involute point; 2 lateral secondary ribs winged, hence the fruit is 2-winged on each side; furrows under the secondary ribs furnished with 1 vitta each. Carpophore bipartite. Seed flatish.—Involucra and involucels wanting, or of few flowers. Leaves yellow.

125 Cymopterus. Calyx minutely 5-toothed. Petals roundish-oval, inflexed at the apex. Fruit nearly elliptic, compressed, 7-8-winged, from all the secondary ribs being winged; wings undivulated; furrows flat, 1-nerved; commissure naked, 3-striped. Carpophore not separable from the mericarps.—Involucra wanting; involucels dimidiate, 5-7-parted.

126 Lasereium. Margin of calyx 5-toothed (f. 55. C. f.). Petals obovate, emarginate (f. 55. C. a.), with an inflexed point (f. 55. C. t.). Fruit compressed from the back (f. 55. C. g.), or nearly terete, 8-winged, in consequence of the 8 secondary nerves being winged; vitæ 1 in each furrow, under the secondary ribs. Carpophore free, bipartite (f. 55. C. k.).—Involucra and involucels of many leaves.

127 Lophosgia. Margin of calyx 5-toothed. Petals elliptic, entire, acuminate, involute at the apex (f. 55. B. d.). Fruit compressed (f. 55. B. c.) on the back; the 2 lateral secondary ribs expanded into a sub serrated wing each: the 2 dorsal ones expanded into an interrupted wing each, at first sight appearing like a retrograde scales (f. 55. B. c.).—Involucra of 5-7 ovate-lanceolate leaves (f. 55. B. a.); involucels of 5-7 narrower leaves (f. 55. B. b.). Flowers yellow.

128 Melanoselinum. Margin of calyx 5-toothed. Petals obovate, emarginate, with a reflexed point. Fruit compressed from the back; the 2 inner secondary ribs filiform and very slender: the 2 outer ones expanded into a membranous serrated wing each; with oleiferous canals under all the ribs. Carpophore bipartite. Seed flat.—A shrub. Involucra and involucels of many leaves, the first composed of cut leaves, and the second of entire leaves.

**Tribe XII.**

**Daucie.** Fruit lenticularly compressed from the back; mericarps with 5 bristly, filiform, primary ribs; lateral ones of these seated in the flat commissure, as in Thapsie; and with 4 secondary ones, which are more prominent and prickly; the prickles free, or joined into a wing. Seeds flatish, or subsemiterete, or convex on the back, and flatish in front.

129 Arctidia. Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point: those on the outer part of the umbel radiating and bipartite. Secondary ribs 4; the 2 inner ones filiform: the outer ones expanded into a sinuate lobed wing each; vitæ none. Carpophore bipartite. Seed flat.

—Leaves of involucra and involucels divided into linear lobes.

130 Orlaya. Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point: those in the ray of the umbel profoundly bifid. Secondary ribs of fruit furnished with 2 or 3 rows of prickles, outer ones more prominent, or a little winged; prickles hooked or rayed at the apex; vitæ 1 in each furrow under the secondary ribs. Carpophore bifid or undivided? Seed convex on the back.—Involucra variable; involucels of many leaves.

131 Daucus. Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point; those on the outer part of the umbel radiating and profoundly bifid. Secondary ribs of fruit furnished with 2 or 3 rows of prickles, outer ones more prominent, or a little winged; prickles hooked or rayed at the apex; vitæ 1 in each furrow, under the secondary ribs. Seed flatish in front.—Involucra of many trifid or pinnatifid leaves; involucels of many entire or trifid leaves.

**Suborder II. Campylosome.** Albumen involute, or marked by a longitudinal furrow or channel on the inner side.

§ 1. Mericarps furnished with both primary and secondary ribs. 

**Tribe XIII.**

**Elaeoselineae.** Fruit cylindrical, more compressed from the
back than from the sides; mericarps with 5 primary filiform ribs; and 4 secondary ones: the 2 dorsal ones of these last nerve-formed, but the 2 lateral ones are expanded into a wing each; with the margins nerve or rib-formed. Seeds involute, semi-lunate.

132 _Elyoselimum_. Margin of calyx hardly 5-toothed. Petals obovate, emarginate, with an inflexed point. Fruit nearly terete, 4-winged; the 2 lateral primary ribs seated between the wings and the nerve-formed margins; vitte under all the ribs abounding in oil, those under the primary ribs narrower and slenderer: in the commissure there are 4.—Involucra and involucles of many cuspidate, linear leaves. Flowers yellow.

**TRIBE XIV.**

_Caucal'ne._ Fruit contracted from the sides, or nearly terete. Mericarps with 5 filiform, bristly, or prickly, primary ribs: lateral ones of these seated in the commissure, which is flat; the secondary 4 more prominent and very prickly. Seeds involute, or inflexed on the margin.

133 _Cau'calis_. Teeth of calyx 5, ovate-lanceolate. Petals obovate, emarginate, with an inflexed point: outer ray ones strongly bifid. Fruit rather compressed from the sides; secondary ribs deeply cleft into a simple series of prickles; vitte solitary in each furrow, under the secondary ribs, and 2 in the commissure. Carpophore stiff; cleft at the apex.—Involucra none, or of 1-2 leaves; involucelles of 3-8 lanceolate leaves.

134 _Tur'gania_. Teeth of calyx 5, setaceous. Petals obovate, emarginate, with an inflexed point: outer ones radiating and bifid. Fruit subdidymous; lateral primary ribs with a simple series of warts or prickles, all the rest furnished with 2 or 3 rows of equal prickles; furrows furnished with 1 vitte each under the secondary ribs. Carpophore seetaceous, bifid.—Involucra and involucelles of 3-5 ovate, concave, equal leaves.

135 _Tor'lis_. Teeth of calyx 5, triangularly lanceolate, acute, permanent. Petals obovate, emarginate, with an inflexed point: outer ones larger and bifid. Secondary ribs having abundance of prickles occupying the whole furrows, which are furnished with 1 vitte each under the prickles. Carpophore setaceous, bifid. Involucra of 1-5 leaves; involucelles of 5-6 lanceolate ciliated leaves.

§ 2. Mericarps only furnished with primary ribs.

**TRIBE XV.**

_Scondic'ne._ Fruit evidently compressed, or contracted from the sides, usually beaked; mericarps with 5 filiform ribs, which are at length winged: lateral ribs marginating, all equal, but sometimes all obliterated at the base, and only conspicuous at the apex. Seeds teretely convex, having a deep furrow in front, or somewhat involute on the margin.

136 _Scand'nx_. Margin of calyx obsolete, or somewhat 5-toothed. Petals obovate, truncate, or emarginate, usually furnished with an inflexed point. Fruit compressed from the sides, with a very long beak; vitte wanting, or nearly obsolete. Carpophore undivided, forked at the apex.—Involucra wanting, or of 1 leaf; involucelles of 5-7 leaves.

137 _Anthri'ceus_. Margin of calyx obsolete. Petals obovate, truncate, or emarginate, with a very short inflexed point. Fruit contracted from the sides: having a beak, which is shorter than the seed; mericarps nearly terete, destitute of ribs, the beak alone being furnished with 5 ribs. Carpophore bifid at the apex.—Involucra wanting; involucelles of many leaves.

138 _Che'rophyl'um_. Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point. Fruit compressed from the sides, without any beak; commissure deep; vitte 1 in each furrow. Carpophore bifid.—Involucra wanting, or of few leaves; involucelles of many leaves.

139 _Cal'dasia_. Margin of calyx obsolete. Petals ovate, with an entire somewhat involute point. Fruit ovate-oblong, rather compressed from the sides, crowned by the short diverging styles; furrows between the ribs broad, flat, striated, and furnished with 1 vitte each; commissure furrowed in the middle. Carpophore bipartite. Seed rather convolute at the commissure.—Umbels simple, surrounded by a 20-leaved involucre.

140 _Sphalle'coca'rpus_. Teeth of calyx 5, subulate. Petals obovate-cuneated, emarginate, with an inflexed point (f. 56. _L. b._): the outer ones of the umbel radiating. Stylodium rather urceolate, toothed; styles short. Fruit elliptic-oblong (f. 56. _L. d._), contracted from the sides, without a beak; furrows between the ribs convex, furnished with 2-3 vitte each, and the commissure with 4-6. Carpophore bipartite (f. 56. _L. h._).—Involucra wanting; involucelles of 5-6 lanceolate leaves (f. 56. _L. a._).

141 _Molo'posper'num_. Calyx 5-toothed, foliaceous. Petals lanceolate, entire, ending in a long ascending point. Fruit contracted from the sides. Mericarps with 5 winged ribs. Seed bluntly tetragonal or angular; channels empty between the seed and the commissure of the pericarp; furrows having 1 broad brown vitte each, but the commissure is very narrow, and without any vitte. Carpophore bipartite.—Involucra of many elongated, membranaceous leaves, which are sometimes multifid; involucre of many leaves.

142 _Ve'lea._ Margin of calyx obliterated. Petals unknown. Stylodium conically depressed, short (f. 56. _G. b._); styles erect, filiform. Fruit ovate (f. 56. _G. e. b._), without a beak; mericarps rather compressed from the sides, with 5 ribs: the 2 lateral ones filiform, and the 3 dorsal ones winged; vitte 3, and sometimes 2 in each furrow, and 4 in the commissure. Carpophore bipartite (f. 56. _G. h._) from the base.—Involucra and involucelles none.

143 _My'rrhis_. Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point. Fruit compressed from the sides. Seeds involute, covered by a double membrane: outer membrane furnished with 5 acutely keeled, sharp, equal ribs, hollow inside; inner one adnate to the seed; vitte none. Carpophore cleft at the apex.—Involucra none; involucelles of many lanceolate ciliated leaves.

144 _Osmorhiza_. Margin of calyx obsolete. Petals obovate, hardly emarginate, with a short inflexed point. Fruit elong-
gated, tapering into a tail at the base, solid, acutely angular; mericarps with hispid, rather furrowed angles; ribs 5, acute; commissure furrowed; furrows flat, without vitæ. Carpophore semi-bifid.—Involuca of 2-3 lanceolate, ciliated leaves; involucels of 5 lanceolate, ciliated leaves.

145 Grammoschium. Teeth of calyx stiff (f. 56. H. g.), permanent. Petals obcordate, with an inflexed point. Styles short, conical (f. 56. H. b.), diverging. Fruit cylindrical (f. 56. H. a. b.), without a beak; mericarps with 5 primary, flattish white ribs; furrows flat, furnished with 1 vitta each, and the commissure with 2.—Involuca of 5-7 multifid leaves; involucels of linear-subulate, rarely cut leaves (f. 56. H. e.).

Tribe XVI.

Smyrææ. Fruit turgid, usually compressed, or contracted from the sides; mericarps with 5 ribs: lateral ones marginating, or situated in front of the margin; the ribs sometimes almost obliterated. Seed involute, or with a furrow on the inside, semi-lunar or complicate.

146 Lopécia. Calycine lobes large, pectinated. Petals obcordately bifid, shorter than the calyx; lobes awned. Ovarium 2-celled, with 1 of the cells abortive. The fruit is therefore ovate, crowned by the calyx, pubescent: marked by a furrow on one side, indicating the place of the abortive seed.—Involuca of 8-10 pectinated leaves; and the involucre of 4.

147 Oliveæ. Margin of calyx 5-toothed. Petals profusely obcordate: lobes involute on the margin at the base, and excavated at the sides, undulated and reflexed at the apex. Fruit obovate, hairy; mericarps nearly terete; with 5 blunt ribs. Carpophore bifid at the apex.—Involuca of 3-4 trifid leaves, with the lobes usually tridentate; involucels of many cuneiform, trifid leaves.

148 Anisoschium. Calycine lobes of the outer flowers of the umbel, large, ovate, and foliaceous: of the outer central ones stiff and hooked: of the other inner ones wanting or tooth-formed. Petals very unequal: outer ones obcordately bifid: inner ones small. Fruit rather downy, oblong-cylindrical, crowned by the calyx, and stiff conical styles; mericarps with 5 blunt ribs; vittæ brown, 1 in each furrow, but none in the commissure.—Involuca of 4-5 oblong, acute, unequal leaves; involucels of 4-5 leaves.

149 Echinophora. Margin of calyx 5-toothed. Petals emarginate, with an inflexed point: outer ones larger and bifid. Styles of the female flowers elongated, filiform (f. 65. k.). Fruit ovate (f. 65. c.), nearly terete, inclosed in a hollow receptacle: with a short, emersed beak; mericarps with 5 undulated, equal depressed ribs; vittæ covered with a cobwebbed membrane, 1 in each furrow.—Involuca and involucels of many leaves (f. 65. a.).

150 Exoaca'ntha. Flowers polygamous: central ones fertile, the rest sterile. Calyx in the sterile flowers obsolete. Petals obcordate, equal, inflexed. Young fruit of the sterile flowers obovate, striated; of the central flowers much more ovate, somewhat papillose, and crowned by 15 elongated stiff bristles.—Involuca of 10-12 large, channelled, spinose leaves; involucels of 7-11 spinose, very unequal leaves on one side.

151 Acrōrus. Flowers polygamous. Margin of calyx 5-toothed. Petals lanceolate, with an incurved acute entire point. Fruit ovate, beaked, crowned by the calyx, dehisced from the base to the middle with the involucrum, depressed in front, and marked by a furrow, not separable into 2 parts, but bilocular, 1 of the cells abortive.—Involuca of 4-5 concrete leaves.

152 Can'ēnus. Margin of calyx 5-toothed, rarely obsolete. Petals ovate, entire, involute at the apex or inflexed. Stylopodium depressed, hardly distinct in the mature fruit. Mericarps with 5 thick ribs, variable in the different sections of the genus; commissure almost the breadth of the mericarps. Seed constituting a free nucleus covered with abundance of vittæ.—Involuca and involucels of many leaves. Flowers yellow.

153 Par'nos. Margin of calyx 5-toothed. Petals ovate, entire, involute at the apex. Stylopodium depressed, hardly prominent in the fruit. Commissure broad. Mericarps compressed from the back, with 5 smooth ribs, which are thick at the base, and ending in vertical membranous wings on the back. Seed girded by an abundance of vittæ.—Involuca and involucels of many undivided leaves.

154 Colla'donia. Margin of calyx entire. Petals oval, entire, involute at the apex. Stylopodium depressed, hardly prominent in the fruit. Mericarps compressed from the sides, ending in 5 vertical membranous wings on the back, having 1 vitta in each furrow; commissure narrow, furnished with 2 vittæ.—Involuca and involucels of many undivided leaves.

155 Lecōria. Margin of calyx with 5 short teeth. Petals ovate, with an inflexed point. Stylopodia 2, distinct. Styles subulate. Fruit ovate, didymous, with a narrow commissure; mericarps semi-terete, with 5 obtuse, spongy ribs, which are beset with prickles on all sides. Seeds girded by copious vittæ. Involucels of 5-8 subulate leaves.

156 Magy'da'ris. Margin of calyx obsolete. Petals obcordate, with an inflexed point. Fruit ovate (f. 56. I. b.), tomentose; mericarps with 5 thick, blunt ribs, and narrow furrows. Seeds clothed on every side with very slender vittæ, convex on the outside, and involute with a deep furrow on the inside.—Involuca and involucels present, of many undivided leaves.

157 He'rmas. Margin of calyx 5-parted, foliaceous, permanent. Petals oval-oblong, acute, keeled, entire, equal. Fruit ovate; mericarps rather inflated, compressed from the back, 5 ribbed: the dorsal rib exerted: the 2 middle ones larger: and the 2 marginal ones small, under the commissure; vittæ many in the furrows between the ribs, which are broad. Seed not adnate to its covering, rather hollow inside.—Involuca of many leaves; involucels of 3 leaves.

158 Coni'um. Margin of calyx obsolete. Petals obcordate, rather emarginate, with a short inflexed point. Fruit compressed from the sides, ovate; mericarps with 5, rather prominent, equal ribs, which are undulately crenulated: having the furrows between the ribs, furnished with many stripes, but without any vittæ. Carpophore bifid at the apex. Seed with a
deep narrow furrow inside.—Involucra of 3-5 leaves; involucels of 3-5 leaves, dimidiate.

149 Vicá'tiá. Margin of calyx obsolete. Petals unknown. Styles short. Fruit ovate-oblong; mericarps nearly semi-terete, with 5 filiform, hardly prominent ribs; vitæ small, many in the furrows, which are broad and flat; commissure narrow. Carpophore thick, somewhat bifid at the apex. Albumen furnished with a furrow at the commissure, convex outside.—Involucra, and generally the involucels, are wanting.

160 Arraca'chá. Margin of calyx obsolete. Petals lanceolate or ovate, entire; with an inflexed point, which is curved above the middle nerve. Fruit ovate-oblong, somewhat compressed from the sides; mericarps with 5 equal ribs; vitæ many in the furrows. Albumen nearly semi-terete, furnished with a furrow at the commissure.—Involucra wanting; or of 1 leaf; involucels of 3 leaves. Flowers polygamous.

161 Pleurospé'rüm. Margin of calyx 5-toothed. Petals obovate, entire, flat, or attenuated and inflexed at the apex. Fruit ovate, somewhat compressed from the sides; mericarps furnished with a double membrane: outer one furnished with 5 winged hollow ribs: the inner one adnate to the seed, and furnished with 5 elevated ribs under those of the outer membrane; furrows of the inner membrane furnished with 1-2 vitæ each, and the commissure with 2. Carpophore filiform, bipartite.—Involucra and involucels of many leaves.

162 Hymenolé'na. Margin of calyx obsolete. Petals obovate, entire, flat, or attenuated and inflexed at the apex. Fruit ovate or oblong; mericarps with 5 exerted, nearly equal wings; commissure flat, furnished with 2 vitæ, and the furrows with 1. Seed with a furrow in front, convex on the outside. Carpophore bipartite.—Involucra and involucels of many leaves.

163 Physospe'rüm. Margin of calyx 5-toothed. Petals obovate, somewhat emarginate, with an inflexed point. Fruit contracted from the sides; mericarps reniformly globose, didymous, with 5 filiform equal slender ribs: the lateral ribs placed before the margins; vitæ broad, 1 in each furrow. Seed semi-lunar.—Involucra and involucels of many leaves.

164 Smy'nüm. Margin of calyx obsolete. Petals lanceolate or elliptic, entire, with an inflexed point. Fruit contracted from the sides; mericarps reniformly globose, didymous: with 3 dorsal, rather prominent ribs, and 2 lateral, marginaing, nearly obliterated ones; vitæ many in each furrow; carpophore bipartite. Seed involute.—Involucra and involucels variable in the different species.

165 Eu’lóphus. Margin of calyx 5-toothed (f. 56. K. b.). Petals unknown. Fruit a little contracted from the sides (f. 56. K. a.); mericarps ovate, rather didymous, with 5 hardly prominent ribs; furrows having 3 convex stripes, more prominent than the ribs, which are hollow inside and filled with oil; commissure furnished with 4 similar vitæ. Seed semi-lunar. Carpophore bipartite.—Involucra and involucels of many linear leaves (f. 56. K. c.).

166 Scaligória. Margin of calyx entire. Petals obcordate, with a short inflexed obtuse point. Stylopodium thick (f. 56. B. k.), parallel. Styles filiform, bent outwardly. Fruit rather didy-mous; mericarps ovate, contracted at the raphe, hardly compressed from the sides, with 5 filiform ribs; vitæ 2-3 in the furrows, which are rather convex, and 4-6 in the commissure, which is flatish. Albumen furnished with a furrow on the inside.—Involucra wanting; involucels of a few small linear leaves.

FIG. 56.

Suborder III. Célospe'ria. Albumen involutely curved from the base to the apex.

Tribe XVII.

Cori'ándrea. Fruit globose, or of 2 subglobose mericarps. Mericarps furnished with 5 primary, depressed, and flexuous ribs: lateral ribs placed before the accessory margin; and 4 more prominent secondary ones; all wingless.

167 Bifóra. Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point: outer ones nearly equal or radiating and bifid. Fruit didymous; mericarps ventricosely subglobose, granularly wanting, with 5 impressed, ob-solete stripes: the 2 lateral stripes semicircular, placed in front of the accessory margin; vitæ wanting; commissure having 2 holes. Carpophore bipartite, adnate on both sides.—Involucra and involucels wanting, or of 1 leaf.

168 Astóbá. All as in Bifóra, but the fruit is evidently didymous; and the commissure is narrow, not perforated, nor dilated at the apex; styles rather diverging.—Involucra of 5-6 lanceolate leaves; involucels of 3-5 leaves.

169 Atré'ma. Teeth of calyx 5, acute, small, permanent. Petals obovate, emarginate, with an inflexed point. Fruit rather didymous; mericarps nearly globose, ventricose, marked with 5 rather prominent ribs, without any vitæ; commissure narrow, closed.—Involucra and involucels of many leaves.

170 Cori'ántrum. Teeth of calyx 3, acute, unequal, permanent. Petals obovate, emarginate, with an inflexed point: outer ones radiating, bifid. Fruit globose, 10-ribbed, hardly divisible; the 4 secondary ribs on each mericarp are more prominent than the primary ones, and keeled; vitæ 1 in each furrow, and 2 in the commissure; carpophore free in the middle, but adnate at the base and apex. Seed hollow in front, covered by a loose membrane.—Involucra none; involucels usually of 3 leaves, dimidiate.

161 Cymbocá'rum. Margin of calyx obsolete. Petals equal, obcordate, with an inflexed point. Stylopodium depressed; styles
reflexed. Fruit nearly globose; mericarps solid, hemispherical: with 5 primary, filiform, usually obliterated ribs, without any secondary ribs or vitce. Carphopore bipartite, free in the middle, but adnate at the base and apex. Seed hollowed in front.—Involuta and involucres composed of linear leaves.

Suborder I. ORTHOSPÉRMÆ (from ορθος, orthos, straight, and σπέρμα, sperma, a seed). D. C. prod. 4. p. 58. Albumen flat on the inner side, neither involute, nor convolute.

§ 1. Umbels simple or imperfect. Fruit destitute of vitæ.

Tribe I.

HYDROCOTYLLÆ (plants agreeing with Hydrocotyle in important characters), or Orthospérmœ, Imperfectæ, Umbelláceæ, Compáresseæ, D. C. prod. 4. p. 58.—Hydrocotyleæ, Spreng. in Schultes, syst. 6. p. 32. Koch, umb. p. 141. exclusive of many genera. Fruit contracted from the sides; back of carpella or mericarps convex, rarely acute; the 5 primary ribs or nerves becoming immediately obsolete: lateral ribs marginaing, or thrown back into the flat commissure; secondary ones permanent and filiform, sometimes absent or nearly so. Albumen flatish in front. Petals spreading, entire, acute, straight, or rather in flexed at the point. This tribe represents the forms of nearly all in the different genera; it is distinguished from nearly all the suborder Orthospérmœ, in the umbels of flowers being imperfect; from Santalidae in the lateral compression of the fruit, and from Mulinææ in the commissure not being gradually contracted.

Lin. syst. Pentádria, Dígbiaxia. Tube of calyx rather compressed: limb with an obsolete margin. Petals ovate, entire, acute, with a straight apex. Fruit flatly compressed from the sides, bicuculate. Mericarps or carpella without vitæ: having the 5 ribs or nerves nearly filiform: the carinal and lateral ones usually obsolete, and the 2 intermediate ones joined. Seed carinately compressed.—Usually slender bog herbs, rarely sub-shrubs. Umbel simple, surrounded by a few-leaved involucrem. Flowers sessile or pedicellate, white. This genus is composed of a heterogeneous mass of species, and is therefore probably divisible into several genera.

Sect. I. Euhydrotyle (this section is supposed to contain the true species of the genus). D. C. prod. 4. p. 59. Hydrocotyle, Lin. gen. no. 325. Stems herbaceous, of nearly all the species, creeping. Fruit compressed; mericarps furnished with 1-2 ribs on each side.

§ 1. Leaves peltate.

Var. β, tuberísa (D. C. prod. 4. p. 59.) stems tumid at the nodes, and tuberosous.

Var. γ, platypýlla (D. C. prod. 4. p. 667.) leaves 11-12-nerved, twice the size. Ζ. H. Native of Tropical Africa, in marshes at Cayor.

Interrupted-flowered Penny-wort. Fl. May, June. Pl. cr.

2 H. vulgäris (Lin. spec. p. 338.) leaves peltate, orbicular, doubly crenated, 9-nerved; petioles pilose at the apex; umbels capitate, usually 5-flowered; fruit somewhat emarginate at the base, of one colour. Η. B. H. Native nearly throughout the whole of Europe, in marshy boggy places, and on the margins of clear rivulets, particularly on a peat soil; plentiful in some parts of Britain; also of North America, in Canada. Pl. dan. t. 90. Smith, engl. bot. t. 751. Curt. lond. 6. t. 19. Schkuhr, handb. t. 59. Rich. hyd. no. 1. t. 50. f. 1. and t. 52. f. 1. exclusive of the variety. Stems creeping, rooting at the nodi. Peduncles of the umbels or scapes much shorter than the petioles. Flowers reddish white or rose-coloured. There is a variety, but it is rather rare, with smooth petioles, and with the limbs emarginate at the base or nearly entire, and with the scapes drawn out beyond the umbels of flowers, and bearing 2 umbels each. Gerade calls this plant water penny-grass; sheep-killing penny-grass; in the north of England it is called white-rot, to distinguish it from red-rot; in Norfolk, flounce-wort, from its being supposed to occasion the flukes in the liver of rotten sheep; and by the husbandman sheep's-bane, "because it killeth sheep that do eat thereof." This, however, is a vulgar error; for the rot in sheep is owing to their feeding in wet grounds, and perhaps to an insect (the Fasciula hepatica), which from its shape is called a fluke or flounder, and abounds in such situations, adhering to stones and plants, as well as to the liver and biliary ducts of sheep affected with the rot. This, together with Dréssera or Sanden, and Pingúicula or Butter-wort, are common in marshy places, and therefore the rot in the sheep has been ascribed to these; but it is pretty certain that neither sheep nor any other quadruped feed on these plants.

3 H. furnílla (Rich. hydro. p. 27. t. 52. f. 2.) plant rather hairy; leaves orbicular, not emarginate at the base, obsolescent, 7-nerved; flowers umbellate; umbels hardly containing so many as 12 flowers; scape equal in length to the petioles. Φ. Η. Native about Monte Video, in arid places; and on shady rocks at Rio Pauquaucur, in the province of Rio Janeiro; also of Buenos Ayres. Chem. et Schlecht. in Linneæa. 1. p. 357. Flowers small. Petioles biauriculate at the base, and as if they were minutely stipulate (Rich.). Fruit smooth; mericarps marked with a single elevated line on each side. The Buenos Ayrean plant differs from the Brazilian one in being perfectly glabrous.

Small Penny-wort. Pl. creeping.

4 H. módéstæ (Chem. et Schlecht. l. c. p. 358.) leaves on long petioles, orbicularly reftiform, glabrous, 9-nerved; petioles pilose at the apex, as well as the young branches; umbels on short peduncles, many rayed; fruit small, emarginate at both ends. Φ. B. F. Native of Brazil, in the province of Monte Video; and of Chili about Valparaiso. Petioles 3-12 inches long. Peduncles an inch long, rarely more, and sometimes only 3 lines. Fruit smaller than in any other species; mericarps marked with a hardly elevated line on the sides. Modest Pennywort. Pl. cr.

5 H. barrará'ossa (Chem. et Schlecht. l. c. p. 360.) leaves on long petioles, peltate, orbicular, 8-nerved, 8-lobed, and crenated, and are, as well as the petioles, clothed with rufous hairs; umbels on long peduncles, many (50-60) rayed; fruit nearly globose, ovoid, rather emarginate, acutely ribbed. Φ. F. Native of Brazil, in shady woods near New Friburg. Petioles 4-8
Barbadosa Penny-wort. Pl. cr.

6 H. umbellata (Lin. spec. p. 234.) plant glabrous; leaves petallate, orbicular, emarginate at the base, doubly crenated, usually 11-12 nerved; scapes rather longer than the pedicels; umbels 20-30-flowered; flowers distinctly pedicellate. 2. B. F. Native of the West Indies, and at Tampico in the Bay of Mexico, as well as of Cuba and North America. Spreng. umb. p. 1. t. 1. f. 1. Rich. hyd. p. 28. t. 52. f. 3. Umbels proliferous in the specimens received from Tampico, but simple in those from Cuba. Corolla white.—Acacio, Piso, bras. p. 9.—Co-kedon aquatica, Sloane, jam. 1. p. 212.

7 H. Bonariensis (Lam. dict. 3. p. 147.) plant glabrous; leaves petallate, orbicular, 15-20-nerved, doubly crenated; scapes hardly longer, but often shorter than the petioles, umbellate at the apex, and umbellately branched; flowers disposed in interrupted whorles along the branchlets. 2. B. F. Native of South America, in marshy places not far from the sea, where it assumes various forms. Cham. et Schlect. in Linnaea. 1. p. 357. H. umbellata, Bonariensis, Rich. et Schult. syst. 6. p. 345.

Var. a. multiflora (Ruiz et Pav. fl. per. 3. p. 24. t. 246. f. a.) rays of umbel 8-10; whorles consisting of 15-20 flowers each. 2. B. G. Native of Brazil, Peru, Buenos Ayres. H. Bonariensis, Rich. Cav. icon. 5. t. 438.

Var. b. triboides (Ruiz et Pav. l. c. f. b.) rays of umbel 3; whorle 6-5-flowered. 2. B. Native of Peru and Brazil. H. polysalvata a, Rich. hyd. p. 31. 4.

8 H. petiolaris (D. C. prod. 4. p. 60.) plant quite glabrous; leaves peltate, orbicular, 10-12-nerved, simply and broadly crenated, on long petioles; scapes equal in length to the petioles, umbellate at the apex, and umbellately branched; branches 2-5, interruptedly verticillate. 2. B. F. Native of the Mauritius. H. vulgäris, Bory, voy. ex Rich. H. quinquenadieta, Per. Th. miss, ex Rich. H. polysalvata b, Rich. hyd. p. 31. Nearly allied to H. Bonariensis, but differs in the lobes of the leaves being simply crenated, in the petioles and scapes being nearly a foot high. Fruit nearly orbicular, emarginate at the base; mericarps furnished with one rib on each side.

Petiolar Water Penny-wort. Pl. 1. foot, cr.

9 H. Langsdorfii (D. C. prod. 4. p. 60.) plant glabrous or rather pilose on the leaves while young; leaves peltate, nearly orbicular, with 5-7 short lobes, crenated, 5-7-nerved; peduncles much longer than the petioles; umbel simple, containing 15-20 pedicellate flowers, surrounded by an 8-10-leaved reflexed involucre. 2. B. F. Native of Brazil, in the Island of St. Catharine. Stems long, creeping, slender. Peduncles 5-8 inches high. Adult leaves glabrous on both surfaces; lobes either acute or obtuse. Pedicells 3 times the length of the involucre. 5.

Langsdorf's Penny-wort. Pl. cr.

10 H. gracilis (Ruiz et Pav. fl. per. 3. p. 26. t. 247. f. 6.) leaves peltate, orbicular, 7-angled, 7-nerved, glabrous, crenated; petioles and scapes hairy; scapes shorter than the petioles; umbels 5-7-flowered. 2. B. F. Native of Peru, in stagnant watery places, and on the edges of rivulets. Rich. hyd. p. 32. Stems creeping. This species differs from all others in the present section in the leaves being acutely angled.

Slender Penny-wort. Pl. cr.

VOL. III.
flowers 15-20 in an umbel, on long pedicels. 

§ 2. Leaves more or less cordate at the base.

* Flowers umbellate, distinctly pedicellate.

19 H. acutifolia (Ruiz et Pav. fl. per. 3. p. 25. t. 248. f. a.) plant rather villous; leaves cordate, acute, situated at the base, unequally crenate-toothed on all sides; peduncles a little longer than the petioles; umbels many flowered, simple, globose; pedicels of flowers distinct; fruit almost dimdymous, bicostate on both sides. 

Acute-leaved Penny-wort. Pl. cr.

21 H. homaloides (Rich. hyd. no. 32. f. 21.) plant hairy; leaves orbicularly reniform, 9-nerved, bluntly 9-lobed, crenated; petioles pubescent, rather shorter than the pedicels; umbels 20-flowered; flowers distinctly pedicellate; mericarps of fruit 3-ribbed. 

22 H. B. F. Native of Peru. 

Geranium-like Penny-wort. Pl. cr.

23 H. multifida (Rich. hyd. no. 44. f. 34.) plant glabrous; leaves palmately cut; segments 5, somewhat 3-lobed; middle segment the longest; peduncles glabrous, longer than the pedicels, which are pilose; umbels 3-5-flowered; flowers distinctly pedicellate; fruit glabrous, quite smooth, finely villous. 

Loose-flowered Penny-wort. Pl. cr.

24 H. B. Native of New Holland. 

25 H. Bonplandii (Rich. hyd. no. 27. f. 7.) plant hairy; leaves reniform, 9-nerved, doubly crenated; petioles an inch long, about equal in length to the pedicels; umbels 10-12-flowered; flowers distinctly pedicellate. 

26 H. B. Native near Santa Fe de Bogota, H. B. et Korth, nov. gen. amer. 5. p. 24. 

Var. B. Chilenensis (Cham. et Schlecht. in Linnaea. 1. p. 263.) umbels more dense; pedicels very short; leaves 7-lobed, 7-lobed; petioles an inch and a half long. 

27 H. B. Native of Chili, near Talcahuano. 

Bonpland's Penny-wort. Pl. cr.

28 H. Mexicana (Cham. et Schlecht. in Linnaea. vol. 5. p. 208.) stems creeping; branches erect; leaves reniform, usually 9-nerved, deeply lobed, hairy; umbels on long peduncles, many flowered, loose, globose; hairs on the pedicels and peduncles reversed; styles spreading. 

29 H. B. Native of Mexico, near Jalapa in shalby woods. Said to be allied to H. leucocophala et H. B. Bompordii. 

Mexican Penny-wort. Pl. cr.

30 H. dumetia (Pohl, in litt. 1823. ex D. C. prod. 4. p. 62.) plant creeping, glabrous; leaves on long petioles, reniform, nearly orbicular, broadly crenated, 9-nerved; peduncles length of the petioles; umbels 20-flowered; flowers distinctly pedicellate; fruit ribbed, emarginate at both ends. 

27 H. B. Native of Brazil. Leaves nearly like those of H. Americana, but differs in the flowers being umbellate, not capitate. 

Penny-wort. I. Hydropityle. 

§ 3. Native Penny-wort. Pl. tr.

28 H. leucocophala (Cham. et Schlecht. in Linnaea. 1. p. 364.) plant creeping; leaves orbicularly reniform, usually 9-nerved, doubly toothed or crenated, beset with a few scattered hairs on both surfaces, as well as on the peduncles and petioles; umbels 20-30-flowered, nearly globose; flowers distinctly pedicellate; mericarps of fruit smooth; at first cream-coloured, and acutely 3-ribbed. 

28 H. B. Native throughout the whole of Brazil. 

White-headed Penny-wort. Pl. cr.

29 H. natans (Cyr. pl. rar. neap. 1. t. 6. f. β.) plant creeping, glabrous; leaves orbicular, with a narrow coriaceous recess, reniform, bluntly and unequally 9-11-lobed, and 9-11-nerved, crenated; peduncules much shorter than the petioles; umbels capitulate, 5-6-flowered; flowers on short pedicels. 

28 H. B. Native of the kingdom of Naples, in bogs, ditches, and rivers; and in the river Anapo near Syracusa, and elsewhere in Sicily; Dombey gathered the same plant in Peru, and Chamisso at St. Francisco in North California.—Column. ephr. p. 316. with a figure. 

30 H. Multifida (Rich. hyd. no. 44. f. 34.) plant glabrous; leaves palmately cut; segments 5, somewhat 3-lobed; middle segment the longest; peduncles glabrous, longer than the petioles, which are pilose; umbels 3-5-flowered; flowers distinctly pedicellate; fruit glabrous, distinctly villous, with 2 ribs on both sides. 

29 H. B. Native of New Granada, on the Andes, in humid shady places near Almaguer. 

29 H. Multifida-leaved Hydrocotyle. Pl. cr.

32 H. B. Native of Brazil. 

28 H. A. Native thinly hairy, sometimes the lower ones of the plant are only 1-flowered. 

29 H. A. Native of Mexico, near Jalapa in shalby woods. Said to be allied to H. leucocophala et H. Bompordii. 

Asiatic Penny-wort. Pl. cr.

30 H. repanda (Pers. ench. 1. p. 309.) plant villous; leaves cordate, reniform, on long petioles, 9-nerved, repandly toothed; petioles villous, much exceeding the peduncles; umbels capitulate, 3-flowered; fruit orbicular, furnished with 4 ribs on each side. 

29 H. B. Native of Louisiana, Carolina, Georgia, Chili, and the West India Islands, in humid and inundated places. 

29 H. B. Native of Chili, near Talcahuano. 

Bonpland's Penny-wort. Pl. cr.

32 H. díásteá (D. C. prod. 4. p. 63.) plant glabrous; leaves distant, on short petioles, reniform, 7-9-toothed, nearly veinless; umbels opposite the leaves, on short peduncles, 2-flowered; fruit flatly compressed, obicularly cordate, with the mericarps having 2 ribs on both sides. 2. B. F. Native of New Holland, at King George's Sound. Stems weak, dichotomous, climbing a little. Leaves hardly twice the size of the fruit. Pedicels of the fruit longer than the peduncles of the umbel.

Two-flowered Penny-wort. Pl. trailing or climbing.

33 H. ábbreviáta (Rich. hydr. no. 17. f. 19.) leaves reniform, with a broad recess, shorter than broad, with 9-11 crenatures, 7-nerved, glabrous; petioles pubescent, longer than the limbs; peduncles longer than the petioles; fruit rather turgid, furnished with 4 ribs on each side, reticulated. 2. B. F. Native of Madagascar and Cochín-china, in humid places. Trissanthus Cochín-chinese, Loud. rich. p. 175. Stems tufted, creeping. Petioles 7-8 lines long; limbs of leaves 6 lines broad, and 3 lines long. Pedicels an inch long. Involucrums 2-leaved. Very nearly allied to H. déntátum, but differs in the leaves being much shorter.

Short-leaved Penny-wort. Pl. cr.

34 H. nummularídeas (Rich. hydr. no. 11. f. 9.) leaves cordately reniform, 5-nerved, wholly or nearly so, with a narrow recess; petioles pubescent, longer than the limbs; umbels capitate, 3-flowered, on short peduncles; fruit orbicular or subglobose, striated. 2. B. S. Native of the Island of Bourbon, creeping along river banks. H. Asiática var. Cham. et Schlect. 1. c. Leaves 4-5 lines in diameter. Petioles 8-12 lines long. Peduncles 2-3 lines long. The central flower in each umbel is fertile, and the 2 lateral ones sterile. Moneywort-like Penny-wort. Pl. cr.

35 H. hébecaréa (D. C. prod. 4. p. 63.) leaves orbicularly reniform, toothed at the base, 7-9-nerved, crested at the apex, glabrous, on long petioles; surculi sarmentose, prostrate; pedicels axillary, villous, much shorter than the petioles; umbels capitate, few-flowered; fruit villous, reticulated; mericarps furnished with 2-3 ribs on each side. 2. B. F. Native of the Island of Timor. Petioles of radical leaves 4 inches long; limbs of leaves 2 inches broad. Three of the fruit in each umbel coming to perfection, rather large.

Hairstrewn Penny-wort. Pl. cr.

36 H. inéguípes (D. C. prod. 4. p. 63.) leaves when young, rather villous, but glabrous in the adult state: radical ones on long petioles, with a reniform crested 9-nerved limb, and a broad recess; umbels radical, on very short incurved, rather villous peduncles; leaflets of involucrum 2, ovate; fruit glabrous; mericarps furnished with 4 stripes on each side. 2. S. Native about Rio Janeiro. Petioles of radical leaves nearly a foot long. Peduncles half an inch long. Stems short, rather sarmentose, bearing leaves, which stand on short petioles. Unequal-petioled Penny-wort. Pl. 1 foot.

37 H. pállida (D. C. prod. 4. p. 65.) leaves reniform, glabrous, broadly and shortly crenate-toothed; petioles rather dilated at the base, longer than the peduncles; leaves of involucrum 2, ovate, obtuse, glabrous; umbels 3-flowered. 2. B. F. Native of the Cape of Good Hope. Burch. cat. geog. no. 1907. Fruit cordate, truncate at the apex, marked on both sides by 3 veins. Alnud. to H. invosstra, pale green.

Var. ? subíntegra (D. C. prod. 4. p. 63.) leaves nearly entire, broadly reniform; peduncles rather villous, shorter. 2. B. F. Native of the Cape of Good Hope.

Pales Penny-wort. Pl. prostrate.

38 H. brevípes (D. C. prod. 4. p. 63.) stems elongated, prostrate, rooting at the nodi; leaves on long petioles, reniform, with broad large obtuse lobe-like teeth, pilose above, and on the petioles, smoothish beneath; peduncles axillary, very short; umbels few-flowered, capitate, villous. 2. S. B. Native of Jamaica. H. leúptostachys ex Jamaica, Spreng. syst. 1. p. 876. Allied to H. eriántha, but differs in being prostrate, as well as to H. macródus, but differs in the teeth of the calyx being blunt; also to H. leúptostachys, but the inflorescence is truly distinct. Short-peduncled Penny-wort. Pl. prostrate.

39 H. fráctaeá (D. C. prod. 4. p. 668.) leaves reniformly cordate, bluntly crenate, on long petioles; nerves, peduncles, and peduncles rather hairy; peduncles much shorter than the petioles; umbels capitate, 2-3-flowered; leaves of involucrum 2, permanent, ovate, rather villous on the outside; mericarps very much compressed, reticulately 3-5-nerved, having the back hairy at the apex. 2. S. Native of Africa, at Cape Verd, in marshes at Khami. Allied to H. eriántha and H. pállida.

Breasteed Penny-wort. Pl. cr.

Hairy-flowered Penny-wort. Pl. sarmentose.

41 H. macródus (Spreng. syst. 1. p. 877. exclusive of the synonyms,) the whole plant covered with spreading hairs; leaves cordately reniform, coarsely 3-9-toothed: teeth or lobules acute, equal, quite entire; peduncles shorter than the pedioles; umbels capitate, few-flowered; leaves of involucrum 2, large, ovate, acuminate, pilose; fruit ovate, with many ribs, wrinkled. 2. G. Native of the Cape of Good Hope,1. Native of the Cape of Good Hope; allied to H. eriántha, but easily distinguished from it by its smoothness, by the teeth of the calyx being acute, and by the nerves of the leaves being 5, not 7, &c.

Beautiful-toothed-leaved Penny-wort. Pl. prostrate.

42 H. americána (Lin. spec. 234.) plant quite glabrous; leaves orbicularly reniform, a little lobed, doubly crenated, 9-nerved; umbels capitate, 3-flowered; upper ones nearly sessile; lower ones on short peduncles. 2. B. H. Native of North America, in boggy or swampy places, from Canada to
UMBELLIFERÆ.

Carolina; and probably of South America, if the synonym of Laetia, itin. p. 281. is referable to the species. Lam. dict. 3. p. 152. Rich. hydr. no. 19. f. 10. Spreng. umb. no. 3. t. 2. f. 3.

*Var. a, flexicaulis* (Michx. fl. bor. amer. 1. p. 162.) stems more firm, shorter, and as if they were flexuous.

*Var. b, gracilis* (Michx. l. c.) plant more slender, filiform, not flexuous; leaves smaller.

44. *H. Multicaulis* (Pohl, in litt. 1828, ex D. C. prod. 4. p. 64.) plant creeping; leaves on long petioles, glabrous, reniformly orbicular, 7-nerved, and somewhat 9-lobed: each lobe with 3 crenatures; petioles shorter than the peduncles, both bearded with pili at the apex; umbels capitulate, 15-20-flowered; fruit glabrous, ribbed, emarginate at both ends. *γ.* B. S. Native of Brazil. Leaves and inflorescence like those of *H. Americana.*

Many-stemmed Penny-wort. Pl. cr.

45. *H. rotundifolia* (Roxb. hort. beng. p. 21.) plant tufted and creeping; leaves petiolate, reniformy orbicular, 7-nerved, bluntly 7-lobed, dentately crenated, hispid beneath, glabrous above; umbels opposite the leaves, nearly sessile, 7-9-flowered; fruit glabrous, acutely 5-ribbed. *γ.* B. F. Native of the east of Bengal, in Silhet. Petioles twice the length of the limbs of the leaves, and are as well as the stems glabrous.

Round-leaved Penny-wort. Pl. cr.

46. *H. tenei* (D. Don, prod. fl. nep. p. 182.) plant tufted and creeping; leaves reniform, somewhat 7-lobed, crenated, quite glabrous, shining; umbels capitulate, sessile, few-flowered.

*γ.* B. H. Native of Nipal. Allied to *H. nitidula,* but differs in the leaves being less lobed, in the petioles being shorter, and in the umbels being sessile.

Pilant Penny-wort. Pl. cr.

47. *H. Ala* (Rich. hydr. no. 50. f. 28.) plant quite glabrous; stems erect, winged, compressed; leaves cordate, bluntly hastate, on short petioles; peduncles longer than the petioles; umbels 4-6-flowered; pedicles quite distinct; fruit lenticular, compressed, furnished with 10 ribs on both sides. *γ.* B. F. Native of New Holland. H. pusilla, R. Br. incert. but not of Rich.

Winged Penny-wort. Pl. ½ to 1 foot.

48. *H. muscosa* (R. Br. in Rich. hydr. no. 45. f. 27.) plant rather hairy; leaves palmate; segments 5-5, narrow, cuneated, tridentate at the apex; peduncles shorter than the petioles; umbels somewhat capitatum, 6-8-flowered, fruit orbicular, rather compressed, having 2 ribs on both sides. *γ.* B. F. Native of New Holland. Petioles nearly an inch long, glabrous.

Mossy Penny-wort. Pl. cr.

49. *H. Tripilata* (R. Br. in Rich. hydr. no. 46. f. 25.) plant rather pilose; leaves palmate; segments 3, cuneated, deeply toothed; lateral ones usually bifid; peduncles much shorter than the petioles; umbels rather capitatum, 6-10-flowered; fruit orbicular, didymous, furnished with 2 ribs on both sides. *γ.* B. F. Native of New Holland. Slowly nearly sessile in the umbel, but after the flowers have decayed the pedicels lengthen a little.

Tripilate-leaved Penny-wort. Pl. cr.

*** Umbels capitatum, many-flowered, especially with from 8 to 50 nearly sessile flowers.

I. HYDROCYTONE.

51. *H. Polyphylla* (D. C. prod. 4. p. 65.) plant trailing, rooting at the joints; leaves orbicular, cordate, with a narrow recess, crenated, 9-11-nerved, glabrous on both surfaces, as well as on the petioles; peduncles villous at the apex; umbels 20-flowered, densely capitata; pedicels elongated after flowering, the fruit is therefore pedicellate; fruit orbicular, minutely dotted; mericarps furnished with one rib on each side. *γ.* B. S. Native of Brazil, in the neighbourhood of Rio Janeiro. Peduncles shorter than the petioles, rarely longer. The disposition of the flowers is intermediate between the first and second division of the genus.

Many-rooted Penny-wort. Pl. cr.

Thickened Penny-wort. Pl. cr.

53. *H. Nefalennis* (Hook. exot. fl. 1. t. 30.) the whole plant scabrous from short scattered hairs; leaves orbicular reniform, 7-lobed, crenately toothed; flowers monoeocious; umbels globose, many flowers, dense; fruit turbid, without ribs. *γ.* B. H. Native of Napal, in wet places. Some of the umbels apparently contain only male flowers, while others contain only female ones; these flowers are on short pedicels while young, but afterwards these pedicels gradually lengthen out. It comes very near to *H. capitata,* and according to Sprengel is probably not distinct from it.

*Var. a, brevipes* (D. C. prod. 4. p. 65.) peduncles at their greatest length shorter than the petioles.

*Var. b, longipes* (D. C. l. c.) peduncles when bearing the fruit longer than the petioles. H. hispida, D. Don, fl. nep. p. 189.

Capitate-flowered Penny-wort. Pl. cr.

55. *H. Globifera* (Ruiz et Pav. fl. per. 3. p. 25. t. 247. f. a.) plant hairy from short down; leaves roundish-reniform, 13-nerved, rather lobulate, crenated; peduncles a little shorter than the petioles; umbels globose, many flowers. *γ.* B. F. Native of Peru, in humid places in woods by stagnant water, near Muna. Nerves of leaves and fruit fulvous. Leaves of involucrum numerous, linear, and short. Flowers in each umbel about 200.

Globeflower Penny-wort. Pl. cr.

56. *H. Citriodora* (Ruiz et Pav. fl. per. 4. p. 26.) leaves reniform, 7-9-lobed, crenated, and are, as well as the pedicels, hairy, but pubescent beneath, as well as on the branches; peduncles densely villous, length of the petioles; umbels small, many flowers, globose. *γ.* B. F. Native of Chili, in shady humid places about Concepcion; and of Peru, in the tract of Huanao, as well as of Brazil according to Pohl.

Citrus-scented Penny-wort. Pl. cr.

57. *H. Ranunculoides* (Linn. fil. suppl. p. 177.) plant glabrous; leaves orbicularly reniform, 5-nerved, and somewhat 5-lobed; lobes obtuse, somewhat crenated: middle lobe more prolonged than the rest; peduncles shorter than the petioles; umbels 5-12-flowered; flowers pedicellate. *γ.* B. H. Native of North America, in Pennsylvania and Mexico; and of South
UMBELLIFERÆ. I. HYDROCOTYLE.

Shining-leaved Penny-wort. Pl. cr. 59 H. sinuiformis (Lam. dict. 3. p. 155.) plant quite glabrous; leaves orbiculiferum, doubly crenated, 3-lobed, 7-lobed, 7-nerved; peduncules slender, about equal in length to the pediolo; umbels 6-8-flowered, capitate; fruit rather dilyvidous, furnished with 2 ribs on each side. 0. F. Native of the Mauritius. Cham. et Schlecht. in Linnae. 1. p. 273. in a note. H. ranunculoides β, Schultes, syst. 6. p. 349. Chondrocarpus sinuiformis, Sweet, hort. brit. p. 185.

Silbithorin-like Penny-wort. Pl. May, July. Cat. 1806. Pl. cr. 60 H. e'legans (Rich. hydr. no. 33. f. 32.) plant glabrous; leaves semi-cleft: lobes tridentate at the apex; peduncules 3 times shorter than the pediolo; umbels capitate, 6-8-flowered; fruit dilyvidous, furnished with 2 ribs on each side. 2. B. F. Native of New Holland. Leaves 4 lines in diameter: pediolo nearly an inch long.

Elegant Penny-wort. Pl. cr. 61 H. pulchella (R. Br. in Rich. hydr. no. 34.) plant glabrous; leaves reniform, rather petiolate, 5-nerved, 5-lobed: lobes bluntly tridentate; peduncules equal in length to the pediolo; umbels capitate, 10-flowered; fruit dilyvidous, furnished with 2 ribs on each side. 2. B. G. Native of New Holland, near Port Jackson. Petiolo an inch long. Heads of flowers small.

Nest Penny-wort. Pl. cr. 62 H. nitidula (Rich. hydr. no. 35. f. 33.) plant quite glabrous; leaves orbiculiferum, 5-7-lobed: lobes tridentate; pediolo 2 or 3 times longer than the peduncules; umbels capitate, 6-10-flowered. 2. B. S. Native of Java. Hook. exot. fl. 1. t. 29. Allied to H. pulchella. Perhaps the same as H. ranunculoides var. incisa, Blum. bijdr. p. 884.

Small-shining Penny-wort. Pl. cr. 63 H. minutula (Pohl, in litt. 1828. ex D. C. prod. 4. p. 66.) stems creeping; leaves on short petiolo, orbicular, cordate, with a narrow recess, crenated, 7-nerved, pilose above, and on the upper part of the petiolo; peduncules rather pilose, 3 times longer than the petiolo; umbels 8-10-flowered, rather capitate; fruit small, roundish. 2. B. F. Native of Brazil. Petiolo 2 lines long. Limb 2-3 lines in diameter. There is a variety with glabrous leaves according to Pohl.

Minute Penny-wort. Pl. cr. 64 H. indecora (D. C. prod. 4. p. 668.) stems creeping, smoothish; petiolo hairy, 5 times longer than the limbs of the leaves, which are orbiculiferum crenate, 3-lobed, toothed, and rather pilose; peduncules hairy, a little shorter than the petiolo; fruit small, ovate, glabrous, densely aggregate into a globose head; mericarps furnished with one rib on each side. 2. B. F. Native of Chili. Poepp. pl. exsic. no. 98. Habit of H. sinuiformis or H. minutula.

Undecked Penny-wort. Pl. cr. 65 H. heteromera (Rich. hydr. no. 36.) plant glabrous; leaves reniform, 7-nerved, 7-lobed: lobes obtuse, crenate; pediolo much shorter than the petiolo, which are flaccid; umbels 6-8-flowered, capitate; fruit smooth on one side, and tubercular on the other, wrinkled and discoloured, furnished with one rib on both sides. 2. B. H. Native of New Zealand. H. flaccida, R. Br. mss. Petiolo 2-4 inches long.

Variable-parted Penny-wort. Pl. cr. 66 H. compacta (Rich. hydr. no. 27.) plant villous; leaves orbiculiferum, small, 7-11-flowered, deeply toothed; peduncules very short, in fascicles; umbels 15-20-flowered, densely capitate; fruit rather dilyvidous, furnished with 2 ribs on each side. 2. H. Native of New Zealand. H. capitata, Banks and Sol. mss. but not of Pet. Th.

Compact-headed Penny-wort. Pl. cr. 67 H. peduncularis (R. Br. in Rich. hydr. no. 38. f. 26.) leaves small, orbiculiferum, deeply toothed, rather 5-5-lobed, glabrous above, hairy beneath; peduncules equal in length to the petiolo; umbels capitate, 6-8-flowered; fruit lenticular, with 2 nearly obsolete ribs on both sides. 2. B. F. Native of New Holland. Perhaps the same as H. peduncularis, Sieb. nov. holl. exsic. no. 114. which is said to be glabrous; or it is perhaps referrible to H. pulchella.

Peduncular Penny-wort. Pl. May, Aug. Cat. 1828. Pl. cr. 68 H. intertexta (R. Br. in Rich. hydr. no. 39.) plant glabrous; leaves irregularly 3-5-lobed, 3-5-flowered: lobes denticulate: middle lobe more prolonged than the rest; pediolo and peduncules equal among themselves; umbel densely capitate, 12-15-flowered; fruit scabrous from wrinkles, furnished with 2 ribs on both sides; carpophore permanent, undivided. 2. F. Native of New Holland.

Interweven Penny-wort. Pl. cr. 69 H. nauta (R. Br. in Rich. hydr. no. 40.) leaves orbiculiferum, hairy on both surfaces, 7-nerved, 7-lobed, crenate; pediolo hairy; peduncules one-half shorter than the petiolo; umbels densely capitate, 20-flowered; fruit rather dilyvidous, furnished with 2 ribs on each side. 2. B. F. Native of New Holland. Leaves distant. Petiolo hardly an inch long. Stipulas membranous, permanent.

Iairy Penny-wort. Pl. cr. 70 H. nova-zeelan(dle) (D. C. prod. 4. p. 67.) leaves orbiculiferum, hairy on both surfaces, as well as on the petiolo, 7-nerved, obliquely 7-lobed, acutely and irregularly toothed; peduncules glabrous, 4 times shorter than the petiolo; umbels densely capitate, 10-12-flowered; fruit rather dilyvidous, furnished with one rib on each side. 2. ? H. Native of New Zealand. Petiolo 12-15 lines long. Stipulas as in H. hirta.

New-Zealand Penny-wort. Pl. cr. 71 H. densiflora (D. C. prod. 4. p. 66.) plant hairy; leaves orbicular, cordate at the base, 7-9-nerved, 7-9-lobed: lobes broad, hardly acute, a little toothed; peduncules opposite the leaves, about equal in length to the petiolo; umbels densely capitate, 30-40-flowered; fruit rather dilyvidous, and are as well as the pedicels glabrous; mericarps furnished with one rib on both sides. 2. ? F. Native of New Holland. Nearly allied to H. hirta, but differs from it in the pedicels being the length of the petiolo, not very short, and in the leaves being cordate, not reniform.

Dense-flowered Penny-wort. Pl. cr. 72 H. hirsuta (Blum. bijdr. p. 884. but not of Swartz nor Spreng.) stems creeping; leaves orbiculiferum, cordate, somewhat 5-lobed, crenate, villosous; umbels capitate; 7-11-flowered, pedunculate, usually mitrate; mericarps furnished with 3 ribs. 2. ? S. Native of Batavia, in grassy places by the sea side. It differs in the inflorescence from H. hirsuta of Swartz, which is the H. spicata of Lam. H. hirsuta of Spreng. is a congers of species very different from each other.

Iairy Penny-wort. Pl. cr. 73 H. globata (Blum. bijdr. p. 885.) stems creeping; leaves roundish-cordate, angular, and are, as well as the pedicules,
UMBELLIFERÆ. I. Hydrocotyle.

Flowers disposed in verticillate interrupted spikes.

81 H. spicata (Lam. dict. 3. p. 153.) leaves reniformy cor- 
date, roundish, 7-nerved, crenated, rather hairy on both surfaces 
from scattered hairs; petioles and peduncles hairy, 
peduncles 3 
times longer than the petioles; flowers in glomerate whorles, 
disposed in interrupted spikes; fruit didymous, without ribs. 2. ? B. S. Native of St. Domingo and Porto Rico, &c. 
in humid parts of mountain woods. Rich. hydr. no. 25. f. 15. 
occ. 2. p. 560. but not of Spreng. nor Blum.

82 H. braehysta-chya (D. C. prod. 4. p. 68.) stems filiform, 
low, smoothish; leaves reniform-roundish, 7-nerved, crenated, 
pilose on both surfaces; petioles shorter than the leaves, hairy; 
peduncles twice the length of the petioles, hairy; spikes oblong, 
continuous; fruit didymous, without ribs. 2. ? S. Native of 
St. Domingo.

Short-spiked Penny-wort. Pl. cr. 
83 H. letofsa-chya (Rich. hydr. no. 26. t. 16. exclusive of 
the country,) leaves reniform, 7-nerved, crenated, rather pilose 
above, glabrous beneath; petioles nearly 3 times longer than 
the limbs, and are, as well as the peduncles, pilose; flowers 
disposed in interrupted spikes, with the whorles of flowers very 
remote; fruit orbicular, didymous, without ribs. 2. B. S. Native 
of Cuba, in humid places near the Havana. H. B. et Kunth. 
ov. gen. amer. 5. p. 23. Spreng. syst. 1. p. 875. exclusive of 
the variety from Jamaica. Very like H. spicata, but differs in 
the leaves being glabrous beneath, in the whorles being remote, 
and containing few flowers; and in the peduncles not exceeding 
the leaves.

Slender-spiked Penny-wort. Pl. cr. 

Sect. II. Centella (meaning unknown to us). Lin. gen. 1051. 
Lag. obs. aparas. 26. D. C. prod. 4. p. 68. Stems shrubby, erectis- 

t. Leaves cuneated at the base, with the exception of only one 
species, neither peltate nor cordate, as in the first section. Fruit 
less compressed, with many ribs.—This section will perhaps form 
a distinct genus when the fruit of the species is better known.

* Petals villous.

84 H. villosa (Lin. fil. suppl. p. 175.) the whole plant more 
or less villous; leaves cordate, acute, nearly entire, 3-nerved; 
stem erectish, branched; peduncles shorter than the pedioles; 
umbels 3-flowered, capitule. 5. G. Native of the Cape of 
Good Hope. Thunb. diss. 2. p. 413. Cham. et Schlecht. l. c. 
p. 273. Mercurealiis Afra, Lin. mant. p. 298. Centella villosa, 
Lin. syst. veg. 13. p. 708. There is a larger variety with leaves 
an inch long, and a smaller variety with leaves hardly 3-4 lines 
long. Leaves nearly entire, obtuse, with a little point. Pedicels 
1-flowered, some of them shorter than the petioles, but usually 
longer.

diss. 2. p. 415. t. 3.) the whole plant clothed with tomentum; 
leaves oblong-cuneiform, narrow, 3-5-toothed at the apex; stem 
erectish; peduncles rising in fascicles, very short; fruit elliptic, 
compressed, furnished with 4 ribs on each side. 5. G. Native of 
prod. p. 34. Allied to H. villosa from the villous petals, and to 
H. Solidandra in the form of the leaves.

Tridentate-leaved Penny-wort. Pl. ½ foot.

* * Petals glabrous.

86 H. tri'loba (Thunb. diss. 2. p. 416. t. 3.) plant gla- 
brous; leaves broadly wedge-shaped, 3-5-nerved, 3-5-toothed 
at the apex; teeth broad, acute; peduncles shorter than the

87 H. SOLA'NDRA (Lin. fil. suppl. 176.) the whole plant clothed with hoary tormentum, the petals only excepted; leaves petiole, obliquely cuneiform, bluntly 7-toothed at the apex; umbels pedunculate, 3-5-flowered; flowers on short pedicels; leaves of involucrum ovate-lanceolate, glabrous inside. 7. G. Native of the Cape of Good Hope, on hills. Lam. dict. 3. p. 155. Rich. hydr. no. 55. H. tormentosa, Thunb. (c. 2. p. 416. Spreng. in Schultes, syst. 6. p. 593. Solanda Capéminis, Lin. spec. 1407. exclusive of the synonymes. Perhaps numerous species are here confused.

Var. a, lângipes (D. C. prod. 4. p. 69.) peduncles exceeding the leaves in length.

Var. $\beta$, comminimis (D. C. l. c.) peduncles length of the leaves. —Lam. ill. t. 188. f. 5. Sieb. cap. excis. no. 140.

Var. $\gamma$? longifolia (D. C. l. c.) peduncles much shorter than the leaves; leaves cuneate, elongated. Native of the Cape of Good Hope. Burchell. Perhaps a proper species.

Solander's Penny-wort. Pl. $\frac{1}{4}$ foot.

88 H. CENTÉLLA (Cham. et Schlecht. in Linna. 1. p. 375.) plant shrubby; leaves oblong, cuneate or lanceolate, 3-nerved, quite entire; umbels pedunculate, 3-5-flowered, with usually only one male flower; leaves of involucrum ovate-lanceolate; petals glabrous. 7. G. Native of the Cape of Good Hope, where the plant varies much in form and habit.

Var. $\beta$, lânejflóa (D. C. l. c.) leaves glabrous, cuneiformly oval. H. buleucreofoia, Rich. hydr. no. 55. f. 59.

Var. $\delta$, plantâgenêa (D. C. l. c.) leaves lanceolate from hairs, oblong. H. plantaginéa, Spreng. neue entl. 1. p. 284. grundz. t. 8i. f. 5-7.

Centella Penny-wort. Pl. $\frac{1}{4}$ foot.

89 H. MONTÁNA (Cham. et Schlecht. in Linna. 1. p. 374.) plant shrubby, when young villous, at length glabrous; leaves lanceolate, quite entire or somewhat tridentate, 3-nerved; petioles villous; umbels 3-flowered, on short pedicels; leaves of involucrum 2, twice the length of the nearly orbicular corolla fruit. 7. G. Native of the Cape of Good Hope, on the tops of mountains. A humble depressed branched shrub. Medicars tumid, with 5 filiform ribs, and flatish furrows.

Mountain Penny-wort. Shrub depressed.

90 H. virgá'ta (Lin. fil. suppl. p. 176.) plant shrubby, erect, branched; leaves linear-liniform, quite entire; umbels pedunculate, 1-5-flowered; flowers hardly pedicellate; leaves of involucrum lanceolate; fruit orbicular, orbiculate, furnished with 2 ribs on opposite sides. 7. G. Native of the Cape of Good Hope, et Cham. et Schlecht. in Linna. 1. p. 379.

Var. a, glâbrescens (D. C. prod. 4. p. 69.) plant twiggy, quite glabrous; flowers pentameros and monoecious. H. virgá'ta, Lam. ill. t. 188. f. 5. Spreng. syst. 1. p. 878.

Var. $\beta$, lânejflóa (D. C. l. c.) plant twiggy, clothed with lanuginous villi; flower polygamo-monoecious; leaves expanded into linear lamina at the apex. Cham. et Schlecht.

Var. $\gamma$, macrâcorpa (D. C. l. c.) plant twiggy, glabrous; flowers polygamo-dioecious; fruit larger.—H. macrâcorpa, Rich. hydr. no. 57. f. 40.—Pluk. alm. t. 310. f. 7.

Var. $\delta$, nana (D. C. l. c.) plant short, glabrous; flowers polygamo-dioecious.

Twiggy Penny-wort. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

† Species not sufficiently known.

91 H. flu'tâns (D. C. prod. 4. p. 69.) stems submersed, straight, fissilur; leaves peltate, orbicular, shining, floating; petioles thickened from the base to the apex. 7. W. H. Na- tive of Louisiana, floating in lakes and tranquil rivers, through immense tracts. H. incrassâtum, Rafin. fil. lud. p. 81. but not of Ruis and Pav. Hydrocotyle Robín, Louis, p. 461. ex Rafin. It grows also in water in Florida, very common. The stems have numerous fibres, issuing from the joints. The leaves are on long petioles, orbicular, peltate, and 15-20-nerved, glabrous, bluntly somewhat lobed and crenated. Very like H. nâtans, but differs in the leaves being peltate.

Floating Penny-wort. Pl. floating.

92 H. hederâfoliâ (Burch. cat. geogr. no. 558. trav. 1. p. 46.) plant decumbent, villous; leaves reniform, 3-5-angled; angles acute. 7. G. Native of the Cape of Good Hope. The rest unknown.

Teg-leaved Penny-wort. Pl. decumbent.

93 H. racemósâ (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 4. p. 70.) plant glabrous; leaves petiole, orbicularly re- niform, broadly crenated, with a narrow recess; peduncles twice the length of the leaves; flowers pedicellate, verticillate, disposed in interrupted racemes; fruit nearly globose. 7. F. Native of Mexico. Stems creeping. Leaves rising from the nodi of the stems in fascicles; petioles 15-15 lines long. Allied to H. interrâõpia, but the leaves are not peltate; and H. spiclâta, but the flowers are evidently pedicellate.

Racemose-flowered Penny-wort. Pl. cr.

94 H. grumósa (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 4. p. 70.) plant glabrous; stems ascending; root grumose, fascicled; petals dilated and stem-clasping at the base; leaves orbicular, crenate, umbels in fascicles; flowers distinctly pedicellate. 7. B. F. Native of Mexico. Grumose-rooted Penny-wort. Pl.

95 H. pinatâfida (Spreng. pug. 2. p. 47.) stems erect, glabrous; leaves pinatitud; segments oblong, a little cut; umbels usually 3-flowered, involucrated.—Native country unknown. In Sprengel's subsequent works this plant is not admitted, and the name is omitted as a synonyme: it is therefore very doubtful.

Pinatifid-leaved Pennywort. Pl. ?

Cult. All the species are of the most easy culture, but require to be kept moist. The stove, greenhouse, and frame kinds should be grown in pots, under which should be placed pans of water.

Linn. syst. Pentândria, Digîânya. Tube of calyx nearly globose; limb very short or hardly any. Petals roundish, entire, obtuse. Styles obtuse. Fruit with the commissure nearly orbicular from the excavation; medicinal unequal, furnished with 3 ribs on the back (ex Nutt.), but according to Koch 8 filiform ribs: the lateral ones marginal, broader, thick
white and spongy inside; the channels between the ribs furnished with 1 brown distinct vitta each, and the commissure with 2 vittae.—Small, glabrous, creeping herbs. Leaves sessile, narrow, obtuse, quite entire, lined with 5 transverse nerves, as the seminal leaves and petals of *Eryngium* *cornutum*. Peduncles axillary, erect. Umbels simple, 8-10-flowered. Involutum 5-6-leaved. Flowers white, pedicellate, hermaphrodite, uniform.

$\gamma$. B. F. Native of Buenos Ayres. Differing from C. lineata remarkably in its much longer and attenuated foliage. Attenuated-leaved Crantzia. Pl. cr.

Cult. See Hydrocotyle above for culture and propagation.

III. Dimetop'ia (from $\epsilon_{\mu}$trω$\sigma$os, $\delta$metopos, having 2 faces; in reference to the mericarps of the fruit being unlike each other). D. C. prod. 4. p. 71.

Lin. syst. Pentandria, Digynia. Teeth of calyx obsolete. Petals ovate-oblong, entire. Styles short. Fruit didymous; mericarps nearly globose, rather contracted at the commissure, of unequal shape and size; the one mucroned with rows of blunt compressed tubercles, the other echinated by conical tubercles, which are drawn out at the apex into soft prickles. Seed?—An annual herb, hardly a finger in height. Stem short, branched, beset with scattered pili. Leaves triplicate; lobes cuneate, linear-oblong, bluntly tridentate at the apex, or trifid. Peduncles opposite the leaves, and longer than them. Umbels simple, usually 5-flowered. Involutum of 5 linear-lanceolate leaves, which are the length of the flowers. Flowers white.

Habit almost of *Eriogena*; the fruit agrees with that of *Sanicula*, and the petals with those of *Hydrocotyle*.

1. D. pusilla (D. C. l. c.). O. H. Native of New Holland, at King George's Sound, and at Port Western. Small Dimetopia. Pl. $\frac{3}{4}$ foot.

Cult. Sow the seeds in a warm sheltered situation, in the open ground.

IV. Eriogena (from $\epsilon$ρεγενεια, *erigeneia*, the name of Aurora, the harbinger of day or of the spring; in allusion to the early appearance of the plant in spring). Nutt. gen. amer. 1. p. 187. D. C. coll. mem. 5. p. 27. prod. 4. p. 71. —Hydrocotyle species, Pursh. and Spreng.—Sison, spec. of Michx.

Lin. syst. Pentandria, Digynia. Margin of calyx obsolete. Petals equal, obovate, expanded, entire. Styles permanent, subulate, very long. Fruit ovate-lanceolate, laterally compressed; mericarps gibbously convex, marked with 3 stripes; commissure flat, without a margin.—A small, smooth herb. Root tuberous, globose. Leaves 1-2, radical, petiolate, biternate. Umbels irregular, imperfect, 3-4-rayed; umbellules 2-3-flowered. True involucrewanting, but in place of it there is a multifid leaf; leaves of involucel few, unequal. Petals white. Anthers exerted, dark purple. This genus agrees with *Ammi* in the compound inflorescence, and with *Bunium* in the tuberos root.

IV. Eriogena. V. Micropleura. VI. Didiscus.

Bulbous-rooted Eriogena. Pl. $\frac{3}{4}$ foot.

Cult. This plant should be grown in a pot, under which should be placed a pan of water.

V. Micropleura (from $\mu$ςρoς, micros, small, and $\pi$λευρος, *pleura*, a rib; the ribs of the fruit are small and capillary). Lag. obs. apars. p. 15. D. C. coll. mem. 5. p. 27. prod. 4. p. 71.

Lin. syst. Pentandria, Digynia. Margin of calyx obsolete. Petals equal, entire, acute. Fruit deeply cordate at the base, rather foliaceous, emarginate at the apex; mericarps compressed from the sides, obliquely ovate, 7-ribbed; ribs capillary, curved, ventricose below; the marginal 2 are shorter, and form a straight line; the commissure is very narrow, one half shorter than the mericarps.—Canescent glabrous herbs, natives of Chili, with the habit of *Hydrocotyle*; but the umbels are rarely compound. Mericarps of fruit probably 9-ribbed, having 2 of them obsolete or hidden.

1. M. renifolia (Lag. l. c.). Native of the Island of Chiloe. Petioles dilated at the base. Leaves alternate, petiolate, coriaceous, 6-9-nerved, and veined, crenate, rather membranous. Umbels terminal, pedunculate, 4-5-rayed; involucre foliaceous, composed of 1 leaf; umbellules 3-4-rayed, surrounded by small, 3-4-leaved involucelles. Flowers 3, middle one fertile and nearly sessile, and the 2 lateral ones male, on short pedicels.

Kidney-leaved Micropleura. Pl. cr.

Cult. See *Hydrocotyle* for culture and propagation, p. 255.

VI. Didiscus (from $\epsilon$ς, dis, twice, and $\epsilon$ςως, dishos, a disk; the mericarps appear like 2 disks). D. C. coll. mem. 5. p. 28. t. 4. Hook. bot. mag. t. 2875.—Lämp. Lindl.—Hugîlia, Rebb. consp. t. 144.

Lin. syst. Pentandria, Digynia. Margin of calyx obsolete. Petals oval, entire, bluntish (f. 57. c.), imbricate in restitution. Styles diverging. Fruit nearly like that of *Biscutella*, hence the name, emarginate at the base; mericarps very much compressed from the sides, without any vitta, a little mucronate, or beset with dot-like hairs, 5-ribbed; ribs filiform: the 2 inner ones near the commissure, very short: the 2 middle ones short and curvilinear: and the dorsal one a little winged. Seed much compressed. Carpophore undivided.—Hersbs, natives of New Holland. Stems terete, branched. Leaves variously parted, or lobed: lobes rather cuneated, cut. Umbels simple. Involutum of many leaves, which are concrete at the base (f. 57. a.). Perhaps merely a section of *Trachymene*, but the margin of the calyx is obsolete, not 5-toothed; the petals obtuse, not acute, and the fruit is compressed, not inflated, &c.

1. D. ceruleus (Hook. bot. mag. 2875. D. C. coll. mem. 5. t. 4.) plant hairy; leaves petiolate, 3-parted; having the partitions 2-5-cleft, and the lobes 2-3-toothed; umbels simple, on long peduncles; involucre of many leaves, when young reflexed. O. F. Native of New Holland. Trachymene cyanaca, Cunningham, mis. Trachymene corulea, Graham, in edinb. phil. journ. 1828. Sept. p. 373. Lindl. bot. reg. no. 1225. Hugîlia cyanaca, Rebb. icon. exot. t. 201. Flowers blue; each umbel having

FIG. 57.
the appearance of a head of the flowers of *Scabiosa Caucásica*, but the flowers are on longer pedicels; pedicels, after flowering, twisted inwards, bearing the fruit, which lies within the involu-
cel, but erect at maturity. Fruit, when young, rather hairy, but in the adult state it is covered with minute tubercles. This is one of the most showy plants of the order.

**Blue-flowered Didiscus.** Fl. July, Sept. Cl. 1827. Pl. 1 to 2 feet.

2 *D. Alibíflórus* (D. C. prod. 4. p. 72.) plant glabrous; radial leaves on long petioles, palmate; segments dilated at the apex, cut, toothed; cauline leaves few, small; umbels simple, on long peduncles. **f.** G. Native of New Holland, at Port Jackson. Trachymène incisa, Rudge, in Linn. trans. 10. p. 300. t. 21. f. 2. Fruit much compressed, beset with minute tubercles. Petals white.

**White-flowered Didiscus.** Cl. 1819. Pl. 1/2 foot. Cult. Sow the seed of these plants on a slight hot-bed in spring, and when the plants are 2 inches high, plant them separately into small pots, and shift them from size to size of pots as they grow.

**Linn. syst. Pentántiádria, Digényia.** Margin of calyx 5-toothed. Petals elliptic, entire, acutish, straight at the apex, rather valvate in estivation; styles diverging. Fruit didymous, compressed, and contracted from the sides; mericarps gibbously convex, without any vestis, 5-ribbed; the 3 dorsal ribs and their channels mucrinated with tubercles; lateral ones marginal. Carpophore unliivered. Seed gibbously convex, flattish in front.—Herbs or subshrub, all natives of New Holland. Umbels compound, many-rayed; umbellules containing 3-12 flowers. Involucrum of many leaves. This genus agrees with *Hydrocély* in the fruit being compressed; the rest agrees with *Azorélla*. *Pranóthera* of Rudge agrees with this genus in habit, but the structure of the flowers is very different, and most probably belongs to the order *Tremángiæ*.

**Sect. I. Platyümene (from πλάτυς, platys, broad; stems compressed).** D. C. prod. 4. p. 72. Plant herbaceous. Stems much compressed. Leaves small, cut.

1 T. *Ánceps* (D. C. prod. 4, p. 73.) plant glabrous, nearly leafless; stem 2-edged, branched; leaves also at the tops of the branches cut into a few fine lobes. **f.** G. Native of New Holland. It agrees with *Thémpérissa* in the stem being compressed, but it is one half narrower, the leaves more finely cut, the umbel much slender. The fruit has not been seen, but the analogy of the herb with the following species is sufficient to indicate its belonging to the same genus.

**Two-edged-branched Trachymène.** Pl. 1 foot.

2 T. *Thémpérissa* (Spreng. umb. spec. p. 9. exclusive of the Chili specimen) plant glabrous, nearly leafless; leaves very few, small, binate or terninate: upper ones linear, entire; stem 2-edged, branched. **f.** G. Native of New Holland, on the sandy coast. Azorélla compréssa, Labill. nov. holl. 1. p. 75. t. 101. Fruit compressed, obovate; mericarps convex on the back, 5-ribbed; ribs wrinkled from the tubercles. Involucrium shorter than the pedicels.

**Compressed Trachymène.** Pl. 1 foot.

**Sect. II. Dendrome`ne (from ἕνεκος, dendron, a tree; in reference to the species being shrubby).** D. C. prod. 4. p. 73. Plants shrubby. Leaves entire.

3 T. *Lineáris* (Spreng. umb. spec. p. 7.) plant quite gla-

brous, shrubby; leaves scattered, erect, linear, subulate and acute at the apex. **f.** G. Native of New Holland, at Port Jackson. Siebl. pl. excis. nov. holl. no. 126. Azorélla linearifólia, Cav. icon. 5. t. 485. Azorélla linearifólia, Pers. ench. 1. p. 503. Fruit obovate, compressed; mericarps 3-ribbed; ribs rough from rows of tubercles. Flowers yellow.

**Linear-leaved Trachymène.** Fl. Ju. Aug. Cl. 1824. Sh. 1 to 2 feet.

4 T. *Theusius* (D. C. prod. 4. p. 73.) shrubby; branches te-

rete, beset with glandular hairs at the apex; leaves scattered, spreading, linear, acute; umbels few-flowered. **f.** G. Native of New Holland. Branches very slender. Leaves hardly ½ line broad, and 3-4 lines long. Umbel trifid; umbellules 1-5-flowered. Ribs of fruit sebaceous from tubercles. Flowers like *T. ericoides*.

**Slender Trachymène.** Shrub 1 foot.

5 T. *Subvélutina* (D. C. i. c.) shrubby; branches tere-
cete, linear, thickish, acute, velvety from short crowded down, as well as the branchlets; umbels crowded. **f.** G. Native of New Holland, at Port Jackson. The leaves are almost like those of *T. ericoides*, but differ in being velvety and eretic. Branches hardly diverging.

**Rafort-velutinae Trachymène.** Shrub 1 foot.

6 T. *Ercoides* (Siebl. pl. excis. nov. holl. no. 121.) shrubby; branches rather angular, glabrous; leaves linear, acute, spreading; umbels crowded. **f.** G. Native of New Holland. Branches numerous, spreading. Leaves a line broad, with the margins hardly revolute when dried. Umbels 5-cleft; umbellules 5-6-flowered. Fruit sebaceous from tubercles on the ribs.

**Heath-like Trachymène.** Shrub.

7 T. *Lanceola`ta* (Rudge, l. c. Spreng. syst. l. p. 879.) shrubby; branchlets rather angular, glandular, and velvety when examined by a lens; leaves lanceolate-linear, nervèd, erect; umbels crowded, many-flowered. **f.** G. Native of New Holland. Azorélla lanceolaíta, Labill. nov. holl. 1. p. 74. t. 99. Leaves an inch and a half long, and 3 lines broad. Leaves of the involucrum the length of the umbel. Umbils 5-8-rayed; umbellules 8-10-flowered. Branches sometimes terminated by an 8-10-flowered, simple umbel.

**Lanceolate-leaved Trachymène.** Shrub 1 foot.

8 T. *Myrtifóli`a* (Siebl. pl. excis. nov. holl. no. 125.) shrubby; branches rather angular, hardly glandular or puberulous, even when examined by a lens: leaves oval-oblong, rather attenuated at both ends; umbels crowded, many-flowered. **f.** G. Native of New Holland. Very nearly allied to *T. lanceolaíta*, but differs in the leaves being 9-10 lines long, and 3 lines broad. Umbels 8-10-rayed; umbellules 8-12-flowered.

**Myrtle-leaved Trachymène.** Shrub.

9 T. *Ovalis* (D. C. prod. 4. p. 73.) shrubby; branches densely clothed with short hairs; leaves oval, nervèd, scattered, nearly sessile, hardly attenuated at either end; umbels many-flowered, crowded. **f.** G. Native of New Holland. T. ováta, Spreng. umb. spec. p. 8. (exclusive of the syn. of Labill.). Siebl. pl. excis. nov. holl. no. 124. Perhaps only a variety of *T. myrtifóli`a*.

**Var. **β, **confécta (D. C. l. c.) leaves and branchlets much crowded. **f.** G. Native of New Holland, at Port Jackson. Perhaps a proper species.

**Oval-leaved Trachymène.** Shrub 1 foot.

10 T. *Ováta* (Rudge, l. c. but not of Spreng. nor Siebl.) shrubby: branches smoothish; leaves broadly ovate, nearly sessile, hardly longer than broad; umbels crowded, many-flowered.

**L I**
UMBELLIFERÆ. VII. TRACHYMENE. VIII. Astrotricha. IX. Xanthosia. X. Bowlesia.

G. Native of New Holland. Azorëllá ovata, Labill. nov. holl. p. 74. t. 100. T. buxifolia, Sieb. pl. excis. nov. holl. no. 122. Leaves 4 lines long, and 3 lines broad. Umbels much crowded, small, 8-10-rayed.

Ovate-leaved Trachymene. Shrub.

Cult. All the species of Trachymène will grow well in a mixture of loam, peat, and sand; and they may be increased by cuttings, under a hand-glass, or by seeds.

VIII. ASTROTIRCHA (from aor, astron, a star, and thrís thrichos, a petiole; or in allusion to the stamens) D. C. coll. mem. 5. p. 29. 3. May. 6. prod. 4. p. 74. —Bolax species, Sieb. 

Lin. syst. Pentandria, Digynia. Tube of calyx ovate; limb small, hardly 5-toothed. Petals ovate, acutish (f. 58 b), permanent, flat, velvety from stellate down on the outside. Styles 2, filiform (f. 58 c.), not gradually thickening to the base. Fruit crowned by the calycine lobules and petals; mericarps ovate-oblong, contracted at the commissure; ribs very blunt, hardly prominent; of the primary ones there are 3 dorsal, and 2 marginal, which are more acute and not so evident: of the secondary ones 4; stamens wanting on the back, but there are 2 rather prominent ones in the commissure, which are covered by a spongy pellicle.—Australian, branched subshrubs, having the branches, petioles, under side of leaves, and umbels beset with white stellate hairs. Peduncles pannied, each ending in a simple, many-flowered umbel. Bracteas under the branches and branchlets solitary. Leaves of involucrum few and linear. Habit almost of Hérmis, but the fruit is very different. It differs from Bolax in habit, and in the fruit not being tetragonal.

1 A. floccosa (D. C. 1. c. t. 5.) the whole plant is clothed with flocks of angularise down; leaves ovate-lanceolate, obtuse at the base, and acuminate at the apex.

G. Native of New Holland. Bolax floccosae, Sieb. exsic. nov. holl. no. 258. Leaves 3-6 inches long and 12-15 lines broad; petioles half an inch long. 

Floky Astrotricha. Shrub.

2 A. ledifolia (D. C. 1. c. t. 7.) plant clothed with short adpressed down; leaves oblong-linear, coriaceous, acutish at both ends.

G. Native of New Holland. Bolax ledifoliæ, Sieb. exsic. nov. holl. no. 257. Leaves 20 lines long and broad; petioles 2 lines long.

Ledum-leaved Astrotricha. Shrub.

Cult. See Trachymène above for culture and propagation.

Lin. syst. Pentandria, Digynia. Tube of calyx ovate, compressed; limb 5-loped; lobes ovate, acute, coloured a little. Petals stipitate, ovate, cuspidate at the apex, replicate. Stamens opposite the calycine lobes. Stylodia (glands, Rudge) 2, thick, villous at the top of the mericarps. Styles 2, filiform, rising from the inner bases of the stylodia. Fruit compressed, striated; mericarps contracted at the commissure, 7-8-ribbed; ribs filiform: 2 lateral ones marginal; channels without vitrea, as well as the commissure, which is very narrow. —Australian subshrubs, usually covered with stellate hairs. Leaves alternate, simple, or triplicate. Umbels variable.

Sect. I. EUXANTHOSIA (this section is supposed to contain the true species of Xanthosia, from eux, well, and Xanthosia). D. C. prod. 4. p. 74. Umbels axillary, simple, or bifid. Leaves of involucrum small.

1 X. montana (Sieb. fl. nov. holl. exsic. no. 248.) the whole plant clothed with villi: some of them starchy, and others simple and elongated; leaves ternate, rarely 3-lobed; umbels axillary, nearly sessile, simple, 1-flowered; involucrum and involucres 2-leaved. G. Native of New Holland, on the mountains. X. pilosa, Rudge; the flowers are only referable to this plant.

Mountain Xanthosia. Shrub.

2 X. hirsuta (D. C. prod. 4. p. 74.) the whole plant clothed with hairs, some of which are stellate, and others simple and elongated; leaves sinuated, rarely 3-lobed; umbels axillary, pedunculate, bifid; umbellules 1-flowered; involucres 2-leaved; involucres 3-leaved. G. Native of New Holland, near Port Jackson. X. pilosa, Rudge, only in the form of the leaves. Sieb. pl. excis. nov. holl. no. 247.

Hearty Xanthosia. Shrub.

3 X. tridentata (D. C. prod. 4. p. 75.) young branches stigrose: adult ones glabrous; leaves cuneate, acutely tridentate at the apex, tomentose from stary down beneath, but glabrous in the adult state; umbels pedunculate, axillary, bifid; umbellules 1-flowered; involucres 2-leaved; involucres 2-3-leaved: leaves lanceolate.

G. Native of New Holland, at Port Jackson. Leucolaena tridentata, R. Br. mss. ex herb. mus. par.

Tridentate-leaved Xanthosia. Shrub.

Sect. II. LEUCOLAENA (from leucos, leucos, white, and chlaina, chlaina, a garment; in reference to the involucrum). D. C. prod. 4. p. 75. Umbels terminal, 3-4-rayed. Leaves of involucrum large, white.

4 X. rotundifolium (D. C. prod. 4. p. 75.) branches densely clothed with hairs, or rather rough from deciduous down; leaves reniformly orbicular, coarsely and acutely toothed; umbels 3-4-rayed; umbellules many-flowered; involucres and involucres 3-leaved.

G. Orbicular of New Holland, on the eastern coast. Crucíllæa càndida, Lesch. in herb. Juss. Leaves of involucrum lanceolate, hairy at the base: those of the involucres broader, somewhat cordate, apiculated, glabrous. Fruit more compressed in the young state.

Round-leaved Xanthosia. Shrub.

Cult. For culture and propagation see Trachymène, above.

Lin. syst. Pentandria, Digynia. Tube of calyx compressed tetragonal; limb 5-toothed. Petals elliptic, entire, acute. Fruit ovate, much contracted at the raphe, turged, rather tetragonal, flattish on both sides at the back; mericarps without vitrea, marked on the back by an oval impression; with 3 obsolete ribs: the 3 middle ones on the back: and the 2 lateral ones placed in the commissure, which is flat.—Weak, South American herbs, usually sebaceous from stellate down. Leaves petiolate, opposite, simple, lobed, or toothed. Umbels simple, axillary, few-flowered. This genus is allied to Spanántha.

1 B. palma (Ruiz et Pav. fl. per. 3. t. 251. f. a.) plant
UMBELLIFERÆ. X. BOWLESIA.

XI. FRAGOSA. XII. AZORELLA.

erectish, beset with scattered, stellate hairs in every part; leaves palmately parted; segments 3-5, jagged; umbels 3-flowered; upper ones on short, and the lower ones on long peduncles. O. H. Native of Peru, in the province of Chancay, on sandy hills. Plant 2 feet high, brittle, perhaps erect.

**Palmate-leaved Bowlesia.** Pl. 2 feet.

2 **B. lobata** (Ruíz & Pav. l. c. t. 251. f. b.) plant decumbent, covered over with all over with fascicles of bristles or stiffish hairs; leaves reniform, 5-7-cleft, or with 5-7 deep crenatures; umbels 3-5-flowered, pedunculate. O. H. Native of Peru, in busby places, on the Andes towards Pillaro. The bristles on the upper surface of the leaves are 3-5 in a fascicle: those on the rest of the plant are 8, and pedunculate.

**Lobed-leaved Bowlesia.** Pl. decumbent.

3 **B. inca'na** (Ruíz & Pav. l. c. t. 268. f. a.) plant procumbent, hoary from crowded stellate fascicles of hairs; leaves reniform-roundish, bluntly 5-7-cleft; lobes entire or tridentate; umbels axillary, on short peduncles. O. H. Native of Peru, on hills in the tract at Huancaco Rondos and Pillaro. Spreng. umb. spec. p. 13. t. 5. f. 10. Petioles permanent, rather tendril-shaped. In cultivation the plant however becomes smoother, longer, and more procumbent than in the wild state.

**Hoary Bowlesia.** Pl. procumbent.

4 **B. tropaeolífolia** (Gill. & Hook. in bot. misc. p. 325.) plant clothed with stellate down; stems procumbent, slender; leaves palmately 5-7- parted; segments lanceolate, bluntish, quite entire, with acute sinuses; peduncles 3-flowered; fruit small. \(\mathcal{L}. F.\) Native of Chili, in shady places at El Salto de San Isidro, and in the valleys of the Andes, towards Mendoza. Stems filiform.

**Var. \(\beta\), triparrtita** (Hook. et Arn. in bot. misc. p. 346.) the 2 lower lobes of the leaves approximating, small, coarsely tridentate from the middle. \(\mathcal{L}. F.\) Native of Chili, about Valparaíso.

**Triparted-leaved Bowlesia.** Pl. pr.

5 **B. te'nera** (Spreng. syst. p. 1. 880.) plant clothed with stellate pubescence; stems procumbent, slender; leaves on long pedioles, reniform, 5-7-lobed; lobes obtuse, bifid or trifid; peduncles short, bearing a 3-flowered umbel each. \(\mathcal{L}. H.\) Native of Chili, about Concepción, Valparaíso, Buenos Ayres, and Talcahuana; of Peru, on the mountains about Huancayo; and of Brazil, in dry fields about Monte Video, and at Porto Allegretto. Link. et Otto, abbild. t. 4. B. nodiflora, Presl. in Haenk. herb. ex D. C. prod. p. 75. B. geraniífolia, Cham. et Schlecht. in Linnaea. 1. p. 382. Hook. et Gill. in bot. misc. p. 324. B. incana, Hort. par.

6 **B. dichóroma** (Poeppig, diag. no. 363. excis. 95.) plant erect, dichotomous, hoary from stellate fascicles of hairs; leaves short, petiolate, ovate, coarsely tridentate at the apex; umbels 5-7-flowered, on long peduncles. \(\mathcal{L}. H.\) Native of Chili, about Valparaíso and the baths of Collina. Peduncles of umbels about equal in length to the leaves, or longer; sometimes simple, bearing an umbellule at the apex; sometimes bifid at the apex, bearing 2 linear leaves, each of the branches bearing an umbellule. This species, like the others, varies much in the proportionate length of the peduncles: they are, however, usually much shorter than the petioles.

**Dichotomus-peduncled Bowlesia.** Pl. 1 foot.

**Cult.** The seeds may be reared on a hot-bed in spring; and when the weather gets warm, the plants may be planted out into the open ground, in any warm sheltered situation.

XI. FRAGOSA (in honour of John Fragosa, first physician to Philip II. King of Spain). Ruíz et Pav. fl. per. prod. p. 48.

**Lin. syst. Pentándria, Digynia.** Margin of calyx 5-toothed, permanent. Petals oval, entire. Styles short. Fruit ovate, almost didymous; mericarps rather compressed from the back and contracted at the commissure; dorsal ribs filiform, with 2 other obsolete ones very like them at the commissure, vitte wanting.—Small, tufted, nearly stemless herbs, natives of the Andes of Peru. Leaves small, toothed, or 3-5-cleft, usually pilose. Umbels sessile or pedunculate; pedicels about equal in length to the involucrum.

1 **F. corymbosa** (Ruiz et Pav. fl. per. 3. p. 27. t. 250. f. a.) leaves imbricate, cuneiform, trifid, small, pilose on both surfaces; umbles simple, few-flowered. \(\mathcal{L}. F.\) Native of Peru, on the humid tops of the mountains called Muna at Tambo-Nuevo. Azorella corymbosa, Pers. Bó lax lycopodioides, Spreng. in Schultes. syst. 6. p. 361. Habit of *Lycopodiun* or *Bó lax*. Umbels 2-4-flowered. Superior leaves expanded in a stellate manner.

**Corybsoe-flowered Fragosa.** Pl. \(\frac{1}{2}\) foot.

2 **F. multifída** (Ruiz et Pav. fl. per. 3. p. 27. t. 249. f. a.) leaves ovate, deeply toothed, strigose above; petioles ciliated with bristles; umbels simple. \(\mathcal{L}. F.\) Native of Peru, on the Andes, near Huassa-Huassi. Azorella multifída, Pers. Bó lax multifídus, Spreng. Roots fusiform. Herb very short. Leaves 3-4 lines long. Leaves of involucrum subulate. Umbels few-flowered. Rich. ann. gen. sc. phys. 4. t. 51. f. 4. fruit only.

**Multifídé-leaved Fragosa.** Pl. \(\frac{1}{2}\) foot.

3 **F. crenàna** (Ruiz et Pav. fl. per. 3. p. 27. t. 249. f. c.) leaves ovate, or roundish-ovate, coarsely toothed, beset with bristly hairs on both surfaces, and on the petioles; umbels sessile, simple. \(\mathcal{L}. F.\) Native of Peru, on cold hills at Huassa-Huassi, in the province of Tarma, and in New Granada, ex H. B. et Kunth, nov. gen. amer. 5. p. 26. Azorella crenàna, Pers. Bó lax crenátus, Spreng. Branches pilose, very short. Herb low, tufted. Leaves numerous, 6-8 lines long. Umbels containing about 14 flowers. Involuturi composed of 7 linear-lanceolate leaves.

**Crenated-leaved Fragosa.** Pl. \(\frac{1}{2}\) foot.

4 **F. cladorízha** (Ruíz et Pav. fl. per. 3. p. 27. t. 250. f. b.) leaves ovate, deeply serrated, shining above; each serrature terminated by an acumen; petioles winged, pilose, ciliated; umbels simple, nearly sessile, many-flowered. \(\mathcal{L}. F.\) Native of Peru, on cold hills in the tract of Chavin, near Huamalíes. Azorella cladorízha, Pers. Bó lax cladorízhus, Spreng. Root thick, much branched. Limbs of leaves length of petioles, about 3-4 lines long. Leaves of involucrum ciliated with pili.

**Branch-rooted Fragosa.** Pl. \(\frac{1}{2}\) foot.

5 **F. reniformis** (Ruiz et Pav. fl. per. 3. p. 26. t. 249. f. b.) the whole plant densely clothed with pilis; leaves reniform, crenated; petioles more than twice the length of the limbs; scapes much shorter than the petioles; umbels simple, many-flowered. \(\mathcal{L}. F.\) Native of Peru, in shady places, at Huassa-Huassi, in the province of Tarma. Azorella reníformis, Pers. Petioles 3-4 inches long, with the limbs \(\frac{1}{2}\) inch in diameter. Scapes of umbels 10-12 lines long.

**Reniform-leaved Fragosa.** Pl. \(\frac{1}{2}\) foot.

**Cult.** If any of the species of this genus should ever be introduced to our gardens, we would advise their being grown in pots, in a mixture of sand and peat, and placed among other alpine plants, so that they may be protected in winter by a frame.

XII. AZORELLA (meaning not explained). Gaud. in ann. l. l 2
UMBELLIFERÆ. XII. Azorella.

LIN. SYST. Pentandria. Dígnia. Margin of calyx 5-toothed, permanent. Petals oval, entire. Styles short. Fruit ovate, contracted at the raphe, and rather compressed from the back; mericarps semi-ovate, without any ribs or vitae; ribs filiform, hardly conspicuous.—Humble tufted herbs, natives of Magellan. Leaves imbricate, entire or trifid, with the petioles sheathing or dilated. Umbels nearly sessile, 2-8-flowered; pedicels about equal in length to the involucrem. Perhaps this genus is hardly distinct from Fragosa.

1. A. arcticoides (Willd. herb. ex D. C. prod. 4. p. 77.) leaves imbricate, tripartite, coriaceus; lobes oblong, acutish; petioles thick and rather corylous, villous at the apex; umbels nearly sessile, simple, 4-flowered; leaves of involucrum 4, equal in length to the pedicels. Fr. F. Native of Quito, on the high mountain of Antisana. Fragosa arcticoides, H. B. et Kuntl, nov. gen. amer. 5. p. 27. t. 424. Bolax arcticoides, Spreng. spec. p. 11. exclusive of the synonyms and character. B. arcticoides, Spreng. in Schultes, syst. 6. p. 358, exclusive of the synonyms. Fruit a little ribbed. (ex Kuntl.)

Arctic-like Azorella. Pl. ¾ foot.

2. A. lycoperidoides (Gaud. in ann. sc. nat. 5. p. 105. t. 3. f. 1.) leaves imbricate, sheathing at the base, trifid, coriaceus; lobes subulate, acute; sheaths funnel-shaped, ciliately toothed; umbels almost sessile, 2-3-flowered; leaves of involucrum 2, serrated. Fr. F. Native of the Maclowe or Falkland Islands. D’Urrl, fl. mal. p. 47. This is a very different plant from Bolax lycoperidoides, Spreng, which is now Fragosa corimbosa.

Club-moss-like Azorella. Pl. ½ foot.

3. A. filamentosa (Lam. ill. t. 189. f. 1. Vahl. symb. 3. p. 47.) leaves oblong, coriaceus, quite entire, crowded; pedicels dilated, ciliated with long bristles; umbels nearly sessile; leaves of involucrum somewhat ciliated and bristly. Fr. F. Native of the mountains of Magellan and the Maclowe Islands. A. chilimis, Pers. cnch. no. 3. D’Urrl. fl. mal. p. 46. Bolax filamentosus, Spreng. in Schultes, syst. 6. p. 358. There are varieties of this plant with either an elongated or crowded habit; and with the umbels either few or many-flowered, and the lower ones 1-flowered. Perhaps the same as Chamitis integríflora, Gourn. fruct. t. 22. f. 4.

Filamentosa Azorella. Pl. ¼ foot.

4 A. Gilliesii (Hook. et Arn. in bot. misc. 3. p. 346.) plant densely tufted; leaves petiolate, trifid; umbels pedunculate, 4-10-flowered; fruit urticulare. Fr. F. Native of Chili, in the valley of Uspallata, on the Andes of Mendoza, at the elevation of from 6000 to 12,000 feet. Bolax Gilliesii, Gill. et Hook. in bot. misc. 1. p. 325. t. 63. Root long, descending. Plant 2 inches high. This plant yields abundantly a gummy substance, which is gait-tered by the natives, and employed by them in the cure of headache.

Gillies’ Azorella. Pl. 2 inches.

5 A. espinosa (Cav. icon. 5. p. 57. t. 484. f. 2.) leaves imbricated, spreading at the apex, thick, quite entire, and quite glabrous; umbels on short peduncles, 6-8-flowered; leaves of involucrum one half shorter than the pedicels. Fr. F. Native of Chili, on the higher mountains, called the Cordilleran del Planchon. A. espinosa, Pers. cnch. 1. no. 2. Fruit ovate; having the mericarps furnished with 3 slender stripes on the outside, as in the genus Fragosa.

Tufted Azorella. Pl. ½ foot.

6 A. dacoftes (D’Urrl. fl. mal. p. 45.) leaves all radical, long, pinnate; segments or leaflets remote, opposite, short, pinnatifid; lobes alternate, acutely cut; scapes short, very hairy; involucrum 8-10-leaved; fruit glabrous, striated, nearly sessile. Fr. F. Native of the Strait of Magellan, along the rivulet called Bougainville River. Root thick, fusiform. Umbels 3-8-flowered. Leaves hardly an inch long, but still longer than the scape.

Carrot-like Azorella. Pl. 1 inch.

7 A. ranunculus (D’Urrl. fl. mal. 1. p. 46.) stem stoloniferous, very short; leaves on long petioles, 5-parted; partitions 3-lobed at the apex, obsolete; umbels axillary, on short peduncles; leaves of involucrum 5, lanceolate, acute, ciliated at the base, equal in length to the flowers. Fr. F. Native of the Strait of Magellan, along with the last. Habit of a small Hydrocotyle or Ranunculus. Fruit round, hardly pedicellate, crowned by the calycine teeth. Umbels 4-6-flowered. Petals greenish yellow.

Cronfoot-like Azorella. Pl. ½ foot.

Cult. See Fragosa p. 259. for culture and propagation.

XIII. PECTOPHYTUM. XIV. Bolax.

MULINEÆ (this tribe contains plants agreeing with Mullineum in important characters), or Orthospermum imperfectæ Umbellatae, parallellæ bissetiae, D. C. prod. 4. p. 78.—Hydrocotylæ Mullinenæ, D. C. coll. mem. 5. p. 39. Mericarps much contracted at the commissure, without any vitæ; ribs 5, usually filiform. Fruit compressed from the back, hence it is square. Petals spreading, flat, entire in all the genera, with the exception of Astiræcum.

Trusses II.

MULINEÆ (this tribe contains plants agreeing with Mullineum in important characters), or Orthospermum imperfectæ Umbellatae, parallellæ bissetiae, D. C. prod. 4. p. 78.—Hydrocotylæ Mullinenæ, D. C. coll. mem. 5. p. 39. Mericarps much contracted at the commissure, without any vitæ; ribs 5, usually filiform. Fruit compressed from the back, hence it is square. Petals spreading, flat, entire in all the genera, with the exception of Astiræcum.

XIV. Bolax (from Bolax, Bolax, a synonym of Bolaex, bolos, a bole or lump; the plant grows in dense tufts, hollowed in the middle). Comm. in Juss. gen. p. 226. Gaud. fl. mal. in ann. sc. nat. 5. p. 104. t. 3. f. 1. D. C. prod. 4. p. 78.—Bolax species, Spreng. Azorella species of Lam.

LIN. SYST. Pentandria. Dígnia. Margin of calyx entire, hardly conspicuous. Petals oval, entire. Styles short. Fruit tetragonal, concave in the disk; mericarps with 5 nerve-formed smooth ribs, 1 dorsal, 2 in the middle forming the angles, and 2 filiform inner ones; commissure very narrow.—A tufted herb, with the habit of Arbuitia. Leaves imbricate, trifid, glabrous, coriaceus; lobes ovate, obtuse; petioles membranous, rather corylous, with the margins not ciliated. Umbels simple, nearly sessile, 4-flowered. Leaves of involucrum 4, about equal in length to the pedicels. Fruit white young furnished with stellate down.

1 B. Clebæma (Comm. ind. ex Gaud. ann. sc. nat. 5. p. 104. t. 3. f. 2.) Fr. F. Native of the Strait of Magellan, on the mountains; in the Maclowe or Falkland Islands; Chili
UMBELLIFERÆ. XV. MULINUM. XVI. LARETIA. XVII. DRUSA. XVIII. HUANACA.

261

Clebaria Bolax. Pl. ½ foot.

Cult. See Frágosa, p. 259. for culture and propagation.

LIN. SYST. Pentàndria, Digynia. Limb of calyx 5-toothed, permanent. Petals oval-oblong, acute, flat. Styles acute. Fruit 4-winged or parallelly bicuspid; mericarps without vitre, very much contracted at the commissures, compressed on the back, 5-ribbed; middle rib on the back nerve-formed, as well as the 2 lateral ones, the 2 intermediate ones expanded into ample lateral wings.—Suffruticosum tufted herbs, natives of Chili. Leaves 3-5-cleft or undivided; petioles sheathing. Umbels simple; pedicles longer than the many leaved involucre. Flowers yellow.

This genus, according to Lagasca, is probably divisible into several.

1 M. spinosum (Pers. ench. 1. p. 309.) caule leaves trifid; segments subulate and spiny; lateral segments bipartite; petioles sheathing, glabrous; peduncles longer than the leaves; leaves of involucre distinct, short, spreading a little; fruit orbicular.

2 F. Native of Chili, on the highest mountains, called Cordillera del Planchon and del Putíllo, towards Mendosa; between Los Ojos de Agua, and El Rio de Los Ojos de Agua; Andes of Chili, and Cordillera of Chili, at the elevation of 5,500 or 7,000 feet. Selenium spinosum, Cav. icon. 5. p. 59. t. 487. f. 1. Bólox spinosus, Spreng. in Schultes, 6. p. 362. exclusive of the synonyms. Stems half a foot tall. Umbels 10-12-flowered. Petals of a reddish yellow-colour.

Spiney Mulinum. Pl. ½ foot.

2 M. proliiferum (Pers. l. c.) caule leaves trifid; segments subulate, spinose; petioles sheathing, glabrous; leaves of involucre short, distinct, rather spreading; umbels pedunculate, longer than the leaves; fruit orbicular.

2 F. Native of South America, at Port Desire; and of Chili, on the Andes of Mendoza between San Isidro and Portezuela, on the declivities of mountains at the elevation of 5,000 to 10,000 feet. Selenium proliiferum, Cav. icon. 5. p. 58. t. 486. f. 1. Bólox proliifer, Spreng. in Schultes, syst. 6. p. 361. Root twisted. Stems 3-4 inches high, covered by the sheaths. Leaves glabrous. Umbels 5-7-flowered, sometimes proliiferous. Petals yellow.

Proliiferous Mulinum. Pl. ¼ foot.

3 M. cuneatum (Hook. and Arn. in Beech. bot. 1. p. 26.) leaves wedge-shaped, trifid, and sometimes 5-6-cleft; each lobe ending in a spiny point; sheaths of leaves elongated, stiff, ciliated; umbels many flowered, on short peduncles. 2 F. Native of Chili, about Valparaíso, and on the mountains of Valparaíso; and at Huiguilíoma, in the province of Raro. Azorélla spinosa, Pers. ench. 1. p. 303. Frágosa spinosa, Ruiz et Pav. fl. per. 3. p. 27.

Cuneate-leaved Mulinum. Pl. ¼ foot.

4 M. ulcínium (Gill. et Hook. in bot. misc. 1. p. 328. t. 64.) leaves trifid: segments subulate, spiny; umbels nearly sessile, terminating the very short branches; fruit elliptic. 3 F. Native of Chili, near La Cienega de Bonillo, near the tops of the Usallata range of mountains, at the elevation of 9,500 feet. M. ulcinus, D. C. prod. 4. p. 79. Bólox echinos, Presl. mss. A glabrous, much branched, humble, odoriferous plant. Petals marked by an elevated longitudinal line in the middle. Leaves of involucre linear-subulate.

Furze-like Mulinum. Shrub ½ to 1½ foot.

5 M. microphyllum (Pers. l. c.) caule leaves imbricate, minute, tripartite: lobes linear-lanceolate, each terminated by a hair; petioles stem-clasping, ciliated at the base. 3 F. Native of South America, at Port Desire. Selenium microphyllum, Cav. icon. 5. p. 59. t. 486. f. 2. Petals reddish, yellow in the dried state. Stem shrubby, 3 inches long, branched, covered by the sheaths.

Small-leaved Mulinum. Pl. ¼ foot.

6 M. alegóvagnatum (Gill. et Hook. in bot. misc. 1. p. 328.) leaves trifid; segments ovate-lanceolate, mucronate; umbels axillary, small, few-flowered, sessile. 3 F. Native of Chili, at Cerro de la Polcera, on the Andes of Mendoza. Shrub branched, dichotomous.

White-sheathed Mulinum. Pl. ¼ foot.

Cult. See Frágosa, p. 259. for culture and propagation.

XVI. LARETIA (Laretia is the vernacular name of the plant). Gill. et Hook. in bot. misc. 1. p. 329. t. 65.

LIN. SYST. Pentàndria, Digynia. Margin of calyx 3-toothed. Petals ovate, entire. Fruit elliptic, square, flatly compressed from the back, 4-winged; mericarps lenticular, with dorsal ribs, and 2 lateral marginal ones, destitute of vitre. Seed flat.

1 L. acutus (Gill. et Hook. l. c.) 2 F. Native of the Andes of Chili, in Ell Valle de Fray Carlos, at the elevation of 10,000 feet; Cordillera of Chili, Los Ojos de Agua. Mulinum acutum, Pers. ench. 1. p. 309. Selenium acutum, Cav. icon. 5. p. 59. t. 487. Root thickish, rather fusiform, woody. Plant tufted. Leaves ovate, attenuated at the base; umbel radical, sessile.

Symless Laretia. Pl. ¼ foot.

Cult. See Frágosa, p. 259. for culture and propagation.

LIN. SYST. Pentàndria, Digynia. Limb of calyx entire, not perspicuous. Petals oval, entire. Fruit oval; mericarps much compressed on the back, without any vitre: the dorsal rib and the 2 inner ones linear, and not prominent: the 2 intermediate ones are drawn out into marginally repandly sinuated wings, having the sinuses obtuse, and the angles furnished with hooked stellate spines. Seed much compressed.—A decumbent slender stoniferous herb, native of Teneriffe. Leaves opposite, petiolate, broadly 3-lobed, crenated. Hairs on divers parts of the plant very different, some of which are stiff, stellate, and hooked at the apex; others are soft, simple, solitary, or in stellate fascicles. Umbels axillary, pedunculate, 1-2-flowered, without any involucre. Flowers small, white. Plant with the habit of Bowlesia, but the fruit is very different.

Cavanilles's Huanaec. Pl. ½ foot.

2 H. geraniófolia (D. C. prod. 4. p. 81.) scape leafless, simple, bearing only one simple umbel; segments of leaves linear, undivided. 3. F. Native of Mexico. Boýnx geraniófolius, Presl. and ms. Herb 1-2 inches high. Scapes numerous, a little less than the peduncle. Umbels 15-20-flowered. Leaves of involucre linear, few, ciliated at the base.

Geranió-leaved Huanaec. Pl. ¼ foot.

Cult. See Frágosa, p. 259. for culture and propagation.

XIX. DIPOSIS (from Διοπες, dipe, twice, and ποιητής, poítēs, a husband; in reference to there being 2 male flowers in each umbellulae, and only one fertile). D. C. coll. mem. 5. p. 33. t. 3. f. O. prod. 4. p. 81. —Hydrocóyte species, Lam. Cav. —Spanánthe species, Spreng.

LIN. Syst. Pentédria, Digýnia. Margin of calyx bluntly 5-toothed. Petals oval, flat, entire. Styles short. Fruit orbicular, bicuspitate; mericarps compressed from the back, joined with the narrow commissure, and therefore constituting 2 parallel disks; dorsal rib filiform, 2 lateral ones hidden, and the middle ones girding the disk; vittae wanting; furrows between the ribs broad and flat. —STEMLESS glabrous herbs, natives of Chili and Brazil. Leaves all radical, petiolate, ternate: leaflets wedge-shaped, toothed or cut at the apex; the lateral segments sometimes 2-parted; umbels 6-8-rayed. 4. F. Native of Monte Video. Hydrocóyte saniacélifolium, Lam. dict. 5. p. 154. Cav. eton. 5. p. 60. t. 488. f. 2. Spanánthe saniacélifolium, Spreng. in Schultes, syst. 6. p. 557. Mulinum saniacélifolium, Desv. in herb. Juss. Saniacél-leaved Dipsis. Pl. ½ to ¾ foot.

Earth-nut Dipsis. Pl. 1 to 2 feet.

Cult. See Frágosa, p. 259. for culture and propagation.

XX. SPANÁNTHE. XXI. HOMALOCARPUS. XXII. POZOA.

LIN. Syst. Pentédria, Digýnia. Limb of calyx 5-toothed. Petals elliptic, entire, at its apex, with a straight apex. Fruit ovate, much compressed at the raphe, flat, and compressed from the back on both sides; mericarps flat, without any vittae; ribs 5, very slender, equal, 3 intermediate ones on the back, and the 2 lateral ones seated in the commissure, which is flat. Seed flat.—A South American branched erect herb, glabrous in every part, except on the pedicels, which are ciliated along the sheaths, and ornamented with a collar of hairs under the origin of the limb. Leaves cordate, toothed, acute. Umbels rather compound, proliferous. Involucra composed of many leaves. Flowers white on long pedicels.

1 S. panicúlata (Jacq. l. c. and icon. rar. 3. t. 350). 5. S. Native of South America, in Trinidad, and the Spanish Main, as well as of Peru. Hydrocóyte spanánthe, Willd. spec. 1. p. 1363. Phellándrium ciliátum, Wild. herb. Perhaps the Peru- vian plant is the same as that from the Spanish Main, but it is much smaller and hardly paniced.

Cult. The seeds of this plant should be raised on a hot-bed, and when the plants are of sufficient size plant them into separate pots, and then place them in the stove, where they will flower and seed; and some may be planted out in the open ground. Not worth cultivating except in botanic gardens.

XXI. HOMALOCARPUS (from ὑμαλός, homalos, equal, and καρπός, karpos, a fruit). Hook. and Arn. in bot. misc. 3. p. 348.

LIN. Syst. Pentédria, Digýña. Margin of calyx 5-toothed: teeth subulate, minute, hardly permanent. Petals ovate, concave, entire. Styles 2, divaricate, short. Fruit roundish-ovate; mericarps compressed on the back, flat, wingless, constituting 2 parallel disks; commissure very narrow; ribs 5, filiform, very slender, hidden in the substance of the pericarp, one dorsal, 2 lateral ones near the raphe, 2 middle ones forming the angles, without any vittae; carpophor oblong. Seed less than the cavity of the fruit. —Herb annual, erectish, hoary by stellate hairs, dichotomy branched. Root slender, simple. Leaves petiolate, reniform-rounded, somewhat 5-lobed; lobes equal, ovate, obtuse, quite entire or deeply lobed; lower leaves alternate; superior ones opposite. Peduncles axillary and terminal, about equal in length to the pedicels. Umbels simple, 3-6-flowered. Teeth of calyx pilose, almost emulating a fascicle of hairs. Fruit nearly twice the length of their pedicels, which are a line long. This genus comes near to Spanánthe.

1 H. bowlesiioides (Hook. et Arn. 1. c.) 5. H. Native of the Cordillera of Chili. The ridges or ribs of the fruit are only to be seen on a transverse section of the fruit, because they are sunk in a thin substance of the pericarp. The middle ridges do not expand into wings as in Mulinum, and some other allied genera.

Bonolesia-like Homalocarpus. Pl. ½ to ¾ foot.

Cult. See Spanánthe above for culture and propagation.

LIN. Syst. Pentédria, Digýña. Calyx 5-toothed, perma-
pent. Petals entire. Fruit primitively tetragonal, 5-ribbed, crowned by the calyx, emarginate at the apex; mericarps concave and channelled on the back: lateral ribs close, nearly in straight lines; commissure much contracted. —Herb. Leaves on long petioles, simple, cuneated, profoundly toothed at the apex, quintuple nervet. Umbels simple. Involutione obsolesce lobed, crenately toothed, many nervet: nerves branched a little. —This genus is allied to Astrantia and Malkinum.

N.B. There are two other species of this genus mentioned by Lagasca in nat. 2. p. 94. under the names of P. denticulata and P. inesita, but these he has not described.

Cult. See Fragosa, p. 259, for culture and propagation.

Lin. syst. Pentandria, Digynia. Calyx 5-toothed, permanent: teeth ovate. Petals ending in an inflexed point, emarginate, with the recess callos. Fruit compressed, tetragonally prismatic, crowned by the calyx, rounded at the base; mericarps 5-ribbed, 2 intermediate ribs expanded into wings, central one as well as the 2 placed near the rapho stripe-formed: having the furrows between the ribs destitute of vitae; commissure very narrow. Seed unknown. —Quite glabrous perennial herbs. Stems terete, branched, few-leaved. Leaves petiolate, simple, roundish-cuneate, unequally toothed, somewhat 3-lobed, 3-5-nerved, rather coriaceous. Umbels simple, nearly globose. Involutione many leaved, shorter than the umbel. Flowers either sterile and male, on long pedicels, or fertile and hermaphrodite in the same umbel. —This genus differs from Poza and Malkinum in the petals being emarginate, not entire.

1 A. Chilenensis (Cham. et Schlecht. l. c.) leaves 3-lobed, deeply serrated: pedunules elongated, scattered: petals deeply emarginate, ending in a long involute point; fruit narrowest at the base; leaves of involucrum lanceolate, cut. Y. F. Native of Chili, in dry sandy places about Talcahuano, and about Concepcion; Cuesta de Zapata, at the elevation of 6,000 feet; cliffs by the sea side at Valparaiso. Hook. Bot. misc. 1. p. 332. t. 67. A. Anisillo vulgo Mouchu, Feuill. chil. t. 3. t. 2.

2 A. Poepplii (D. C. prod. 4. p. 82.) leaves deeply triad; lobes obovate, obtuse, regularly toothed. Y. F. Native of Chili. Very like the preceding, but differs in the lobes of the leaves and recesses being obtuse, and regularly toothed all around.

Poeppli's Asterium. Pl. 3/ foot.

3 A. Polly'phalum (Gill. et Hook. in bot. misc. 1. p. 332. t. 67. b.) plant leafless? peduncles corymbose, numerous, sometimes abortive and spinose; petals entire, acute, with an involute apex; fruit broadly oblong; leaves of involucrum linear, entire. Y. F. Native of Chili, in the valleys on the Andes near Ladera de la Jaula, and towards Usapallata in the province of Mendoza, at the elevation of 7,500 feet. Malkinum Dipterygium, D. C. prod. 4. p. 80. The reflexed petals of this species and the next forbid their being united to Malkinum.

Many-headed Asterium. Pl. 3/ foot.

4 A. Isatidica'rum (Hook. et Arn. in bot. misc. 3. p. 332.) stem much branched; branches terete; umbels many, few-flowered, disposed in panicles; involucr of few leaves; fruit oval, parallelly bissectate; mericarps approximate. Y. F. Native of the Cordillera of Chili. Malkinum isatidicarpum, D. C. prod. 4. p. 80. Dipterygium isatidicarpum, Presl, mss. Umbels small, very numerous. Carpophor bipartite; mature mericarps yellow, rather cuneate at the base.

Isatis-fruiting Asterium. Pl. 3/ foot.

Cult. See Fragosa, p. 259, for culture and propagation.

Tribe III.

SANICULAE (this tribe contains plants agreeing with Sanicula in important characters). D. C. prod. 4. p. 82. or Umbellate Imperfectae Orthospermae turgidae, Koch, umb. 158. —Umbellate disciscentes, Spreng. in Schultes, syst. 6. p. 30. exclusive of 3 genera. Transverse section of fruit nearly terete. Mericarps covered with scales, furnished with 5 equal primary ribs, without any secondary ones, and destitute of vitæ. Transverse section of seed semi-terete, flattish in front. Petals erect, bent inwards from the middle, and emarginate. Umbels fasciculate or capitulate, simple or irregularly subcompound.

Lin. syst. Pentandria, Digynia. Tube of calyx ovate, contracted at the top; limb 5-lobed: lobes oval-oblong. Petals wanting. Stamens opposite the calyxine lobes. Styles 2, thickened at the base and villous, but sessaceous at the apex. Ovarium 1-ovulate. Fruit ovate, villous, marked by 5 stripes, and crowned by the calyx. —Erect branched Australian herbs. Leaves alternate, petiolate, variously cut. Umbels simple, many flowered, capitulate; pedicels very short; involucrum many leaved, radiating, longer than the flowers.

1 A. Helia'sntha (Labill. nov. holl. l. p. 67. t. 92.) the whole plant clothed with tomentose wool; leaves bipinnatifid: lobules bluntish; involucrum 10-18-leaved, clothed with soft tomentum. Y. G. Native of New Holland, about Port Jackson, &c. Eriocaulia major, Smith, exot. bot. t. 78. Involutum expanded 1 1/2 or 2 inches in diameter, yellow. Flowers white.

2 A. mnxor (D. C. prod. 4. p. 83.) plant smoothish; leaves clothed with adpressed villi beneath, tereate; segments or leaflets trifid, acute; involucrum 9-10-leaved, acute, clothed with silky villi. Y. H. Native of New Holland, on the Eastern coast. Eriocaulia minor, Smith, exot. bot. t. 79. Sieb. pl. exsic. nov. holl. no. 127. Involutum expanded, 5 lines in diameter, red.

Smaller Actinotus. Pl. 1 foot.

Cult. The seeds of these plants may be reared on a hot-bed in spring, and in the month of May the plants should be planted out in the open border in a warm situation, where they will flower and seed freely.

Lin. syst. Pentandria, Digynia. Umbellules containing only
3 flowers; central one hermaphrodite, fertile, sessile: 2 lateral ones male, pedicellate; the pedicels rather close at the base, with the calyx of the fertile or central flower. Male flowers with the tube of the calyx almost wanting, but with an obsolete somewhat 5-toothed limb; petals oval-oblong, acute at both ends, flexed at the apex; stamens 5, alternating with the petals, and longer than them. Female or hermaphrodite flowers, having the tube of the calyx ovate and compressed, and the limb obsolete: petals the same shape as those of the male flowers, rather membranous, permanent; stamens 5, caducous; styles 2, filiform, divaricate, very long; fruit ovate, compressed, 8-nerved, with 3 nerves on each side, particularly one central, indicating where the raphe is, in the middle, and 2 more conspicuous, seated on the dorsal angle of the mericarps. Mericarps and carpophor not distinct. Fruit empty or containing one ovulum, from one of the mericarps being abortive.—Herb perennial, smooth. Root or rhizoma like that of Adoxa or Hacquetia. Leaf radical, on a long petiole, rather palmate, parted: partitions oval-cuneated, somewhat 3-lobed at the apex, and toothed: teeth mucronate. Stem solitary, hardly half a foot high, bearing at the apex 2 almost sessile opposite 3-lobed toothed leaves. Branches 2, bifid at the apex. Bracteas or leaves of involucrum 2, opposite, oblong, acute, mucronately serrated, seated just under the branches. Branches or rays of umbel 2, short, bearing each 3 flowers at the apex, furnished with 2 small bracteas under the ramifications. This very singular genus is allied to Hacquetia and Sanicula.

1 P. SANICULEFOLLA (Guss. l.c.) 2. H. Native of Sicily, in groves by the sides of rivulets, in cool places. Sison Gussoniánnum, Balb. herb. Sison Gussónii, Spreng. cur. post.

Sanicle-leaved Petagna. Pl. ½ foot.

Cult. See Hacquetia, p. 265. for culture and propagation.

LIN. Syst. Pentándria, Digitá. Tube of calyx echinatized; lobes foliaceous (f. 59. c.), permanent. Petals erect, conniving, obtuse, emarginate, with an inflexed point (f. 59. g.). Fruit nearly fusiform, not separable into 2 parts spontaneously; mericarps destitute of ribs, but furnished with many vitre, and densely clothed with hooked prickles; carpophor not distinct. Seed semi-globose.—Perennial herbs. Leaves radical, petiolate, palmate lobed: lobes cuneated, deeply toothed at the apex. Stems either naked or furnished with very few leaves. General umbel with few rays; leaves of involucrum few, and usually divided. Umbellules of many rays; leaves of involucel many, entire. Flowers male, female, and hermaphrodite in the same umbel.

Sect. I. SANÍCA (an alteration from the generic name). Tube of calyx echinatized. Leaves palmate lobed.

1 S. Européa (Lin. spec. 339.) leaves radical, palmate-parted; lobes trifid, toothed; flowers polygamous, all nearly sessile, disposed in umbellules; lobes of calyx denticulated. 2. H. Native throughout the whole of Europe and Caucasus, in woods and groves, and particularly by the sides of rivulets. Oed. fl. dan. 293. Schkuhr, handb. t. 60. Hoffm. umb. p. 67. Smith, engl. bot. t. 98. Blackw. herb. t. 63. S. officinarum, Neck. gallob. p. 137. Austrânia Diapénus, Seop. carn. 304. S. mas. Fuchs. hist. p. 671. S. officinalis, Goun., lect. 131. Caúcalis Sanica, Crantz. Flowers white or tinged with red, sessile, disposed in little heads. The plant was much celebrated formerly as a vulnerary. It discovers to the taste a bitternes and roughness. It has, however, been long discarded in medi-
numerus, pedicellate. 2. S. Native of Java, on the top of Mount Gede. Perhaps this is the same as S. Javanica, Juss. from the description of the leaves; but the umbels are nakedish above, in the forks of the stem, and on the tops of the branches, each umbel bearing 3 nearly sessile fruit afterwards.

Java Sanicula. Pl. 1 foot.

9 S. montana (Reinw. in Blum. bijdr. p. 832.) leaves all ternate; leaflets somewhat 3-lobed, rather ovate-rhomboid, deeply and setaciously serrated; flowers all pedicellate. 2. S. Native of Java, in mountain woods in humid places. Said to be nearly allied to S. Canadensis.

Mountain Sanicula. Pl. 1 to 2 feet.

Trachyllum Sanicula. Pl. 1 to 2 feet.

11 S. bipinnatifida (Dongl. miss. ex Hook. fl. bor. amer. 1. p. 258. t. 92.) plant caulescent; leaves bipinnatifid; lower ones on long petioles; segments remote, obovate or obovate-lanceolate, acute, deeply serrated. serratures very acute; rachis winged, acutely toothed; peduncles elongated; umbels compound, somewhat proliferous; umbellules globose. 2. H. Native of the north-west coast of America, at Fort Vancouver, on the Columbia. Root rather fusiform. Plant glabrous. Stem erect, branched, furnished with a few leaves. Segments of the upper cauline leaves narrow. Male flowers on short pedicels.

Bipinnatifid-leaved Sanicula. Pl. 1 foot.

12 S. arctopus (Hook. et Arn. in Beech. voy. pt. bot. p. 141.) plant almost stemless; leaves on long petioles, profoundly 3-parted; segments long, cuneated: lateral ones bifid: intermediate one trifid; all are somewhat ciliately pinnatifid; pinnule hardly longer than the leaves; leaves of involucrum foliaceous, lanceolate, quite entire, longer than the simple compact umbel. 2. H. Native of the north-west coast of America, and North California. Hook. fl. bor. amer. 1. p. 258. t. 91. Root fusiform. Habit of the genus Arctopus.

Arctopus-like Sanicula. Pl. ½ foot.

Sect. 1. Sanicòria (an alteration from the generic name). D. C. prod. 4. p. 85. Tube of calyx smooth, but perhaps only in the flowering time. Leaves bipinnate-parted.

13 S. graveolens (Poeppl. diar. no. 222. fl. exsic. no. 93.) leaves bipinnate-parted; segments pinnatifid; lobes obtuse; flowering branches elongated, nearly naked, trifid at the apex; umbellules by threes, on short peduncles; flowers 12-15 in each umbellule; male ones nearly sessile: female one central. 2. F. Native of Chili. Leaves almost like those of Scrophularia canina. Umbels truly compound. Flowers yellowish in the dried state. Petals cuneate, emarginate, having the segment at the top reflexed. Filaments of young stamens inflexed. Styles very long. Male flowers more numerous in the umbels than the sessile female flowers. Calyx of the male flowers smooth, of the female-teethed.

Strong-scented Sanicula. Pl. 1 foot.

Cult. The species of Sanicula grow best in a shaded rather moist situation; and they are easily propagated by dividing at the root. Some of the species being natives of warm climates, will require to be protected in winter.

Lin. syl. Pestalotria, Digynia. Tube of calyx furnished with 10 ribs, and 5 lobes: lobes foliaceous, permanent. Petals erect, connivent, ovobate: with the segment at the apex length of the limb of the petal, and bent in from the middle. Fruit crowned by the calyx, contracted from the sides; mericarps gibbously convex, furnished with 5 filiform ribs.—A small perennial herb. Leaves radical, petiolate, pinnate; leaflets 3-cuneated, 2-3-cleft, mucronately serrated. Scapes 1-3, bearing at their tops simple umbels. Involucrum of 5-6 obovate leaves, which are toothed at the apex, and longer than the umbels. Flowers yellow, on short pedicels, some male, and some female. Fruit compressed from the sides; mericarps with 5 broad ribs, which are rather cuneate at the base, but separated by channels above.

Cult. See Sanicula above for culture and propagation. The plant, however, does best in a pot in a mixture of sand and peat, placed among other alpine plants.

Lin. syl. Pestalotria, Digynia. Tube of calyx 10-ribbed, with tubercular plats; lobes 5, foliaceous. Petals erect, connivent, oblong-obovate: bent in from the middle by a segment, which is nearly the length of the petal. Fruit rather compressed from the back; mericarps without any vitta, but having 5 elevated obube plicate toothed inflated ribs, inclosing in the cavity of each a smaller fistular rib; carpophore not distinct. Seed semi-terete.—Perennial herbes, natives of Europe and Caucasus. Roots blackish. Radical leaves petiolate, palamately lobed: cauline ones few, sessile. Universal umbels irregular, of few rays, surrounded by variable involucra; partial umbels regular, and containing many flowers, surrounded by many leaved involucres. Flowers white or rose-coloured, pedicellate, usually polygamous, the female ones alone fertile.

1 A. mirta (Lin. spec. p. 340.) leaves palmate; segments 7-9, lanceolate, acute, profusely and acutely toothed; leaves of involucrum entire, about equal in length to the umbel. 2. H. Native of the higher Alps of France, Switzerland, Italy, Germany, &c. Lam. ill. 191. f. 2. Sturm, deutschl. fl. with a good figure. Lodg. bot. cab. t. 93. A. minor var. a and b, D. C. fl. fr. 4. p. 353. A. digitata, Monech, meth. p. 94. Hall. hist. no. 791. Leaves of involucrum white and acute. Flowers white.

Var. b, macrodonita (D. C. prod. 4. p. 86.) segments of leaves lanceolate-linear, profusely and sharply serrated; leaves of involucrum exceeding the umbel. 2. H. Native of the Alps of Piedmont.—Bocc. pl. sic. p. 10. t. 5. f. 111.

2 A. fauciiflora ( Bertol. journ. bot. 1811. p. 76. am. iiim. 96. and 347.) leaves pulate; segments 5-7, entire at the base, but finely and sharply serrated from the middle to the apex; leaves of involucrum entire, exceeding the umbel. 2. H. Native of the mountains of Abruzzo and Naples. Very like A. minor. There is a variety having the segments of the leaves linear or oval-oblong.

3 A. Carnioica (Jacq. fl. austr. 6. t. 10.) radical leaves palmate-parted; lobes 5-7, oblong, acuminate, unequally serrated, toothed; leaves of involucrum 12-13, quite entire, exceeding the umbel. 2. H. Native of Carnithia, Carniolan, in alpine meadows. Sturm, deutschfl. fl. with a figure. A. major, Spreng. in Schultes, syst. 6. p. 311. A. minor, Scop. fl. carn. no. 303. t. 7. Smith, exot. bot. 2 t. 17. Habit of A. minor, but with the character of A. major. Leaves of involucrum white, with a green line running along the middle of each, tinged with red. Petals white. Cauline leaves 3-lobed or simple. Root dark brown, having an aromatic balsamic smell, with a taste at first slightly aromatic, but nauseous, and afterwards acid.

Carniolan Master-wort. Fl. May. June. CIt. 1812. Pl. 1/2 to 1 foot.

Var. a.; leaves of involucel white; flowers white.

Var. β; leaves of involucel purplish; flowers tinged with red.

Larger Master-wort. Fl. May, Sept. CIt. 1596. Pl. 1 to 2 ft.

5 A. intermedia (Bieb. suppl. p. 194.) radical leaves palmate-parted: lobes 5, rarely only 3, ovate-oblong, deeply biserated, and ciliated with bristles; cauline leaves nearly palmate; leaves of involucrum 12-13, oblong-lanceolate, bearing from 1 to 3 spines each at the apex, exceeding the umbel a little. 2. H. Native of Caucasian, in mountain meadows. A. trifida, Hoffm. umb. ed. 2. vol. 1. p. 8. A. Caucaucica, Spreng. umb. p. 17. syst. 8. p. 874. exclusive of the synonyms. Flowers pink?

Var. a; leaves of involucel nearly entire. 2. H. Native of Caucasian and the mountains of Naples. A. major, Bieb. fl. and suppl. no. 509.

6 A. helleborifolia (Salisb. par. Lond. t. 60.) radical leaves palmate-parted; lobes 3, ovate-lanceolate, unequally serrated, ciliated with bristles; leaves of involucrum 12-13, ovate-lanceolate, exceeding the umbel a little, ciliated with bristles their whole length. 2. H. Native of Eastern Caucasian, in the more elevated meadows. A. máxima, Pall. nov. act. petropol. 7. p. 357. t. 11. Sim., bot. mag. 1553. A. heterophylla, Wild. nov. act. berol. 3. p. 419. Bieb. fl. taur. 1. p. 202. suppl. p. 196. Involucrum and flowers pink. There are varieties of this species having the cauline leaves either 3-lobed or undivided.

Hellebore-leaved Master-wort. Fl. June, July. CIt. 1804. Pl. 1 to 2 feet.

Cult. The species of this genus grow well in any common garden soil, and are well adapted for ornamenting flower-borders, being rather pretty; they are easily increased by dividing at the root. A. minor and A. Carniolica, being more tender than the rest, should be grown in pots, and placed among other alpine plants.

Lin. syst. Pentândria, DIGYNA. Tube of calyx beset with minute tubercles. Petals inflexed. Transverse section of fruit terete, ovate, tubercular on the outside; mericarps without ribs, and without vitae; carpophore adnate its whole length to the seeds.—An herb, with the habit of Erûngium nudicuttale, native of the Cape of Good Hope. Radical leaves petiolate, oblong, ciliately toothed from spinose bristles. Stems nearly naked, branched, umbellate at the apex. Leaves under the branches small, and stem-clasping. Umbels like those of Astrantia. An intermediate genus between Astrantia and Erûngium.

Ciliated-leaved Alepidea. Pl. 1 foot.

Cult. Any light rich soil will suit this plant, and it will be easily increased by dividing at the root.

1 H. aculeâta (Blum. l.c.) 2. S. Native of Java, on Mount Tjernanai, in the province of Cheribon, where it is called Gompon. The rest unknown.

Prickly Horsfieldia. Shrub.

Cult. Any light rich soil will suit this shrub, and cuttings will be easily rooted in the same kind of earth under a handglass, in heat.

Lin. syst. Pentândria, DIGYNA. Tube of calyx rough from vesicles and scales; lobes 5, foliaceous. Petals erect, connivent, oblong-obovate: bent in from the middle by a segment as long as the limb of the petal, which consequently appears emarginate. Fruit obovate, scaly or tubercular, with the transverse section nearly terete; mericarps semi-terete, without ribs, and without vitae; carpophore adnate its whole length to the seeds.—Herbs, usually perennial and spiny. Radical leaves, as well as the cauline ones, sheathing more or less at the base. Flowers congregated into oblong or roundish dense heads. Lower bracteas usually the largest, and forming an involucrum round the head of flowers; the rest like chaff, mixed among the flowers.

§ 1. Ramusinèriâ (from ramosus, branched, and nèrus, a
sine nerv or; in reference to the nerves of the leaves being more or less branched and diverging). D. C. prod. 4. p. 88. 

* Limbs of radical leaves more or less distinct from the petioles: having the nerves more or less branched, and diverging, but never parallel.

1 E. campestræ (Dodd. pemp. 730. f. 2. Lin. spec. 337.) radical leaves nearly ternate; segments pinnatifid: lobes ovate, cauline leaves auriculated; stem paneled; leaves of involucrum linear-lanceolate, nearly entire, exceeding the head of flowers, which is roundish; paleae among the flowers subulate. 2.  

2. H. Native of South and Middle Europe, and Caucasus; very common in dry sandy fields. In Britain not so very common; on the coast near the ferry from Plymouth to Cornwall; and near the Devil's Point at Stonehouse, Plymouth; near Newcaste upon Tyne; on the shore called Frau's Goose, below Melling, in Yorkshire; also far inland opposite Brookhall, near Daventry, in Northamptonshire. Laroché, eryng. p. 22. Oed. fl. dan. t. 554. Hayne, arz. gew. 7. t. 1. Smith, eng. bot. 57. Jacq. austr. 2. t. 155. Plench. t. 173. E. vulgare, Bauh. pin. 368. E. Mediterraneum, Ger. 999. Corollas blue, but sometimes white and yellow. Roots creeping. Plant rather glaucous. 

* Var. β: radial leaves nearly entire. 2. H. Native of Portugal and the Levant.  

2 E. Bourgæti (Goun. ill. p. 7. t. 3.) radical leaves orbicular, triplicate; lobes pinnatifid or cut in a forked manner, quite entire between the divisions; stems simple, a little branched at the apex; leaves of involucrum 10-12, lanceolate, pungent, erect, furnished with 1 or 2 teeth on each side, much longer than the head of flowers, which is ovate; paleae among the flowers entire. 2. H. Native of the Pyrenees, but has not been found elsewhere. D. C. fl. fr. 4. p. 555. Laroché eryng. p. 24. Tratt. arch. t. 207. E. amethystinum, Lam. fl. fr. 3. p. 401, but not of Lin. E. Bourgæti, L. planum, and E. alpinum, Lapeyr. abr. p. 157. There are varieties of this species with either sky blue or pale flowers; and with the stems either bearing one or more heads of flowers. Plant glaucous. 

3 E. Billardæri (Laroché eryng. p. 25. t. 2.) radical leaves nearly orbicular, triplicate; lobes lanceolate, pinnatifid, spiny, profusely toothed all round; stems branched at the apex; leaves of involucrum 8, linear-lanceolate, 3 times higher than the head of flowers, which is globose; paleae among the flowers entire. 2. H. Native of the Levant; and in fields on the mountains at the limits of the Turkish districts called Khoi, in the province of Abyd über. Tratt. arch. p. 356. Very nearly allied to E. Bourgæti, but differs in the lobes of the leaves being toothed all round, and in the paleae being hardly longer than the calyces. Flowers blue. 

La Billardæri's Eryngio. Pl. 1 foot. 

4 E. spina-alba (Vill. dauph. 2. p. 660. t. 15.) radical leaves 3-5-parted; lobes profusely toothed, or cut in a forked manner; stem thick, nearly simple; leaves of involucrum 9-10, pinnatifid, very stiff, pungent, with about equal length to the head of the flowers, which is of an ovate-cylindrical form; paleae among the flowers entire, or usually tricuspidate. 2. H. Native of Dauphiny, Provence, &c. in arid exposed places of mountains. D. C. fl. fr. 4. p. 356. Laroché eryng. p. 26. t. 3. E. rigidum, Lam. t. 184. p. 752. E. alpinum, Lin. mant. p. 949, but not of his spec. E. alpinum, Schults. syst. 6. p. 322. E. pallescens, Mill. dict. no. 5. Spina ålo, Dalech. lgl. 1462. Both heads of flowers and herb are white. There are varieties with either dwarf stems, or a foot high. 

5 E. dilatatum (Lam. dict. 4. p. 755.) radical leaves pinna- 

6 E. crisum (Presl, del. prag. p. 139.) radical leaves pinnatifid; outer lobes trifid, spiny toothed: lower ones much smaller and bristly, or jagged into bristle-formed teeth; petioles ciliated with bristles from the base; stems nearly simple, bearing few heads; leaves of involucrum 5-6, lanceolate, spiny ciliated, exceeding the head of the flowers, which is roundish; paleae exceeding the flowers, outer ones spiny ciliated. 2. H. Native of Spain. Very nearly allied to E. dilatatum, but it differs from it and all the others in the bristles being yellowish, and rather spiny along the petioles and the lower lobes of the leaves. Flowers blue. 

Hairy Eryngio. Pl. 1 to 2 feet. 

7 E. amethystinum (Lin. spec. p. 337. var. a.) radical leaves pinnatifid: lobes cut, spiny, somewhat pinnatifid; petioles entire at the base; stems smoothish, corymbose branched at the apex; leaves of involucrum 7-8, lanceolate, furnished with a few teeth at the base, much exceeding in length the head of flowers, which is globose; paleae among the flowers entire: outer ones hardly furnished with a tooth on each side. 2. H. Native of Dalmatia, Croatia, and Belgium, but in the last mentioned country it has probably escaped from the gardens. Waldst. et Kit. hung. 3. t. 215.—Besl. hort. syst. ord. t. 8. f. 4. Tratt. arch. 206. E. campestræ aruzreum, Læuen, in herb. Gay. E. excul- leum, Bauh. hist. 3. t. 86. f. 1. The upper part of the stem, and also the heads of flowers, are of the finest amethyst colour, so that they make a very fine appearance. This species is often confused with E. dilatatum, but is easily distinguished from that species in the petioles being entire, not pectinated. 

8 E. Anderssoni (Lag. in litt. Loyal hort. brit. p. 101.) radical and cauline leaves pinnatifid: 3 terminal segments large, lanceolate, and 3-lobed at the apex: the rest of the segments small; all spiny toothed; stem smooth, striated, corymbose and trichotomously branched; leaves of involucrum 7-8-lanceolate, spiny toothed, much longer than the head of the flower, which is roundish, furnished with retrograde forked or simple prickle on the lower side at the very base; upper paleae among the flowers linear, entire, and the lower ones trifid, ending in spiny points, about the length or longer than the flowers. 2. H. Na-
**UMBELLIFERÆ.**

16. **Eryngium maritimum** (C. Bann. pin. p. 386. Lin. spec. p. 337.) leaves of a whitish glaucous hue; coriaceous; radical leaves on long petioles, roundish, cordate, spinous-toothed; superior ones stem-clasping, palmately lobed; leaves of involucrum 5-7, ovate, spinous-toothed, exceeding the head of flowers, which is roundish; palae among the flowers, tricuspidate, about equal in length to the calyxes. **2. H.** Native throughout Europe, among the sand along the sea-shore; and on both sides of the Mediterranean Sea. It is to be found plentiful in some parts of Britain, on the sea-shore. Od. fl. dan. t. 718. Tratt. arch. t. 209. Wooty. med. bot. t. 102. Smith, engl. bot. t. 718. Roots creeping. Flowers very pale blue. By English writers the Sea eryngium has been called sea holly, sea halley, and sea holme. The young flowering shoots of the plant, eaten like asparagus, are very nourishing, according to Linnaeus. The leaves are sweetish, with a slight aromatic warm pungency. The roots are supposed to have the same aphrodisiac virtues as the Orchis tribe. They are kept in the shops candied, and are still regarded by the Arabs as an excellent restorative. Eryngium is from Eryngium, the name of the Roman repentant to the beginning of the 17th century by Robert Buxton, apothecary. His apprentice, Samuel Great, continued this business, and it has ever since been carried on by the posterity of the latter.—Morant’s Colchester, p. 92.

17. **E. oliveri** (Laroch. eryng. p. 37. t. 12.) radical leaves on long petioles, roundish cordate; lower cauline leaves petiolate, 3-lobe, and deeply toothed: upper cauline ones stem-clasping, 3-parted, and cut; leaves of involucrum 10-12, lanceolate, stiff, having 5-6 teeth on each side, which are more crowded towards the base, exceeding beyond the head of flowers; pale among the flowers, tricuspidate, and entire. **2. H.** Native of the Levant. E. alpinum γ, Schultes, syst. p. 323. Heads of flowers blue. Nearly allied to E. alpinum, but is constant to its characters, even in cultivation: it differs from it in the radical leaves being much less cordate, in the lower ones being more dissected, and in the leaves of the involucrum being still, and having fewer teeth. The colour of the herb is green.

18. **E. multifidum** (Bieb. fl. taur. p. 201.) radical leaves on long petioles, profusely cordate, serrate-toothed; cauline leaves stem-clasping, deeply lobed, spiny-serrate; leaves of involucrum 8-9, large, ovate-lanceolate, deeply spiny-ser- rated, longer than the head of flowers, which is ovate; pale among the flowers tricuspidate. **2. H.** Native of the Alps of Caucasus, Armenia, and Iberia. E. glaucum, Willd. herb. ext. in litt. E. asperifolium, Laroch. eryng. p. 36. t. 11. Poir. suppl. p. 289. Tratt. arch. t. 355. Stein dichotomously branched, 3-4 feet high, blue at the top as well as the heads of flowers. Lower leaves roughish, pubescent or glabrous beneath, reticulated with anastomosing nerves.

19. **E. alpinum** (Lin. spec. p. 337.) radical and lower cauline leaves on long petioles, deeply cordate, serrate-toothed: upper cauline leaves palmately lobed, ciliately serrate; serrations spinulose; leaves of involucrum 10-20, rather soft, a little longer than the head of flowers, pinnatifidly serrated, having 12-15 cilia-formed serratures on each side; and with the lower serratures pinnatifid; pale among the flowers tricuspidate or entire. **2. H.** Native of Switzerland, Piedmont, Germany, Cretai, Carniola, &c. in alpine pastures. Jacq. icon. rar. t. 1 t. 55. Sims, bot. mag. t. 922. Tratt. arch. t. 205. Involution along with the upper part of the herb and the flowers are of a beautiful blue colour; but there is also a variety which is white in the last-mentioned parts: and another which has the paleae among the flowers pinnatifid. Herb green.

---

**Sectious-petioled Eryngio.** Pl. 1 to 2 feet.

10. **E. glomeratum** (Lam. dict. 4. p. 225.) leaves bipinnatifid; lobes linear, very stiff, divaricate; heads of flowers small, collected into a thyrse; flowers small; leaves of involucrum much longer than the head of flowers, and are as well as the paleae nearly entire, and spinose. **2. H.** Native of Crete. Laroch. eryng. p. 29. t. 6. Tratt. arch. t. 760. E. parviflorum, Smith, prod. fl. greec. t. 1. p. 175. Herb white, densely beset with leaves. Perhaps the E. glomeratum, Siebr. herb. crete, which he gathered at the foot of Mount Ida, is the same, but it differs from the figure given by Laroch in, the heads of flowers being disposed in a corymb, in the lobes of the leaves being broader, and in the leaves of the involucrum being furnished with a spine-like subulate divaricate tooth on each side.

**Glomerate-headed Eryngio.** Pl. 1 to 2 feet.

11. **E. rostratum** (Cav. icon. 6. t. 552.) radical leaves long, lanceolate: outer ones spiny-ciliolate: inner ones pinnatifid; stems a little branched; leaves of involucrum entire, rather shorter than the head of flowers, which is glabrous; paleae among the flowers, entire, or ending in a horn each, each much longer than the flowers. **2. H.** Native of Chili, at Talamahu, Conception, &c. Laroch. eryng. p. 29. This species is intermediate between the section Raisomínea and Parallelinëria.

**Beaked-scaled Eryngio.** Pl. 3 to 4 feet.

12. **E. cosomun** (Laroch. eryng. p. 30. t. 7.) radical leaves bipinnatifid; lobes lanceolate, spinose, ciliately toothed at the base; stems much branched at the apex, bearing many heads; leaves of involucrum 5-6, trifid, longer than the head of flowers, which is ovate; paleae among the flowers simple: upper paleae spiny-toothed, drawn out into a tuft. **2. H.** Native of Mexico, in temperate places between Rio Sacra and Toluco. 11. B. et Kunth, nov. gen. amer. p. 30. Flowers blue?

13. **E. Capcium** (Lam. dict. 4. p. 75.) cauline leaves almost pinnatifid; lobes lanceolate, spinose, ciliately toothed at the base; stems much branched at the apex, divaricate; leaves of involucrum 5, lanceolate-subulate, bearing 1-2 spiny teeth on each side, much longer than the head of flowers, which is roundish, paleae among the flowers, tricuspidate. **2. H.** Native of the islands of Canid, Sanlo, and of some of the Archipelago: frequent. Laroch. eryng. p. 30. t. 80. D’Urv. enum. 29. Siebr. herb. crete. E. cyanæum, Siebr. fl. grece. t. 258. prod. 1. p. 175. Tratt. tab. t. 350. Stems and heads of flowers of an amethyst colour. Floriferous branches elongated, or short and crowded.

**Cretan Eryngio.** Pl. 1 to 1½ foot.

14. **E. multifidum** (Siebr. et Smith, fl. grece. t. 259. prod. 1. p. 175.) leaves all pinnatifid, somewhat lyrate, and paltmately parted at the apex; lobes deeply lobed; stems corymbose, coloured at the top; leaves of involucrum linear-lanceolate, pinnatifid, or nearly entire, exceeding the head of flowers, which is ovate; paleae among the flowers, entire. **2. H.** Native of the hills of the Morea and Sicily. E. alpinum, elatius, &c. Cup. pamph. t. 29. Guss. prod. fl. sic. 1. p. 305. Top of stem and heads of flowers blue. Allied to **E. amethystinum** and **E. Créticum**.

**Multifid Eryngio.** Pl. 2 feet.

15. **E. ovatum** (Cunning, in Field’s new south wales, p. 358.) stems erect, furrowed, dichotomous; leaves bipinnatifid; lobes linear, stiff, spinose, divaricate; heads of flowers spherical, pedunculate; leaves of involucrum linear, mucronate, stiff. **2. G.** Native of New Holland, near Bathurst. Flowers white. The plant when young is much sought after by sheep.

**Limbs of radical leaves cordate at the base, undivided, or a little lobed.**
Alpine Eryngo. Fl. July, Aug. Clt. 1597. Pl. 1 1/2 to 2 ft. 20 E. planum (Math. comm. p. 505, with a figure. Lin. spec. p. 337.) lower leaves on long petioles, oval, cordate at the base, crenated, flat: middle cauleine leaves sessile, undivided: superior ones 5-parted, serrated; leaves of involucrum 6-7, lanceolate, remotely spin-serrated, spreading, about equal in length to the head of flowers, which is round; paleae among the flowers entire. 2. H. Native of Austria, Russia, Siberia, Transylvania, Galicia, Caucasus, Mauritania, Provence, &c. in meadows. Jac. aust. t. 391. Tratt. arch. t. 214. Laroch. eryng. p. 40. Upper part of the stem, leaves of involucrum, and heads of flowers blue; there is, however, a variety equally common in the gardens with white flowers. Herb green.

Falcate Eryngo. Pl. 1 to 2 feet. 23 E. menotomum (Desf. atl. 1. p. 226. t. 55.) radical leaves petiolate, oblong, cordate at the base, toothed; cauleine leaves palmately parted, spreading; lobes spin-serrated; leaves of involucrum lanceolate, furnished with a few spiny teeth, much longer than the head of flowers, which is globose; outer paleae tricuspidate, the rest entire. 2. H. Native of Asia Minor, Caucasus, Mount Lebanon, Candida, Mauritania, Sicily, and about Montpelier, in exposed places. Upper part of stems, leaves of involucrum, and heads of flowers blue.

Var. a; stem tall, flexuous, much branched. Desf. 1. c. Tratt. arch. t. 362. E. caruleum, Bieb. fl. taur. 1. p. 200.—Mor. ox. sect. 7. t. 37. f. 13, and therefore E. Syracum, Lam. dict. 4. p. 759.

Var. β; stems dwarf; flowers crowded at the neck of the plant. Laroch. eryng. p. 40. t. 14.

Dichotomous Eryngo. Fl. Jul. Aug. Clt. 1820. Pl. 1 to 2 ft. 24 E. diffusum (Torr. rock. mount. no. 177.) leaves all digitately palmate; segments oblong, deeply serrated, spinose; stem dichotomously branched, diffuse; heads of flowers globe; leaves of involucrum 4-6, trifid, deeply serrated, longer than the head of flowers; ovaries scaly. 2. H. Native of North America, on the banks of the Canadian river. Perhaps this species will form a proper section.

Dissipate Eryngo. Pl. 1 foot. 25 E. pusillum (Lin. spec. p. 337.) radical leaves lanceolate, entire, toothed or pinnatifid, attenuated at the base, petiolate: cauleine leaves palmately parted, sessile; heads of flowers sessile; leaves of involucrum subulate, longer than the head of flowers, furnished with an appendage, or tooth at the base; paleae among the flowers, entire. 2. H. Native of Spain, Portugal, Mauritania, Sicily, Sardinia, &c. Laroch. eryng. p. 44. Tratt. arch. t. 212.—Barrel. icon. t. 1247. Heads of flowers greenish. This species is nearly allied to E. dichotomum, but differs from it in the radical leaves being attenuated at the base, never in any way cordate.

Var. γ, galioides (D. C. l. c.) stem erectish; lower leaves somewhat pinnatifid, small; heads few-flowered. Laroch. l. c. E. galioides, Lam. dict. 4. p. 757.

Var. ε, palpudum (D. C. l. c.) stem nearly erect; lower leaves pinnatifid, large; heads few-flowered. Laroch. l. c. t. 16. E. odoratum ε, Lam. l. c.

27 E. trispartitum (Desf. cat. hort. par. 1828.) radical leaves glabrous, petiolate, trifid; leaves obovate-oblong, cuneate at the base, coarsely serrated: serratures distant, ending in spiny points; stem much branched; cauleine leaves nearly sessile, 3-5-parted: lobes lanceolate, coarsely serrated; leaves of involucrum twice the length of the head of flowers, which is ovate-globose; outer paleae tricuspidate: inner ones undivided.

28 E. aquitaleum (Cav. ann. sc. nat. 3. p. 32.) radical leaves obovate-oblong, nearly sessile, attenuated at the base, coarsely ciliated or spin-serrated from the base; cauleine leaves somewhat stem-clasping, broadest at the base; leaves of involucrum 8, ovate-lanceolate, spin-serrated, longer than the head of flowers, which is roundish; paleae ending in 3 or 5 points. 2. H. Native of Spain. Laroch. eryng. p. 34. t. 10. Tratt. arch. t. 753. E. maritimum β, Pers. ench. p. 299. exclusive of the syn. of Fl. dani. Heads of flowers blue. The plant cultivated under this name has the lower leaves much longer and narrower at the base than those in the figure cited. Plant glaucous.

30 E. tricuspidatum (Lam. spec. p. 337.? Desf. atl. 1. p. 224.) radical and lower cauleine leaves on long petioles, orbicular,
cordate, acutely toothed; cauline leaves sessile, palmate-parted; lobes lanceolate, spiny-serrate; leaves of involucrum lanceolate, spiny-serrate, excising the head of flowers, which is nearly globose; paleale tricuspidate, longer than the calyxes.

3. H. Native of Mauritania, Sardinia, Sicily, and the Morea, in cultivated fields and exposed places. Laroch. eryng. p. 33. t. 9. Tratt. arch. t. 211. E. Bocconi, Lam. dict. 4. p. 754. —J. C. Dec. sic. 88. t. 47. Heads of flowers greenish. Flowers purplish. There are varieties of this species with tall and humber stems; and with the lobes of the leaves either linear or lanceolate.

31 E. lucidifolium (Lam. dict. 4. p. 757.) radical leaves and lower cauline ones on short petioles, obovate, coarsely spiny-toothed; petioles quite entire; leaves of involucrum 5-6, dilated at the apex, and coarsely spiny-toothed, excising the head of flowers, which is oblong-oblongate; paleale tricuspidate, longer than the calyxes. O. H. Native of Mauritania, Spain, and Portugal. Brof. fl. lus. 1. p. 419. Desft. l. t. 225. t. 55. Cav. ann. sc. 3. p. 51. Laroch. eryng. p. 34. Heads of flowers blue? Herb a hand high, stiff. There are varieties of this plant having the leaves of the involucrum cut or pinnatifid.

Hex-leaved Eryngo. Pl. 1/2 foot.

32 E. tenue (Lam. dict. 4. p. 755.) radical leaves obovate-elliptic, deeply toothed; cauline ones palmate-parted; lobes linear, spreading, spiny-toothed; leaves of involucrum linear, spreading, spreading, spiny-toothed, excising the head of flowers, which is oblong; paleale tricuspidate, bearing spines on the back, longer than the calyxes. O. H. Native of Spain, Portugal, and Mauritania, in cultivated fields, and on hills. Laroch. eryng. p. 32.—Clas. hist. 2. p. 159. f. 1. E. pusillum, J. Banh. hist. 3. p. 87.—Lob. icon. 2. t. 23. Flowers blue?

33 E. nauturifolium (Juss. in Laroch. eryng. p. 56. t. 17.) leaves all lanceolate, dilated at the apex, and somewhat pinnatifid; branches decumbent; heads of flowers lateral, sessile, ovate; leaves of involucrum lanceolate-subulate, elongated, and entire, as well as the paleale. O. S. Native of South America. Tratt. arch. t. 768. Allied to E. vesiculatum, but differs in the angles of the calyx being 5, and in being rough from scales, not from vesicles.

Nasturtium-leaved Eryngo. Pl. decumbent.

34 E. cernantesi (Laroch. eryng. p. 47. t. 18. f. 1.) sessile decumbent; floral leaves trifid; leaves linear; heads of flowers axillary, pedunculate, roundish; leaves of involucrum 2, subulate, spreading, exceeding the head of flowers a little. O. H. Native of Mexico. Tratt. arch. t. 359. E. viviparum, Cer. mss. Calyxes scaly. Allied to E. vesiculatum.

35 E. prostratum (Nutt. in litt. ex D. C. prod. 2. p. 92.) sessile creeping, filiform; leaves petiolate, ovate, unarm'd, membranous, some entire, and others are furnished with a tooth or lobule on each side; heads of flowers ovate, pedunculate, axillary; leaves of involucrum 5-6 oblong-linear, entire, deflexed; paleale linear, small; calyx papulose from vesicles. O. H. Native of North America, in the Arkansas territory. Petioles variable in length, some shorter than the limbs of the leaves, and others longer. Leaves rosalate, at the neck of the plant, but crowded at the node of the surculi, sometimes opposite. Peduncles 1 or 1 1/2 inch long. Heads 2-3 lines long.

Prostrate Eryngo. Pl. prostrate.

36 E. baldwinii (Spreng. syst. 1. p. 870.) leaves petiolate, oval, entire, or serrated; stem much branched, slender, usually prostrate; heads of flowers small, numerous; leaves of involucrum 2, tripartite; leaves linear, a little toothed at the base. O. H. Native of Florida, in pine woods around St. Maria, and along the sea-shore near Augustine. E. gracile, Baldwin in Nutt. gen. amer. 1. p. 175. Ill. sketch. 1. p. 345. but not of Laroch. E. repans, Willd. herb. ex Spreng.

Baldwin's Eryngo. Pl. prostrate.

37 E. vesiculatum (Labill. nov. holl. 1. p. 73. t. 98.) surcul creeping; radical leaves lanceolate, cuneate, and attenuated at the base; deeply toothed, almost pinnatifid; floral leaves triplicate with linear lobes; heads of flowers lateral, short pedicellate; leaves of involucrum 5, lanceolate-subulate, and are as well as the paleale; calyx papulose. O. G. Native of Van Diemen's Land. Laroch. eryng. p. 47. Tratt. arch. t. 780. Poir. suppl. 4. p. 291.

Bladder-calyxed Eryngo. Pl. cr.

38 E. subacaulce (Cay. icon. 6. t. 556. f. 2.) radical leaves petiolate, lanceolate, nearly quite entire; scape naked, bearing only 1 head of flowers, longer than the leaves; leaves of involucrum 8, lanceolate, spinose, spreading, furnished each with 1 tooth on each side, longer than the head of flowers, which is hemispherical; paleale subulate, shorter than the calyx.—Native of Mexico, in Chalma. Laroch. eryng. p. 56. Tratt. arch. t. 778. Plant hardly more than a finger in height.

Nearly-stemless Eryngo. Pl. 1 1/2 to 1 foot.

39 E. radicifolium (Tratt. arch. t. 764.) radical leaves sessile, ovate, spiny-serrate; heads of flowers solitary, roundish, sessile at the neck of the plant; leaves of involucrum 6, ovate-lanceolate, tridentate at the apex, discoloured, longer than the head; paleale entire.—Native of New Granada, on the mountains of Pasto. E. humile. E. Laroch. eryng. p. 54. t. 18. f. 2. H. B. et Kunth, nov. gen. amer. 54.

Root-flowered Eryngo. Pl. 1/2 foot.

40 E. Flaccidum (Hook. et Arn. in bot. misc. 3. p. 350.) radical leaves flaccid, on long petioles, deeply pinnatifid; segments linear, spinose, bent downwards; stem slender, panicled at the apex; leaves of involucrum linear-lanceolate, stiff, acute, entire, about equal in length to the head of flowers, which is elliptic; paleale hardly equal in length to the flowers. O. H. Native of Buenos Ayres.

41 E. coronatum (Hook. et Arn. in bot. misc. 3. p. 350.) radical leaves lanceolate, spiny-pinnatifid; segments lanceolate-subulate, spreading; stem panicked at the top, many-headed; leaves of involucrum linear-subulate, spiny, quite entire, reflexed, about equal in length to the head, which is cylindrical; paleale oblong, acute, pale, equal in length to the flowers, the 2 or 4 superior ones protruding in long horns, which emulate the leaves of the involucrum. O. H. Native of Buenos Ayres. Stem 6-8 inches high.

Crowned-headed Eryngo. Pl. 1 to 2 feet.

42 E. mille (Cay. ann. p. 115. icon. t. 556. f. 1.) radical leaves on long petioles, oval-oblong, spiny-serrate; cauline leaves 1 or 2, oblong, sessile, serrated; stems bearing only 1 head of flowers, shorter than the radical leaves; leaves of involucrum 10, ovate-lanceolate, tridentate at the apex, coloured above, exceeding the head of flowers, which is globose and depressed at the apex; paleale entire. O. G. Native of Peru, on the mountains of Chimborazo and St. Antonio. E. humile, Laroch. eryng. p. 55. Tratt. arch. t. 763.

Var. β; leaves of involucrum entire. Laroch. eryng. p. 55.

Humble Eryngo. Pl. 1/2 foot.

43 E. stellatum (Mittis, in Laroch. eryng. p. 55. t. 25.) lower leaves petiolate, linear-lanceolate, crenated; upper ones sessile, opposite; branches elongated, bearing 1 head of flowers each; leaves of involucrum ovate, spiny-toothed, discoloured, exceeding the head; paleale subulate, exceeding the flowers.
UMBELLIFERÆ.

271 G. Native of Santa Fe de Bogota. Tratt. arch. t. 777. H. B. et Kunth, nov. gen. amer. 5. p. 33. Leaves of involucre smooth, yellow above.

Stellate Eryngio. Pl. 1 foot?

44 E. PHY'TE'MA (Laroch. eryng. p. 51. t. 21.) cauline leaves few, petiolate, linear-lanceolate, unarmored, crenated; crenate mucronate; stem nearly simple, bearing 2 heads of flowers; heads oblong, crowned by exerted foliaceous paleae; leaves of involucrum 3-10, linear, deflexed. 2 G. Native of Mexico, in meadows, near the town of Tulloco. H. B. et Kunth, nov. gen. 5. p. 30. Heads of flowers white.

Phyteuma-like Eryngio. Pl. 1 to 1 1/2 foot.

45 E. GRA'CLE (Laroch. eryng. p. 54. t. 24. but not of Nutt.) radical leaves petiolate, elliptic, very blunt at the base, crenated; stem nearly naked, few-flowered; leaves of involucrum 5, linear-lanceolate, pungent, a little toothed, twice the length of the head of flowers; paleae subulate, entire, longer than the calyces. 2 G. Native of Mexico, in humid places. H. B. et Kunth, nov. gen. amer. 5. p. 33. Plant a foot high. Heads of flowers of an amethyst blue colour. Leaves of involucrum smooth and yellow above, but green beneath.

46 E. BonPLANDI'A (Laroch. eryng. p. 52. t. 22.) radical leaves petiolate, ovate-oblong, crenated; stem nearly naked, 1-3-flowered; leaves of involucrum 8, and are as well the palea lanceolate; paleae scarcely exceeding the calyces, of equal size and shape. 2 G. Native of Mexico, in shady woods. Tratt. arch. t. 754. E. Bonplandianum, H. B. et Kunth, nov. gen. amer. p. 31. Tube of calyx tubucerulous.

Bonpland's Eryngio. Pl. 1 to 1 1/2 foot.

47 E. nu'deac'ule (Lam. dict. 4. p. 759. t. 187. f. 2.) radical leaves obovate, coarsely spiny-toothed; teeth ciliated; stem dichotomous, nearly naked, bearing few heads; leaves of involucrum lanceolate, spinose, equal in length to the head of flowers, which is roundish; paleae subulate. 2 H. Native of Monte Video; and of Chili, in the province of San Louis, on the tops of the mountains called Cerro del Morro, at the elevation of 4,000 feet. Laroch. eryng. p. 51. Tratt. arch. t. 769. Cham. et Schlecht. in Linnaea. 1. p. 251. There are varieties of this species with bracteas all entire; or the outer ones are spiny-toothed, and the rest entire; or all spiny-toothed ex Cham. et Schlecht. 1.c. The teeth of the leaves are sometimes entire and not again ciliated, and this brings the species very near E. serratum.

Naked-stemmed Eryngio. Pl. 1 1/2 foot.

48 E. Ser'ratu'm (Cav. ann. 2. p. 132. icon. 6. t. 554.) radical leaves petiolate, lanceolate, profusely serrated; stem nearly naked, and almost simple, few-flowered; leaves of involucrum 8-10, subulate, spreading, length of the head of flowers, which is globose; paleae entire, subulate, exceeding the flowers a little. 2 G. Native of Mexico. Laroch. eryng. p. 55. Tratt. arch. t. 776. Calyx covered with white scales. Stem a foot high. Perhaps the same as E. serratum, Linck, enum. 1. p. 260. but the leaves are not doubly serrated as described by him, but acutely crenated. Heads of flowers blue?

Serrate-leaved Eryngio. Pl. 1 foot. 1/2 foot.

49 E. CAR'LI'NE (Laroch. eryng. p. 52. t. 25.) radical leaves lanceolate, deeply spiny serrated, acute; cauline leaves palmatifid: lobes deeply serrated; stem branched, bearing few heads; leaves of involucrum 7-9, ovate-lanceolate, deeply serrated; paleae subulate, simple. 2 G. Native on the mountains about the town of Mexico, and between Joya and Las Vagas, near Pueblonuevo, and on Mount Orizaba. H. B. et Kunth, nov. gen. amer. 5. p. 32. Leaves of involucrum yellow above. Flowers blue.

Var. a, eréctum (D. C. prod. 4. p. 94.) stem erect, solitary; leaves of involucrum ovate, twice the length of the head of flowers. 2 G. Laroch. eryng. l. c. with a figure. Tratt. arch. t. 358.

Var. b, decumbens (D. C. l. c.) stem simple, diffuse; leaves of involucrum equal in length to the head of flowers, which is oblong. 2 G.

Carline-like Eryngio. Pl. 1 foot.

50 E. hor'i/no'des (D. C. prod. 4. p. 94.) leaves glabrous; radical ones unknown; cauline ones ending in a spine-like point: uppermost ones opposite; stem branched, bearing many heads; leaves of involucrum 10-12, oblong-lanceolate, spiny-serrated at the apex, white inside; paleae forming a tuft at the top of the head of flowers. 2 G. Native about the town of Mexico. Allied to E. carline, but differs in the heads of flowers being oval and tufted at the apex.

Horinum-like Eryngio. Pl. 1 foot.

51 E. ci'lla'tum (Cham. et Schlecht. in Linnaea. 2. p. 249.) radical leaves obovate-lanceolate, pectinately serrated; teeth stiff, bristly; stem naked, bearing 1-3 heads; heads elliptic, echinated from the paleae, which are subulate acuminate and smooth, and exceed the flowers; leaves of involucrum similar to the paleae. 2 G. Native of Brazil, in the province of Cisplatine and Rio Grande, in fields. Heads coloured, 8-9 lines long. Ciliated-leaved Eryngio. Pl. 1 foot.

52 E. ex'ligus (Cham. et Schlecht. in Linnaea. 2. p. 248.) leaves linear-lanceolate, spiny-serrated, ciliated, tricuspidate at the apex; stem bearing many heads; heads globose, echinated; leaves of involucrum 10, lanceolate, spiny-toothed, tricuspidate at the apex; paleae tricuspidate, a little longer than the flowers, smooth. 2 G. Native of Brazil, in the provinces of Monte Video and Rio Grande do Sul. Root nearly globose, size of a filbert. Leaves 10 inches long, and 9 lines broad. Heads of flowers small, of one colour.

Elegant Eryngio. Pl. 1 foot.

53 E. nu'num (Gill. et Hook, in bot. misc. 1. p. 334.) stem tall, pinnate; leaves linear-subulate, channelled, spiny-ciliated; spines 2-3 together; heads of flowers globose. 2 G. Native about Buenos Ayres, in the plains called the Pampas. Stem 4-5 feet. Allied to E. ebracteátum, Lam.

Naked Eryngio. Pl. 4 to 5 feet.

54 E. di'va'ri'catum (Hook. et Arn. in bot. misc. 3. p. 550.) stems prostrate, dichotomously divaricate, leafy, rigid; lower leaves bipinnatifid: cauline leaves pinnatifid; segments linear, spiniscent, divaricate; peduncles short, axillary, and in the forks of the stem; leaves of involucrum subulate, reflexed, 4 times shorter than the head of flowers, which is elliptic. 2 F. Native of Buenos Ayres.

Divericate Eryngio. Pl. 1 foot.

55 E. se'rra (Cham. et Schlecht. in Linnaea. 2. p. 246.) leaves ensiform, spiny-serrated, ciliated; stem pinnate, bearing many heads; heads ovate, echinated; leaves of involucrum and outer palea lanceolate, subulate acuminate, spiny-toothed, smooth: inner paleae entire, a little smaller than the outer ones. 2 F. Native of Brazil, in the province of Cisplatine, and near Monte Video. Radical leaves half a foot long. Heads unguiculur, of one colour.

Saw-leaved Eryngio. Pl. 1 foot.

56 E. unc'ni'natum (Cham. et Schlecht. in Linnaea. 2. p. 247.) leaves lanceolate, serrated; serratures ending in recurved spines, ciliated; stem bearing few heads; heads globose, echinated; paleae scabrous, tricuspidate; leaves of involucrum spinosely pinnatifid. 2 G. Native of the south of Brazil.

H. oked-spi'ned Eryngio. Pl. 1 foot.

57 E. fl'o'ri'bu'ndum (Cham. et Schlecht. in Linnaea. 1. p. 245.) leaves ensiform, spiny-serrated, ciliated; stem pinnate, bearing many heads; heads echinated by scabrous, subulate mucronulated paleae; leaves of involucrum ovate, acuminated,
subulate, hardly different from the pæcae. 12. G. Native of the south of Brazil. Stem fustlar at the base.

**Bundle-flowered Eryngium.** Pl. 1 foot.

- **E. aromatica** (Baldw. in Ell. sketch. 1. p. 344.) leaves cuspidate, pinnate, trifid at the apex, with cartilaginous margins; stem leafy, bearing many heads, corymbose; leaves of involucrum 5-7, trifid, about equal in length to the head of flowers; pæcae tricuspidate. 2. H. Native of Florida, in dry pine woods. Stems 9-10 inches high, numerous. Root aromatic.

**Aromatica-rooted Eryngium.** Pl. 1 foot.

- **E. radicatum** (Linn. spec. p. 336. exclusive of the syn. of Grun.) radical leaves lanceolate, bluntish, attenuate at the base, spino-ously serrated; floral leaves palmate-parted, sessile; heads nearly sessile, cylindrical; leaves of involucrum lanceolate, spiny-serrate, much longer than the heads; pæcae among the flowers entire. 2. S. Native of Jamaica, Cayenne, Demerara, Florida, Brazil, &c. in fields and woods. Larch. eryng. p. 56. Michx. fl. bor. amer. 1. p. 163. Sloane, hist. 1. t. 156. f. 3-4.—Herm. ligg. t. 237. Plant with an ungrateful odour when bruised. Flowers white. Calyx ornamented with roundish vesicles, not scales. The radical leaves are sometimes trifid at the apex in the plants we have seen growing in Brazil. The plant named *E. foetidum* by Ucria, a native of Sicily, is probably distinct from this. All parts of the plant are reckoned very powerful anthyllistics, and much used by the negroes and poorer whites on all occasions of that nature, whence they call it *fluedo*. It is chiefly administered in decoctions or infusions. *Fœtid Eryngium.* Fl. Aug. Oct. Clt. 1714. Pl. 1 foot.

- **E. Henkei** (Presl, in herb. Henke, ex D. C. prod. 4. p. 94.) radical leaves lanceolate, 1-nerved, obtuse, attenuate at the base, furnished with spiny serratures from the base to the apex; cauline leaves pinna-tiffid serrated, palmately lobed at the apex: floral ones short, half stem-clasping; cymes twice forked; heads terminal, roundish; leaves of involucrum 5, much longer than the head of flowers, lanceolate-subulate, entire. 2. G. Native of Mexico, in grassy places towards Jalapa. E. Schiedeana, Cham. et Schlecht. in Linnaea. 5. p. 206. Habit of *E. pusillum* on the one hand, and of *E. foetidum* or *E. virginatum* on the other.

**Henke’s Eryngium.** Pl. 1 to 3 feet.

- **E. virginatum** (Lam. dict. 4. p. 757.) leaves all on very short petioles, ovate, toothed, lower ones hardly subcordate at the base; stem very simple, but branched divaricately at the apex; leaves of involucrum 5-7, linear, furnished with a tooth on each side, exceeding the head of flowers, which is globose; pæcae among the flowers tricuspidate. 2. H. Native of North America, in New Jersey, Carolina, and Georgia, in moist meadows and woods. Larch. eryng. p. 40. t. 20. Tratt. arch. t. 781. E. ovalifolium, Michx. fl. bor. amer. 1. p. 165. Flowers pale blue?

- **E. microcephalum** (Wild. herb. no. 5558. Spreng. syst. 1. p. 871.) radical leaves oblong, glaucous beneath, with cartilaginously created margins, having the recesses between the creme glandular; cauline leaves very few; peduncles elongated, naked; leaves of involucrum with cartilaginous margins, lanceolate, ending in spiny points, shorter than the head of flowers, which is small. 12. G. Native of South America, according to Humb. trav. but the particular place is unknown. Leaves 1½ inches long, and 5-6 lines broad. Heads 3 lines in diameter. Paleae not different from the leaves of the involucrum, unless that they are smaller, longer, and terminated by a mucrone, but without the cartilaginous margin.

**Small-headed Eryngium.** Pl. 1 foot.

- **E. depressum** (Hook. et Arn. l. c. 3. p. 551.) plant stemless; radical leaves linear-oblong, spicate, spiny-toothed, having the nerves in the limb branched, with the branches diverging; branches of stem tufted, diffuse, dichotomous, numerous from the neck of the plant; heads of flowers terminating the branches, and in the forks; leaves of involucrum and paleae subulate, about equal, spiny, and entire, or furnished with a short spine on each side at the middle, much exceeding the flowers, which are sessile. 2. H. Native of Chili; and of Chili, near Valparaiso, in Vina de la Mar.

*Var. a, rigidum* (Hook. et Arn. l. c.) branches stiff, forked a little, about equal in length to the leaves. *Var. β, flaccidum* (Hook. et Arn. l. c.) branches elongated, slender, triflotomously divided. Chili at Valparaiso and Casa Blanca.

**Depressed Eryngium.** Pl. 1/2 foot.

- **E. anomalum** (Hook. et Arn. in bot. misc. 3. p. 350.) root simple; leaves coarsely serrate-toothed at the apex; radical leaves roundish, cuneated at the base, petiolate; upper cauline ones cuneated; heads on short peduncles; leaves of involucrum and infrequent, unequal, oblong, spiny-mucronate, quite entire, much exceeding the flowers, which are sessile; fruit papillos from vesicles. 2. H. Native of Chili, about Valparaiso. The fruit and the paleae among the flowers has induced the authors to refer this plant to *Eryngium*, to which its appearance is altogether foreign.

**Anomalous Eryngium.** Pl. 1/2 to 1 foot.

- **E. aquatium** (Linn. spec. 336. var. a. exclusive of the syn. of Grun.) leaves broadly linear, with parallel nerves, remotely spiny-ciliated; lower leaves rather ensiform: floral ones lancate-toothed; leaves of involucrum 8-9, shorter than the head of flowers, which is globose, and as are also as the pæcae entire; stems dichotomous. 2. H. Native of North America, from Pennsylvania to Virginia; also of the Society Islands, California, and Buenos Ayres, in marshes, inundated pastures, and on the banks of rivers. Jacq. icon. var. t. 347. Larch. eryng. p. 5. Ker. bot. reg. t. 572. E. yuccæfolium, Michx. fl. bor. 1. p. 164.—Pluk. alm. t. 975. f. 4.—Mor. ox. 3. p. 167. sect. 7. t. 37. f. 21. Stem erect, 2-3 feet high, terete, simple below. Flowers white, or very pale blue. In North America the plant is called *Rattle-snake-weed*, from its use in curing the bite of that venomous reptile.

- **E. longifolium** (Cav. ann. 2. p. 133. icon. 6. t. 553.) leaves broadly linear, with parallel nerves, remotely spiny-ciliated; stem many times forked; leaves under the branches opposite, very short, 3-5-leaflet; leaves of involucrum 10, deflexed, lancatate, rather shorter than the head of flowers, which is nearly globoso; pæcae entire, exceeding the flowers. 12. G. Native of Mexico, about Pachuca and Real del Monte. Larch. eryng. p. 58. Tratt. arch. t. 766. Flowers white.

UMBELLIFERÆ.

68 E. angustifolium (D. C. prod. 4. p. 95.) radical leaves linear, with parallel nerves, lobately serrated; serrations distant; cauleine leaves few, opposite; heads of flowers short; scales of involucrum and pales very long, linear-subulate, very acute. 2. G. Native of New Holland. Stem terete, a foot high, striated, twice trifid, erect. Leaves of involucrum and palea half an inch long, much longer than the flowers.

Narrow-leaved Eryngo. Pl. 1 foot.

69 E. canaliculatum (Cham. et Schlecht. in Linnaæa. 2. p. 238.) leaves very narrow, channelled, with parallel nerves, shining, spinly-ciliated; spines often accessory; stem paneled, bearing many heads: heads nearly unarmèd, globoso; leaves of involucrum conate at the base, smooth, hardly larger than the paleae. 2. G. Native of the interior regions of Brazil. Habit of E. pristis. Radical leaves 2 lines broad. Spines 7-8 in the space of an inch.

Channelled-leaved Eryngo. Pl. 1 foot.

70 E. Pristis (Cham. et Schlecht. in Linnaæa. 2. p. 237.) leaves with parallel nerves, very narrow, flat, striated, spinly-ciliated, often with accessory spines; stem paneled, bearing many heads: heads globoso, echinatus, subulate, spinly-spiculose bracteas; leaves of involucrum ovate, acuminated, seaboars, twice the length of the calyxes, hardly different from the paleae. 2. G. Native of Brazil, in the province of Rio Grande. Stem 4 feet high and more, solid. Radical leaves tufted, a foot and half a long.

Grampus Eryngo. Pl. 4 feet.

71 E. pandanifolium (Cham. et Schlecht. in Linnaæa. 2. p. 236.) leaves with parallel nerves, linear, obliquely and remotely spinly-toothed: stem paneled, bearing many heads: heads disposed in umbels, egg-shaped, unarmed; leaves of involucrum ovate, acuminated, smooth, hardly different from the paleae, which are rather longer than the calyxes. 2. F. Native of Brazil, in the province of Cisplatine. Heads semi-unguicular, coloured. Radical leaves 18 lines long, broad at the base.

Screw-pine-leaved Eryngo. Pl. 2 to 3 feet.

72 E. petiolatum (Hook. fl. bor. amer. 1. p. 259.) leaves with parallel nerves, lanceolate, tapering into long petiolo, remotely spinly-ciliated; upper leaves narrow, sessile; leaves of involucrum and pales subulate, spinly-ciliated, stiff, twice the length of the flowers. 2. H. Native of north-west America, in moist soils on the plains of the Multnomah river. Petiolo 4-6 inches long. Heads echinatus.

Petiole-leaved Eryngo. Pl. 2 feet!

73 E. Paniculatum (Laroch. eryng. p. 59. t. 26.) leaves with parallel nerves, linear, spinly-ciliated: floral ones very short; stem nearly naked, bearing at the apex umbellate branches; branches bearing 1-3 heads; leaves of involucrum 9-10, lanceolate, and are as well as the paleae entire. 2. G.

Var. b. oligodon (D. C. l. c.) leaves of involucrum hardly different from the palea; lower leaves entire, or scarcely ciliato on the edges. 2. G. Native of Brazil. E. paniculatum, var. a, Cham. et Schlecht. in Linnaæa. 2. p. 234.

Var. bracteosum (D. C. l. c.) leaves of involucrum elongated and reflexed. 2. G. Native of Brazil, in the province of Cisplatine. Cham. et Schlecht. l. c.

Panicled-flowered Eryngo. Pl. 1 foot.

74 E. cymosum (Laroch. eryng. p. 63. t. 31.) leaves with parallel nerves: lower ones linear, channelled, bearing very long, conjunctive, subulate teeth; upper leaves pinnatifid; floral branches umbellate; leaves of involucrum 8-10, linear, quite entire, at length reflexed, longer than the head of flowers, which

Vol. III.

is round; paleae subulate, a little longer than the calyxes. 2. F. Native of Mexico, in the higher plains near Tasco. Tratt. arch. t. 361. H. B. et Kunth, nov. gen. 5. p. 35.

Cymose-headed Eryngo. Pl. 2 feet.

75 E. luzulifolium (Cham. et Schlecht. in Linnaæa. 2. p. 240.) leaves with parallel nerves, linear, denticulated; lower teeth setiferous: upper ones obsoletely spinulose; stem bearing few heads: heads unarmed, globoso; leaves of involucrum ovate, acute, roughish, hardly different from the paleae. 2. G. Native of the south of Brazil. Leaves 2-3 lines broad. Heads pale straw-coloured, as also the rest of the plant.

Luzula-leaved Eryngo. Pl. 1 foot.

76 E. gramineum (Laroch. eryng. 60. t. 27.) leaves with parallel nerves, narrow-linear, remotely spinly-ciliated; stem bearing only 2 heads; leaves of involucrum 8-9, lanceolate-subulate, nearly entire, spreading, a little shorter than the head of flowers, which is ovate; palea subulate, a very little longer than the flowers. 2. F. Native of Mexico, in shady woods near Santa Rosa. H. B. et Kunth, nov. gen. amer. 5. p. 34. Tratt. arch. t. 761. Stem simple, 2 feet high. Heads of flowers of an amethyst colour.

Grassy-leaved Eryngo. Pl. 2 feet.

77 E. bromelifolium (Laroch. eryng. 60. p. 28.) leaves with parallel nerves: bearing large subulate teeth, which are shorter than the breadth of the leaves; radical leaves very long, broadly lanceolate-linear: floral ones opposite, keeled, arched; leaves of involucrum 10, lanceolate, acuminated, few-toothed, exceeding the head of flowers, which is round; palea entire, twice the length of the calyxes. 2. F. Native of Mexico, in humid woods. Tratt. arch. t. 327. H. B. et Kunth, nov. gen. amer. 5. p. 34. Flowers white?

Pine-apple-leaved Eryngo. Pl. 3 to 4 feet.

78 E. pectinatum (Presl, in herb. Henck. ex D. C. prod. 4. p. 96.) leaves with parallel nerves, bearing twin, subulate teeth, 1 in each pair, very short, and the other longer than the breadth of the leaves; radical leaves long, lanceolate-linear: floral ones opposite; leaves of involucrum 10, lanceolate, acuminated, coarsely spinly-toothed at the base. 2. F. Native of Mexico. E. Deppeanum, Schlecht. et Cham. in Linnaæa. 5. p. 297. Very like E. bromelifolium, but differs in the leaves being much narrower. Branches of stem bearing either 1 or 3 heads.

Pectinate-leaved Eryngo. Pl. 2 to 3 feet.

79 E. Humboldtii (Laroch. eryng. p. 61. t. 29.) leaves with parallel nerves, lanceolate-linear, closely spinly-toothed: spinules in pairs; stem branched above; heads of flowers oblong, conglomerate; leaves of involucrum 7-8, lanceolate, toothed, usually shorter than the head of flowers; outer palea toothed: inner ones entire. 2. G. Native of New Granada, on Mount Quindiu. Tratt. arch. t. 762. E. Humboldtianum, H. B. et Kunth, nov. gen. amer. 5. p. 34.

Humboldtii Eryngo. Pl. 2 to 3 feet.

80 E. proteaeflorum (Laroch. eryng. p. 62. t. 30.) leaves with parallel nerves; cauline leaves densely crowded, rather imbricated, lanceolate, coarsely spinly-toothed; heads of flowers large, oblong; leaves of involucrum 20-22, large, toothed, lanceolate, exceeding the head of flowers; palea entire. 2. F. Native of Mexico, at the foot of the burning Mount Jorullo, and on Mount Orizaba. Tratt. arch. t. 773. H. B. et Kunth, nov. gen. amer. 5. p. 35. Leaves of involucrum smooth and yellow above.

Protea-flowered Eryngo. Pl. 2 to 3 feet.

81 E. monoecephalum (Cav. ann. 2. p. 116. icon. t. 553.) lower leaves with parallel nerves, linear, channelled, bearing unequal, tinate, subulate teeth; upper leaves pinnatifid; stem bearing only 1 head of flowers; leaves of involucrum 20-24, lanceolate, furnished each with 1-2 spreading spines, exceeding
the head of flowers, which is roundish. **t.** F. Native of Mexico, near Huannajto and Chilapencino. Laroch. eryng. p. 62. Tratt. arch. t. 767.

**One-headed Eryngo.** Pl. 4 feet.

82 E. ju'ñceum (Cham. et Schlecht. in Linnaea. 3. p. 241.) leaves with parallel nerves, very narrow, inconspicuously spiny-denticulated, acute; stem bearing few heads; heads nearly unarmed, globose; leaves of involucrum 10-19, connate at the base, ovate, 3-nerved, acuminate, and are as well as the palea smooth. **t.** G. Native of Brazil. Heads of one colour, 5 lines in diameter.

**Rusky Eryngo.** Pl. 1 to 2 feet.

83 E. ekiéorphum (Cham. et Schlecht. in Linnaea. 3. p. 242.) leaves very narrow, linear, with parallel nerves, quite entire, fringed with villi at the base; stem bearing 1 or few heads; heads between egg-shaped and globose, unarmed; leaves of involucrum as well as the palea elongated, acuminate, and striated. **t.** G. Native of Brazil, in the province of Cisplatlin and Rio Grande. Stem bearing few leaves, from 1 to 2½ feet high. Leaves a line broad: radical one a foot and more long. Bracteas longer than the flowers. Habit almost of a *Cypérus.*

**Wool-bearing Eryngo.** Pl. 1 to 2 feet.

84 E. sanguisôbra (Cham. et Schlecht. in Linnaea. 3. p. 239.) leaves linear, with parallel nerves, spiny-serrated: serratures towards the apex of the leaf blunt and retrograde; stem naked, bearing few heads; heads ovate; leaves of involucrum as well as the palea subulately acuminated, a little longer than the flowers. **t.** F. Native of the south of Brazil, in the province of Rio Grande. Tube of calyx clothed with squarrose scales at the angles. Heads echinate, coloured, 9-10 lines long.

**Sanguisôbra-like Eryngo.** Pl. 2 feet.

85 E. erbratea'tum (Lam. dict. 4. p. 759.) leaves linear, with parallel nerves, usually ciliated at the base with long bristles; stem trichotomously corymbose; heads cylindric, unarmed; leaves of involucrum as well as the palea entire, shorter than the flowers. **t.** G. Native of the south of Brazil. Laroch. eryng. p. 64. t. 32. Tratt. arch. t. 758. Cham. et Schlecht. in Linne. 2. p. 244. E. nudiflórum, Willd. herb. which was collected about Ibague, in New Granada, is the same, according to Cham. et Schlecht. i. c. Stem erect, 2 feet high. Habit of the last species. Calyx rough from scales.

**Subgenus II. Lessônia (in honour of — Lession, a writer on composite).** Bertero, miss. Hook. bot. misc. 3. p. 351. Small shrubs or trees, with dichotomous branches, which are marked below by the cicatrices of the fallen leaves, but densely leafy at the extremities. Peduncles terminal, bearing a solitary, globose, or hemispherical head of flowers each.

**Bupleuroôdes-like Eryngo.** Shrub 5 to 6 feet.

87 E. sarçôphyllum (Hook. et Arn. in bot. misc. 3. p. 352.) arborescent; leaves cylindrical, fleshy; leaves of involucrum wanting. **t.** G. Native at Massa Fuera, near Juan Fernandez. The heads of flowers are exactly globose, without any involucrum. Branches dichotomous.

**Fleshy-leaved Eryngo.** Shrub 5 to 6 feet.

† *Species not sufficiently known.

88 E. palle'scens (Mill. dict. no. 5.) radical leaves roundish, multiform; heads pedunculate. **t.** H. Native of Europe. E. alpinum amethystinum, capitulo majore pallescente, Tourn. inst. 327. Allied to *E. amethystinum,* according to Mill, but distinct from it.

89 E. Americânum (Walt. fl. carol. p. 192.) leaves entire: radical ones roundish: cauline ones ovate-lanceolate: uppermost ones trifid; stem procumbent. **t.** H. Native of Carolina.

**American Eryngo.** Pl. procumbent.

90 E. carthamoides (Smith, in Rees' cycl. vol. 13.) leaves oblong, toothed, undivided, coriace at the base, and stem-clasping; stem nearly simple, bearing few heads; leaves of involucrum few and ovate. **t.** H. Native of Mauritania. Perhaps the same as *E. aquifolium*?

**Carthamâs-like Eryngo.** Pl. 1 foot.

**Starry-blue Eryngo of Mount Lebanon.** Pl. 1 foot.

92 E. pá'rum palmâ're fôlis serra'tâs. Mor. oxon. sect. 7. t. 36. f. 13.

**Small Eryngo with serrated leaves.**

**Mexican Eryngo with long toothed leaves.** Pl. 1 foot.

94 E. laterrifôrum (Lam. dict. 4. p. 475.) or Grômen orientâle spicâtum (Tourn. cor. p. 30.) is not a *Cénchus,* as had been supposed by Linnaeus, nor an *Eryngium* but *Corisâmrum* pângenos.

**Cult.** Most of the species of this genus are extremely handsome and beautiful, and particularly so the hardy kinds, which are therefore well fitted for decorating borders. They all succeed well in common garden soil; but the lighter and more sandy the soil is the better they will grow. The greenhouse or frame kinds should be grown in pots, so that they may be sheltered in winter. All are readily increased by dividing at the root, or by seed.

**XXXII. ACTINÂNTHUS.**

(from **a**ctir, actin, a ray, and **a**rchos, anthos, a flower; involucels). Ehrenb. in Linnaea. 4. p. 398. D. C. prod. 4. p. 668.

**Lin. syst.** Penîndria, Dígynía. Flowers monoeccious, female ones capitate: male ones in capitae umbels: marginal ones joined, abortive, and spinescent, having the receptacle destitute of palea. Teeth of calyx permanent. Petals oblanceolate at the apex, rather cilirose. Fruit compressed from the sides: mericarps with the 5 alternate sutureal ribs strongest: having the furrows between the ribs furnished with 1 vitae each, and the commissure with 2 vitae; carpophore adnate.—A stiff, squarrose plant. Lower leaves ternately bipinnate. Involucrum none; involucels of many leaves. Flowers white. This genus comes between *Oenânthe* and *Eryngium,* according to the fruit, but from the inflorescence it is analogous to *Echinâphora.*

1 A. Syn'tàctus (Ehrengb. i. c.). **t.** H. Native of Syria, between the towns of Sahlé and Balbec.

**Syrian Actinânthus.** Pl. 1 foot.

**Cult.** See *Eryngium* above for culture and propagation.

§ 2. Umbels compound or perfect. Vitae on the fruit variable, rarely wanting.

- *Fruit having only primary ribs present.*

**Tribe IV.**

**AMMI'NÆ** (plants agreeing with *Ammi* in important

LIN. SYST. Pentândria, Digýnia. Margin of calyx 5-toothed. Petals oblong, ovate, entire, spreading, having an inflexed or involucral point. Fruit roundish or ovate, didymous, plicately wrinkled; mericarps solid, with 5 thick, very blunt, circularly plicate ribs, covering the furrows; each furrow furnished with a vitta, and ornamented with plicate tubercles. Carphophore bipartite. Seed gibbously convex, flat in front.—Perennial smooth herbs, natives of the Levant. Leaves deciduous. Umbels numerous. Universal involucrum wanting or few-leaved; involucrels 3-5-leaved. Flowers yellow, dioecious, or polygamous. This genus differs from Câchrys in the seed not being involute nor free, but straight, and adnate to the calyx. It differs from Sâxel in the form of the petals and sunk ribs of the fruit, and from Hippomâria in the seeds being flatish in front, not with involutive margins.

2 R. Microcâ'ria (Hoffm. umb. 175. fig. in tit. 3 and 21.) leaves deciduous; segments linear-setaceous; involucrum many-leaved; flowers for the most part hermaphroditic; fruit subglose, wrinkled. 2. H. Native of Caucasus at Nasrâna, and of Iberia. Câchrys microcarpa, Bieb. fl. taurn. 1. p. 218. (exclusive of the syn. of Mor.) suppl. p. 216. Bieb. in Schultes, syst. 6. p. 445. Câchrys Sicula, Gild. trav. p. 154-190. ex Bieb. Fruit roundish, rather didymous; ribs thick, concretes into a mass, which is glossy inside; furrows narrow, each furnished with 1 vitta. Habit almost of Câchrys crispa, but differs in the true involucra not being pinnatifid, but the leaves are multifid and disposed in whorls under the flowering branches beneath the true umbel.

Var. B. rigida. (D. C. prod. 4. p. 98.) leaves more stiff and glaucous than the species. 2. H. Native of the Caucasus.

Smaller-frooted Rumia. Pl. 1 foot.

4 R. Lëgôôsa (Meyer, verz. pflanze. p. 125.) leaves supra-decompound; leaflets bifid or trifid; segments linear, shortish; involucres obsolete; fruit ovate; ribs straight, destitute of plaits and tubercles. 2. H. Native of Caucasus on the higher mountains of Talusch, at the elevation of 5000 to 6000 feet. Trinia Hoffmannii, D. C. prod. 4. p. 104.

Var. B. microcarpa (Meyer. l. c.). Native of Caucasus, on Mount Beschmach.

Smooth-angled-fruit Rumia. Pl. i. 1 to 2 feet.

5 R. Athamanthiodes (D. C. prod. 4. p. 98.) leaves dec teproduct; segments cuneiformly-ovate, pinnatifid, pubescent; leaves of both the involucrum and involucel numerous, with membranous margins; fruit ovate, having the ribs tubercular. 2. H. Native of Siberia. Câchrys athamanthioides, Bieb suppl. p. 217. Athamâna carvfîolia, Willd. herb. is either referable to this or to the preceding species.

Athamanthi-like Rumia. Fl. July. Cult. 1818. Pl. i. 2 ft. Cult. A light soil answers the species of this genus best; and they are easily increased by seeds.

LIN. SYST. Pentândria, Digýnia. Margin of calyx 5-toothed, foliaceous. Petals obcordate, with an inflexed point. Fruit roundish, contracted from the sides, didymous; mericarps with 5 flatish, equal ribs; lateral ribs marginal; furrows furnished with 1 vitta each, which fills them, even in a dried state, but not elevated so much as the ribs. Commissure furnished with 2 vittae; vittae under a loose membrane; carphophore bipartite. Transverse section of seed terete.—Perennial; glabrous, aquatic, poisonous herbs. Stems terete, fistular. Leaves tripinnate, or biternate. Involucrum wanting or of very few leaves; involucres many-leaved. Flowers white.

* European species. Fibres of roots cylindrical and slender.

1 C. viroâ (Lin. spec. 368.) trunk of root hollow, divided into cells by transverse dissepiments; fibres of roots disposed in whorled fascicles; leaves trinervate; segments lanceolate, serrated; umbels opposite the leaves and terminal. 2. H. W. Native of the north of Europe, from Lapland to Germany; and of Siberia in ditches, lakes, rivers; North America between lat. 54° and 64°. In England it is not common, but is found at Isleworth, in the Coln, near Colnbrook, and Uxbridge; on Hounslow Heath; in the Isle of Ely; Lovingland, in Suffolk; near Norwich and Yarmouth, &c. In Scotland it is more common, as in the Lake of Forfar, and other lakes in Strathmore, &c. Oed. fl. dan. t. 208. Nees. off. pflz. 12. t. 8. Hayne, arz. gew. 1. t. 37. Bull. herb. t. 91. Smith, engl. bot. t. 479. Blackw. t. 354. Pech. icon. t. 213. C. aquaticâ, Wefer. mon. phil. trans. 44. t. 237. t. 4-5. Cicturâ aquâtica, Lam. dict. 2. p. 2. Coriândrum Cicuta, Roth. germ. 1. p. 130. Slum Cicuta, Vest. enh. no. 311. Flowers white; anther reddish. Towards the end of autumn the root for the succeeding summer is formed out of the lower part of the stalk; this is divided transversely into many large unequal cells, so that it becomes specifically lighter than water, and in winter, when the rivers or pools swell, is buoyed up. The old root then rots, floats all the winter, and in rivers is frequently carried to great distances, In the spring the old root is washed away, and the new one, on coming near the soil, sends out many slender fibres, by which it is again fixed, grows, and flowers. Watson, in phil. trans. It is one of the rankest of our vegetable poisons. Numerous instances are recorded of its fatality to the human species by Wefer, Haller, and others; and in the phil. trans. by Dr. Watson. Linneus relates its fatal effects on kine; and Dr. Withering relates that early in the spring cows often eat it, and are killed by it, but as the summer advances, and its scent becomes...
stronger, they carefully avoid it: that goats, however, devour it greedily with impurity, and that horses and sheep eat it with safety. Strong emetics are the most approved remedy for this poison.

*Var. β, tennifolia* (Schrank, akad. munch. philos. class. 7. p. 56. t. 4. f. 1.) trunk of root slender, bearing fascicles of cylindrical fibres; leaves bipinnate; segments linear, entire, and sub serrated; umbels opposite the leaves, and terminal. 2. W. H. Native of Germany, near Fussen.

Poisonous Water Henlock or Cowbane. Fl. July. Britain. Pl. 2 to 3 feet.

**American species.** Fibres of roots oblong and fleshy.

Cult. The species should be planted in ponds or ditches, where they will increase without any further care.

Lin. syst. Pentândria, Digynia. Margin of calyx obsolete, or with 5 very short teeth. Petals elliptic, tapering into a long inflexed acumen. Fruit contracted from the sides, rather dilated, roundish or oval; mericarps with 5 filiform, prominent, equal ribs: lateral ribs marginal; furrows between ribs furnished with 1 vitta each, and the commissure with 2 vittae; carpophore biiartite. Seed teretily convex, scarcely flatish in front.—Perennial herbs, natives of North America. Stems nearly simple, erect. Leaves ternate or binate; segments ovate, or cordate. Involucrum wanting; involucels few-leaved, variable. Flowers yellow, rarely white, or dark purple. This genus differs from *Smyrnium* in the seed not being involute, and from *A'pium* in the petals ending in a long inflexed acumen each.

Lin. syst. Polygâmia, Monogéia. Calyx unknown. Petals equal, lanceolate, acuminate, inflexed. Fruit oblong-elliptic, compressed from the sides; mericarps with 5 ribs, the 3 dorsal ones are elevated and acute, and the 2 marminating ones rounded: each furrow having 1 vitta. Albumen 5-angled; angles roundish.—Herb suffruticosum at the base. Leaves tri-ternitimately pinnate. Flowers dark purple, polygamous. Perhaps sufficiently distinct from *Thaspium.*

1. *P. atrópurpurae* (Lel. in sem. hort. hamb. 1828. p. 16.) 2. F. Native of Mexico. Mature fruit brownish, and have a strong scent of parsley, as well as every part of the plant.

Dark-purple-flowered Pentacryptta. Pl. 2 feet.

Cult. This plant will require to be protected in winter; it can only be increased by division or by seeds.

Lin. syst. Pentândria, Monogéia. Margin of calyx obsolete. Petals roundish, entire. Stylodium depressed. Fruit roundish, contracted from the sides, didymous; mericarps with 5 filiform equal ribs: lateral ribs marginal; furrows between the
ribs having one vittae each, but the outer ones have 2-3 vittae; carpopore undivided. Seed gibbously convex, flattish in front. —Herbs, having the roots thickish at the neck. Stems furrowed, branched. Leaves pinnate; leaflets cuneiform, cut. Umbels axillary on the branchlets, and nearly sessile at the top of the stem. Involution and involucres wanting. Flowers white or greenish.

**Sect. I. Euamium** (from eu, well, and apium, celery; this section is supposed to contain the true species of the genus). D. C. prod. 4. p. 101. Point of petals closely involute.

1 A. graveolens (Lin. spec. 379.) plant glabrous; leaves pinnate: upper ones ternate; leaflets cuneate, cut and toothed at the apex. g. H. Native nearly throughout the whole of Europe, even to Caucasus, in ditches; and also of Chili, near Mendoza, and of the Falkland Islands. D'Urv. fl. mal. p. 457. In Britain it is a common weed by the sides of ditches, brooks of water, and marshy ground, especially towards the sea. Smith, engl. bot. t. 1310. Schultes, syst. 6. p. 429. Hayn. arz. gew. t. 24. Fl. dan. t. 790. Planch, icon. t. 217. Siselli graveolens, Scop. carn. no. 360. Sium A'pium, Roth, germ. I. p. 128. Sium graveolens, Vest. man. bot. p. 517. Celery is known in Britain in its wild state under the name of smallage. The seeds and whole plant in its native ditches are acrid and dangerous, with a peculiar rank coarse taste and smell, and the effects of cultivation in producing from it the mild sweet stalks of celery are not a little remarkable; for which, and its name, we are indebted to the Italians, and which has now supplantec our native Alexander's (Smyrium Olaus trium).

**Use.**—The blanched leaf-stalks are used as a salad from August till March; they are also stewed, and put in soups. In Italy the unblanched leaves are used for soups, and when neither blanched nor the green leaves can be had, the seeds bruised form a good substitute. The root only of the variety called the celeriac, is used, and is excellent in soups, in which, whether white or brown, slices of it are used as ingredients, and readily impart their flavour. With the Germans it is also a common salad, for which the roots are prepared by boiling, until a fork will pass easily through them; after they are boiled and become cold, they are eaten with oil and vinegar. They are also sometimes served up at table, stewed with rich sauces. In all cases before they are boiled, the coat and the fibres of the roots, which are very strong, are cut away, and the root is put in cold water on the fire, not in water previously boiling. The varieties are as follows:

**Var. β, dulce** (D. C. prod. 4. p. 101.) leaves erect; petioles very long; leaflets 5-lobed, serrated. A'pium dulce, Mill. dict. no. 5. A'pium Celleri, Gern. fruct. 1. t. 22.

**Celery of the English; celeri or ache of the French; appieck of the Germans; and appio of the Italians.** There are several sorts of common or sweet celery, viz. 1 Common upright Italian. 2 Large hollow upright. 3 Solid stalked upright. 4 Large red stalked upright.

**Var. γ, rapaceum** (D. C. 1. c.) leaves spreading; petioles short; segments of leaves 5, serrated; root roundish. A'pium rapaceum, Mill. dict. no. 5. Celeriac of the English; celeri-race of the French; and knott-cellerie of the Germans. There are 2 or 3 sorts of celeriac, viz. 1 Common celeriac or turnip-rooted celery. 2 Celeri-race of the French; and 3 Knott-cellerie of the Germans. This last is harder than the other kinds, and will continue longer in spring. It is grown to a large size in the neighbourhood of Hamburg, and is sometimes imported for the London market.

**Var. δ, Lusitanicum** (D. C. 1. c.) radical leaves 3-lobed; caulis one 5-lobed, crenated. A'pium Lusitanicum, Mill. dict. no. 7.

**Estimate of sorts.**—The first three sorts of var. β are preferable for general culture. The red variety is rather coarse for salads, but is hardy to stand the winter, and well adapted for soups and stews. The sorts of var. γ are cultivated for their roots, under the name of celeriac, which are fit for use in September and October, and may be preserved in sand through the winter. Celery may be grown to 10lbs. weight, and averaging 6lbs. each head. A head of celery, we are informed (Cal. mem. vol. 2. p. 297.), was dug up on the 4th of October, 1815, at Longford, near Manchester, which weighed 9lbs. when washed, with the roots and leaves still attached to it, and measured 4 feet 6 inches in height. It was the red sort, perfectly solid, crisp, and firm, and remarkably well flavoured.

**Propagation.**—All the sorts are raised from seed; and half an ounce is reckoned sufficient for a seed-bed 4 feet and a half wide by 10 feet in length, of the upright sorts; but for celeriac, a quarter of an ounce will be enough for a bed 4 feet square.

**Soil.**—Celery delights in a soil rather moist, rich in vegetable mould, but not rank from new unrotted dung.

**Times of sowing.**—The most forward crop is slightly forced. Any of the varieties may be sown in the spring in the open garden, at 2 or 3 different times, from the 21st of March until the first week of May; but the principal sowing should be made in the first fortnight of April.

**Early crop.**—For early summer and autumn celery, sow a small portion towards the end of February, in a moderate hotbed. When the young plants are about 2 inches high, put out some into a warm border, 2 or 3 inches apart, or rather into a second slight hot-bed, if before the 21st of March, as well to protect the plants, as to expedite their growth for final planting. As soon as the leaves are 6 inches high, in May or June transplant them into trenches for blanching, as directed below for the main crops. But as these early sown plants will not continue long in full growth before many of them will pipe or run, you should plant only a moderate crop, for a temporary supply; when they are advanced in the trenches from 8 to 12 inches in growth, begin to earth them up several inches on both sides of each row; continue earthing up by degrees as they rise higher, till they are whitened from 6 to 12 inches in length; when they may be dug up as wanted.

**Main crop.**—To raise the main crops for summer, autumn, and winter, make a considerable sowing at the commencement of April. Sow in beds of light mellow earth, and rake in the seed lightly and regular. In very dry weather give moderate waterings, both before and after the plants come up. When they are 2-3 or 4 inches high, thin the seed-bed, and pick out a quantity at successive times into intermediate beds, 3-4 inches asunder. Water those removed, and till they have struck fresh root. D. Judd sows about the middle of January in a warm situation, on very rich ground, protecting it by mats at night. When the plants are from 2-3 inches high, he pricks them out into a nursery-bed, immersing the plants, as he draws them, in water, so as they may remain moist while out of ground. The plants remain in the nursery-bed until they become very strong. John Walker, a gardener near Manchester, grows the red celery; sows for the early crop about the 1st of March, and for the late crop about the 1st of April. The seed-bed is formed of fresh dark loamy soil, mixed with old rotten dung, half and half, and placed on a hot-bed. The nursery or transplanting bed is formed with old hot-bed dung, very well broken, laid 6 or 7 inches thick, on a piece of ground which has lain some time undisturbed, or has been made hard by compression. The situation should be sunny. The plants are set 6 inches apart in the dung, without soil, and covered with hand-glasses. They are watered well when planted, and frequently afterwards. By hardening the soil under the dung in which the plants are set,
the root is formed into a brush of fibres; and by thus preventing the pushing of a tap-root, the plant never runs to seed before the following spring."—Cal. hort. mem. vol. 2.

Transplanting into trenches.—When either the plants left in the seed-bed, or those removed, are from 6 to 12 inches high, or when the latter have acquired a stalky growth, by 4 or 5 weeks’ nurture in the intermediate bed, transplant them into trenches for blanching. For this purpose allot an open compartment. Mark out the trenches a foot wide, and from 3 feet to \(\frac{3}{4}\) feet distant; dig out each trench lengthwise, a spade in width, and a light spade deep, that is, 6 or 8 inches, or even a foot. Lay the excavated earth smoothly in the intervals, making the edges of the trenches equally full and straight; also loosen the bottom moderately, in a level order, to receive the plants. Before inserting them, it would essentially strengthen the soil, to apply some good rotten dung in each trench 3 inches thick, and let it be dug into the bottom regularly a moderate depth. Then having lifted the plants, just thin any long straggling tops of the leaves and fibres of the roots; also slip off side shoots; plant a single row along the bottom of each trench, 4 or 5 inches apart. Give a good watering directly, and occasionally after, if the weather be dry, till the plants take root, and show renewed growth. Continue planting out a monthly succession in June, July, August, and September; thus providing for a supply from July and August of the present summer throughout the course of autumn and winter, till May in the following spring. Judd prepares his ground for transplanting by trenching in 2 spades deep, mixing with it in the operation a good dressing of well-reduced dung from the old forcing beds. He says, "I give it a second trenching in order that the dung may be better incorporated with the mould, and then leave it in as rough a state as possible, till my plants are ready to be put out." In the ground thus prepared, he forms trenches 20 inches deep, and 6 feet distant from each other, measuring from the centre of each trench. Before planting he reduces the depth of the trenches to 5 inches, by digging in sufficient dung to fill them so much up. At the time of planting, if the weather be dry, the trenches are well watered in the morning, and the plants are put in, 6 inches apart in a row, in the evening, care being taken by the mode above mentioned, to keep the fibres quite wet whilst out of ground; as they are drawn from the nursery-bed, the plants are dressed for planting, and then laid regularly in the garden pan. The trenches, in which his rows of celery are planted, being so very shallow, the roots of the plants grow nearly on a level with the surface of the ground: this he considers particularly advantageous; for as considerable cavities are necessarily formed on each side when the moulding takes place, all injury from stagnant water or excess of moisture is prevented. The trenches when planted are watered, as may be required. He prepares his ground for celery during the winter, and avoids putting much of a crop in the space between the trenches, especially one that grows tall, as he finds celery does best when it grows as open as possible. Walker makes his trenches at 4 feet distance, and 18 inches wide, 12 deep, and filled 9 inches with a compound of fresh strong soil, and well-rotted dung; three-fourths dung, and one-fourth soil. Old hot-bed dung is the best. The plants should be taken up with as much soil as will conveniently adhere to the roots, and the side-shoots are removed from the stems; they are then set with the hand at 9 or 10 inches apart, in the centre of each trench; it is necessary to water well until they are ready to be earthed, but not afterwards.

Landing or earthing up.—As the plants in trenches rise from 10 to 15 inches high, Abercrombie begins to land-up for blanching, observing "to trim in the earth gently when first raised to the stems, with a hoe or spade, but mostly the latter. When the plants are of a more advanced growth, earth them up equally on both sides each row, 3-4 or 5 inches, according to the strength and height of the different crops. Repeat this once a week or fortnight, till by degrees they are landed-up from 12 inches to 2 feet, in order to Blanch them of some considerable length. Continue thus landing-up the different crops from July till February. As the autumnal and main winter crops attain full growth, give them a final landing-up near the tops, which will increase the length of the blanched part, and also protect the later crops more effectually during the winter." In landing-up celery, Judd does "not think it well to load the plants with too much mould at first. The two first mouldings, therefore, are done very sparingly, and only with a common draw-hoe, forming a ridge on each side of the row, and leaving the plants in a hollow, to receive the full benefit of the rain and the waterings. When the plants are strong enough to bear 6 inches high of mould, the moulding is done with the spade, taking care to leave bases enough to support the masses of mould, which will ultimately be used in the ridge, and still keeping for some time the plants in a hollow, as before directed. The process of moulding is continued through the autumn, gradually diminishing the breadth of the top, until at last it is drawn to as sharp a ridge as possible to stand the winter. In the operation it is necessary, in order to prevent the earth from falling into the hearts of the plants, to keep the outer leaves as close together as possible; for this purpose, before I begin the moulding I take long bands of bass matting, tied together till of sufficient length to answer for an entire row, and I fasten this string to the first plant in the row, then pass it to the next plant, giving it one twist round the leaves, and so on till I reach the other, where it is again fastened; when the moulding is finished, the string is easily unravelled, by beginning to untwist it at the end where it was last fastened." Walker, having removed the lateral shoots, the leaves of each plant being held together with one hand, the soil pulverized, is drawn round with the other, taking care not to earth up too high at once, nor too close. The heart should always be left quite free. This may be repeated about once a fortnight until the plants are ready for use.

Late crop.—For late spring celery to stand till the end of May in the returning spring, without running considerably, it is expedient to make a small late sowing at the commencement of May. The plants when 6 weeks old may be pricked on intermediate beds, 6 inches by 3 asunder; to remain till September or October, then transplant them into moderate trenches; as they advance in growth, earth them up a little in winter, and finally in the spring in February and March.

Occasional shelter.—On the approach of frost take up a part of the crop, and lay it by under dry sand for winter use. To preserve the plants left in the bed, lay some long dry litter over the tops, which remove in every interval of mild weather. It is a common complaint, that very fine looking celery is often found to be rotten at the base of the leaf-stalks; the fact being, that when it is full grown, and the blanching completed, it begins to decay, and will not keep good in the ground for more than a month at most. Some, therefore, take up and preserve in dry sand, but in that situation it soon becomes tough and dry. The best mode seems to be that of forming successive plantations.

Taking the crop.—It is best to begin at one end of the row, and dig clean down to the roots, which then loosen with a spade, that they may be drawn up entire without breaking the stalks.

Cultivation of celeriac.—The times of sowing are the same as that for other sorts of celery. The plants require a rich well-manured soil, and according to an account communicated by Lord Stanhope to Mr. Sabine, the plants are reared on a hot-bed under glass, and transplanted when 2 or 3 inches high to another hot-bed, and set an inch and a half apart. In the be-
ginning or middle of June they are transplanted into flat beds in the open air, at the distance of 15 inches from each other, and not in trenches like other celery. They must be abundantly watered as soon as they are set out, and the watering must be repeated every other day, or, if the weather should be warm, every day. As they increase in size they will require a greater quantity of water, and they must be occasionally hoed. The roots will be fit for use in September or October. Mr. Sabine states that he has been informed, that the plan of giving excess of water is peculiar, and that the vigorous growth of the plant is more dependent on richness of soil than on any other cause. Abercrombie directs to earth up the bulbs 4 or 5 inches to blanch them, when they are full grown.

To save seed.—Either leave some established plants in the spring where growing; or in February or March dig up a competent number, cut down the top leaves, and set the plants in the ground full 2 feet asunder. They will produce seed in autumn. Walker grows only red celery, and in preparing plants for seed, chooses the most solid, of the redder colour, and the smallest size. When taken out of the transplanting bed, the lateral shoots being removed, they should be planted in a dry warm situation, where the seed will ripen well.

2 A. *Chile* L ≈ (Hook. et Arn. in hot. misc. 3. p. 353.) plant glabrous; stem nearly terete, hardly angular; leaves spreading, bipinnate; lobes cuneated, somewhat trifidly cut, quite entire; petals involute at the apex. *H.* Native about Valparaiso. The plant is much stouter than *A. graveolens*, and the stem is not deeply furrowed. The leaves resemble those of common parsley, but are much smaller, and more flaccid. The peduncles or short lateral branches are stout and firm. Fruit much larger than that of *A. graveolens*. Involucrum and involucules wanting. *Chili* Celery. Pl. 2 feet.

*Sect. II. OREOSCHLES* (ορος ορεος, oros oreos, a mountain, ορεινος, oreinon, an umbel; habitat of plants). D. C. prod. 4. p. 101. Petals denticulated, with an inflexed point.

*Mountain Celery*. Pl. 2 to 3 feet.

4 A. *Ranunculifolium* (H. B. et Kunth, l. c. p. 18. t. 421.) leaves somewhat ternate; leaflets obovate-cuneated: lateral ones 5-lobed: intermediate one 3-parted; segments 2-3-lobed. *Y.* F. Growing along with the preceding, of which it is probably only a variety. *Crowfoot-leaved* Celery. Pl. 2 to 3 feet.

5 A. *Glaucescens* (H. B. et Kunth, l. c.) leaves subternate; leaflets obovate-cuneated; trifid; lobes bifid or trifid. *Y.* F. Growing along with the two preceding species, of which it is perhaps only a variety. *Glaucescent* Celery. Pl. 2 to 3 feet.

6 A. *Commersoni* (D. C. prod. 4. p. 101.) leaves pinnate; leaflets multifid: lobes linear. *Y.* F. Native of South America. Styles a little longer and more divergent than any other of the species. It is very nearly allied to *A. ranunculifolium*, but the segments of the leaves are narrower and more acute, and the lower leaves are pinnate. *Commerson's* Celery. Pl. 2 to 3 feet.

† Species not sufficiently known.

7 A. *Fratrophylleum* (Horn. hort. hafn. suppl. p. 128.) segments of radical leaves cordate, and truncate at the base, and trifid at the apex. *H.* Native country unknown. The fruit is very like that of *A. graveolens*. *Broken-leaved* Celery. Fl. June, July. Clt. 1826. Pl. 1 to 2 feet.

*Southern Celery*. Pl. 1 foot.

Cult. The species will grow in any common soil, and are increased by seeds.

LIN. SYST. Pentandria, Digynia. Margin of calyx obsolete. Petals roundish, incurved, entire, hardly emarginate, with an inflexed point. Stylopodium short, conical, rather crenulated. Styles diverging. Fruit ovate, contracted from the sides, somewhat didymous; mericarps with 3 equal filiform ribs: lateral ribs marginal; having the furrows between the ribs furnished with one vitta each, and the commissure with 2. Carpophore bipartite. Seed gibbously convex, flatish in front.—*Branched* glabrous herbs. Leaves compound, with cuneate segments. Involucra few-leaved; involucels many-leaved. Flowers white or greenish, uniform: those in the disk of the umbel frequently sterile. Stamens longer than the corolla.

1 P. *sativum* (Hoffm. et Koch, l. c.) stem erect, angular; leaves decumbent, shining; lower leaflets ovate-cuneated, trifidly toothed: superior ones lanceolate, nearly entire; leaves of involucel filiform. *H.* Native of Sardinia, Greece, Archipelago, Turkey, Chili about Conception, &c. on shaded rocks; and now cultivated in every culinary garden. Nees. off. pflanz. 16. t. 21. *A'pium* Petroselinum, Lin. spec. 379. Hayn. arz. gew. 7. t. 23. *A'pium* vulgare, Lam. fl. fr. 3. p. 1027. *A'pium* tenuifolium, Riv. pent. irrit. with a figure. The Parsley is called *Persil* in French, Petroselit in German, and *Petroselino* in Italian. It is a hardy biennial; introduced to England in 1548 from Sardinia. It is now so common as to be naturalised in several places both in England and Scotland. The root leaves are much curled in some varieties. The flowers are yellow, and appear in June; they have usually one leaf at the origin of the universal umbel; and the involucel often of from 6 to 8 short small leaves, fine almost as hairs to the partial umbels.

"It may be right to notice, that the poisonous plant called fools-parsley (*Æthusa Cynapium*), a common weed in rich garden soils, has sometimes been mistaken for common parsley. They are very easily distinguished: the leaves of fools-parsley are darker green, of a different shape, and, instead of the peculiar parsley smell, have when bruised a disagreeable odour. When the flower-stem of the fools-parsley appears, the plant is at once distinguished by what is vulgarly called its beard, the 3 long pendant leaves of the involucrum. The timid may shun all risk of mistake by cultivating only the curled variety. This last it may be remarked, makes the prettiest garnish." Neill.

Varieties.—There are:

1. The *common plain leaved*, which is the true species, is seldom cultivated.

2 The *curled-leaved*. This is the most esteemed variety. *A'pium* crispium, Mill. dict. no. 2. *P. sativum* ς crispum, D. C. prod. 4. p. 102.

3 The *broken-leaved or large-rooted* Humburgh, which is cultivated for its carrot-shaped roots. *A'pium* latifolium, Mill. dict.
no. 5. but not of Poir. P. sativum γ latifolium, D. C. prod. 4. p. 102.

Use.—The leaves of the two first varieties are used as pot-
herbs at all seasons of the year; also as a garnish. The third
kind is esteemed for its large white carrot-shaped roots, drawn
in winter like parsnips for the table; and occasionally to be used
in medicine, being a good remedy for the gravel.

Culture of the pot-herb kinds.—"One sowing in spring will
mostly furnish young leaves all the year, though to answer a
constant demand, many persons make successive sowings from
February to May. Some also sow early in autumn for young
parsley in winter and spring; but such a supply is better pro-
vided by cutting down established plants. Sow in a single drill
along the edge of any compartment, or occasionally in rows 9 or
12 inches asunder. Draw small drills, something less than an
inch deep, in which drop the seed moderately thick, and cover
a little above half an inch. The plants will come up in 3 or 4
weeks, and when 2 or 3 inches high, may be gathered as wanting
all the summer, winter, and following spring till May, when
they will go to seed. Have always a young crop sown timely
in the spring, to succeed the declining old plants. In gathering
pot-herb parsley, cut close and regular. In summer, when the
plants grow rank, yielding more leaves than can be used, cut
them in close to the bottom, and they will shoot up stocky in
a regular close growth. Observe also to do the same in autumn,
about the end of September, that the plants may form heads of
fresh young leaves before winter. On the approach of frosty
weather protect them with hauhin or reed-pannels, laid upon
branches of birch or other light supports."

Culture of Hamburgh parsley.—"To obtain large roots allot
a compartment where the soil is deep, and has been well dug.
Any common mould will suit, if dry and not too rank. Sow in
February, March, or early in April, in one or more beds; either
in drills 9 inches asunder, or broad-cast, and rake it. The
plants should be thinned to 9 inches distance, to give room for
proper growth in the roots, for use in August, September, Oc-
tober, and thence till the following spring. On the approach of
frost take up some roots, and preserve them in sand. A sowing
may be made in the third week in June, when young roots are
wanted in winter."

To save seed.—"Permit some old plants to run to stalks in
May; they will produce plenty of seed, ripening in July or Au-
gust." Abercornbe.

Cultivated or Common Parsley. Fl. June, July. C1t. 1548.
Pl. 2 feet.
2 P. peteRiNus (Lag. am. nat. 2. p. 100. Koch, umb. 128.)
stem erect, stiff, rather angular; petioles sheathing, scarious;
leaves shining; leaflets on long petioles, cuneate, deeply serr-
ated; leaves of both the involucrum and involucell linear. 8. H.
Native of Spain? Portugal? and on the mountains of Peru
according to Henk. herb. A'mmi petroselinoide, Presl, miss.
Apium petroselinoide, Poir. dict. 4. p. 369. but not of Mill.

Foreign Parsley. Fl. June, July. Cit. 1633. Pl. 2 feet.
3 P. seliNoide (D. C. prod. 4. p. 102.) stem striated; radic-
al leaves tripinnate; cauline ones bipinnate; leaflets pinna-
tifid; lobes linear-lanceolate, acute, entire, or tripartite; umbels
dropping a little; involucrum almost absent. 2. H. Native
This plant differs from Gnidiun apioides, to which it is joined
by Sprengel, in the segments of the leaves being much larger,
in the petals being cream colored, not white, and in being
entire, not obcordate.

Selinum-like Parsley. Pl. 2 feet.
4 P. prostrATum (D. C. prod. 4. p. 102.) stem procumbent,
flexuous; leaves pinnate; leaflets petiolate, pinnatifid; lobes
5-7-lanceolate; ultimate ones trifid at the apex; umbels
nearly sessile, opposite the leaves; involucrum usually of one leaf.
1. F. Native of Van Diemen's Land. Apium prostratum,
Labill. nov. holl. 1. p. 76. t. 103. Vent. malm. t. 81. Schultes,

Prostrate Parsley. Pl. prostrate.
5 P. sequeTum (Koch, umb. p. 128.) stem erect, twiggy,
nealy naked; leaves pinnate; leaflets nearly sessile, roundish-
ovate, pinnatifidly cut, mucronately toothed; upper lobes linear;
involucrum 2-3-leaved; rays of umbel very unequal. O. H.
Native of Britain, France, Caucasus, and Switzerland, in corn-
fields, vineyards, and gardens. In Britain in a chalky rather
moist soil, but not very common; as about Mapledurham,
Hants; at Binham, Norfolk; near Kelmash, Northamptonshire;
at Walthamstow, Essex; and in the island of Tiree, Scotland.
Sisum sigeTum, Lin. spec. 362. Jacq. hort. vind. t. 134. Smith,
engl. bot. 228. Sium segetum, Lam. dict. 1. p. 406.—Mor.
hist. 3. p. 283. sect. 9. t. 5. f. 6. Flowers and fruit agree
with the rest of the genus Petroselium, but the habit is that of
Pimpinella. Flowers all fertile, white or even reddish. Teeth
of calyx rather conspicuous. Perhaps Sisum arvensis, Broth.
fl. his. 1. p. 424, and Schultes, syst. 6. p. 418. is not distinct
from this. The whole account of this herb by that accurate
observer Goodyer, with the origin of honewort, from its curing
a swelling in the cheek, called a hone, &c. is a model of precise
information.

Cult. The species will grow in any soil, and they are only
to be propagated by seed.

XXXIX. WYDHERIA (in honour of H. Wydler, who has
mem. v. p. 36. t. 7. prod. 4. p. 103.

Lin. syst. Pétuníáda, Digíínia. Margin of calyx obsolete
(f. 60. a.). Petals ovate-lanceolate, entire, acuminate (f. 60.
c.); acumen incurved. Fruit ovate, rather didymous, crowned
by the short stylopodium, and short reflexed styles (f. 60. b.);
mericarps somewhat semi-terete, and rather contracted at the
margins; furnished with 5 filiform thickish obtuse ribs at equal
distances; having the furrows between these ribs furnished with
one vitta each, but the commissure is narrow, and furnished with
2 vittae; all the vittae are very narrow. Carphophore bífis.—
A smooth West Indian herb, with a terete branched erect stem;
ternate leaves, with multifid leaflets, and cuneate lobes.
Involucrum none or only of one leaf, but the involucres are many
leaved. Flowers white, not sufficiently known. This genus,
 according to Koch, is allied to Petroselium, but differs both
from it and Ferulium, in the petals ending in long taper points.
It is also to be distinguished from Cnidiun, in the fruit being some-
what contracted at the sides, and in the ribs not being winged;
from Séseli, in the calyx being toothless, and from both these
last genera in the petals being entire.

1 W. Portorice'nsis (D.C. 1. c.) O. F. Native of Porto Rico,
on the west coast, where it is cul-
tivated along with Musa para
diviusa and Lepidium Virginicum. Plant a foot high and more.
Leaves rather stiff. Umbels numerous, 12-14-rayed. (fig. 60.)

Porto-Rico Wydleria. Pl. 1 foot.

Cult. A plant of easy culture, and only to be propagated by seeds.

LIN. SYST. Pentândria, Digynia. Margin of calyx obsolete. Flowers usually dioecious from abortion, rarely monoecious. Petals of the male flowers lanceolate, ending in an involucate segment; those of the female or hermphrodite flowers ovate, and ending in a short inflexed point each. Fruit ovate, compressed from the sides; mericarps furnished with 5 filiform, rather prominent equal ribs; lateral ones marginal; having the furrows between the ribs either without vitta, or with one in each furrow; carphophore flat, bipartite from the base. Seed gibbously convex, flatish in front.—Much branched biennial herbs. Stems angular. Leaves bipinnate; leaflets latrorse; lobes linear, pale or glaucous. Umbels numerous, of many rays, without any involucre, either disposed in a thyrse or panicale. Umbelles usually naked, seldom furnished with an involucre, sometimes prolific or somewhat racemose. Flowers white, dioecious or polygamous.

of many parts of Europe, in ditches and rivulets; plentiful in some parts of Britain. Sium nodiflorum, Lin. spec. 361. Woody. med. bot. 3. t. 182. Smith, engl. bot. t. 639. but not of the Flora Danica. Sison nodiflorum, Brot. fl. lus. 1. p. 423. Séseli nodiflorum, Scop. caryn. 2. p. 253. Flowers white. There is a dwarf variety of this mentioned in D. C. fl. fr. 4. p. 390, which is hardly a finger in height; and a large variety, which grows even 1 1/2 foot high. This plant was formerly admitted into the London Pharmacopoeia, in the character of an antiscorbutic, or rather as a corrector of acid humours, especially when manifested by cutaneous eruptions, and tumors in the lymphatic system. The best proofs of its efficacy are from Dr. Withering. A young lady was cured of a most obstinate cutaneous eruption by taking three large tea-spoonfuls of the juice twice a day; and he has repeatedly given to adults 3 or 4 ounces every morning, in similar complaints, with the greatest success. It is not nauseous, and children take it readily if mixed with milk. In the dose he has given it, it neither affects the head, the stomach, nor the bowels. This plant, therefore, if it should be eaten for water-cresses, does not seem to be very dangerous, or to require all that caution which Miller prescribes, to distinguish it from water-cresses.

6 H. rēpens (Koch, l. c.) stem prostrate, rooting; leaves pinnate; leaflets roundish, deeply toothed; umbels on long peduncles, opposite to the leaves; involucrum of 2-4 ovate-lanceolate permanent leaves. 4. W. H. Native of France, Denmark, and Germany. In Britain in boggy meadows, or on watery commons; on Bullington Green and Cowley Bottom, near Oxford; on Coldham Common, Cambridgeshire; on Goldington Green and Stevington bogs; at Fisher Row and on Guilford Links, near Edinburgh; and in ditches near Forfar. Sium rēpens, Lin. fil. suppl. 181. Fl. dan. 1514. Jacq. auct. 3. t. 260. Smith, engl. bot. t. 1431. Peduncles of umbels equal to the naked part of the petiole, which are in H. nodiflorum much shorter. Flowers white.

4 H. inunīdum (Koch, l. c.) stems creeping; leaves pinnate; leaflets of the submerged leaves capillaciouly multifid; those of the emerged ones cuneiform and deeply trifid; umbels opposite the leaves; peduncles bearing 2 rays or umbels, without an involucrum; umbellules 4-flowered. 4. W. H. Native of Europe, in marshes, bogs, ditches, pools, and wet ground over-flowed in winter; plentiful in some parts of Britain. Sium inunīdum, Wigger’s, Holst. p. 24. Hydrocotyle inunīdum, Smith, fl. brit. 1. p. 290. Engl. bot. t. 227. Fl. dan. t. 89. Siron inunīdum, Wildl. Mēum inunīdum, Sprech. umb. spec. 115.—Plink. alm. t. 61. f. 3. Flowers white.

6 H. Calīfōrinicum (Hook. et Arn. in Beech. bot. 4. p. 143.) plant procumbent? leaves pinnate, with 8-11 ovate, acute, deeply serrated leaflets; lower leaflets pinnatifid or pinnate, with few leaflets; umbels lateral and terminal; involucrum of many leaflets; styles elongated. 4. B. H. Native of North California, and on the low moist soils of the Columbia. The plant has a good deal the habit of H. rēpens. Douglas says the stems are 2-3 feet high, from which expression it may be inferred that the plant is not procumbent. Californian Helosciadium. Pl. 2 to 3 feet.

Sect. II. Cyclospērēnum (from κυκλος, kyclos, a circle, and σπέρα, sperma, a seed). Lag. am. nat. 2. p. 101. D. C. prod. 4. p. 105. Both the involucrum and involucres are wanting. Fruit quite glabrous.

8 H. lacinīatūm (D. C. mem. soc. generv. vol. 4.) plant glabrous, erect; leaves many times ternately divided: leaflets cut, oblong-linear: cauleine leaves all petiolate; umbels sessile, opposite the leaves, 3-rayed, one-half shorter than the petioles. 4. H. Native of Peru and of Chili; in stony pastures. Berto, herb. no. 101. Poepp. no. 93. p. 281. Very like H. leptophyllum, but differs in the leaflets being broader, and in the petioles of the cauleine leaves being much longer. Sison lacinīatūm, Lher. herb. in herb. Domb.

Jagged-leaved Helosciadium. Pl. 1 foot.

9 H. ranunculīfōrum (D. C. prod. 4. p. 105.) plant glabrous, erect, dichotomous; lower leaves bipinnate: upper pinnate and ternate, opposite; leaflets cut at the base, cut into acuminate lobes; umbels rising from the forks of the branches, on short peduncles. 4. H. Native of Chili, on the Andes in Rio Saladillo, in the province of Cordova; and about Concepcion. H. laterifōrum, Hook. et Arn. Some of the petals are entire, and some of them somewhat emarginate, from the point being bent in so much. Calyx obsolete. Fruit coriaceous at the base when young, more compressed, and less ribbed than in the rest.
Crown-foot-leaved Helosciadium. Pl. 1 foot?

10 H. tenérum (D. C. prod. 4. p. 105.) plant glabrous, erect; leaves bipinnate; leaflets tripartite: lobes obovate, obtuse, small; umbels rising from the axils, pedunculate, 4-5-rayed, without involucrum.—Native of Nipaun, on the high mountain of Shepole. Sison? ténér, Wall. mss. Herb 6-8 inches high. Sheath of petioles dilated and membranous. Fruit small, ovate, glabrous in the immature specimen. Styles very short.

Tender Helosciadium. Pl. 3 foot.

11 H.? Ru’ta (D. C. prod. 4. p. 106.) stem multiple, diffuse; leaves binate: lower ones on long petioles: lobes ovate, confluent a great way, obtuse: upper leaves on short petioles, with oblong lobes; umbels opposite the leaves, sessile, 3-5-rayed; rays elongated.—Native of the Cape of Good Hope. Sium forté Afrikanum foliis trifidis se lætæ hortensis Oldeni. herb. Sison trifidum, Burn. herb. Sison Rūta, Burnfl. cap. p. 7. A rather doubtful species, but from the immature fruit it appears to belong to this genus.

Rue-leaved Helosciadium. Pl. diffuse.

12 H. Heyne'num (D. C. prod. 4. p. 106.) stem nearly simple, erect; leaves on long petioles, ternate; leaflets petiolate, lanceolate, acuminate, deeply toothed; umbels on long peduncles, opposite, with 5-6 elongated rays; and the umbellules 5-8-flowered. O. H. Native of the East Indies, but in what place is unknown. Pipinnélá Heyne'num, Wall. mss. Mature fruit not seen. Allied to the following section, but differs in the fruit being glabrous while young.

Heyne’s Helosciadium. Pl. 1 foot.

SECTION III. TRACHISCÁDIUM (FROM τραχύς, trachys, rough, and σκιάδιον, skiadion, an umbel; in reference to the rough fruit of the species). D. C. prod. 4. p. 106. Both involucra and involucules are wanting. Fruit rough from short stiff hairs.

13 H. trifolíatum (D. C. prod. 4. p. 106.) stem glabrous, branched, erect: lower leaves 3-5-parted, the rest ternate: leaflets nearly sessile, ovate-lanceolate, smooth above, but scabrous from pili along the nerves beneath, deeply toothed: teeth mucronate; fruit ovate, scabrous from rigid pili.—Native of Nipaun, on the higher mountains about Gosangtham. Pipinnélá trifolíátum, Wall. mss. Umbels terminal, and opposite the leaves, 6-8-rayed. Styles very short. Fruit rather dillymous.

Trifoliate Helosciadium. Pl.

14 H. pubescéns (D. C. prod. 4. p. 106.) stem erect, multiple, pubescent, as well as the petioles, rays of umbel, and under side of leaves: lower leaves ternate: leaflets ovate, toothed, stalked: upper leaves on long petioles, ovate-cordate, toothed, rarely cut; fruit scabrous.—Native of Kamaon, in the East Indies. Pipinnélá pubescéns, Wall. mss. Very like the preceding, but differs in the pubescence and structure of the leaves. The immature fruit has only been seen.

Pubescent Helosciadium. Pl.

Cult. Those species belonging to the first section of the genus being aquatic perennial plants, should be grown in ponds of water; the rest being annual, the seeds of them should be sown in any warm situation.

XLII. DISCOLEURA (from δίσκος, diskos, a disk, and πελευσ, pleura, a rib; the 2 lateral nerves of the fruit form a disk on both sides of the fruit). D. C. coll. mem. 5. p. 38. t. 8. and 9. prod. 4. p. 106.—A’mmi species of Michx. Ell. &c.

LIN. Syst. Pentándria, Diogyia. Calyceal teeth 5, subulate, permanent (f. 61. c.). Petals ovate, entire, each furnished with a replicate point (f. 61. f.). Fruit ovate (f. 61. c.), rather dillymous; mericarps with 5 ribs; the 3 dorsal ones filiform, exserted, and acuash: the 2 lateral ones rather corneous, with the thick accessory margin, forming a broad disk on both sides of the fruit: having the furrows between the ribs furnished with one vitta each; carpophore bifid. Seed nearly terete.—Smooth North American herbs. Stems terete. Leaves compound; leaflets linear-setaceous, some trifid, and others entire. Leaves of involucel few, linear-setaceous. Flowers white. A genus of elegant plants.

Var. θ7 costáta (D. C. I. c. t. 8. β) plant large, erect; stem simple below; segments of the leaves somewhat verticillate; involucres of 10 or 12 leaves; fruit deeply furrowed. O. W. H. Native of Georgia, in marshes on the banks of the river Ogeechee. A’mmi costátum, Ell. sketch. 1. p. 350. Said to be nearly allied to the species, but differs according to Elliot, in the plant being of taller stature, 4-5 feet high, not 1 or 2 feet high, as in the species, and in the time of flowering, which is in autumn, and not in the spring, and in the leaves of the involucel being equal in length to the umbellules.

Capillary-leaved Discopleura. Pl. 1 to 2 feet.

2 D. Nutta'lı (D. C. I. c. t. 9.) plant erect; umbels 20-rayed; leaves of involucel 5-6, and for the most part undivided; involucels of 5 leaves, about equal in length to the umbellules. O. H. Native of North America, at the Red river. Cíclica capilláceas, Nutt. in litt. 1825. Fibres of roots in fascicles. Stem simple at the base, 1-2 feet high. Involucel deflexed.

Nuttal’s Discopleura. Pl. 1 to 2 feet.

Cult. The seeds only require to be sown early in spring in the open border.

LIN. Syst. Pentándria, Diggia. Margin of calyx obsolete. Petals elliptic, entire. Styles permanent, short. Fruit compressed from the sides, ovate; mericarps with 5 hardly prominent ribs: having one vitta in each furrow between the ribs. Seed convex on the outside, and flattish on the inside; carpophore bifid at the apex.—Glabrous, slender, smooth, erect North American annual herbs. Stems terete. Leaves multifid; leaflets linear. Umbels pedunculate, opposite the leaves, and terminal, with few rays, destitute of involucro: rays of umbellules few and unequal; involucelles short, few-leaved. Flowers small, white.

§ 1. Fruit neither scabrous nor echinated.

1 L. ine'rmis (Nutt. in litt. ex D. C. prod. 4. p. 107.) fruit o 0 2

Unarmed-fruited Leptocaulis. Pl. ½ foot.

§ 2. Fruit muricated or echi-nated.

2 L. diffusus (Nutt. in litt. ex D. C. l. c.) fruit muricated from rather adpressed bristles; branches and rays of umbel diffurcate; umbels and umbellules 3-rayed; pedicels of umbellule about equal in length to the rays of the umbel. O. H. Native of North America, at the Red river. Stem erect, slender, branched at the apex. Lobes of leaves or leaflets capillary. Involute of 1-2 leaves. Pedicels half an inch long. Flowers diffuse.

Diffuse Leptocaulis. Pl. ½ foot.

Divericate Leptocaulis. Pl. 1 foot.

4 L. pætns (Nutt. in litt. ex D. C. prod. 4. p. 107.) fruit muricated from tubercles; branches divaricate; rays of umbels and umbellules 4-5, rather contracted. O. H. Native of North America, at the red river. This is the largest species of the genus, being a foot high or more. Lobes of leaves or leaflets capillaceous. Flowers white.

Spreading Leptocaulis. Pl. 1 foot.

5 L. echinatus (Nutt. in litt. ex D. C. prod. 4. p. 107.) fruit echinated by spreading bristles; branches at length diverigate; umbels and umbellules 5-rayed, rather diverging. O. H. Native of North America, at the red river.

Echinated Leptocaulis. Pl. ¾ foot.

Cult. The seeds only require to be sown in spring.

XLIV. PYTCHOTIS (from πυγός, pytche, a plait, and ource, ource, our, otos, otan, an ear; the petals have a plait in the middle, emitting a little ear or segment). Koch, umb. 124. D. C. coll. mem. 5. p. 39. prod. 4. p. 107.—Bunium, Lag. am. nat. 2. p. 104. —Sæsii species of authors—Amnozois, Adans. fam. 2. p. 96.

LIN. SYST. Pentântëria, Digynia. Margin of calyx 5-toothed. Petals obovate, bifidly emarginate, having a transverse plait in the middle, which emits a little segment. Fruit compressed from the sides, ovate or oblong; mericarps with 5 filiform equal ribs; lateral ribs margination, having the furrows between the ribs furnished with one vitta each; carphophore bipartite. Seed terete or gibbously convex, flat in front.—Annual or biennial herbs. Cauline leaves multipli-capillaceous. Umbels compound, having the universal involucral variable, and the partial ones of many leaves. Flowers white. This is a very distinct genus from the form of the petals, having the segment not at the apex, but rising from the transverse plait.

Sect. II. Trachyspermum (from τραχύς, trachys, rough, and σπέρμα, sperma, a seed; in reference to the muricated fruit). Link, enum. 1. p. 267. Universal involucrum composed of a few linear entire or trifid leaves. Fruit muricated.

4 P. anethifolía (D. C. prod. 4. p. 108.) stem erect, branched; leaves all multifid, with linear hair-like segments; umbels of 20 rays; rays rather pubescent; leaves of involucellum, undivided. O. H. Native of Nipaul. Athamânta? anethifolia, Wall. mss. Pimpinellâ anethifolia, D. Don, prod. fl. nep. p. 184. Perhaps only an uncultivated variety of P. Ajowan, ex Wall. but the leaves are much more jagged and larger, and the rays of the umbel more numerous.
**UMBELLIFERÆ. XLIV. Pycnostis. XLV. Falcaria.**

FENNEL-LEAVED Pycnostis. Pl. 1 foot.

5 P. AO'WAN (D. C. mem. soc. gen. vol. 4.) stem erect, dichotomous; leaves few, cut into multifid linear segments; upper leaves pinnatifid; umbels of 7-9 rays; leaves of the involucre linear, undivided. O. H. Native of the East Indies, where it is called Jueane, Ajovan, Ajowal or Ajaswain. Ligisticum Ajowan, Roxb. hort. beng. p. 21. Athamántha Ajowan, Wall. *ms.* Ligisticum Ajáwain, Schultes, syst. 6. p. 556. Fleming, ind. med. in asiarch. 1. p. 170, journ. bot. 4. p. 200. Ajava-seed, Perciv. ess. 1. p. 453. Very like *P. Cúptica*, but differs in the stem being less leafy, in the umbels being of fewer rays, in the rays being puberulous, and in the fruit being more ribbed, but puberulously tubercular in the same way. The fruit of this plant is prescribed in India in diseases of horses and cows.

AJOVAN Pycnostis. Pl. 1 to 2 feet.

6 P. ROXBURGHIA'NA (D. C. prod. 4. p. 109.) stem erect, dichotomous; leaves ternate; leaflets deeply pinnatifid; lobes oblong-linear; umbels of 6-8 rays; leaves of involucre few, linear, undivided. O. H. Native of and cultivated in various parts of India, but particularly in Bengal, in the island of Singapore, and in the mountains of Sumatra, &c. ex Wall. An'ium involvulratum, Roxb. ex journ. bot. 1824. vol. 2. p. 158. Athamántha Roxbúrgíána, Wall. *ms.* and herb. Roxbúrgíá's Pycnostis. Pl. 1 to 2 feet.

7 P. ACHILLÉEFO'LIA (D. C. prod. 4. p. 109.) stem erect, a little branched; leaves bipinnate; leaflets pinnatifid; lobes linear-subulate, trifid, stellifer; umbels of 6-8 rays; leaves of involucre few, linear-lanceolate; fruit glabrous, rather muriated on the back along the ribs. O. H. Native of Nipaul and Kamaon. Athamántha achiilléefolíá, Wall. *ms.* A very distinct species, but the fruit on the specimen examined not being mature, the genus to which it belongs is still rather doubtful.

MILFOIL-LEAVED Pycnostis. Pl. 1 foot.

**SECT. III. HETEROPTYCHA (from *írrepoc, heteros, variable, and *πτγε, ptyche, a plait; in allusion to the middle nerve of the petals being lamellate above, and varying in this respect from the rest of the sections). D. C. prod. 4. p. 109. Universal involucre none. Teeth of calyx nearly obsolete. Petals rather emarginate, having the middle nerve lamellate above. Fruit echniated by bristles. Styles long, diverging a little.—Perhaps a proper genus. Mature fruit unknown, and therefore also the vittas.**

8 P. PUBE'RELA (D. C. prod. 4. p. 109.) stem erect; leaves and rays of umbel beset with short hairs in every part. O. H. Native of the Levant, about Bagdad. Rays of umbel 6-9 lines long; and those of the umbellules 2 lines long. Puberulus Pycnostis. Pl. 1 to 2 feet.

9 P. BARBÁ'TA (D. C. l. c.) stems erect, and are as well as the lobes of the leaves glabrous; but with the sheath of the petiole and limb of the leaf at the origin of the leaflets bearded with soft hairs. O. H. Native of the Levant, between Bagdad and Kermánchez. Rays of umbel 5-6 lines long, and those of the umbellules hardly 2 lines long. Perhaps only a variety of the preceding species.

Bearded Pycnostis. Pl. 1 foot.

10 P. VARGASIA'NA (D. C. l. c.) stem much branched, erect, glabrous as well as the leaves; leaves pinnate; leaflets euneated, cut at the apex; involucreum almost wanting; fruit clothed with short pubescence. O. H. Native of South America, about Caracas, where it was collected by Vargas. Perhaps this plant belongs to a different section of the genus.

Vargas's Pycnostis. Pl. 1 to 2 feet.

CULT. The species being natives of rather warm latitudes, their seeds will require to be sown in warm sheltered situations, or they may be reared in a hot-bed in spring, and the plants afterwards planted out in the open border in May.

LIN. SYST. Pentádria, Díginía. Margin of calyx 5-toothed; the tube in the sterile flowers wanting, but those in the fertile flowers are cylindrical. Petals obovate, curved, emarginate, with a broad recess, having the terminating segment reflexed. Styles divericate. Fruit oblong, compressed from the sides; mericarps furnished with 5, filiform, equal ribs; lateral ribs marginating; carpophore free, bifid; furrows between the ribs furnished with 1 filiform vitta each. Seed tetately convex, flatish in front.—Glabrous, perennial herbs. Leaves pinnate; leaflets broad-linear, deciduous, cartilaginous serrated. Umbels opposite the leaves and terminal, compound, of many rays; involucre of many leaves; involucres somewhat dimidiate, in consequence of the inner leaves being small. Flowers white, having hermaphrodite, fertile ones, and male sterile ones in the same umbelullle. This genus differs from *Sim* in the petals being curved, in the furrows of the fruit being furnished with 1 vitta each, and in the carpophore being free and bifid.

† Species hardly known.

3 F. JAVA'NICA (D. C. prod. 4. p. 110.) leaves pinnate or bipinnate; leaflets ovate-oblong, deeply serrated; umbels opposite the leaves; involucrum wanting; but the involucres are of many setaceous leaves. O. B. F. Native of Java, in marshes, where it is called Tespong by the natives. Sium Javánicum, Blum. bdjr. p. 881. The furrows of the fruit are furnished with 1 vitta each, and the commissure with 2, as in the following species.

Java Falcaria. Pl. 1 to 2 feet.

4 F. LACI'NIA'TA (D. C. prod. 4. p. 110.) leaves bipinnate; leaflets pinnatifid; umbels opposite the leaves; involucrum wanting; involucres of many setaceous leaves. O. B. F. Native of Java, in the province of Batavia, in marshes. Sium laci'nátm, Blum. l. c. Perhaps a species of Oenánthe.

Jagged-leaved Falcaria. Pl. 2 to 3 feet.

5 F. ? DIVERSIFOLIA (D. C. l. c.) superior leaves ternate;
leaflets petiolate, quite entire, some linear and others filiform.

2. H. Native of Nipaul. Sismon diversifolius, Wall. mss. Stem much branched. Herb glabrous. Lower leaves unknown. Fruit glabrous. Flowers all teraphroline. Mature fruit not seen, and therefore the vittes are not well known. Both the involucra and involucels are composed of a few linear, short, acute, undivided leaves.

Diverse-leaved Falcaria. Pl. 2 feet.

Cult. The two first species will grow in any soil, and under any circumstance. Those natives of Java will require to be grown in a stove.

XLVI. SISON (from sion, Celt. a running stream; some plants formerly contained in this genus were inhabitants of running streams). Lag. am. nat. 2. p. 103. Koch, umb. p. 123. D. C. prod. 4. p. 110. — Sison species, Lin. and all other authors.

Lin. syst. Pentandria, Digynia. Margin of calyx obsolete. Petals roundish, curved, deep, pinnate, with an inflexed point. Styles very short. Fruit compressed from the sides, ovate; mericarps with 5 filiform equal ribs; lateral ribs marginating: having one short, club-shaped vitta in each furrow between the ribs; carpophore bipartite. Seed gibbously convex, flattish in front. — Herbs paniculate branched. Leaves pinnate; lower leaflets a little lobed, toothed, or cut: upper ones linear, multifid. Both the involucra and involucels are composed of few leaves. Umbels of 4 unequal, elongated rays; and the umbellules of 4–5-short rays.

Doubtful species.

2 S. Siereria (D. C. prod. 4. p. 111.) plant glabrous, dwarf; leaves almost radical, ternal, or tripartite; segments approximate, cucateated at the base, very blunt at the apex, generally toothed, or somewhat cut; involucrum wanting. H. Native of Candia, on the tops of the Spacciose mountains. Sismon alpinus, Sieb. in Schultes, syst. 6. p. 414. Peucédanum Créticum, Sieb. herb. c. 1848. Spreng. nev. entl. 2. p. 148. From the immature fruit this appears to be a species of Cârum or Bînnum, the fruit being compressed from the margin, not from the back. Stem a finger in height. Umbels 4-5-rayed. Sieber's Stone-parsley. Pl. ½ foot.

3 S. Trinefve (Hamilt. ex D. Don, prod. fl. nep. p. 184.) stem erect, terete, dichotomous, striated, nearly naked; leaves all radical, pinnate; leaflets lanceolate, acute, quite entire, 3-nerved, glabrous; involucrum 5-leaved; leaves of involucels lanceolate, awned. H. Native of Nipaul, about Bassar. The fruit is undescribed, and the genus is therefore doubtful. Three-nerved-leaved Stone-parsley. Pl. 1 foot.

Cult. The seeds of the species only require to be sown in spring, in any common earth.

Lin. syst. Pentandria, Digynia. Margin of calyx obsolete. Petals elliptic, terminated by a short inflexed point. Stylodium conical. Styles erect, rather capitate at the apex, permanent, at length diverging. Fruit cylindrically prismatic, the transverse section nearly terete; mericarps somewhat compressed from the sides, and furnished with 5 filiform, exserted ribs: the 2 lateral ribs nearly marginating: having the furrows between the ribs flat, and furnished with 1 vitta each. Carpophore undivided. Seed nearly terete. — Smooth perennial herb. Leaves either radical, or from the lower part of the stem, pinnate; leaflets many-parted, decussate at the rachis: segments linear, acute. Umbels terminal, on long peduncles of many rays. Both the involucra and involucels are composed of many multifid leaves; the lobes linear and acute. Flowers white, all fertile.

1 S. crinita (Spreng. 1. c.). H. Native of the Altai, on the highest of the mountains, not far from the torrent of Tegerk. Sison crinitum, Pall. act. petrop. 1779. 12. p. 250. t. 7. Willd. spec. 1. p. 438.

Lin. syst. Pentandria, Digynia. Margin of calyx obsolete. Petals ovate, emarginately 2-lobed, with an inflexed point; lobes of petals unequal, irregular, those of the outer part of the umbel usually the largest. Fruit ovate-oblong, compressed from the sides; mericarps furnished with 5 equal, filiform ribs: lateral ribs marginating: having the furrows between the ribs furnished with one vitta each; carpophore free, bipartite. Seed teretely convex on the outside, and flattish in front. — Herbs with the habit of Daucus, having fusiform roots and pinnate or many-parted leaves. Umbels compound, of many rays. Both the involucra and involucels are of many leaves; the leaves of the involucel trifid or pinnatifid. Flowers white.

1 A. majus (Linn. spec. p. 349.) stem glabrous; leaves pinnate; leaflets with cartilaginous, sharply serrated margins; those of the inferior leaves obovate-oblong, and those of the upper ones multifid, linear-lanceolate. H. Native of south and middle Europe, Egypt, and the Levant; also of Newfoundland. Lam. ill. 193. Smith, fl. græc. t. 273. Schkuhr, handb. t. 61. A'pium A'mmi, Crantz, aust. 217. A'mmi Boebéri, Hoëq. diss. abo. 1810. and A. cicutæfölium, Willd. herb. ex Schultes, syst. 6. p. 591. do not differ in any particular from A. majus. The A. Boebéri, Hoffm. umb. XVIII. Horn. suppl. p. 52. is merely a larger variety of the present species.—Lob. icon. t. 721. f. 1. Mill. fig. 25.—Plencli. icon. 181. Blackw. t. 447. Flowers white; outer ones of the umbels large, like those of the rest of the species. Stem-leaves biternate.

2 A. glaucifölium (Linn. spec. p. 349. exclusive of the synomine of J. Baulp.) stem glabrous; leaves all bipinnate, jagged; segments narrow-linear, acute, and a little serrated. H. Native of France, at Lucon (Guett. etamp. 2. p. 433.), about Paris (Thuill. par. 137.) Andegavenny (Bast. ess. 105.), Rouen, Nanettes, and in Dauphiny (Vill. dauph. 2. p. 592.), Greece, (Smith, prod. pl. græc. 1. p. 185.), Spain at Aranjuez, Sicily, Liguria. This species differs from A. majus in the characters mentioned above, and in the more branched habit and glaucous
hue. There is a monstrous variety of this species, found about Rouen, which has the 2 carpels changed into petals, besides having also the usual number of petals.

3 A. INTERMEDEUM (D. C. prod. 4. p. 113.) plant glabrous; leaves all decomposed, many-parted, greenish; segments cut or toothed: lower ones cuspidate; upper ones linear-subulate, serrated, and ending in long tapering points. C. H. Native of the Pyrenees, and the kingdom of Naples. A. glaucifolium, Lapeyr. fl. p. 144. An intermediate plant between A. glaucifolium and A. Visnaga. It differs from the first in the leaves being greenish, not glaucous, and in being tripinnate; from the last in the lobes or leaflets of the upper leaves being much acuminate and serrated, and in the umbel spreading after flowering.

Intermediate Bishop's-weed. Pl. 1 to 2 feet.

4 A. Visnaga (Lam. dict. 1. p. 132.) stem terete, striated, glabrous; leaves decomposed; lobes or leaflets linear, cuspidate, divaricate; rays of umbel contracted after flowering, and indurated. C. H. Native of the south of Europe, in fields, north of Africa, Caucasus near Kuban, and in plains towards the Caspian Sea, and the Levant; also in Chili, at Mendoza and Hacienda de Vasquez, between Casa Blanca and Valparaiso. D. C. fl. p. 327. Daucus Visnaga, Lin. spec. 348. Jacq. hort. vindi. 3. t. 26. Visnaga daucoides, Gaertn. fruct. 1. p. 92. t. 21. Visnaga, Vill. daubh. 2. p. 594. Daucus gignonifolium, Lin. herb. ex Smith, Gohoria, Neck. elem. no. 287.—Cariad. aix. t. 36.—Lob. icon. 726. f. 1. Umbels often not very much above the leaves. Receptacle of the petals of the umbel much dilated. Rays crowded, very numerous, and at length they become so hard as to be used as tooth-picks, hence the name of the plant in France herbe aux cure-dents. In Spain, when they have served this purpose, they are chewed and thus are supposed to be of service in cleaning and clearing the guns; however this may be, the leaves have a pleasant aromatic taste in the mouth. Flowers with white petals and purple anthers.

5 A. DAUCOIDES (Salzm. pl. exsic. ann. 1825. ex D. C. prod. 4. p. 113.) stem terete, striated, mucrinated, having a few scattered bristles at the top of the petioles and branchlets; leaves bipinnate, rather ciliated; leaflets linear, cut, acute; leaves of involucel either simple or trifid; fruit covered all over with small, obuse tubercles. C. H. Native about Tangiers. Habit almost that of Daucus. Umbels nearly as in A. Visnaga, having the receptacle of the rays of the umbel thickened, and the rays very numerous. Fruit ribbed, as in the rest of the genus, but differs in being mucrinated.

Carrot-like Bishop's-weed. Pl. 2 feet.

6 A. CRINITUM (Guss. pl. rar. p. 128. t. 25. prod. p. 332.) stem terete, striated, glabrous, rather setose at the apex; leaves supra-decomposed; lobes or leaflets linear-setaceous, glabrous; petioles bristly; margins of the sheaths of the petioles scarious; fruit glabrous, somewhat tetragonal. C. H. Native of Calabria and Sicily, in fields. Leaves of involucrum multiform, reflexed. Flowers yellow in the dry state, as in Daucus alaeus.

Hairly Bishop's-weed. Pl. 2 to 4 feet.

8 A. PUMILUM (D. C. prod. 4. p. 113.) stem erect, angular, leafy, glabrous; leaves bipinnate; segments or leaflets pinnatifid; lobes linear; umbels opposite the leaves, pedunculate; leaves of involucels numerous, with scarious margins, and are rather scabrous, as well as the rays; some of the leaves of the involucra are trifid at the apex. C. H. Native of Portugal, in sandy places, at the river Tavora, and elsewhere in Beira. Sison pumilus, Broth. fl. luc. 1. p. 425. Fruit, according to Brotero, like that of parsley. Lower leaves like A. glaucifolium. Petals obovate, unequally obsolete. Herb a foot high, not dwarf. This is joined by Sprengel with Pychotis verticillata, but it is very distinct from that plant; but from the obsolete teeth of the calyx, and from the leaves of the involucrum being sometimes trifid, it comes nearest to the present genus, although it may hereafter form a proper genus, from the fruit being much more angular?

Dwarf Bishop's-weed. Pl. 1 to 1 ½ foot.

9 A. BROUSSETI (D. C. prod. 4. p. 113.) stem erect, terete, leafy, glabrous, branched; lower leaves unknown; upper ones tripartite; lobes cuneate-oblong, entire or dentate; leaves of involucrum linear or rarely trifid; young fruit rather scabrous from adpressed short hairs. C. H. Native of Africa, probably about Mogador. Habit nearly of A. majus and A. glaucifolium, but the involucra are very different.

Brossseton's Bishop's-weed. Pl. 1 to 2 feet.

10 A. CICUTA'RUM (Willd. rel. in Schultes syst. 6. p. 531.) stem angularly-furrowed, quite glabrous, furnished with few leaves; leaves ternately tri-pinnatifid; ultimate segments lanceolate, very acute, trifid; umbels with 6-8 rays; leaves of involucrums bipinnate: having the lobes or leaflets linear, and deeply toothed. C. ?. H. Native of South America, but in what place is unknown. Plant small. Schlecht in litt. Petioles 3 to 4 inches long. Rays of umbel stiff, angular, shorter than the involucrum. Leaves of involucel pinnatifid or trifid. Fruit ovate, compressed from the sides, glabrous; styles short, diverging. Ribs of mericarps rather prominent, having the furrows between the ribs furnished with 1 vitula each, and the comissure with 2 vitae.

Cicuta-like Bishop's-weed. Pl. 1 foot.

* Species not sufficiently known.

11 A. ? PYRENA'TUM (Lapeyr. abr. p. 145.) stem glabrous, flexuous; leaves somewhat bipinnate; lobes or leaflets entire; cut, ultimate ones decurrent; leaves of involucels setaceous or trifid, twice the length of the umbellules. C. H. Native of the Pyrenees, in fields about Madres and St. Beat. The petals are said by La Peyrouse to be rounded (arrondis) which indicates that the plant does not belong to this genus.

Pyrenean Bishop's-weed. Pl. 1 foot.

12 A. RUBRICA'VELE (Horn. hort. ln. 1. p. 272.) stem unknown; leaves somewhat verticillately tripinnate; leaflets capillary; leaves of involucel compound, longer than the umbellule. C. ?. H. Native of North America, near Baltimore. Perhaps the same as A. anethifolium.

Red-stemmed Bishop's-weed. Pl. 1 to 2 feet.

Cult. The species of A'mni are very showy while in flower; the seeds of them only require to be sown in the open ground early in spring.

XLIX. EGOPODIUM (from αἰξ, aix, a goat, and πονό, a dim. of πονος, pain; a foot; probably from the shape of the leaves.) Lin. gen. no. 368. Hoffin. umb. gen. p. 82. t. 1. f. 6. Koch, umb. p. 122. D. C. prod. 4. p. 114.—Podagraria Riv. peut. t. 47.

LIN. SYST. PENTANDRIA DIGYNIA. Margin of calyx obsolete. Petals obovate emarginate, with an inflexed point. Stylopodium
distinct, conical, terminated by the long deflexed styles. Fruit compressed from the sides, ovate; mericarps with 5 filiform ribs; lateral ribs marginating; furrows between the ribs destitute of vitre. Carpophore setaceous, forked at the apex. Seeds teretely convex on the outside, and flattish on the inside. Branching hairs, with creeping roots. Leaves biternate or triternate; upper cauline ones ternate; leaves oblong, acuminate, serrated. Umbels composed of many rays. Both the involucra and involucelles are wanting. Flowers white: anthers when young purple.

1. **A. podagria** (Linn. spec. p. 379.) stem furrowed; leaves biternate or triternate; leaves oblong, acuminate, unequal at the base, lower ones binate. **L. H.** Native throughout the whole of Europe, even to Caucasus and Siberia, in hedges and orchards. Very common in some parts of Britain. Oed. fl. dan. t. 670. Smith engl. bot. t. 940. Schkuhr, handb. t. 79. Riv. t. 47. Tragoselinum anglica Lam. fl. fr. 3, p. 419. Pimpinella aniceps, Lam. dict. 1, p. 451. Ligusticum podagraria, Crantz. aust. p. 200. Séseli Áségopodium, Scop. carn. ed. 2, no. 359. Podagraria Áségopodium Miench, Meth. p. 90. Sisón Podagraria Spreng, umb. prod. p. 55.—Lob. icon. t. 700. **L.** The plant is called Herb Gerard, Gout-weed, Aleh-weed, or Aich-weed, and **Wild Masterwort,** and being a great creper, it cannot be admitted into gardens, for after it gets hold it is next to impossible to eradicate it again. Though it has the quality of most umbelliferous plants, of being aromatic, yet it is not used at all in medicine; nor has it any title to its name gout-weed, though the Germans formerly used it to assuage the pain both of the gout and piles. Linneus says it is eaten in Sweden, boiled for greens, when tender in the spring. The roots are sometimes sold for those of the true Masterwort, the *Imperatia Ostruthium.*

**Gout-weed.** Fl. May, July. Britain. Pl. 2 to 3 feet.

2. **A. alpestre** (Led. fl. Ross. alt. ill. t. 7. fl. alt. 1, p. 354.) stem smooth; lower leaves ternately pinnate; leaflets ovate, cut, lower and terminal ones somewhat tripartite; upper leaves ternate, having the leaflets pinnate at the base, but drawn out at the apex, and nearly entire. **L. H.** Native of Altaia, in shady places on the north sides of the mountains near Riddersch, about the fountains of the rivers Uba and Tscharych. Root creeping. Flowers white. 

**Cult.** The plants will grow under any circumstance.

L. **CARUM** (so named from Caria, in Asia Minor; originally found there) Koch, umb. p. 121. D. C. coll. mem. 5, p. 41. Prod. 4, p. 414. Cárum, Sison, and Búinum species of Lin. and Hoffm.—Cárum and Sion species of Spreng.

**Lin. syst.** Pentádria Digyía. Margin of calyx obsolete. Petals regular obovate, emarginate, with an inflexed point. Styles depressed; styles deflexed. Fruit contracted from the sides, ovate or oblong; mericarps furnished with 5 filiform, equal ribs; lateral ribs marginating; having the furrows between the ribs furnished with one vitta each, and the commissure, which is flat, with two vittae. Carpophore free, forked at the apex. Seed terete, convex on the back, and flattish in front. Herbs glabrous, usually perennial. Roots tuberous, edible. Leaves pinnate; segments or leaflets multifid. Both the involucra and involucelles are variable. Flowers white.

**Sect.** I. **Cárvi** (an alteration of the generic name). D. C. prod. 4, p. 115.—Cárum, Lin.—Cárüm, Adans. fam. 2, p. 98. **Involucrum wanting; involucelles wanting, or of few leaves.**

1. **C. Cárvi** (Lin. spec. 378.) root fusiform; leaves bipinnate; leaflets decussate, multifid; stems furrowed; involucra and involucelles wanting. **L. H.** Native throughout the whole of Europe, in meadows and pastures; and of Altvia, in dry grassy places at the river Tscharych. Frequent in Britain, but is only a naturalised plant. Fl. dan. 1091. Smith, engl. bot. t. 1503. Nees, off. pil. 14. t. 17. Mart. rust. t. 55. Hayn. arum. gew. 7, t. 19. Woodv. ned. bot. Jacq. aust. t. 393. A'pium Cárvi Crantz, aust. p. 218. **Séseli Cárvi, Scop. carn. no. 361. Búinum Cárvi, Bieb. fl. taur. 1, p. 211. suppl. p. 206. Lágæia cuminoides, Willem. phyt. l. p. 254. but not of Lin. Cárvi, Riv. pent. irr. with a figure. Flowers white. Leaflets of leaves in sixes, appearing rather verticillate. The caraway is called *Carvi* in France, Italy, and Scotland, and Kummel in Germany. The plant is cultivated chiefly for the seed, which is used in confectionary and in medicine. In spring the under leaves are sometimes put in soups; and in former times the fusiform roots were eaten as parsnips, to which Parkinson gives them the preference.

**Garden culture.**—The plant is raised from seed, of which a quarter of an ounce is sufficient for a seed-bed 4 feet by 6. Sow annually, in autumn, soon after the seed is ripe; the seedlings will rise quickly, and should be thinned to a foot distance each way. In default of sowing in autumn, sow in March or April, either in drills or broad-cast; but the plants so raised will not, in general, flower till the following year. When the seed is ripe, the plant is generally pulled up in gathering, especially in field culture.

**Field culture.**—The cultivation and management of the caraway is the same as that of *Coriander.* In all probability both plants would answer if sown like clover among a crop of corn, hoed and thinned when the crop was removed, and again in the following spring. The method of culture in Essex is, about the beginning of March to plough some old pasture land; if it has been pasture for a century the better; and the soil should be very strong clayey loam. Twelve pounds of caraway-seed are mixed with ten pounds of coriander, and twelve pounds of teasel-seed; this is sufficient for an acre, and is sown directly after the plough, harrowing the land well. When the plants appear of sufficient strength to bear the hoe, which will not be until about ten weeks after sowing, it must not be omitted; and in the course of the summer the crop will require three hoeings, besides one at Michaelmas. The coriander, being annual, will be fit to cut about the beginning of July. It is left in the field after cutting, and threshed on a cloth in the same manner as rape-seed. About April following the caraway and teasel will want a good hoeing, done deep and well, and another about the beginning of June. The caraway will be fit to cut the beginning of July, and must be threshed in the same manner as the coriander. This compound crop is mostly sown on lands so strong as to require being a little exhausted to make it fit for corn. Caraway and coriander are oftentimes sown without teasel; the latter being a troublesome and uncertain crop, and the produce of caraway much greater without it. The produce of caraway, on very rich old leys, in the hundreds or low lands of Essex, has often been twenty cwt. to the acre. There is always a demand for the seed in the London market. The uses of caraway-seed are the same as those of coriander, and its oil and other preparations are more used in medicine. Dr. Anderson says, both the roots and tops may be given to cattle in spring. The seeds have an aromatic smell, and warm pungent taste, and yield much essential oil. They are employed as stomachic and carminative, in flatulents colics. The oil is used in the same way as other volatile oils.

**Var.** 8, *pterocchlamium* (D. C. prod. 4, p. 115.) leaves of involucrum few and multifid. **O. H.** Native of Montbéliard, in humid meadows not unfrequent.

**Var.** 8, *elongatun* segments of the leaves linear, elongated.

**2. H.** Native of Canada. C. Cárvi, var. 8, *Hook,* fl. bor.
toothed. Petals ovate-lanceolate, quite entire, oblique or inflected at the apex. Stylopodium depressed, margined. Styles reflexed. Fruit ovate-oblong, compressed from the sides; mericarps solid, having 5 equal filiform ribs: the lateral ribs margining; with the furrows between the ribs furnished with 3-4 vitte each. Seed somewhat semi-terete, flatish in front; carpopore adnate, bifid at the apex.—An herb with a fusiform root, supra-decompound or bipinnate leaves: having the segments or leaflets divided into many setaceous lobes. Scapes radical. involucre and involucels of many leaves. Petals yellow. Composition of fruit furnished with 4-6 vitte. The fruit is nearly like that of Sium, and the petals of that of Helosciadium.

Cult. See Bünium for culture and propagation.

LIN. SYST. Pentàndria, Monogy̱nia. Margin of calyx obdolute. Petals ovobate, emarginate, with an inflexed point. Fruit contracted from the sides, linear-oblong; mericarps furnished with 5 equal filiform, obuse ribs; lateral ribs margining; having the furrows between the ribs furnished with 2-3 vitte each, and the commissure with 4 vitte; the vitte all superficial. Carpophore flatish. Seed terete and convex on the outside, and flatish in front. Herbs perennial. Roots usually tuberous and glbose. Stems terete and attenuated at the base in the tuberous rooted species. Leaves decomposed; segments or leaflets divided into many slender linear lobes; involucre various: involucels few-leaved. Flowers white, rarely yellow or green.

sec. I. Chry̱seum (from χρυς, chry̱soς, gold; in allusion to the yellow flowers of the species.) D. C. coll. mem. 5. p. 41. prod. 4. p. 116. Both the involucræ and involucels are many-leaved. Flowers yellow or greenish. Styles diverging. The vitte in the furrows of the fruit in the different species are variable in number. This section is intermediate between Cárüm and Bünium, but differs from both these genera in the flowers being yellow.

1 B. Peucedanoides (Bieb. fl. taur. 1 p. 211. suppl. 208.) root fusiform; stem straitly furrowed, branched; leaves bipinate; leaflets of the radical leaves decussated, with broader lobes; segments of the cauline leaves linear and divericate; leaves of involucræ and involucels and short and setaceous; rays of umbel very unequal.  2. H. Native of Caucasus, about Nartza, and on Mount Bechtou, among grass. Sium peucedanoides, Spreng. umb. spec. 41. no. 5. syst. 1 p. 906. Peucedanum carvifólium, Bieb. Petals pale yellow. The furrows of the fruit are only furnished with one vitta each, according to Besser; but in fruit of the plant sent from Fischer, the furrows are furnished with 2-3 vitte each, rarely solitary.

2 B. Viré̱scens (D. C. mem. soc. gen. vol. 4. prod. 4. p. 116.) root fusiform; stem straitly furrowed, branched; leaves bipinate; leaflets of all the leaves linear; leaves of involucræ and involucels short and setaceous; rays of umbel very unequal.  2. H. Native of Burgundy, on a mountain called Afrique, near Pp.
UMBELLIFERÆ. LII. BUNIUM.

Greenish-flowered Earth-nut. Pl. 1 to 2 feet.

3 B. luteum (Hoffm. umb. p. 108.) root nearly globose; stem terete, branched; leaves pinnate; leaflets decussate, pinnatifid: lobes linear, very fine; leaves of involucrum and involucels very short, with membranous margins; fruit linear-cylindrical. H. Native of Siberia, in deserts, at the river Don, near the colony of Sarepta. Bünium luteum, Bibb. suppl. p. 207. Sium luteum, Spreng. syst. 1. p. 906. There are 3 vittae in each furrow of the fruit, according to Koch. Petals yellow.

Yellow-flowered Earth-nut. Pl. 1 to 2 feet.

Sect. II. Carôdes (from Càrum, the caraway, and idea, form; plants with the habit of Càrum,) D. C. coll. mem. 5. p. 41. prod. 4. p. 116. Involucra usually of many leaves, rarely absent. Flowers white. Stylodermum depresse: styles diverging. This section is intermediate between the genera Càrum and Conopodium.

4. B. carvifólium (D. C. prod. 4. p. 116.) root fusiform, terete, elongated; leaves pinnate; leaflets divided into many linear acute lobes; stem flexuous, erect, furnished with a few leaves; leaves of involucrum and involucels linear acute. H. Native of Abruzzo, and on Mount Fiori among the Appenines; but not of Sicily, ex Guss. prod. 1. p. 339. Saxon flexuosum, Ten. prod. fl. neap. p. 67. Sium carvifólium, Bert. in herb. Moric. Saxon proflifer, Brochi and Jan. Petals of a greenish white colour when dried. The furrows of the fruit, when immature, are furnished each with 2 or 3 vittae.

Caraway-leaved Earth-nut. Pl. 1 to 2 feet.

5 B. glácœscens (D. C. prod. 4. p. 117.) bulb ovate-oblong; stem erect, straight, terete; branches alternate; leaves glaucous: radical ones bi-pinnate, with multifid leaflets, and linear short lobes; cauline leaves distant, small, multifid; leaves of involucrum as well as of involucels, 6-7 in number, linear-oblong, acute, white. H. Native of Persia, in grassy valleys among the mountains about Seikhdzhodi. Stem % foot high. Umbels 10-11-rayed. Flowers white.

Glácœscens Earth-nut. Pl. 1/3 foot.

6. B. paucifólium (D. C. prod. 4. p. 117.) bulb globose; stem erect, straight, terete; branches alternate; superior leaves tripartite, having the lobes linear and entire; upper leaves undivided, linear; involucel of 3-4-leaves, and the involucel of 5-6 linear white leaves. H. Native of Persia, in grassy valleys of the mountains about Seikhdzhodi. Herb 2 feet high. Lower leaves unknown. Flowers white. Umbels of 4-5 rays. Fruit unknown.

Fern-leaved Earth-nut. Pl. 2 feet.

7. B. aphyl•llum (Jan. herb. ex D. C. prod. 4. p. 117.) root nearly globose, thick; stem terete, erect, nearly simple: cauline leaves striated at the sheaths, reduced to a short limb: both the involucrum and involucels are composed of 4-5 acuminate leaves. H. Native of Sicily, on the Nebrodes. Herb 4 to 5 inches high.

Leafless Earth-nut. Pl. 1/4 foot.

8 B. alpinum (Walst. et Kt. pl. rar. lung. 2. p. 199. t. 182.) root nearly globose, thick; stem terete, flexuous, hardly longer than the radical leaves; segments of leaves linear-oblong, fleshy; involucra of 5 linear-subulate leaves. H. Native of Croatia, on chalky mountains; and of Persia, in the province of Aderbajan. Wallróthia tuberosa. Spreng. pug. 2. p. 52, and in Schultes, syst. 6. p. 556. Flowers white. There are 3 vittae in each furrow of the fruit.

9 B. ferulefo'lium (Desf. ann. mus. 11. p. 275. t. 50. cor. Tourn. 55. t. 43.) root nearly globose; stem terete, dichotomous; leaves all somewhat truncate: leaflets linear; leaves of involucel 1-5, of the involucel 4-5, very short; fruit narrow, cylindrical. H. Native of the islands of Cyprus, Candia, and Seio. Sium ferulefo'lium, Spreng. in Schultes, syst. 6. p. 539. B. ferulefo'lium, Smith. Tuber about the size of a filbert, rufous on the outside, and white on the inside. Flowers white. Fruit not sufficiently known. The involucrum is very variable in the number of leaves.

10 B. coryda'linum (D. C. prod. 4. p. 117.) root globose; stem flexuous; segments of leaves linear-oblong; involucrum almost wanting; involucels of few leaves. H. Native of Corsica, on the mountains. B. petrae'um, Lois. fl. gall. ed. 2. vol. 1. p. 195. Tuber hardly so large as a pea. Stem 4-5 inches high, sparingly branched. Umbels of 3-5 rays; and the umbellules of 8-10 flowers; involucels of 5-6 leaves. Fruit oblong; having the furrows furnished with 2-3 vittae each.

Corydal•lis-like Earth-nut. Pl. ¾ foot.

11 B. cre•ticum (D'Urv. enum. p. 31.) root turnip-formed; stem dichotomous, nearly naked; leaflets of radical leaves ovate and cut: of the cauline ones linear; involucrum none; involucels of few leaves. H. Native of the Island of Cos, among rocks. Bulbocastanunè Griticium, radice napiformi, Tourn. cor. 21. and therefore Sium napiforme, Spreng. and Bünium napiforme, Willd. rel. in Schultes, syst. 6. p. 539. Flowers white. Fruit unknown.

Cretan Earth-nut. Pl. 1 foot.

Sect. III. Conopódiun (from κόρος, κόνος, a cone, and τόκος, τόκος, pou, pada, a foot; in allusion to the stalk or foot of the style, called the stylodermium, being conical). D. C. coll. mem. 5. p. 41. prod. 4. p. 117.—Conopódiun, sect. 1. Koch, umb. p. 118. Involucrum wanting, or of few leaves. Stylodermium conical, exserted. Styles straight.—Perhaps a proper genus.

12 B. be•ducatum (D. C. fl. fr. 4. p. 525.) root globose; cauline leaves nearly sessile, with short sheaths and toothed or cut leaflets; involucels unilaterial, few-leaved. H. Native of the west and south of Europe, and Caucasus, in mountain meadows and grassy pastures and among bushes, especially on a gravelly soil; plentiful in Britain. Myrrhis capillifólia, Guss. prod. fl. sic. 1. p. 321. Myrrhis Bünium, Spreng. umb. spec. 1. p. 131. syst. 1. p. 903. exclusive of numerous synonymns. Bünium flexuosum, With. 291. Smith, fl. brit. 1301. angl. bot. 983. Bünium bulbocastanum, Huds. angl. 122. Curt. lond. fasc. 4. t. 24. Bünium majus, Gouan. illl. p. 10. This species varies much in height. Styles long, pale, short, and reddish. Fruit ovate and oblong. Involucrum wanting, or 1-3-leaved. Segments of the leaves linear and lanceolate, more or less toothed. Sprengel refers Bünium ammoids, Link. or Myrrhis ammoids, Spreng. in Schultes, syst. 6. p. 517. to the present plant; and probably Myrrhis tenerrima, Presl, del. prag. 131. is also referrible to it. Flowers white. There are probably numerous species confused under this name. The plant has several names in England, as earth-nut, pig-nut, ar-nut, kipper-nut, hank-
nut, jur-nut, or yer-nut, earth chestnut, and ground-nut; in Germany it is called erdnuss; in Holland aardnot; in Sweden jordnot; in France suron, terre noix; in Italy castagna di terra; in Spain castano di terra. Root nearly globular, black, or chestnut-coloured on the outside and white inside; aromatic, sweet, and mucilaginous, with some acrimony: they are frequently dug up and eaten by children. Swine are very fond of them, and will soon become fat with feeding on them. When boiled they are very pleasant and delicious, and are supposed to afford great nourishment. Thus prepared, they are said to be eaten in Holland and the Alps, and in some parts of England in soup or broth. Roasted they are even superior to chestnuts.

Naked-stemmed or Common Earth-nut. Fl. May, June. Britain. Pl. 1 to 2 feet.

18 B. pu'illum (Smith, fl. grac. 274. prod. 1. p. 187.) root globose; leaves bipinnate: cauline ones petiolate, pilose; sheaths short; segment of leaves cut and acute; involucrum wanting or 1-leaved; involucres of many leaves. 2. H. Native of Mount Parnassus. Fruit ovate-oblong. Flowers white.

Dwarf Earth-nut. Pl. \( \frac{1}{2} \) foot.

14 B. tenutifólium (Salzm. pl. exsic. ex D. C. prod. 4. p. 118.) root unknown: cauline leaves petiolate; sheaths elongated, glabrous; segments of leaves few, linear, very narrow, elongated, and quite entire; involucres of many leaves. 2. H. Native of Mauritania, about Tanger. Perhaps Buniwm ammodes, Link. is referrible to this plant. Flowers white.

Fine-leaved Earth-nut. Pl. 1 foot.

Quite-glabrous Earth-nut. Pl. 1 foot.

Stiff Earth-nut. Fl. Ju. Jul. Clt. 1787. Shrubs \( \frac{1}{2} \) foot. Cult. A light sandy soil suits all the species best; and they can only be increased by seeds.

LIII. CRYPTOTÉNIA (from κρυπτός, cryptos, hidden, and τένεια, tainia, vitta; the vitta of the mercarps are hidden by a pericarp, and are invisible, unless the mericarps are cut transversely). D. C. coll. mem. 5. p. 42. prod. 4. p. 118. —Conopódium, sect. 2. Koch, umb. 119. Cyrtóspérmum, Rafin. in liit. 1819.—Alacóspérmum, Neck. elem. no. 276. ?

LIX. syst. Pentandría, Digynia. Margin of calyx obsolete. Petals obovate, nearly entire, ending in a narrow inflexed point. Fruit contracted from the sides, linear-oblong, crowned by a short stylopodium and 2 short styles; mericarps with 5, equal, filiform, obtuse ribs: the 2 lateral ribs placed before the margin; vitæ in the furrows between the ribs numerous, covered by a somewhat corky pericarp, but closely adnate, and only visible when the carpels are cut transversely. Seed teretely convex, flatlath in front. Carpophore free, bifid at the apex.—Perennial, glabrous, erect herbs. Roots not bulbous. Leaves ternate; leaflets ovate, coarsely toothed: teeth mucronate. Umbels numerous, almost disposed in a panicle. Rays of umbels and umbellules few, very unequal. Involucrum wanting; involucres few-leaved. Flowers white.

Thomas's Cryptotétia. Pl. 1 foot.

Cult. The species of this genus will grow in any soil; and may either be increased by cuttings or by seed.

LIN. syst. Pentandría, Digynia. Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point. Fruit ovate, contracted from the sides, crowned by the pulvinate stylopodium and reflexed styles, which are capitulate at the apex; mericarps with 5, equal, filiform ribs: lateral ribs margintating: having the furrowes between the ribs furnished with many vitae; carpophore free, bifid. Seed gibbosely convex, flattish in front.

—Herbs, for the most part natives of Europe. Roots simple. Radical leaves pinnate: leaflets roundish, toothed, rarely undivided; cauline leaves more finely dissected than the radical ones. Umbels and umbellules of many rays, without any involucrum. Flowers usually white, rarely reddish or yellow.

**UMBELLIFERÆ.**

**LIV. PIMPINELLA.**

2 P. magna (Lin. mant. 217.) radical leaves pinnate; leaflets serrated and somewhat cut, orate or oblong: the terminal one 3-lobed. 2. H. Native throughout the whole of Europe, Caucasus, and the Levant, in mountain meadows, pastures, and woods. In Britain it grows chiefly in woods and hedges, in a calcareous soil. Smith,engl.bot.t.408.Fl. dan.1155.Hayn.arz.gcw.7.t.21.Jacq.aust.4.t.396.P.majör.Mill.dict.no.1.Gouan.ill.t.21.P.saxifraga,Spreng.syn.213.Tragoselinum mágnum,Łam.fr.2.t.448.Tragoselinum mágnus,Moench.meth.99.—Barrel.icon.t.548.P.saxifraga, Ray.syn.213.Petiv.brit.t.26.f.5.Saxifraga mágnæ,Dod.pempt.315.f.1. This and the following species partake nearly of the same qualities. The root is very acid, burning the mouth like pepper. It affords a blue oil. Its acrimony has occasioned it to be used to cure tooth-ache, and to clear the skin from freckles. It is chewed to promote the secretion of saliva, and is used in gargles to dissolve viscid mucous in the throat. In Germany it is prescribed in the asthma and dropsy. Flowers either white or reddish.  

Var. β, rubens (D. C. prod. 4. p. 120.) flowers reddish. P. rubra, Hoppe. exsic.

Var. ε, rosea (Stev. in litt. ex D. C. prod. 4. p. 120.) leaflets acutely and deeply pinnatifid; flowers rose-coloured.  

Flowers white.

Var. β, nigra (D. C. prod. 4. p. 120.) plant pubescent; leaflets of lower leaves ovate, serrated, somewhat lobed, rather coriaceous at the base; the upper leaves bipinnate; root black.  

P. nigra, Wildl.spec.1.p.1471.—J. Bauh.hist.3.p.111.f.2.

Var. γ, hircina (D.C. l. e.) plant rather pubescent; leaflets of nearly all the leaves pinnatifid or jagged. P. hircina, Moench, hess.no.255.P. genevénos,Vill.dauph.2.p.604.

Var. δ, dissecta; leaflets all pinnatifid, with narrow segments.

Stem erect, branched, dichotomous; branches filiform, twiggy, almost leafless. Flowers yellow, with an aromatic odour.

5 P. aurea (D. C. prod. 4. p. 120.) lower leaves pinnate, glossy; leaflets cuneated, 2-3-lobed at the apex: teeth large, few, mucronate; cauliine leaves trifid and undivided and linear, few; petals ciliated, hardly emarginate. 2 H. Native of Persia, in sandy places at Khó, in the province of Arderbeijan. A very distinct species, with yellow flowers, differing from P. lutea in the plant being glabrous, in the form of the leaflets, and in the petals being ciliated. Fruit subglobose, dilymous, compressed, furnished with many vitre in the furrows. There is a variety with smaller bipinnate leaves, also a native of Persia.

**Golden-flowered Burnet-saxifrage.** Pl. 2 to 3 ft?

6 P. ramosissima (D. C. l. e.) plant glabrous; lower leaves bipinnate; leaflets ovate-rhomboid, rather trifid, acuminate, quite entire at the base, deeply toothed at the apex, some of them crossed in a decussate manner; stem much branched; the leaves under the branches reduced to short ligulate; umbels 5-rayed; fruit glabrous, ovate, not contracted at the commissure. 2 H. Native of Persia. Flowers unknown. Transverse section of fruit terete, as in the genus Scei, but without either involucrum or involucel, but with the habit of Pimpinella. Leaves like those of Pseúdánium céréria. Perhaps a proper genus.

**Much-branched Burnet-saxifrage.** Pl.

7 P. anisoides (Briog. act. acad. neap.1819.vol.1.p.1.t.1.) plant glabrous; radical leaves bipinnate; leaflets roundish-ovate, serrated; umbels numerous; styles erect; fruit glabrous. 2 H. Native of the kingdom of Naples. It differs from P. babonoides, ex Guss. prod.1.p.331., in the fruit being glabrous, in the styles not being divaricate, and in the stigmas not being globose.

**Anise-like Burnet-saxifrage.** Pl. 1 to 2 ft.

8 P. deprésssa (D. C. prod. 4. p. 120.) stem pubescent; radical leaves pinnate; leaflets cuneated, pinnatifid, smoothish, ciliated: lobes lanceolate, obtuse; cauliine leaves pinnatifid, 1 under each branch; fruit rather puberulous from small, adpressed bristles. 2 H. Native of Candia, on the Sphecioit mountains. Tragión depréssum, Sieb.eret.exsic.Spreng.inSchultes.syst.6.p.392.Herb1-2incheshigh.Rootterete.Flowerswhite.

9 P. nodosa (D'UrV. enum. or. p. 33.) plant glabrous; stem branched, dichotomous; leaves many-parted, with linear segments; umbels numerous; petals glabrous; fruit small, ovate, with a few adpressed hairs. 2 H. Native of the Island of Samos, among stones, frequent, and on the old walls of cities. In the place of the stem where the involucrum ought to be, there is a thick thornlike knot, probably caused by insects.

**Nodose Burnet-saxifrage.** Pl. 1 foot.

10 P. trágium (Vill. dauph. 2. p. 606.) stem caespitose; radical leaves pinnate, smoothish; leaflets cuneate-ovobate, deeply serrated, usually variously cut; cauliine leaves very few; petals pilose on the outside; fruit clothed with caescent tomentum. 2 H. Native of the south of France, Italy, Sicily,

*Var. β, glauca* (D. C. prod. 4. p. 121.) plant of a canescent glaucous hue; radical leaves pinnate; leaflets roundish-ovate, somewhat 3-lobed, toothed, pubescent on both surfaces, the 3 or 4 superior lobes linear; petals and fruit clothed with adpressed villi. 2 H. Native of Sicily, on the Nebrodos. Tragium glaucum, Presl, del. prod. p. 125. Flowers white. Allied to *P. Cúmbræ*, but the leaflets are all 3-lobed, and the terminal one deeply so.

*Var. γ, laiciáta* (D. C. 1. c.) leaflets of all the leaves dissected into narrow linear segments. 2 H. Native of Tauria. P. Tragium var. Bieb. suppl. p. 250. P. petraæ, Beaulac, ined. Perhaps a proper species. The whole plant is clothed with canescent pubescence.

11 P. Peregána (Lin. mant. p. 357.) plant pubescent; radical leaves pinnate; leaflets ovate-cordate, serrated; terminal one usually 3-lobed; cauline leaves narrow, wedge-formed, jagged; fruit hispid. 3 H. Native from the south of France to Sicily, Caucasus, and Tauria. Jacq. hort. vind. 2. t. 131. P. hispida, Lois. not. p. 48. Tragium peregirinum, Spreng. umb. spec. p. 185. syst. 1. p. 884. exclusive of the synonyme of Presl. Ledeæbura pinnipellíoides, Link, enum. 1. p. 286. Tragium Taíricum, Ledeæ.—Barr. ic. 1114.—Column. ephr. 1. t. 109. Flowers white. The herb varies in smoothness and hairiness; in the first state it is *P. peregirinum*, D. C. fl. fr. suppl. p. 502.; in the second it is *P. hispida*, Lois. ex. D. C. l.c. The first leaves are simple, the second ternate, but the succeeding ones are pinnate, also the lower stem ones; but the upper stem leaves are variously divided into lanceolate segments. The umbels are drooping before the expansion of the flowers. The seeds have no smell, and when first chewed have scarcely any taste, but in a short time are very acrimonious, and excite a great heat in the fauces.

14 P. Cúmbræ (Buch. ubers. can. p. 29, and beschreib. d. can. ins. p. 152.) the whole plant is hoary from short down; radical leaves pinnate; leaflets 5-7, ovate, deeply serrated, terminal one usually 3-lobed; stem nearly leafless, branched; petals villous. 2 H. Native of Teneriffe, on the highest mountains. Tragium incánsum, Chois. ined. Said to be allied to *P. villosa*, but differs in being more hoary, and in the leaves being simply pinnate, not doubly pinnate. Root woody, throwing out many stems at the neck.

*Cumbre* Burnet-saxifrage. Pl. 1 foot.

15 P. Pseudotrágium (D. C. prod. 4. p. 122.) plant glaucous and canescent; radical leaves pinnate; leaflets roundish-ovate, somewhat 3-lobed, deeply toothed, velvety-canescence on both surfaces: upper ones trifid; lower ones undivided, linear; petals rather villous on the outside; fruit very hairy. 2 H. Native of Persia, in dry exposed stony places about Seidkhdizi. This is an intermediate plant between *P. trágium* and *P. aromático*.

The fruit is larger than in either, and the hairs on the plant are soft and spreading, not as in *P. trágium*, adpressed. Petals rather villous on the outside, not as in *P. aromático* very hairy.

*False Trágium.* Pl. 2 feet.

18 P. diverstifóliá (D. C. prod. 4. p. 122.) leaves ternate or binate; leaflets petiolulate, cordate, coarsely toothed, membranous, glabrous above, but puberulous along the nerves beneath; involucrum wanting; involucres 3-leaved; rays of umbels and umbellules 13-20 in number, and are as well as the fruit pubescent. 2 H. Native of the East Indies, in Sirmore. Heracleum diversifólium, Wall. mss. Leaves as if they were pinnate, from the 2 lateral leaves being undivided, and the middle one ternate. Teeth of lower leaves rounded and mucronate; of the superior leaves acute. The immature fruit has only been seen.

*Diverse-leaved Burnet-saxifrage.* Pl. 1 to 2 feet.

19 P. Leschenaulth (D. C. l. c.) radical leaves petiolate, orbicular, cordate, toothed, rather coriaceous, many-nerved at the base, glabrous above, velvety from short down beneath; cauline leaves few, parted, almost reduced to the sheaths; stem a little branched, glabrous. 2 H. Native of the East Indies, on the Nellygerry Mountains, where it is called by the natives Tourasson. Petals hardly puberulous, when examined under a lens, but at length becoming glabrous. Plant 1-2 feet high. Rays of umbel 5, of the umbellules 12-15. Flowers white.

*Leschenaulth’s Burnet-saxifrage.* Pl. 1 to 2 feet.

20 P. *Java* (D. C. prod. 4. p. 122.) cauline leaves petiolate, cordate, acute, cartilaginosus serrated, many-nerved in the base, velvety beneath as well as the petioles, but pubescent above; sheaths ciliated; involucrum wanting, or of 1 linear leaf; fruit hairy. 2 H. Native of Java. Herb said to be
2 feet high. Stem terete, velvety at the apex. Umbels of many rays. Fruit ovate, hairy. Styles diverging.

Java Burnet-saxifrage. Pl. 2 feet.

Sect. III. Ani'sum (the herb anise; containing plants agreeing with it). Adans. fam. 2. p. 95. Gaertn. fruct. 1. p. 102.
—Bible species of Lag. Fruit puberulous. Annual plants.
21 P. anisum (Lin. spec. 399) stem glabrous; radical leaves cordate-roundish, lobed, deeply serrated; middle ones pinnatifid, with cuneate-lanceolate lobes; upper ones trifid and undivided, linear; fruit bearing a few scattered hairs. O. H. Native of the Island of Seio, Egypt, and cultivated in Europe. Nees, off. pltz. 12. t. 17. Hayn. arz. gew. 7. t. 22. Woody med. bot. t. 180. Anisum vulgare, Clus. hist. 2. p. 202. Gaertn. fruct. 1. t. 23. f. 1. Anisum officinale, Mench. meth. p. 100. Sison anisum, Spreng. in Schultes, syst. 6. p. 407. A'pium anisum, Trag.—Blackw. herb. t. 374.—Lob. icon. 731. Flowers of a yellowish white colour. Fruit pubescent when young. Styles short, straight. The anise is cultivated in Malta and Spain for its seeds, which are annually imported as medicinal, and for distillation and expression. In this country it is occasionally grown in the garden, to be used as a garnish, and for a seasoning like the fennel. For this last purpose, the seeds require to be sown in April, in a warm border, in a dry light soil, or raised in pots on heat, and removed to a warm site in May, where the plants will blossom and ripen their seeds in August, in favourable seasons. The plants should be thinned to 3 or 4 inches' distance.

22 P. cretica (Poir. suppl. 1. p. 684.) plant dwarf; radical leaves roundish, 3-lobed, toothed; superior leaves small, terminately multifid; segments rather filiform; fruit puberulous. O. H. Native of Candia, Italy, and the Morea. A'pium Créticieum minimum anis facie, Tourn. herb. P. tenuis, Sieb. pl. exsic. Stems filiform, 4-5 inches high. Umbels spreading; with capillary rays; umbellules small. Fruit shorter than the styles, not glabrous, but puberulous, as in P. anisum, of which it is probably only a small variety. Flowers whitish.

23 P. dichotoma (Lin. mant. 58.) plant glabrous, dichotomously branched, erect; leaves biemarginate or trinerved; leaflets linear; petals winged, membranous; peduncles opposite the leaves; fruit mucracted from short hairs. O. H. Native of Spain, on hills about Aranjuez. Habit of Trinia, but differs from that genus in the flowers not being dioecious. Petals all emarginate at the apex, from the point being incurved. Fruit nearly globose, striated. Styles reflexed. Flowers white.

Dichotomous Anise. Pl. 1 1/2 foot.

† Species not sufficiently known.

Hairy-fruited Burnet-saxifrage. Pl. 1 foot.
26 P. Alpìna (Host, fl. austr. 1. p. 399.) radical leaves pinnate, glabrous; leaflets of lower leaves ovate, cut: of the intermediate ones, pinnatifid, and of the upper ones linear-subulate, entire. Y. H. Native of the Alps of Styria and Austria, in stony places. The petals are said to be yellowish-white. Fruit striated, probably glabrous, or villous. This is perhaps only a variety of P. magna.

27 P. kuevèsris (Bory, ann. gen. ph. 3. 1820. p. 12.) radical leaves on long petioles, pinnate; leaflets deeply crenated, acute; stems rather dichotomous. Y. H. Native of Spain, among stones, on Sierra Nevada. Plant glaucous, stiff, slender. Perhaps only a variety of P. saxifraga.

Rock Burnet-saxifrage. Pl. 1 foot.

—Cape Burnet-saxifrage. Pl. 1 foot?
Cult. All the species are of easy culture.—A dry sandy soil suits them best; and they are only to be increased by seeds, which ripen in abundance. Those species marked perennal are little better than biennial in the gardens.

Lin. syst. Pentáндria, Digestia. Margin of calyx 5-toothed, now and then obsolete. Petals obovate, emarginate, with an inflexed point. Stylopodium pulvinate, depressed at the margin. Styles divergingly reflexed, rather capitate at the apex. Fruit compressed from the sides or contracted, and rather didymous, crowned by the stylopodium and styles; mericarps having 5 equal filiform bluntish ribs: with the furrows between the ribs, as also the commissure, furnished with many vittae; carpopetalous bitarinate; the stalks adnate to the mericarps. Seed nearly terete. Mostly aquatic herbs. Leaves pinnate; leaflets ovate-oblong, toothed or many parted. Umbels terminal, many parted; surrounded by many leafy involucra, which are very rarely composed of one leaf. Umbellulas many flowered, surrounded by many leafy involucres. Flowers white.

Sect. 1. Siśarum (altered from the Arabic name of the plant dagizer; this word signifies a carrot in Persian, and Siśarum has small bundles of roots resembling carrots). D. C. prod. 4. p. 124.—Sium, Koch, deutschl. fl. Lateral ribs of fruit marginating, having 3-4 superficial vittae in each furrow between the ribs. Seed terete, convex on the back, and flattish in front.
1 S. Siśarum (Lin. spec. p. 361.) root composed of fascicles of fusiform tubers; stem terete; leaves pinnate, but the uppermost ones are ternate; leaflets ovate-lanceolate, acute, serrated; involucra of 5 reflexed leaves; calycine teeth almost obsolete. Y. H. Native of China, Japan, Corea, Altaia, Mongol, and Cochin-china, but only cultivated in Europe. Schkuhr, handb. t. 69.—Lob. icon. t. 710. f. 1. Col. phyt. 89. with a figure.—Park. par. t. 507. f. 1. The commissure of the fruit, according to Koch, is furnished with 4 vittae. Stium brevifolium and S. Podolicum are probably hardly varieties of this species. Flowers white. The tubers of the root are about the size of the finger, joined together at the crown or head; they were formerly much esteemed in cookery. The Skirit is called Chervis in French, Zuckernrussel in German, and Sisaro in Italian; it is also cultivated in the north of Scotland, under the name of crummock. The tubers are boiled, and served up with butter,
and are declared by Worledge, in 1862, to be "the sweetest, whitest, and most pleasant of roots." This plant grows freely in lightish soil, moderately good. It is propagated both from seed and by offsets of established roots. The better method is to raise seedlings to have the root in perfection, young, and tender.

**By seeds.**—"Sow between the 21st of March and the 15th of April; a fortnight later, rather than earlier, for a full crop, as plants raised forward in spring are apt to start for seed in summer. Sow on an open compartment of light ground, in small drills 8 inches apart. When the plants are 1 or 2 inches high, thin them to 5 or 6 inches asunder. They will enlarge in growth to the end of autumn; but before the roots are full grown, in August, September, or October, some may be taken up for consumption, as wanted; those left to reach maturity will continue good for use throughout winter and in spring, till the stems run.

**By slips.**—"Having some plants of last year's raising, furnished with root offsets, slip them off; taking only the young outward slips, and not leaving any of the large older roots adhering to the detached offsets; which plant by dibble, in rows from 6 to 9 inches asunder. They will soon strike and enlarge, and divide into offsets which, as well as the main roots, are eatable, and come in for use in proper season.

**To save seed.**—"Leave some old plants in the spring: they will shoot in stalks, and ripen seed in autumn."

*Var. β, Ninsi*; stem bulbiferous; leaflets broader, rather cordate. Sium Ninsi, Burk. ind. t. 29. Thunb. jap. 118.

2 S. **sissaroides** (D. C. prod. 4. p. 124.) root unknown; stem furnished; leaves pinnate; leaflets ovate, rather cordate at the base, toothed: upper leaves ternate, having the leaflets oblong, acuminate, and serrated; involucrum of 4-5 reflexed leaves; calyces teeth almost wanting. **2.** H. Native of Persia, in the province of Aderbeidjan, about Badelan, in shady sandy places, where it was collected by Skowits. The root is said to be creeping, but according to the specimens examined, they appear to be fasciculate like those of the common skirret. The whole plant is like *S. Sisarum*, and especially variety *β*, but differs in the stem being furnished, in the leaves being broader, in the fruit being shorter, and in the fibres of the roots being cylindrical.

**Skirret-like Water-parsnip.** Pl. 1 to 2 feet.

3 S. **lancifolium** (Bieb. suppl. p. 290.) root creeping; leaves pinnate; leaflets lanceolate, equally and sharply serrated; involucrum of many leaves; calyces teeth very short. **2.** H. Native of Tauria and Caucasus, in marshes and humid places; and of Altaia, at the river Irtysh. S. latifolium, Bieb. fl. taur. 1. p. 225. exclusive of the synonyms. S. latifolium Ucrainum, Fisch. cat. hort. gor. 1812. Bérla lancifolium, Bess. enum. pl. volh. p. 44. Very nearly allied to *S. latifolium*. The commissure of the fruit, according to Koch, is furnished with 4-6 vittes.

*Var. β;* leaflets narrower, linear-lanceolate. **2.** H. Gmel. sib. 1. p. 201. no. 14. t. 47.

4 S. **latifolium** (Lin. spec. p. 361.) root creeping; stems angularly furnished; leaves pinnate; leaflets lanceolate, acuminate, unequal at the base, serrated, rarely pinnatifid; involucrum of many leaves; calyces teeth elongated. **2.** H. Native throughout the whole of Europe and North America, in ditches and marshes. In Britain in rivers, ditches, and fens. Jacq. fl. austri. p. 36. Smith, engl. bot. t. 204. Oed. fl. dan. t. 246. Hayn. arz. gew. 1. t. 35. good. Coriárium latifolium, Crantz. austr. p. 219. Drepanophyllum palüstræ, Hoffm. umb. 110. The leaflets of the submersed leaves are in the same plant often multifidly jagged. The commissure of the fruit, according to Koch, is furnished with 6 vitte. Stem with whorls of fibres under water. The plant is of an acid poisonous quality, particularly the roots.

**Broad-leaved Water-parsnip.** Fl. July, Aug. Britain. Pl. 3 to 6 feet.

5 S. **longifolium** (Presl. fl. chech. p. 65. but not of Pursh,) root unknown; stem striated; leaves pinnate; leaflets linear-lanceolate, elongated, unequally toothed, very acute; involucrum usually one-leaved. **2.** H. Native of Bohemia, in marshes and ditches.

**Long-leaved Water-parsnip.** Pl. 2 to 3 feet.

6 S. **lineare** (Michx. fl. bor. amer. 1. p. 167.) stem angularly furnished; leaves pinnate; with 4-5 pairs of linear-lanceolate leaflets, which are acutely and finely serrated; involucrum of a few linear leaves. **2.** H. Native of North America, from Canada to Carolinia; on the mountains and at the Saskatchewan, in marshes; watery places about Lake Huron; moist and overflowed grounds of the Columbia. Nutt. gen. amer. 1. p. 186. exclusive of the synonyme of Pursh ex Torrey, fl. un. st. 1. p. 211. The young submersed leaves are deeply multifid or tripinnate, with very narrow linear subulate segments.

7 S. **Douglasii** (D. C. prod. 4. p. 125.) stem terete; leaves pinnate; lower leaflets ternate, the rest petiolulate, ovate-oblong, coarsely serrated; umbels opposite the leaves, and terminal, pedunculate, without an involucrum, of many rays. **2.** H. Native of the north-west coast of America. Stems and petioles reddish. Lower leaves 1½ foot long. Flowers white. Calyx 5-toothed.

**Douglas's Water-parsnip.** Pl. 3 to 4 feet.

**Sect. II. Bérula** (probably from *βηρος*, a cloak or garment). Koch, deutschfl. fl. 2. p. 455. D. C. prod. 4. p. 125. Lateral ridges of the fruit placed a little before the margins of the mericarps. Transverse section of seed perfectly terete.

**Narrow-leaved Water-parsnip.** Fl. July, Aug. Britain. Pl. 2 to 3 feet.

9 S. **Thunberghi** (D. C. prod. 4. p. 125.) root fibrous, throwing out stolons from the neck; stem erect, striated; branches angular; leaves pinnate; leaflets ovate, acute, regularly and callously serrated; umbels pedunculate, opposite the leaves, and terminal; involucrum of 3-5 linear acute undivided leaves. **2.** B. H. Native of the Cape of Good Hope, in marshes near Seekhuwallei. Sium angustifolium. Thunb. prod. p. 51. Leaflets approximate and regularly disposed. Plant erect.

**Thunberg's Water-parsnip.** Pl. 2 to 3 feet.

† Species not sufficiently known, and are therefore doubtful whether they belong to the genus.
UMBELLIFERÆ. LV. Sium. LVI. Bupleurum.

Hispid Water-parsnip. Pl. ?

11 S. ? asperum (Thunb. prod. p. 51. fl. cap. 2. p. 210.) stem striated, glabrous, erect; leaves somewhat tripinate, glabrous; leaflets multifid, lanceolate; petioles and peduncles scabrous; umbels terminal; involucre of 6 leaves.—Native of the Cape of Good Hope. Spreng. umb. spec. 96. Fruit unknown.

Rough Water-parsnip. Pl. 1 to 2 feet.

12 S. villosum (Thunb. l. c.) stem erect; branches divaricate, striated; leaves tripinate; leaflets ovate, deeply serrated, and are, as well as the petioles, ciliated with villi; umbels terminal; leaves of involucre 6, ovate, with scarios margins.—Native of the Cape of Good Hope. Spreng. umb. spec. 97.

Villos Water-parsnip. Pl.

13 S. ? villosulum (Thunb. prod. p. 50. fl. cap. 2. p. 207.) stem erect, flexuous, terete; radical leaves simple, linear-filiform, elongated; umbels terminal; involucre of 8 leaves, which are about equal in length to the umbel.—Native of the Cape of Good Hope. Spreng. umb. spec. 99. exclusive of the synonyms. Schultes, syst. 6. p. 544. exclusive of the synonyms.

Thread-leaved Water-parsnip. Pl. 2 feet.

14 S. grandiflorum (Thunb. prod. p. 50. fl. cap. 2. p. 208.) stem erect, striated, branched a little; leaves glabrous, bipinnate; leaflets roundish, deeply toothed; umbels terminal; leaves of involucre 8, ovate, acuminate. 2. G. Native of the Cape of Good Hope. Spreng. umb. spec. 99. Fruit said to be ovobate, and striated.

Great-flowered Water-parsnip. Pl. 2 feet?

15 S. ? paticum (Thunb. l. c.) stem striated, glabrous; branches divaricate; leaves bipinnate, somewhat fascicate; leaflets linear, trifid; umbels terminal; involucre of 6 lanceolate leaves, with scarios margins.—Native of the Cape of Good Hope. Spreng. umb. spec. 99. Fruit unknown.

Spreading Water-parsnip. Pl. spreading.

16 S. paniculatum (Thunb. l. c.) stem terete, striated, glabrous; branches pinnate; leaves bipinnate; leaflets deeply pinnatifid, linear, channelled; umbels terminal; involucre of 6 lanceolate leaves, with scarios margins.—Native of the Cape of Good Hope. Spreng. umb. spec. 98. Fruit unknown.

Panicled Water-parsnip. Pl.?

17 S. Japo nilicum (Thunb. fl. jap. p. 118.) stem erect, flexuous, branched above; leaves pinnate, glabrous; leaflets unequal, oblong-obovate, deeply toothed at the apex: upper ones lanceolate, quite entire; umbels terminal.—Native of Japan. Stem terete. Superior leaves ternate. Umbels of many rays.

Japan Water-parsnip. Pl. 1 to 2 feet?

18 S. ? decumbens (Thunb. fl. jap. p. 118.) stems decumbent; leaves bipinnate, on long petioles, glabrous; leaflets trifid; umbels terminal, nearly simple. 2. H. Native of Japan. Perhaps S. Graecum, Lour. coeh. p. 179. is referrible to this species.

Decumbent Water-parsnip. Pl. decumbent.

19 S. ? oppositifolium (Kit. in Schultes, fl. austr. 2. p. 495. syst. 6. p. 506.) leaves numerous, opposite, doubly pinnate; leaflets pinnate, acuminate, quite entire.—Native of Hungary, on the mountains.

Opposite-leaved Water-parsnip. Pl. ?

Cult. All the species of this genus do best in a moist soil, and most of them altogether in water. They are increased by separating the roots and stolons.

Lin. syst. Pentandria, Digynia. Margin of calyx obsolete. Petals roundish, entire, strictly involute, with a broad retuse point. Fruit compressed from the sides or somewhat didymous, crowned by the depressed stylopodium; mericarps with 5 filiform acute winged ribs, or with obsolete ones; lateral ribs margined; furrows between the ribs either furnished with vitre or without them, smooth or granular. Seed teretely convex, flatish in front.—Quite glabrous herbs or shrubs. Leaves rarely cut, but mostly quite entire in consequence of the limbs, which are supposed to be absent, and the petioles being dilated, and changed into quite entire phyllodia, as in many species of Odogia. Umbels compound. Involucres variable. Flowers yellow. A very natural genus, with a distinct habit from all other umbelliferous genera, but the fruit is variable in character.

Annual plants.

1 B. papillosum (D. C. prod. 4. p. 127.) stem erect, branched; leaves linear, acute, stiffish, umbels terminal, of 3-4 rays; involucre of 3-4 unequal leaves; umbellules 10-flowered; involucres of 5 reflexed leaves, longer than the fruit; fruit coarsely papillose all over. 0. H. Native of the Levant. Allied to B. glaucum and B. tenissimum, but the branches of the umbel are perfect; and the fruit is beset with large, obuscute, white papille.

Papillose-fruited Hare's-ear. Pl. ½ to 1 foot.

3 B. procumbens (Desf. fl. atl. 1. p. 230. t. 56.) stems procumbent, panicularly branched; lower leaves narrow-lanceolate, the rest linear-subulate; involucre of 2 leaves; involucres of 5, nearly ovate, acute, very short leaves; fruit short and maricated by tubercles. 0. H. Native about Tunis. Odontites procumbens, Spreng. in Schultes, syst. 6. p. 382. Habit
297

**UMBELLIFERÆ.**

**LVI. Bupleurum.**

juncæm var. Lam. Spreng. B. filicaule, Brot. ex Steud. Isophyllum Gerardi, Hoffm. Buprestis Gerardi, Spreng.—Ger. Gallopov. t. 6. There are varieties of this plant with either erect or spreading branches, and with the involucres either shorter or longer than the flowers.

Gerard's Hare's-ear. Fl. July, Aug. Cl. 1804. Pl. 1 to 3 feet.

10 B. juncæm (Lin. spec. p. 343.) stem erect, paniced; leaves linear-lanceolate, cuspidate; umbels terminal, of 3 rays; leaves of involucre linear-lanceolate, cuspidate, shorter than the flowers, which are 3-5 in each umbel; ribs of fruit elevated, acute: having the furrows smooth, and almost without vitæ.

**Rushy Hare's-ear.** Fl. July, Aug. Cl. 1777. Pl. 2 to 4 ft.

11 B. glumaæm (Smith, prod. fl. grec. 1. p. 177.) but not of Spreng.) stem erect, very slender, paniced; leaves linear, 3-nerved; involucra and involucels of 5 lanceolate cuspidate 3-nerved leaves, which are pellucid between the nerves and veins, exceeding the umbels; furrows of fruit smooth, furnished each with one vitta, and the ribs are acute and very slender.

O. H. Native of Calabria, in barren fields; island of Sicio; about Constantinople, Cephalonia, Candia, and Cyprus. Rehb. icon. 2. p. 71. t. 179. B. flaveum, Forsk. ex ar. suppl. p. 205.? B. græcæ d'Urvill. enum. 30. p. 250. but of Bieb. Nearly allied to B. odontites, but perfectly distinct, in the leaves of the involucel being diaphanous between the nerves, not reticulatæ.

**Glumaceæ Hare's-ear.** Pl. 1 foot.

12 B. odontites (Lin. spec. p. 342. exclusive of the syn. of Haller.) stem erect, paniced; leaves linear, 3-nerved; leaves of involucel 5, linear-lanceolate, cuspidate, 3-nerved, reticulately veined from the middle nerve being pinnate; fruit having the furrows smooth, and furnished with one vitta each, and the ribs acute and very slender.

O. H. Native of Italy, Sicilia, Greece, Smyrna, Montpelier, and Mauritania. Jacq. hort. vind. 3. t. 91. Rehb. Icon. 2. t. 68. t. 177. B. Fontanesii, Guss. ind. sem. hort. bocc. 1825. ex indic. sem. 1826. pl. rar. 112. and prod. 1. p. 312.

13 B. aristaum (Barth. in Rehb. icon. 2. p. 70. t. 178.) stem erect, paniced; leaves lanceolate, linear, 3-nerved; leaves of involucel 5, elliptic, aristately cuspidate, reticulately veined, from the middle nerve being pinnate, exceeding the umbelles; fruit with smooth furrows, furnished with one vitta each, and acute very slender ribs.

O. H. Native of England, France, Balearic Islands, Corsica, Sardinia, Sicilia, Liguria, Dalmatia, &c. in dry fields and on hills. In England on a marble rock in Devonshire, unquestionably wild. B. discaricum, Lam. fl. fr. 3. p. 410. B. glumæcum, Spreng. umb. spec. 18. t. 3. f. 5. but not of Sibth. B. odoritites, Smith, engl. bot. t. 2468. Odontites luteus, Spreng. prod. 33. Schultz, syst. 6. p. 380. but not of Hoffm. By most authors this species has been confused with the preceding.

14 B. nodiflorum (Sibth. and Smith, fl. grec. t. 260.) stem dichotomous or trichotomous from the base; branches spreading, forked; leaves linear: radical ones distich; umbels axillary and terminal, rather capitate; leaves of involucre 5, ovate, cuspidate, transparent between the nerves, as well as the margins of the upper leaves; fruit with smooth furrows.

O. H. Native of Candia, in corn-fields; in Syria near Baruth; and Egypt. B. nanum, Foir. suppl. 1. p. 750. B. Mareoticum, Qq
Delil. ined. B. proliferum, Delil. fl. egyp. p. 61. t. 22. f. 2. B. minimum, Spreng. neue entd. 3. p. 163. Fruit striated, not warted.

15 B. heterophyllum (Link, enum. 1. p. 269.) leaves stem-clasping; lower ones lanceolate-linear; upper ones obovate-acuminate, almost perfoliate; umbels bident; involucrum none; involucels of 5 ovate acuminate leaves. Ʃ. H. Native of Egypt; and the Levant, near Aleppo. B. Ægyptiacum, Wild. B. lanceolatum, Horn. cat. hort. taur. 1812. ex herb. Furrows of fruit granular, ex Koch, umb. p. 157. This species is confounded with B. prostratum by Spreng. in Schultes, syst. 6. p. 365.

**Prostrated Hare's-ear.** Fl. May, July. Clt. 1819. Pl. ½ to ⅓ foot. 17 B. rotundifolium (Lin. spec. p. 340.) cauline leaves perfoliate, roundish-ovate; umbels of 5-6 rays; involucrum wanting; involucels of 5 mucronate leaves; furrows of fruit smooth, and destitute of vittae; ribs very slender. Ʃ. H. Native of Europe, in fields, especially in Caucasus, south of Siberia, and Persia; in England in corn-fields, especially on a chalky soil. Smith, engl. bot. t. 99. Sturm, deutschl. fl. with a figure. Hayn. arz. gew. 7. t. 1. B. perfoliatum, Lam. fl. fr. 3. p. 405. B. rotundifolium ♂, Spreng. in Schultes, syst. 6. p. 364.—Moris, hist. 3. p. 299. sect. 9. t. 12. f. 1. This plant has been reckoned among the vulnerary herbs; but its virtues, whether ever experienced or not, are recorded in old herbas only.

* * Perennial plants.*

18 B. auræum (Fisch. in Schultes, syst. 6. p. 366.) leaves coriaceous; radical ones ovate, ovate-oblong, obovate, attenuated into the petioles at the base: cauline ones ovate, acute, stem-clasping; leaves of involucrum 3-5, elliptic, or nearly orbicular, mucronate; of the involucels 5, conforming to those of the involucrum, coloured, longer than the flowering umbels. Ʃ. H. Native of Siberia, on mountains beyond the Baikal; and of Altaia. B. longifolium var. Spreng. umb. spec. p. 119. Very nearly allied to B. longifolium, but differs in the involucels being yellow, obtuse with a mucrone, not acuminate.

**Golden-umbelled Hare's-ear.** Fl. May, June. Clt. 1820. Pl. 1 to 2 feet.

19 B. longifolium (Lin. spec. p. 341.) leaves ovate-oblong; radical ones petiolate: cauline ones stem-clasping; leaves of involucrum 3-5, ovate, somewhat acuminate; of the involucels 5. Ʃ. H. Native of France, Germany, Transylvania, Switzerland, Savoy, &c. on the mountains.—J. Bauh. hist. 3. p. 199. f. 1. Cam. hort. t. 38. Umbellules 7-14 flowering. Fruit with upward, sharp, rather winged ribs: and with the furrows between the ribs smooth, and furnished with 3 vittae each, which are full of pellucid dots, ex Koch, umb. p. 117.

**Long-leaved Hare's-ear.** Fl. May, July. Clt. 1813. Pl. 1 to 2 feet.

20 B. Pyrenææ (Gouan. ill. p. 8. t. 4.) radical leaves lanceolate, elongated: cauline ones cordate-lanceolate, half stem-clasping, acuminate; umbels of 5, very rarely of 3 rays; involucrum of 3 broadly ovate leaves; involucels of 5 obovate distinct leaves, which are almost twice the length of the umbel-ules. Ʃ. H. Native of the Pyrenees; in rocky meadows, in the places called Llaurenti, Eresilds, Entre de Luz, Port d'Ozo; and in the Eastern Pyrenees. D. C. fl. fr. 4. p. 346. B. Pyrenæum, Wild. spec. 1. p. 1371. B. angulosum var. a, Lin. spec. p. 341. Leaves of involucrum rarely lobed at the base. Ribs of fruit broadly winged; wings sharply and membranously keeled; furrows smooth, furnished each with 3 vittae, which are full of pellucid dots. Koch, umb. p. 116.

**Pyrenean Hare's-ear.** Fl. May, July. Clt. 1814. Pl. 1 ft. 21 B. stellatum (Link. spec. p. 340.) radical leaves linear-lanceolate, elongated: cauline ones almost wanting; involucrum of 3 ovate-lanceolate leaves; involucels of 8 leaves, which are joined together into an 8-cleft disk, longer than the umbelles. Ʃ. H. Native of the Alps of Switzerland, Piedmont, Dauphiny, and Savoy, in stony meadows; and of Corsica, on the mountains, and probably of the Pyrenees. D. C. fl. fr. 4. p. 346.—Hall. helv. hist. vol. 177. t. 18. Ribs of fruit broadly winged; wings sharply and membranously keeled; furrows smooth, each furnished with one vitta.

**Stellate-involucellate Hare's-ear.** Fl. May, July. Clt. 1775. Pl. 1 to 1½ foot.

22 B. tríradia (Adams, ex Fisch. in l. c. p. 130.) radical leaves linear-oblong: cauline ones 3, stem-clasping, oblong or ovate, hardly acute; umbels of 3 rays; involucrum of 3 obovate leaves; involucel of 7-8 obovate leaves, which are scarcely longer than the umbelle. Ʃ. H. Native of Altaia, or the mountains, and at Lake Baikal. Allied to B. Pyrenæum, but differs in the leaves being much less acute, in the umbels being of 3 rays, in the involucels being hardly longer than the flowers, and in the young fruit not being glaucous.

**Three-rayed-umbellled Hare's-ear.** Pl. 1 foot.

23 B. sultineæ (D. C. mem. soc. gen. vol. 4.) radical leaves oblong-linear, attenuated at both ends: cauline ones stem-clasping, ovate, acuminate, with many parallel nerves; involucera of 5 unequal leaves, having many parallel nerves; leaves of involucel 5, ovate, acuminated, coloured, hardly longer than the umbelle. Ʃ. H. Native of Altaia, on the mountains. Allied on the one hand to B. àureum and B. longifolium, and on the other to B. granfinolium.

**Var. ß. angustius** (D. C. prod. 4. p. 130.) cauline leaves narrower, more glaucous; involucel of 2 leaves. Ʃ. H. Native of Dahuria.

**Var. γ. minus** (D. C. l. c.) involucel of 3-4 leaves; stem nearly simple; leaves narrow. Ʃ. H. Native of Altaia, on the mountains.

24 B. granfinolium (Vahl. symb. 3. p. 48.) stem nearly naked; leaves radical, linear; involucel of 3-5 elongated leaves, about one-half shorter than the rays of the umbel; leaves of involucel 5-8, oblong, mucronate. Ʃ. H. Native of the Alps of Europe and the Pyrenees. Rœm. fl. taur. p. 7. with a figure. D. C. fl. fr. 4. p. 367. Spreng. in Schultes, syst. 6. p. 368. B. petraum, Vill. dauph. 2. p. 576. t. 14. Jacq. icon. rar. 1. t. 56. This species differs from B. ranunculoides, in the leaves being all nearly radical, in the involucels being often 7-8-leaved, in the leaves of the involucel being more elongated. B. incirrum, Bell. app. 77. t. 11. is hardly a variety of this species, unless that the leaves of the involucel are more elongated. B. caricifolium and B. petraum of many authors are identical with this.

**Var. β. bicalyculæ (D. C. prod. 4. p. 131.) leaves of in-
volucrum 10, disposed in two series. \(2^1/2\) H. Native of Piedmont, on the mountains about Limone. B. bialycylatum, Bell. st. nov. p. 4. t. 2. in mem. acad. taur. vol. 7.

Grass-leaved Hare's-ear. Fl. May, July. Cirt. 1768. Pl. \(1/3\) ft. 25. B. Ranunculoideis (Lin. spec. p. 345.) radical leaves linear-lanceolate, attenuated towards the base; cauline ones stem-clasping, oblong-cordate, or ovate-cordate, striate; involucrum of 3 unequal leaves; involucres of 5 ovate or oblong nerves divided mucronate leaves. \(2^1/2\) H. Native of the Alps, Pyrenees, Jura, Apennines, Siberia, in rough exposed places; and of North America, at Cape Mulgrave, in Behring's Straits. Lam. dict. 1. p. 518. D. C. fl. fr. 4. p. 348. B. angulosum, Spreng. in Schultes, syst. 6. p. 366.—Park. theat. 581. no. 7.—Baum. hist. 3. p. 199. f. 2. Ribs of fruit elevated and sharp; and the furrows between the ribs smooth, and furnished with one vitta each, ex Koch, umb. p. 116. Habit of herb very variable, from a finger to a foot in height, simple or branched, bearing one or many umbels. Involucre of from 1 to 3 leaves, very variable in length, either broader or narrower than the leaves. The limits between the varieties are hardly perceptible, and to these may be referred the B. angulosum, ranunculoideis, repens, obtusatum, and graminifolium, Lapeyr. abr. and suppl. as well as B. graminum and Vapincense, Vill. B. caricifolium and Burserianum, Willd.

Var. \(\beta\), caricinum (D. C. prod. 4. p. 131.) leaves radical rather convolute, linear-subulate; cauline ones hardly divided at the base. \(2^1/2\) H. Native of the Apennines and the Pyrenees, in exposed rocky places. B. caricifolium of many herbaria. B. petraeum, Lin. spec. 340.? but the leaves of the involucres are distinct, not joined.

Var. \(\gamma\), oblongijfolium (Led. fl. alt. 1. p. 348.) stem very simple; radical leaves 2, linear-oblong, \(1\frac{1}{4}\) to 2 inches long, and 2 to 3 lines broad, acute; cauline leaves sessile, broader than the radical ones, of different shapes: the uppermost ones cordate-ovate, rounded at the apex, and mucronulate; involucrum of 3-8 unequal leaves; umbels of 4 unequal rays; involucres of 5-7 obovate mucronate leaves. \(2^1/2\) H. Native of Siberia.

26. B. Baldesche (Host, syn. 141.) stem branched; leaves stem-clasping, nearly linear, acute, nerved; radical ones tapering into the petioles; leaves of involucel oblong-linear, about equal in length to the fructiferous pedicels; ribs of fruit sharp; vittae 3 in each furrow. \(2^1/2\) H. Native of Mount Baldo; and of Altaia, at the rivers Tscharsky, Kerlyk, Bucktorfminsk; and near Schulbinsk. B. bicatul., Helm. in act. mosq. 2. p. 106. t. 8.—Gmel. sib. 1. p. 209. no. 24. Stems numerous, erect or ascending, simple at the base, and branched at the apex. Radical leaves 2-6 inches long. Involucrum of 4-7 lanceolate-linear leaves, but sometimes only of one elongated deciduous leaf. Umbels of 5-13 rays. Involucres of 5-9 oblong acute 5-nerved leaves; umbellules of 10-20 flowers.

Var. \(\beta\), multifolium (Led. fl. alt. 1. p. 530.) plant tufted; leaves rather fleshy. \(2^1/2\) H. Native of Altaia, in saltish deserts at the river Tschuja.

Baldo Hare's-ear. Fl. June, July. Pl. \(1/2\) to 1 foot.

27. B. Longicaule (Wall. cat. no. 557.) stems erect, sparingly branched; leaves linear, acute, 5-7-nerved, rather membranous; umbels 3-5-rayed; involucra of 1-3 ovate acute leaves; umbellules 15-rayed; leaves of involucel 5, ovate, mucronate, longer than the flowers, but shorter than the fruit; fruit 3 times longer than the pedicels, acutely ribbed; vitta 3 in each furrow. \(2^1/2\) H. Native of Nipaul, at Gossingasthan, Emoldi, and Kamnon. Herb 1\(\frac{1}{2}\) to 2 feet high, dividing into many stems at the neck. Leaves 3-6 inches long. Mature fruit 2 lines long.

Long-stemmed Hare's-ear. Pl. 1 to 2 feet. 28. B. Candollei (Wall. cat. no. 552.) stems rising from horizontal surculi, erect, sparingly branched; leaves lanceolate, acute, membranous, obliquely many nerved on both surfaces; umbels 12-18-rayed; involucrum of 2-3 ovate, acute, many nerved leaves; umbellules 12-15-rayed; involucres of 5 oval acute leaves, which exceed the fruit. \(2^1/2\) H. Native of Nipaul, at Gossingasthan and Emodi. Herb 2 feet high. Immature fruit hardly longer than the pedicels, oblong, ribbed, with the furrows smooth.

De Candolle's Hare's-ear. Pl. 2 feet. 29. B. Paniculatum (Brot. fl. lus. 1. p. 455.) leaves linear-narrow, many nerved: radical ones very long; stem erect, paniclited; umbels 2-3-rayed; involucrum of 2-3 small leaves; involucres of 4-5 subulate leaves, which are 3 or 4 times shorter than the umbellules; fruit oblong. \(2^1/2\) H. Native of Portugal, on calcareous hills. Fruit with 3 ribs on each side, usually of one mericarp and abort. Habit of B. frutescens, but the stems are annual.

Panicled Hare's-ear. Fl. June, Aug. Cirt. 1824. Pl. 1 to 3 ft. 30. B. exaltatum (Ten. app. 1st cat. hort. neap. ex D. C. prod. 4. p. 191.) stems erect, simple; leaves linear, acute, narrowed at the base so much as to form petioles, many nerved; umbels 5-9-rayed; involucra of 2-4 leaves; involucres of 5-7 spatulate leaves; furrows of fruit smooth. \(2^1/2\) H. Native of the kingdom of Naples, on calcareous rocks. B. obtusifolium, Ten. prod. p. 18. Leaves acute. A very distinct species, although it has been joined by Sprengel with B. semipossum. Very nearly allied to B. Paniculatum.

Drooping Hare's-ear. Pl. 1 foot. 31. B. exaltatum (Bieb. tabl. casp. p. 166.) leaves all linear, many nerved: lower ones elongated; stem erect, leafy, paniculately branched; umbels 5-10-rayed; involucra and involucres of 3-5 subulate unequal, small leaves; fruit ovate. \(2^1/2\) Bieb. 3. Stev. H. Native of Tauria and Caucasus, in maritime meadows, and on hills. B. Baldesche, Willd. spec. 1. p. 1375. exclusive of the syn. Bieb. fl. cauc. no. 513., but not of Turr. nor Host. Allied to B. falcatum, but differs in the fruit being shorter, and in the ribs being less acute.

Exalted Hare's-ear. Fl. July. Cirt. 1807. Pl. 2 feet. 32. B. Lineari-folium (D. C. prod. 4. p. 151.) stem erect, paniculately branched; leaves linear, very long, hardly acute, many nerved; umbels of 5-6 rays: involucra and involucres of 5-6 small acuminate leaves; fruit linear-oblong, with rather prominent ribs. \(2^1/2\) H. Native of Persia, on mountains about Badala, in the district of Khoi in the province of Aderbeijian, where it was collected by Szovits. Very like B. exaltatum, but differs in the fruit being longer. It is perhaps, however, only a variety of it.

Linear-leaved Hare's-ear. Pl. 1 foot. 33. B. Scorzonera-folium (Willd. enum. suppl. p. 80.) radical leaves lanceolate: cauline ones linear, all striated with 9-11 parallel nerves; stem paniculately branched; umbels 8-10-rayed; involucrum of 1-2 leaves; involucres of 4-5 lanceolate apiculate leaves, which are shorter than the umbellules. \(2^1/2\) H. Native of Siberia, at Lake Baikal. Allied to B. falcatum, but differs in the leaves being narrower, and in the nerves being parallel and more crowded.

34. B. Lanceolatum (Wall. cat. no. 551.) stem erect, sparingly branched; leaves lanceolate, much acuminate, glabrous, membranous, furnished with 2 oblique nerves on each side; umbels 5-6-rayed; involucrum of one small leaf; umbellules 5-8-rayed; involucres of 1-2 small leaves, rarely wanting; fruit ovate-oblong, with the ribs hardly elevated, and the furrows smooth.
**UMBELLIFERÆ.**

Long. B. *sulcātum* β Africānum, Berg. cap. 76. 7. but the umbels are said to be 5-rayed, and the involucres of 5 leaves.

*Murādi* Hare's-ear. Shrub 1 to 2 feet.

41 B. *Sīthorpi*cum (Smith, fl. grec. t. 264. prod. 1. p. 179.) plant suffrutescent; leaves linear, rather falcate, with smooth margins; involucra usually of 3 leaves; leaves of involucre linear-lanceolate, cuspitate, shorter than the umbelles. 2. H. Native of the Morea. A specimen collected near Theban agrees very well with the character given to this; and is probably the same. Plant only frutescent at the base.

*Sīthorpi*p* Hare's-ear. Shrub 1 foot.

42 B. *spinōsum* (Lin. fl. suppl. p. 178.) shrubby, erect, floriferous branches divaricate; stiff; the deflowered ones spinose; leaves linear-subulate, many veined, quite entire; involucra of 3-5 small subulate leaves. 2. H. Native of Spain and Mauritania. Gouan. ill. p. 8. t. 2. f. 3. Desf. atl. 1. p. 232.

Tenōriā spinōsā, Spreng. Ribs of fruit obtuse.

43 B. *frūtīcescens* (Lin. aman. 4. p. 269.) suffrutescous, erect; branches slender, elongated, erect; leaves linear-subulate, stiff, striated, 5-7-rayed; involucra of 3-5 very short subulate leaves. 2. H. Native of Mauritania, Spain, and between Perpignan and Narbonne. Cav. icon. t. 2. t. 106. Tenōriā frūtīcescens, Spreng. in Schultes, syst. 6. p. 376.—Burr. icon. t. 1256. Umbels small, 3-5-rayed. Ribs of fruit obtuse.

44 B. *foliolūsum* (Salzm. pl. exsic. ex D. C. prod. 4. p. 133.) suffrutescent, erect, nearly simple; leaves sessile, half stem-clasping, linear-lanceolate, acuminate, undulated, crowded, 1-nerved, quite entire; leaves of involucra ovate. 2. H. Native of Mauritania, about the Angiers. Stems a foot high. Leaves broad and half stem-clasping at the base. *Involucra* of 3 leaves; involucres of 4-5 leaves. Fruit ovate, with obtuse ribs.

*Leafe* Hare's-ear. Shrub 1 foot.

45 B. *ella*tum (Guss. prod. fl. sic. 1. p. 316.) plant suffrutescent at the base; branches elongated; leaves membranous, many veined: radical ones oblong-lanceolate, tapering into the petioles; cauline ones sessile, linear-lanceolate; umbels 8-12-cleft, involucra of 4-5 short leaves; leaves of involucres oblong, acuminate, longer than the umbelles. 2. F. Native of Sicily, on calcareous rocks. Allied to *B. plantaginēnum*, but the plant is frutescent at the base, and the leaves are acute. Ribs of fruit smooth.

*Tall* Hare's-ear. Shrub 3 to 5 feet.

46 B. *cane*scens (Schousb. mar. beob. p. 113.) shrubby, erect, branched; leaves oblong, membranous, very blunt, quite entire, sessile, with many parallel nerves; umbels 8-10-rayed; leaves of involucra oblong, obtuse, short. 2. F. Native of Mogador. Branches of a greyish white-colour. Plant glabrous.

Fruit like that of *B. frūtīcēs*. Leaves much thinner, and one-half smaller than those of *B. plantaginēnum*.

47 B. *plantaginēnum* (Desf. atl. 1. p. 233. t. 57.) shrubby, erect, branched; leaves lanceolate, mucronate, stiff, coriaceous, sessile, quite entire, many nerved; umbels 4-10-rayed; leaves of involucra elongated, subulate, acute. 2. F. Native of Mount Atlas, near Bougie. Tenōriā plantaginē, Spreng. in Schultes, syst. 6. p. 376. Nerves almost diverging from the base of the leaves, not parallel.

48 B. *Gibral*trica (Lam. dict. (1784.) 1. p. 520.) shrubby, erect, branched; leaves lanceolate, attenuated at both ends, 1-nerved, coriaceous, glaucous, oblique, quite entire, sessile; leaves of involucra lanceolate. 2. F. Native of Gibraltar, on the

Cult. Any common soil will answer this shrub; and cuttings are easily rooted.

### Tribe V.

SESEL'NEÉ (plants agreeing with Séseli in important characters) or Orthospermæ, pauefugiate terticulæ, Koch, umb. 102. D. C. prod. 4. p. 135. Transverse sections of fruit terete, or nearly so. Mericarps with 5 equal filiform or winged ribs: lateral ribs marginating, and often a little broader than the rest. Seed somewhat teretely convex on the back, and flat-tish in front. Raphe marginal or submarginal.

LIN. syst. Pentandria, Digynia. Margin of calyx 5-toothed. Petals elliptic, drawn out into a long acumén, which is bent in nearly to the base. Fruit nearly terete, variable in length, crowned by the teeth of the calyx in the immature state, and by the stylopodium and short spreading styles. Mericarps smooth, with 5 filiform ribs, lateral ones marginating; vitæ large, solitary under each rib, but none in the commissure nor furrows.—Perennial herbs, natives of the Cape of Good Hope, yielding an aromatic juice. Radical leaves cut. Stems erect, fistular, naked, branched, furnished with sheathing scales or abortive leaves. Terminal umbels compound, fertile: lateral ones often sterile. Involucra and involucles of many short marcescent leaves. Flowers yellow. This genus from the situation of the vitæ agrees almost alone with Melanoselum, but the form of the fruit is very different.

Jagged-leaved Lichtensteinia. Pl. 3 to 4 feet.

2 L. trífida (Cham. et Schlecht. l. c. p. 39.) leaves glabrous, ternate, rarely 2-4 cleft; leaflets lanceolate, entire or toothed; fruit elliptic. 2. G. Native of the Cape of Good Hope, at Schurfieldberg. Óenanthæ obscura, Spreng. syst. 1. p. 890. Umbels 10-20-rayed.

Trifid Lichtensteinia. Pl. 1 to 2 feet.

3 L. PYRÆTHRÓGIA (Cham. et Schlecht. l. c. p. 397.) leaves glabrous, pinnaled: lobes ovate, cut, serrated; fruit elliptic. 2. G. Native of the Cape of Good Hope, in the woods of Ruyterbosch. Sieb. pl. excis. no. 211. and 222. Bébon proliferum, Bum. fl. cap. p. 8. Óenanthæ inébrians, Thunb.
UMBELLIFERÆ. LVIII. LICHTENSTEINIA. LIX. OTTOA. LX. CÉNANTHE.

1 CE. fistulosa (Lin. spec. 365.) roots fasciculate, intermixed with oblong tubers; neck of root throwing out stout or stems; and leaves fustilar; leaves radical leaves bipinnate: leaves cuneate, lobed; calyx leaves pinnate: leaves filiform; umbels 3-5-rayed, without any involucrum; fruit turbinate, much crowded, ribbed. 2. H. Native of Europe and Caucasus, in ditches, ponds, and other watery places; plentiful in Britain. Drev. et Heyne. pl. europ. 5. t. 98. Fl. dan. t. 846. Smith, engl. bot. t. 365. O. aquatica, Bauh. pin. 162.—Bauh. hist. 3. p. 192. f. 1.—Petiv. herb. brit. t. 25. f. 5. and 6. There is a variety of this whose roots are composed of whorls of fibres. The plant has an unpleasant smell, and a hot nauseous taste, like many other umbelliferous plants. The roots and whole herbage are said to be poisonous. Flowers pale red.

Var. β, Tabernaemontàni (Koch, ex D. C. prod. 4. p. 136.) radical leaves divided into many linear segments. 2. H. Native of Altasat, in inundated places. O. Tabernaemontani, Gmel. fl. bad. 1. p. 676. exclusive of the syn. Poll.

Var. γ l lanceolata (Spreng. ex D. C. prod. 4. p. 136.) radical leaves pinnate or bipinnate: leaves or segments linear-lanceolate; and umbels bifid. 2. H. Native of Mauritania, in humid places on the sea shore near LaCalée. CE. lanceolata, Poir. suppl. 4. p. 135. CE. fistulosa, Poir. voy. 2. p. 137.

FisGeVular or Common Water-dropwort. Fl. June, Aug. Britain. Fl. 1 to 2 feet.

Var. γ involucrata (D. C. l. c.) involucrum of many leaves. 2. H. CE. peucedanifolia, Schlecht. et exsic. CE. Renhâna, Morivand, fl. ven. p. 149. In some specimens the involucre is absent. Fruit ovate, striated, pedicels not thickened after flowering.

3 CE. PEUCEDANIFOLIA (Poll. pall. 1. p. 289. f. 3.) tubers of roots sessile, elliptic, ending in a fibre each at the apex; radical leaves bipinnate: calyx ones pinnate; lobes or leaflets all linear; umbels 5-8-rayed, involucrum wanting, or of 1 leaf; fruit oblong, attenuated at the base, nearly sessile, coarctate beneath the calyx. 2. H. Native of middle Europe, in meadows, ditches, and bogs; as in France, Switzerland, &c. In England, near Bury; about Bedford; on the banks of the Isis, beyond Isley; and in peat bogs, under Headington Wick Coope, Oxfordshire. Umbeluliles dense, many-flowered, surrounded by the many leaves of the involucres, which are of equal length. Smith, engl. bot. t. 348. CE. filipendulifolia, Thüll. fl. par. 146. CE. Pollichii, Gmel. fl. bad. 1. p. 679. CE. peucedanifolii, Roth. CE. patens, Mench.-Lob. icon. 729. f. 2.—Dalech. hist. 773. f. 1. Flowers often reddish. The roots taste like the garden parsnip, but are probably dangerous food; yet they are not reckoned poisonous, though the roots of other species are virulent.

UMBELLIFERÆ.  

LX. ÓENANTHE.  

303

4. **E. silaefolia** (Bieb. suppl. p. 232.) knobs of roots of an oblong-fusiform shape, or cylindrical, fasciculate; leaves pinnate; leaflets of the lower leaves lanceolate: of the upper ones linear; involucre almost wanting; fruit ovate, crowded, sessile, hardly longer than the involucel.  

5. **E. pimpinelloides** (Lin. spec. 365.) roots of several slender, fleshy, cylindrical fibres, which are dilated into ovate-globose tubers at the apex; radical leaves bipinnate; leaflets cut; cauleine leaves pinnate; leaflets of the cauleine leaves elongated, linear, and entire; involucre of many linear leaves; fruit cylindrical, striated, callous at the base, longer than the pedicels, which are thick and short.  

7. **E. apifolia** (D. C. prod. 4. p. 137.) roots unknown; stem branched, striated; lower leaves bipinnate; leaves ovate, deeply serrated; upper leaves pinnate; leaflets lanceolate-linear, acuminate; umbels of many rays; involucre almost wanting; fruit cylindrical-oblong, callous, almost at the base and apex, longer than the pedicels, which are thick.  

8. **E. crocata** (Lin. spec. 365.) knobs of roots oblong or elliptic, sessile; stem branched, furrowed; leaves bipinnate; leaflets wedge-shaped, deeply toothed; umbels of many rays; involucre and involucels of many leaves; fruit linear-oblong, with slender intermediate ribs, longer than the pedicels.  

9. **E. cavernifolia**; the whole plant being rather glaucous. Perhaps truly distinct from **E. pinnatifida**.  

**Var. a.** charophylla (D. C. prod. 4. p. 137.) tubers hanging by long fibres.  

**Var. b.** pimpinelloides (Lin. spec. 365.) tubers on short peduncles, intermixed with fibres.  

**Var. c.** apiatifolia (D. C. prod. 4. p. 137.) roots unknown; stem branched, striated; lower leaves bipinnate; leaves ovate, deeply serrated; upper leaves pinnate; leaflets lanceolate-linear, acuminate; umbels of many rays; involucre almost wanting; fruit cylindrical-oblong, callous, almost at the base and apex, longer than the pedicels, which are thick.  

**Callous-rooted Water-dropwort.** Pl. 2 to 4 feet.  

**Callous-rooted Water-dropwort.** Pl. 2 to 4 feet.
UMBELLIFERÆ. LX. ÓNANTHE. LXI. ANNESORHIZA.

p. 304. with a figure and p. 305. with a description.—Mor. ox. sect. 9. t. 7. f. 5.

12 CE. PHELLA'NDRIUM (Lam. fl. fr. 3. p. 432.) root fusiform, with many whorled fibres; stem furrowed, fiddle-shaped, leaves stalked, repeatedly pinnate, with innumerable, fine, expanded, dark green, narrow, wedge-shaped, cut, shining, acute, divaricate leaflets; umbels opposite the leaves, on short thick peduncles, without involucre; involucres of many narrow, taper-pointed leaves; fruit ovate, with 5 broad ribs, and narrow intermediate furrows, rather shorter than the pedicels. G. H. Native of Europe, Tauria, and Siberia, in rivers, ditches, and lakes; plentiful in some parts of Britain, as in ditches in Battersea-fields, near London; and near Edinburgh. Phellandrium aquaticum, Lin. spec. 366. Fl. dan. t. 1154. Smith, engl. bot. t. 689. Schkuhr, handb. t. 71. Hoffm. umbh. 1. p. 71. descript. and icon. t. 1. f. 17. Hayne, arz. gew. 1. t. 40. Nees. off. pl. 14. t. 6. Woody. med. bot. suppl. 266. Bull. fr. t. 147. Erh. pl. off. 24. CE. aquatica, Lam. dict. 4. p. 380. Ligústícum phellándrium, Crantz. hort. fasic. 3. p. 384. Cicutária palúdística, Ger. emac. 1063. f. 1. Lob. icon. 755. f. 1. Phellandrium, Dode, pempt. 591. f. 1. Roth always writes the old name phellándrium, which agrees with a cymology hazarded by Sir James Smith, in Rees' cycl. vol. 27. from φίλω, to be treacherous, alluding to the poisonous nature of the plant; φιλής αὐξήσων, as Linnaeus has it, κοράν of man, is not at all satisfactory. Linnaeus informs us that the horses in Sweden are seized with a kind of palsy by eating this plant; hence Withering and Sibthorp have named it horse-bane. This effect, however, is not to be ascribed to the plant, but to a coleopterean insect breeding in the stalks, which he therefore names Curculió paraparícetecus. The leaves are sometimes applied to discutent cataplasms, and for this reason Boerhaave speaks highly of it. The seeds are recommended in intermitentens, and are said to be diuretic, antiseptic, and expectorant. The efficacy of this plant rests chiefly on the testimony of Ernstein and Lange, by whom various cases of its successful use are published, especially in wounds and invertebrate ulcers, and even in cancers; also in phthisis, pulmonary, asthma, dyspepsia, and intermitent fevers. Dr. Woodville rightly observes, that though the disorders here noticed are so dissimilar as to afford no satisfactory evidence of the medicinal qualities of these seeds, yet they appear to well deserving of farther investigation.

Phellandrium or Fine-leaved Water-dropwort. Britain. Pl. 2 to 3 feet.

18 CE. STOLONIFERA (Wall. cat. no. 585.) stems creeping at the base, ascending, fiddle-shaped; leaves pinnate; upper ones pinnate; leaflets lanceolate, acuminate at the base and apex, with a few coarse serratures; umbels opposite the leaves, exuvolucrate; fruit obovate-oblung, much shorter than the pedicels. G.? H. Native of Silhet, in the east of Bengal, in rice grounds. Phellandrium stoloniferum, Roxb. hort. beng. p. 81. Teeth of calyx 3, subulate. Styles permanent.

Stoloniferous Water-dropwort. Pl. creeping.

14 CE. LINEÁRIS (Wall. cat. no. 556.) stems throwing out roots from the nodi at the base, erect, fiddle-straight; leaves pinnate; leaflets of the lower leaves oval, toothed; of the upper linear, elongated, toothed, or univalved; umbels opposite the leaves, without involucra; rays compressed. G. H. Native of Nipaul, in rice grounds. Fruit unknown.

Linear-leaved Water-dropwort. Pl. 1½ foot.

15 CE. JÁVÁNEC (D. C. prod. 4. p. 138.) stems terete, fiddle-straight; leaves divided into 3 parts above the sheaths of the pedioles, which are bipinnate; leaflets ovate-oblong, cuneated at the base, deeply toothed at the apex; umbels opposite the leaves, pedunculate; involucrum of a few small leaves; leaves of involucral setaceous; fruit ovate. G. S. Native of Java. Sium Javanicum, Blum?

Jaca Water-dropwort. Pl. ?

§ 2. Species, natives of the Cape of Good Hope, the greater part of which are hardly known, and all of them, most probably, belong to different genera from the present.

Filiform Water-dropwort. Pl. 1 foot.

18 CE. TENUIFÓLIA (Thunb. prod. 49. fl. cap. p. 253.) stem simple, striated; leaves bipinnate; leaflets linear-setaceous, deeply pinnatifid; upper leaves undivided, filiform; leaves of involucram and involucres very short; ribs of fruit rather winged. G. Native of the Cape of Good Hope. Spreng. umb. spec. p. 109.

19 CE. FERULÁCEA (Thunb. prod. 50. fl. cap. p. 252.) root unknown; stem branched, pinnate; leaves compound; leaflets lanceolate, acute, furrowed on both sides; involucra of few leaves. G. Native of the Cape of Good Hope. Spreng. umb. spec. p. 109.

Ferulate Water Drop-wort. Pl. 1 to 2 feet.

20 CE. INTERRUPTA (Thunb. prod. 50. fl. cap. p. 252.) root unknown; stem simple, terete, nearly leafless; leaves radical, petiolate, divided into 3 parts, and these parts are decomposed; leaflets oblong, sinuately pinnatifid, mucronately toothed; lower ones reflexed; involucrum of 5 leaves. G. Native of the Cape of Good Hope. Spreng. umb. spec. p. 107. Stem said by Thunberg to be villous at the base, but by Sprengel it is said to be smooth. Perhaps the same as Annesorhiza Canadensis.

Interrupted Water-dropwort. Fl. Ju. Jul. Cult. 1818. Pl. 1 ft. Cult. Although all the species grow naturally in ditches, rivers, and watery places, they grow well in any kind of soil, whether dry or wet. Increased by dividing at the root, or by seeds.

LXI. ANNESORHIZA (from ἀγγες, ἀγεσ, chaste, and πίτις, rhiza, a root; smell of root). Cham. et Schlecht. in Linnaea. 1. p. 398. t. 5. f. 4. D. C. prod. 4. p. 139.

LIN. SYST. - Peniändria, Digynia. Margin of calyx 5-toothed, permanent. Petals elliptic, acuminated, more or less emarginate, with an inflexed point. Fruit 5-angled, prismatic, crowned by the reflexed calyx and styles; mericarps convex on the back, unequal: one of them 8-winged, in consequence of the carinal and marginal ribs being winged, but the intermediate ribs are filiform: the other 4-winged, in consequence of the carinal...
umbelliferæ. lxii. sclerosciadium. lxiii.

rib being filiform, and the intermediate 2 and marginal 2 being winged; vitæ 1 in each furrow, and 2 in the commissure, which is flat. Carpophore bipartite.—An herb, native of the Cape of Good Hope. Root fusiform. Stem erect. Cauline leaves scale-formed. Umbels of 12-15 rays. Involucra and involucelles of many leaves, having hyaline margins.

1 A. Cape'nis (Cham. et Schlecht. l. c.). Y. G. Native of the Cape of Good Hope, on the sides of mountains. The root smells of anise, hence the name of the herb at the Cape, Anysonontel.

Cape Anise-root. Pl. 1 to 2 feet?

Cult. Any soil will suit this plant; and it will be easily increased by cuttings or by seeds.

lxii. sclerosciadium (from σκληρός, skleros, hard, and σκιάδων, skiadion, an umbel; in reference to the solid fruit). Koch, diss. inéd. in litt. 1823. D. C. coll. mem. 5. p. 43. t. 2. f. F. prod. 4. p. 140.

lin. syst. Pentândria, Digynia. Teeth of calyx 5, conjunct, permanent. Petals obsolete, with an inflexed point, which is bidentate or tridentate at the apex. Stylodium conjunct, styles filiform, at length diverging. Fruit ovate-globose, solid; mericarp with 5 thick, elevated, blunt, equal ribs; vitæ 1 in each furrow, which are narrow, and 2 in the commissure. Carpophore distinct, undivided. Seed terete, flattish on inside.—Herb glabrous. Root fibrile. Leaves divided into linear-oblong lobes or leaflets. Umbels axillary, sessile, almost without any involucrum; rays very unequal, that is, some of the umbellules are sessile, and some are on long peduncles in the same umbel. Involucræ of 5-7 leaves, having membranous margins. This genus is allied to Óenânthæ, from which it differs in the carpophore being free, in the stylodium being conical, and in the ribs of the fruit being prominent, t. (f. 56. F.)

1 S. nîmîle (Koch, l. c. D. C. l. c.). O. H. Native of fields, about Mogodor, and probably of Teneriffe. Óenânthæ nolîfôra, Schouw. mar. p. 120. Cônium rigiûdis, Mert. herb. and perhaps the same as Bûnium rigens, Spreng. but neither the description nor the country agrees with the present plant.

Cult. The seeds only require to be sown in the open ground in a warm sheltered situation.

lxiii. dasyloma (from δασις, dasyς, thick, and λομο, loma, a fringe; in reference to the ribs of the fruit). D. C. prod. 4. p. 140.

lin. syst. Pentândria, Digynia. Margin of calyx obsolete. Petals unknown. Stylodium depressed; styles short. Fruit ovate, with the transverse section terete; mericarps semi-ovate, not separating at maturity, with 5 corky, cellular ribs: the 3 dorsal ones small, and the 2 lateral ones large and blunt; vitæ 1 in each furrow, which are narrow, and 2 in the middle of the commissure, which is flat. Carpophore indistinct. Seed triangular, that is, convex on the back and angular at the commissure.—Herbs with the habit of Óenânthæ. Stems fustulose. Leaves bipinnate; leaflets cuneated, few-toothed at the apex. Umbels opposite the leaves, 5-6-rayed. Umbellules crowded, many-flowered. Involucra and involucelles none.

Bengal Dasyloma. Pl. 1 foot.

2 D. glâuca (D. C. l. c.) umbels pedunculate. O. H. Native of Bengal. Biforis? glâca, Wall. Differs from the preceding in the umbels being distinctly pedunculate, in the leaves

being larger and glaucous, in the dorsal ribs of the fruit being more acute, and the lateral ones smaller.

Glaucous Dasyloma. Pl. 1 foot?

Cult. The seeds only require to be sown in the open ground.

lxiv. cynosciadium (from κυκος, kykos, kykos, a dog, and σκιάδων, skiadion, an umbel). D. C. coll. mem. 5. p. 44. t. 11. prod. 4. p. 140.

lin. syst. Pentândria, Digynia. Teeth of calyx 5, subulate, permanent (f. 68. c). Petals ovate, nearly elliptic, obtuse, entire, flat, with an inflexed point. Stylodium conjunct, permanent; styles very short, reflexed. Fruit oval-oblong or ovate (f. 68. b.), attenuated at the apex; mericarps with 5 thick, corky ribs (f. 68. a.), 2 lateral ribs marginating; vitæ nearly straight, 1 in each furrow, and 2 in the commissure. Seed sub-semieterete. Carpophore bipartite.—American glabrous herbs. Stems angular, filiform, branched a foot high and more, with very few leaves. Leaves pinnate or palmate; leaflets linear, elongated, entire, articulated near the base, at which places the leaflets fall off; lower and upper ones undivided, linear, and elongated. Involucra and involucelles of many leaves. Flowers white.—This is an intermediate genus between Óenânthæ and Æthusa, but it differs from both, and from all its allies in the petals being flat and entire; it differs particularly from Æthusa in the calyx being 5-toothed, in the vitæ of the commissure being straight, and in the involucra and involucelles being of many leaves; from Sësëli in the stylodium being conical, and from Óenânthæ in the carpophore being distinct.

1 C. digita tum (D. C. l. c. t. 11. f. A.) leaves palmate; leaflets 3, linear, quite entire; fruit ovate at the base, but attenuated at the neck.—Native of North America, on plains of the Arkansas River. Óenânthæ digitâta, Nutt. mss. Umbels few-flowered. Involucrum of a few unequal leaves: leaves of involucrum subulate, very short. Rays of umbel very long.

Digitate-leaved Cynosciadium. Pl. 1 to 1½ foot.

2 C. pinna tum (D. C. l. c. t. 11. f. B.) leaves pinnate; leaflets distant, few pairs, linear, quite entire: terminal one very long; fruit oval-oblong.—Native of North America, along with the preceding species. Æthusa pinnâta, Nutt. mss. Pedicels a little longer than the leaves of the involucrum. Leaves of involucrum 7-8, nearly equal, linear-subulate.

Pinnate-leaveded Cynosciadium. Pl. 1 foot.

Cult. Sow the seeds in the open ground, and the plants will rise and flower and seed freely.

lin. syst. Pentândria, Digynia. Margin of calyx obsolete. Petals ovate, marginate, with an inflexed point: outer ones radiating. Fruit ovate-globose; mericarps with 5 elevated, thick, acutely keeled ribs: lateral ribs marginal, and a little broader than the rest, girded by a somewhat winged keel; vitæ 1 in each furrow, and with 2 arched ones in the commissure. Seed semi-globose. Carpophore bipartite.—Erect, annual, poisonous herbs. Leaves uniform, multifid. Involucrum wanting R r

FIG. 63.
or of 1 leaf; involucels of 3 or 5 spreading, or pendulous, setaceous leaves, situated on the outside of the umbellules, that is, unilateral. Flowers white. This species of this genus is admitted, but they are probably only varieties of one.

1 Æ. cynoÆtium (Lin. spec. p. 367.) leaflets wedge-shaped, decurrent, with lanceolate segments; rays of umbel nearly equal; involucrum wanting; involucels of 3 leaves, which are longer than the umbellules. O. H. Native throughout the whole of Europe, in cultivated grounds: a common weed. Smith, engl. bot. 1192. Curt. lond. fisc. c. t. 18. Bull. herb. t. 91. Hayn. arz. gew. 1. t. 35. Hoffm. umb. p. 97. Coriánium cynoÆtium, Crantz, fl. aust. p. 221. Cicuta cynoÆtium, Targ. ist. bot. CynoÆtium, Riv. pentap. irr. t. 76. Cicatária tenuifolia, Raîi, syn. 215. C. fátua, Lob. icon. 2 p. 280. f. 1. Herb erect, lurid green, fetid, and reckoned dangerous. Great carelessness can alone cause this weed to be mistaken for garden parsley; yet such an accident sometimes happens. The 3 long pendulous bracteas under each umbellule distinguish it from all its tribe. Dr. Bigelow, of Boston in New England, observed this Anëthos to be without scent in America, but seeds transmitted by him produced plants with the same nauseous garlic-like flavour as those of Great Britain. Some curious facts of a similar nature have been observed. The flowers of Hësperis matronâlis are said to lose their scent in America, after the first generation.

2 Æ. cynoÆtioûtes (Bieb. fl. taur. p. 227. suppl. p. 283.) segments of the leaves oblong, acute; rays of umbel nearly equal; involucrum wanting; involucels of 3 leaves, which are shorter than the umbellules; vittae in the commissure contiguous at the base. O. H. Native of the Ukraine, in shady places. Hoffm. ed. 2 p. 98. and 205. and tit. f. 9. Very nearly allied to the first species, but differs in being more branched, and 3 feet in height, or more.

3 Æ. elâ’ta (Friedlander, ex Fisch. cat. hort. gor. 1813. p. 45.) segments of the leaves bluish; involucrum usually of 1 leaf; involucels of 1-3 leaves, which are longer than the umbellules; outer rays of umbel longest; pedicels twice the length of the fruit. O. H. Native of Podolia. Hoffm. ed. 2 p. 98. Besser. enum. p. 54. Horn. cat. 4. hort. hafl. suppl. p. 34. Petals white, not as in Æ. cynoÆtium, greenish at the base. Styles purple after flowering. The plant is said to be edible, and not poisonous as the others.

Linn. sys. Pentândria, Digînà. Margin of calyx tumid, obsolete, toothless. Petals roundish, entire, involute, with a rather square retuse point. Transverse section of fruit nearly terete; mericarps with 5 prominent, bluntly keeled ribs: lateral ribs marginal, and a little broader than the rest; vittae 1 in each furrow, and 2 in the commissure. Seed somewhat semi-terete.

—Biennial or perennial herbs. Roots fusiform. Stems terete, striated, branched. Leaves triply pinnate, decomposed: with linear, pinnate leaves. Involucra and involucels almost wanting. Flowers yellow.—This genus differs from Anëthos with which it was formerly combined, by the mericarps being more turgid: having the margin rather more compressed than the back; and the transverse section of the fruit is therefore nearly terete, or with the margin rather compressed.

1 F. vulgâre (Ray, syn. 217. Gaertn. fruct. 1. p. 105.) stem terete at the base; leaves bipinnate, distich; leaflets awl-shaped, drooping; umbels 13-20-rayed; involucra and involucels wanting. 2 H. Native of Europe, in exposed, uncultivated places; in Britain, on chalky cliffs, very plentiful; and of Caucasus, near Baku, and in the plains between Sallian and Lenkeron. Anëthos Fœnîculum, Lin. spec. 722. Smith, engl. bot. t. 1298. Mill. fig. t. 15. Hayne, arz. gew. 7. t. 18. Fœnîculum officinale, All. pedem. no. 1359. Mûrum Fœnîculum, var. a, Spreng. prod. p. 32. and in Schultes, syst. 6. p. 433. Ligûsticum Fœnîculum, Roth. germ. 1 p. 124. Fœnîculum, Math. valgr. 2 p. 135. f. 1. Cam. epit. p. 534. f. 1. The taste and aromatic flavour of this our garden fennel are well known, and has long been an inmate of our gardens. The tender stalks are used in salads; the leaves boiled enter into many fish sauces. The sweet and warm seeds are a common carminative medicine for infants. The blanched stalks of the next species, F. dulce, called finocchio, are eaten with oil, vinegar, and pepper, as a cold salad, and they are likewise sometimes put into soups. This thickened part is blanched by earthing up, and is then very tender. “Owing to the peculiar nature of this species,” Mr. Neill observes, “it is more tender than the common fennel, and often perishes in the course of the winter. Misled by this circumstance, several horticultural writers describe it as an annual plant, under the name of Anëthos sêgëtum.” All are raised from seed, of which half an ounce is sufficient for a seed-bed 4 feet by 6 feet. Sometimes they are raised from offsets from the old plants, where only a few are wanted. Sow in the spring in light earth, either in drills from 6-12 inches apart, or in broad cast and raked in. When the plants are 3 or 4 inches high, thin or transplant a quantity 15 inches asunder. As the roots of old plants divide into offsets, these may be slipped off in spring, summer, or autumn, and planted a foot apart. They will produce immediate leaves for present supply and in continuance; or for immediate larger supply of leaves, you may procure some established full roots, and plant as above; let them be well watered. The same plants remain several years by the root; but as fennel sends up strong stems for seed in summer, these, or a part of them, should be cut down, to encourage a production of young leaves below in succession. It is apt to spread more than is desirable, if suffered to seed. The swelling stems of the Finocchio or F. dulce, when of some tolerable substance, should be earthed up on each side 5 or 6 inches to plant them white and tender. This will be effected in 10 days or a fortnight; and by successive sowings or cutting down plants during summer, successive crops of blanched stalks may be had from June to December. In procuring seed, permit some of the best flower-stems to shoot; and they will produce large umbels of seeds in autumn.

2 F. dulce (C. Bauh. pin. p. 147.) stem rather compressed at the base; radical leaves rather distich: leaves all tripinnate; with capillary elongated leaflets; umbels 6-8-rayed. O. H. Native of Italy, and Portugal, where it is cultivated for the sake of the blanched stalks, under the name of Finocchio. Finocchio dulce, Targ. cors. agr. 2 p. 52. Anëthos dulce, D. C. cat. hort. monsp. p. 78. Fœnîculum dulce, &c. J. Bauh. hist. 3 p. 4 with a figure. It differs from the preceding species in being hardly a foot high, in the earlier florescence, in the darker hue, in the stalks being edible, and in the characters given above. The use of this kind of fennel is given above with the common fennel.

Sweet Fennel or Finocchio. Fl. May, June. Clt. Pl. 1 ft.
3 F. pipér'tum (D. C. prod. 4. p. 142.) stem terete; leaflets subulate, very short, stiff, thick; umbels 8-10-rayed. Ψ. H. Native of the south of Europe, especially in Sicily, Sardinia, Portugal, &c. Anéthum Féniciulum β, pipér'tum, D. C. cat. hort. monsp. p. 79. Möeum pipér'tum, Schultes, syst. 6. p. 435. Guss. prod. fl. sic. 1. p. 345. Féniciulum asinus, Cup. hort. cath. 79. ex Bert. The plant is called Finocchio d'asino, or Assèf finocchio, by the Sicilians; it has a hot biting taste, hence the specific name.

Pepper Fennel. Fl. June, July. Cht. 1824. Pl. 4 to 6 ft. 4 F. Pan'mó'rium (D. C. prod. 4. p. 142.) stem erect, branched; leaves supra-decompound; umbels of 10-12 unequal rays; fruit oblong, deeply furrowed, destitute of wings. O. H. Native of the East Indies, where it is cultivated under the name of Painmuhooree or Madhuorrika. Anéthum Panmórium, Roxb. hort. beng. p. 22. journ. bot. 1814. vol. 2. p. 188. Said to be very like common fennel.

Painmuhooree. Fl. 2 to 3 feet.

Cape Fennel. Pl. 2 to 3 feet?

Cult. See the first species for the culture and propagation of the rest.

Lin. syst. Pentândria, Digínyia. Margin of calyx 5-toothed, increased a little after flowering. Petals roundish, entire, involu-

with a broad resuse segment: stylopodium conical; styles short, somewhat reflexed. Fruit terete, 10-furrowed; mericarps with 5 filiform, obtuse, equal ribs; lateral ribs marginal; vitae many, both in the furrows and commissure. Carphophore undi-

vided. A glabrous perennial herb. Root fusiform. Radical leaves rarely undivided, but usually pinnate, or bipinnate; leaf-

lets ovate or lanceolate, serrated; upper leaves ternate, and jagged. Umbels compound, terminal, of many rays. Involuta and involu-

cles of many filiform reflexed leaves. Flowers yellow. This genus is very nearly allied to Féniciulum, but differs in the calyx being 5-toothed and permanent.

ta Sicula Ucria, hort. paranorm. p. 137. p. 542. Sium Grae'cum, Lin. hort. cliff. 98? Sieb. et. exsic. Schultes, syst. 6. p. 542. Zan. hist. ed. Mont. 171. t. 128. There are varieties of this plant, having the leaves of the involucres either the length of the umbellules, or one half shorter than them.

Cult.—The plant will grow in any soil, and is easily increased by dividing at the root, or by seed.

LVIII. DEV'ERRA (a goddess worshipped by the ancients for encouraging housewifery, or rather the goddess of brooms; the plant having much the appearance of a broom,) D. C. coll. mem. 5. p. 45. prod. 4. p. 143. Bûbon species of authors.

Lin. syst. Pentândria, Digínyia. Margin of calyx obsolete. Petals ovate, acuminated, with an inflexed point. Styles short, at length divaricate. Fruit ovate, or roundish, rather compressed from the sides, rough from scales or spreading pili; meri-
carps semi-terete, with obsolete ribs; vitae 1 in each furrow, and 4 in the commissure. Carphophore bipartite.—Aromatic, leafless, glaucous, stiff, broom-like subshrub, natives of Africa. Pe-
tioles sheathing, permanent; limbs of leaves wanting in the adult plants, or nearly so; but in young plants they are small and many-terted, with setaceous linear leaves. Umbels of few rays. Involuta of 4-6 small deciduous leaves; involucels of 4-6 ovate-lanceolate, deciduous leaves, with membranous margins. Flowers white.

Sect. I. Div'erbraia (an alteration from the generic name).

D. C. prod. 4. p. 143. Fruit villous or hispid.

Var. β, Burckel'lii (D. C. prod. 4. p. 143.) young fruit beset with short, tubercular villi. Ψ. G. Native of the Cape of Good Hope. Very like the species, but the fruit is much less villous, and is therefore perhaps distinct.

Leafless Diverra. Shrub.

2 D. tortu'osa (D. C. prod. 4. p. 143.) stem much branched, twisted, divaricate; lower sheaths furnished with divided limbs, bearing subulate leaflets; fruit sparingly villous. Ψ. F. Native of the north of Africa.

Var. a, virgîa (D. C. prod. 4. p. 143.) stem twigg, bent a little. Ψ. F. Native of the kingdom of Tunis, near Kerouan. Bûbon tortuosus, Desf. fl. atl. 1. p. 357. t. 73. Poir. suppl. 1. p. 733.

Var. β, rigidîdor (D. C. prod. 4. p. 144.) stem much branched, stiff. Ψ. F. Native of Egypt, at the Pyramids. Bûbon tortu-

Sect. II. Pitú'rânthos (from πυτωρ, pituron, scurf, and ἄνθος, anthos, a flower; in allusion to the fruit bearing scurflike scales). D. C. prod. 4. p. 144. Fruit covered with scales.

3 D. Pitú'rânthos (D. C. l. c.) stem twigg; branches elongated, leafless, but furnished with sheaths; involucra, involucels, and fruit covered with scurf-like scales. Ψ. F. Native of Ly-

Scurfy-flowered Diverra. Shrub 1 to 2 feet.

Cult. A mixture of loam, peat, and sand will suit the species of Diverra; and they can only be increased by seeds.

LXIX. SORÀ'NTHUS (from σωρος, soros, a heap, and ἄνθος, anthos, a flower; in reference to the close capitate umbels of flowers). Led. fl. ross. alt. ill. t. 82. fl. alt. 1. p. 344. D. C. prod. 4. p. 669.

Lin. syst. Pentândria, Digínyia. Margin of calyx obsolete toothed. Petals broad-oval, permanent, with an inflexed point. Fruit a little compressed from the back, crowned by the divaricate styles: the transverse section elliptic; mericarps with 5 hardly prominent, equal ribs: lateral ribs marginating; vitae 1 in each furrow, and 4 in the commissure. Carphophore bipar-

tite.—An erect herb, with a habit between Sēsēli and Ėnāthe, but differs from the first in the teeth of the calyx being obsolete, in the petals being broad-ovate, not obovate, and in the ribs of the fruit being less prominent; and from the last in the shape of the petals, in the styles and in the carpophore being present.

1 S. Meye'ni (Led. l.c.). 2 H. Native of Siberia, at the river Irtysh, not far from the lake called Noor-Saisan; and at the river Bekin, in sandy places. Root fusiform. Stem erect, striated, simple at the base, and usually bearing 3-4 verticillate branches at the apex; branches leafless, or furnished with membranous scales in the middle. Radical leaves 3-4, tripinnate: leaflets linear; cauline leaves 1-2. Umbels of 10-15 rays, of these 4 longer than the rest. Involucra wanting, rarely of 1 leaf; involucels of 6-8 leaves, which are ovate-lanceolate, pilose on the outside, and ciliated, shorter than the umbellules. Flowers sessile in the umbellules: outer ones female; intermediate ones hermaphrodite: central ones male.

Meyer's Sorantius. Pl. 1 ½ to 3 feet.

Cult. This plant will grow in any soil, and is easily increased by seed.

LXX. SÉSÈLI (Seeycelyous is the Arabic name of an umbelliferous plant, but to what plant it is given is now unknown). Lin. gen. no. 560. Lag. am. nat. 2. p. 103. D. C. coll. mem. 5. p. 46. t. 3. f. R. prod. 4. p. 144.—Sēsēli and Bōbon species, Spreng.—Sēsēli species, Koch.

Lin. syst. Pentándria, Digýnia. Margin of calyx 5-toothed; teeth short, thickish, and sometimes oblateral. Petals obovate, coarctate into an inflexed point at the apex, emarginate or nearly entire. Fruit oval or oblong (t. 55. D. a. E. a.), with the transverse section nearly round, and crowned by the styles, which are reflexed (t. 55. D. b. E. b.). Mericarps with 5 prominent filiform or elevated thick corky ribs; lateral ribs marginal, and a little broader than the rest; vitex one in each furrow, but there are sometimes 2 in the outer furrows, and always 2 in the commissure, but very rarely 4. Seed somewhat semi-terete.—Usually glaucous biennial or perennial herbs. Leaves pinnate or ternately decompound. Involucrum wanting or almost so; involucels of many leaves. Flowers white, very rarely yellow.

Sect. I. Hippomârâthrum (from ἱππο, hippo, a horse, and μαραθα, marath, fennel; horse fennel). Rivin, Roehl, but not of Link, D. C. prod. 4. p. 144. Involucra wanting. Leaves of involucels joined nearly to the apex into a bowl-shaped cup, having a toothed margin.

1 S. Hippomârâthrum (Lin. spec. 373.) stem terete, usually branched at the apex, and nearly naked; leaves glaucous, bipinnate; leaflets linear, trifid, acutish; petioles dilated and sheathing; fruit smoothish; involucel cup-shaped. 2 H. Native of Altai, Piedmont, and Germany, on chalky hills and rocks. Jacq. fl. austr. 2. t. 143. Sium Hippomârâthrum, Roth, fl. germ. 1. p. 128. Sēsēli articulâtum, Ėrantz, fl. austr. p. 205. t. 5. f. 1-2. Hippomârâthrum pelviforme, fl. wett. st. Hipp. vulgâre, Roehl. Hippomârâthrum, Riv. pent. irreg. t. 67. Flowers white. Umbels smoothish, not tomentose as in S. leucosâprum. Fruit pubescent while young, but glabrous or nearly so when mature. The wild plant is nearly simple, but the plant branches when cultivated in a garden.

Var. β. hebecâryum (D. C. prod. 4. p. 144.) fruit beset with down, even in the mature state. 2 H. Native of Siberia. Nearly allied to S. tomentosum, but the habit is more that of S. Hippomârâthrum, and the umbel is downy, not tomentose. Horse-fennel. Fl. July. Clt. 1656. Pl. 1 to 2 feet.

2 S. tomentosum (Vis. dalm. spec. 6. t. 3. f. 1.) stem simple, terete; leaves biternate or trinerved: leaflets filiform, chan-
pinnate; leaflets broad, cuneiform, forked; superior ones oblong, entire; leaves of involucels very short, joined together at the base; fruit villous. 2. H. Native of Eastern Caucasus, in subalpine situations. Búbon cuneifolius, Spreng. syst. 1. p. 900.

_Wedge-leaved Meadow-saxifrage._ Fl. 1 foot?

9 S. _leucofýrum_ (Waldst. et Kt. pl. rar. hung. 1. p. 92. t. 89.) stem terete, flexuous, branched at the apex; leaves glaucous, decumbent; leaflets setaceous, linear; petioles dilated, and sheathing; involucre usually of one leaf; leaves of involucels subulate, joined together at the base, and are as well as the fruit puberulous. 2. or 3. H. Native of the Caucasus, about Buda on chalky hills. Athamántha leucuspérma, Poir. suppl. 1. p. 534. Very nearly allied to _S. Hippométrarthrum_, but differs in the leaves of the involucel being joined only at the base, not to the apex. Umbelhus dense. Fruit with elevated corky ribs and narrow furrows, ex Koch, umb. p. 110.

**Flowers yellow.**

10 S. _gracile_ (Waldst. et Kt. hung. 2. p. 122. t. 117.) stem terete; leaves trinervate; leaflets triangularly setaceous, very thin and rather flaccid; rays of umbel elongated; involucre wanting or nearly so, very short. 2. H. Native of Pannonia and Transylvania, on calcareous rocks. Baumg. fl. trans. 1. p. 298. Flowers yellow; petals oval-oblong, incurved at the apex. Caulux ascending. Flowering stems erect. Sheaths of leaves entire. Fruit elliptic and smooth, like the rest of the plant. Umbels opposite the leaves, drooping before expansion.

_Slender Meadow-saxifrage._ Fl. June, July. Clt. 1805. Fl. 1 to 2 feet.

11 S. _trinervátum_ (Pursh, fl. amer. sept. 1. p. 197.) root fusiform; leaves sheathing a long way along, ternate, binate, or trinervate; leaflets or segments elongated, linear or linear-lanceolate, quite entire, petiolulate; stem leafy at the base; umbels compound, with nearly equal rays; umbelules capitate; flowers dioecious or polygamous; immature fruit oblong, somewhat cylindrical; mericarps with 5 elevated acute ribs; involucrum and involucels wanting. 2. H. Native of North America, about the Columbia river; common on the dry gravelly soils near Fort Vancouver. Hook. fl. bor. amer. 1. p. 264. t. 94. This has much the habit of _S. leiocarpum_. Petals involucrate entire. Teeth of calyx obsolete. Flowers yellow.

12 S. _divinícatum_ (Pursh, fl. amer. sept. p. 739.) stem dichotomous, leafy; leaves petiolate, with short sheaths, bipinnate or tripinnatifid; segments linear-oblong, acute, short; peduncles lateral and terminal; rays of umbels equal; leaves of involucels linear-subulate; fruit roundish-ovate, crowned by the calcine teeth; mericarps rough, with 5 elevated ribs and many vitice. 2. H. Native of North America, on the banks of the Missouri; and about Carlton House upon the Saskatchewan. Sims, bot. mag. 1742. Nutt. gen. amer. 1. p. 194. S. leícidum, Fras. cat. 1813. Marathrum, Rafin. journ. phys. 1820. Flowers yellow. The vitice are numerous, and abound in powerfully aromatic oil.

13 S. _leíocarpum_ (Hook. in fl. bor. amer. 1. p. 265. t. 93.) leaves with long sheaths, trinervate or trinervately pinnate; leaflets petiolate, oblong, entire, attenuated or trifid, glaucous; stem nearly naked; umbels compound, with the rays very unequal; umbelules capitate; flowers dioecious or polygamous; immure fruit very smooth; involucre and involucels wanting. 2. H. Native of the north-west coast of Americ; on gravelly soils near Fort Vancouver, in the Columbia. Flowers yellowish. Styles reflexed.

_Smooth-fruitled Meadow-saxifrage._ Fl. 1/2 foot.

14 S. _defoliátum_ (Led. fl. ross. alt. 1. p. 343.) radical leaves early, caducous; stem furnished with leafless sheaths; involucre and involucels of few leaves. 2. H. Native of Siberia, in the Kirghisean Steppe, in sandy wet salt situations. Plant with the habit of _Férida sális_. Root pendunculate. Petals solitary, simple at the base, divided into floriferous branches from the middle, which are branched again. Flowers yellow, polygamous. Carpels with 5 prominent equal filiform ribs; vitice one in each furrow, and 2 in the commissure.

_Defoliate Meadow-saxifrage._ Fl. 1 foot.

**Flowers white.**

15 S. _elátum_ (Gouan, ill. 16. t. 8.) stem rather dichotomous, terete, few-leaved; leaves bipinnate; leaflets linear-filiform, stiffish; involucre almost wanting; fruit ovate, tubercular while young, but glabrous in the adult state, crowned by the calyx. 2. H. Native of the south of France, Italy, &c. in open situations. Gmel. syst. p. 489. D. C. fl. fr. 5. p. 284. Spreng. umb. spec. 118. exclusive of the first and perhaps of the second synonyme. S. elatium, Lin. spec. p. 375. is very probably a distinct plant.—Lob. icon. t. 727. f. 2. Plant glaucous.

_Var. β, ligálāre_ (D. C. prod. 4. p. 146.) superior caluce leaves long-linear, quite entire. Native country unknown, but is usually to be found in gardens, under the name of _S. gláucum_.

16 S. _varium_ (Trev. ind. sem. wratis. 1808. nov. act. bonn. 13. p. 168.) stem terete; branches few, erect; petioles furrowed, as well as the leaves, which are tripinnate; leaflets linear, glabrous, glaucous; involucrum almost wanting; leaves of involucels short, subulate; fruit oblong, glabrous, not crowned. 2. H. Native of Caucasus and Austria. S. várium, Koch, umb. p. 110. S. Тауричicum, Link, in Spreng. syst. 1. p. 884. but not of Koch. S. gláucum, Beib. fl. taur. 1. p. 234. suppl. p. 241. ex Trev. Differs from _S. montánunum_ and _S. Pallásii_, in the fruit not being crowned by the teeth of the calyx.

_Var. β, bráchycárpum_ (Bess. in litt. 1823.) fruit shorter. 2. H. S. choralphaloides, Hortul. not of Thunb. Perhaps a proper species.

17 S. _juvéceum_ (Sibth. et Smith, fl. grec. prod. 1. p. 200.) stem much branched, divaricate, stiff, glabrous; leaves rather glaucous; radical ones trinervate; leaflets keeled, trifurcate; cauline petioles very short, spreading; umbels solitary, few-

Rushy Meadow-saxifrage. Pl. 1 foot.

18 S. montanum (D. C. fl. fr. 4. p. 285, and suppl. p. 505.) stem striated; leaves glaucous, bipinnate, with entire sheaths, and narrow-linear mucronulate leaflets; involucre of 1-3 leaves, and the involucels of many linear-subulate leaves; fruit elliptic, glaucous, glabrous, or clothed with fine pubescence. 2. H. Native from France to Tauria, in open mountainous places.

Var. γ, multicaule (D. C. prod. 4. p. 147.) stem multiple at the base; leaves strictly adpressed. 2. H. S. multicaule, Rezn. obs. S. p. 27. Jacq. hort. vind. 2. t. 129.

19 S. Palla'sii (Bes. cat. hort. crem. 1816. p. 130.) stem terete, branched at the top; leaves bipinnate or tripinnate; leaflets trifid; segments linear, flat, acutish, glabrous, glaucous; upper leaves trifid or undivided; involucre wanting; leaves of involucels subulate, very short; fruit ovate, glabrous, crowned by the short 5-toothed calyx. 2. H. Native of Russia. D. C. mem. soc. gen. vol. 4. S. crassifolium, Schrad. and Hort. Umbels 10-15. Fruit elegantly striated with fuscous vitrea. Petiole sheaths narrow, elongated. Allied to S. elatum, but the fruit is not tubercled when young; to S. leucopsporum, but the fruit is glabrous. According to Koch, it is a variety of S. glaucescens.

20 S. tenuifolium (Lede. fl. ross. alt. ill. t. 97. fl. alt. 1. p. 333.) stem branched, flexuous; leaves bipinnate; leaflets linear, stiffish; involucre almost wanting; involucels short; fruit prismatic, tuberculately warped, rather shorter than the pedicels; receptacle with a membranaceous margin. 2. H. Native of Altai, in dry open sterile places near Ustakmenegorsk, and in the Kirghisean steppe, between the first mentioned place and Alakait. Plant glaucous. Stems many. Leaves with 5 opposite pinnas, and each pinna bearing 3 or 5, usually entire leaflets. Umbels 6-8-rayed. Involucrum usually wanting, rarely of one setaceous leaf; involucels of 7-8 small lanceolate membranaceous acuminated reflexed leaves. Styles and teeth of calyx reflexed on the fruit.

Fine-leaved Meadow-saxifrage. Pl. 1 foot.

21 S. corona'tum (Lede. fl. ross. alt. ill. 169. fl. alt. 1. p. 336.) stem branched; leaves bipinnate; leaflets linear-oblong, decurrent, entire or tripartite; involucre of 2 deciduous leaves; involucels of many lanceolate acute membranaceous reflexed leaves; fruit at length rather prismatic, wrinkled, crowned by the conical stypodium. 2. H. Native of Siberia, in the Soongarian desert. Plant glaucous. Radical leaves 8-10 inches long. Petioles dilated, and rather violaceous at the base, with white membranaceous margins. Umbels 6-8-rayed. Leaves of involucels inflexed at the points. Calyx obsoletely 5-toothed. Styles reflexed.

22 S. vagins'atum (Lede. fl. ross. alt. ill. t. 171. fl. alt. 1. p. 336.) plant glaucous; stem very simple; radical leaves pin-

nate; leaflets entire or trifid, nearly linear, acuminate; involucels and involucels of many broad linear leaves, with membranaceous margins; one of the leaves of the involucre larger than the rest; those of the involucels equal in length to the umbellules. 2. H. Native of Dahuria, near Nertschinsk. Stem nearly leafless, beset with sheaths, which have membranaceous margins, and truncate at the apex. Umbels 10-12-rayed, equal in length. Flowers rather large. Fruit with prominent ribs.

Sheathed Meadow-saxifrage. Pl. 1 to 1¼ foot.

23 S. Gillies'i (Hook. et Arn. in bot. misc. 3. p. 554.) plant clothed with hoary pubescence; stem angular; branches few, erect; leaves pinnate; leaflets of the lower leaves cuneated, and deeply toothed; of the superior ones linear and entire, or bipartite; involucra of few leaves or wanting; leaves of involucels linear, exceeding the pedicels; young fruit ovate, pubescent; styles elongated; stigmas globose, capitulate. 2. H. Native of Chili, in Valle de la Punta des Vacas, Andres of Mendoza. Petroselimum sativum, Hook. et Gill. l. c. p. 335. Flowers white. The ribs of the young fruit are hardly visible.

Gillies's Meadow-saxifrage. Pl. 1 foot.

24 S. polychyrum (Ten. ind. sem. 1825. p. 12. append. 5. fl. neap. p. 10.) stems clinate, tufted, having a few short branches; leaves supra-decompounded; leaflets trifid, linear, nearly terete, fleshy, rather mucronate; upper leaves reduced to the sheaths; umbels 13-20-rayed; leaves of involucels setaceous, shorter than the umbellules; fruit glabrous. 2. H. Native of Goat's Island and elsewhere, in the kingdom of Naples. Perhaps sufficiently distinct from S. montanum.

Many-leaved Meadow-saxifrage. Pl. 1 foot.

25 S. caspi'tum (Sibth. et Smith. fl. gracc. prod. l. p. 200.) stem simple, nearly naked; radical leaves tufted, flat, pinnate; leaflets deeply trifid; ultimate ones decurrent; involucrum of 3-5 very short leaves; fruit cylindrical, smooth, obscurely striated. 2. H. Native of the top of Mount Olympus. Smith, in Rees's cyclo. vol. 52. Spreng. umb. spec. 12. Radical leaves 3 lines long.

Tufted Meadow-saxifrage. Pl. 1 foot.

26 S. colora'tum (Ehrh. herb. p. 113.) stem striated, nearly simple; petioles straight, sheathing; leaves decompound, erect; leaflets or segments crowded, linear-cupulate, having the margins and keel, as well as the rays of the umbel, rather puberulous; involucrum almost wanting; leaves of involucels with membranaceous edges, about equal in length to the umbellules; fruit glabrous, acutely ribbed. 2. or 2. H. Native of France, Germany, Tauria, and Siberia, on mountains and hills. S. annuum, Lin. spec. p. 375. Schultes, syst. 6. p. 398. Jacq. fl. austr. t. 55. Hort. vind. t. 225. S. bienn. Crantz. auct. p. 204. Sium annuum, Roth, fl. germ. 1. p. 128. Sellarnum dimidiatum, D. C. fl. fr. no. 3492, and suppl. p. 503. S. carvifolium, Vill. dauph. 2. p. 586. Caurus simplex, Willd. spec. l. p. 1410—Vaill. par. p. 54, t. 9, f. 4. S. alpinum, Bieb. fl. taur. 1. p. 236. but which is perhaps referrible to Caudium venosum. Flowers white, but often reddish when young. The plant not being annual, the name given by Linnaeus is therefore not admissible. It differs from all the other species in the leaves of the involucre being equal in length or exceeding the umbellules.

Var. b, minus (Wallr. sched. crit. p. 124.) stem very humble.

In dry situations.

Var. γ, ferulaceum (D. C. prod. 4. p. 147.) leaves of involucels exceeding the flowers, usually reflexed.

27 S. striat'um (Led. fl. ross. alt. ill. t. 174. fl. alt. 1. p. 338.) stem branched, straight; leaves tripinnate; leaflets linear, elongated, straight; petioles sheathing; involucra wanting; involucels of many setaceous leaves, which are shorter than the
umbellules; fruit prismatic, glabrous. H. Native at the bottoms of the Altai mountains, frequent; as near Sogra, Lokteew, Smejow, and elsewhere. Root fusiform. Rays of umbels 15-30, angular, roughish at the angles. Umbellules with 20-20 flowers. Mericarps with 5 prominent ribs. Stylopodium pulvinate. It differs from S. coloratum, in the leaflets of the leaves not being roughish on the margins, in the rays of the umbel not being pubescent, and in the leaves of the involucre.

Var. B. simplex; stem simple; leaves bipinnate: leaflets 2-3 inches long, very narrow.

28 S. Pube'sculum (D. C. prod. 4. p. 147.) stem striated; petioles dilated at the base; sheaths with membranous margins; leaves decempound: leaflets few, linear, acute, glabrous; involucrum of one leaf; rays of umbels and fruit puberulous; involucels shorter than the umbellules. 2. H. Native about Constantinople. Sheaths and bracteoles coloured at the margins. Petals and styles purple. Allied to S. coloratum.

Var. B. Pálidulcum (D. C. prod. 4. p. 147.) sheaths less dilated, with pale margins; petals and styles white, or hardly reddish. 2. H. Perhaps Sélènum carvifolium. Vill. is referable to this variety.

Puberulous Meadow-saxifrage. Pl. 1 foot.

Var. B. T. Stratióicum (D. C. prod. 4. p. 148.) leaves bipinnate or tripinnate; leaflets trifid: segments linear, elongated, hardly glaucous. 2. H. Native of Tauria, about Odessa; and of Galicia. S. tortureōrum, Bieb. fl. taur. 1. p. 255. suppl. 1. p. 242. Bess. fl. gal. 1. p. 221. Intermediate from habit between S. tortureōrum and S. campéstre, but is referred to the first, from the involucre being absent, and from the leaves of the involucels being equal in length to the umbellules, &c.

32 S. Boconnici (Guss. cat. pl. 1821. p. 80.) stem terete, subfusiform at the base; leaves ternately decempound: leaflets stiff, lanceolate-cuneated, acute, rather trifid; upper sheaths leafless, long; involucra wanting; involucles of many setaceous leaves, which are about equal in length to the pedicels; fruit glabrous, ovate-oblong. 2. H. Native of Sicily on the mountains among chalky rocks by the sea-side, near Palermo; and of Corsica, on rocks about Sagona. Spreng. nuee endt. 2. p. 146. syst. 1. p. 885. Bühon Siculus, Spreng, in Schultes. syst. 6. p. 499. exclusive of the syn. of Bib. Crithum Dumiculum, Bocc. sicc. 53. t. 27, 28.—Cop. cupani. ed. 1. t. 105. ed. 2. t. 162. but in this last table it is delineated with the stem drooping at the apex, which is not the case.

† Species not sufficiently known.

33 S. S. striátum (Thunb. prod. p. 51. fl. cap. 259.) stem terete, striated, nearly simple; leaves tripinnate: leaflets linear-subulate, furrowed; involucrum of 4 leaves; umbel contracted; peduncles unequal; involucelles reflexed. 2. G. Native of the Cape of Good Hope. Stem purplish, a foot high or more. Branches few, divaricate. Leaves of involucel ovate-lanceolate, concave. Leaves glabrous.

34 S. C. cerephyllo'idēs (Thunb. prod. p. 51. fl. cap. 254.) stem terete, striated, dichotomous at the apex; leaves ternately decmpound: leaflets ovate, cut: segments linear, obtuse; involucræ and involucelles of 4 very short leaves. 2. G. Native of the Cape of Good Hope. Sheaths of cauline leaves membraneous, verticose, entire. Stem 2 feet high and more. Leaves glabrous, pale beneath. Leaves of involucel ovate, obtuse.

35 S. F. frāgile (Gouan. ill. p. 15.) stem unknown; leaves tripinnate; leaflets ternate, brittle, articulated: segments linear; sheaths large, 2-lobed at the apex; involucra none; umbels 15-rayed; involucelles of 7-9 leaves, which are 3 times shorter than the umbellules. 2. H. Native country unknown, as well as the flowers and fruit. Gouan cites under this plant the figures in J. Bauh. hist. 3. p. 18. f. 2. Clus. hist. 2. p. 196. f. 1. Tabern. icon. t. 97. f. 2. but these figures are very different from each other, and therefore the plant is very doubtful.

Brittle Meadow-saxifrage. Pl. 1 1/2 foot.

Cult. The plants of this genus are of easy culture; they require sandy or chalky soil, and are easily increased by seeds. Those species marked perennial prove seldom more than biennial when cultivated in gardens.

LXXI. L. Lībanotís (from ἱβάνος, ἱβανάσ, incense, and not from Mount Libanon, as the name would imply; L. vulgaris is supposed to exhale an odour like incense). Crantz. austr. p. 222. Garrn. fruct. 1. t. 21. D. C. coll. mem. 5. p. 17. t. 3. f. 5. prod. 4. p. 149. but not of Scop.—Athamānta, Scop. carn. no. 309. Lag. am. nat. 2. p. 103.—Sélesi section, Koch, umb. 111.—Athamānta species of Lin.

Lin. Syst. Pentádria, Digynía. All as in Sélesi but differs in the lobes of the calyx being slender (f. 55. F. c. a.), subulate, elongated, coloured, and deciduous, with the base hardly remaining; and in the involucra and involucelles being both usually composed of many leaves. Leaves pinnate or bipinnate: leaflets ovate, cut or multifid: lower ones usually decussate.
Sect. I. *Eríótis* (from ἔριον, wool, and οὖς *osos, ote*; an ear; in allusion to the petals being covered with short down). D. C. coll. mem. 5. p. 17. t. 3. f. 5. prod. 4. p. 149. Petals canescent from fascicles of short down (f. 55. F. g.).

1 L. *Buchtorfënsis* (D. C. coll. mem. 5. t. 3. f. 5. mem. soc. gen. vol. 4.) stem angular, branched; leaves pinnate; bipinnate, shining; leaflets broad-ovate or oblong, serrated at the top, with the serratures mucronate; peduncles stiff; involucrum almost wanting; involucels of many leaves, which are shorter than the umbelles; fruit villous from fascicles of hairs. getPath. H. Native of Siberia, very common in dry sterile places, especially about Buchtorfënsk. Bëbon Buchtorfënskës, Fisch, in Spreng. pug. 2. p. 55. Schlütes, syst. 6. p. 496. Athamânta rigidâs, Horn. hort. hafn. 2. p. 960. Athamânta cavarziefoliâs, Schrad. ined. Séseli Buchtorfënskës, Koch, umb. 111. Habit almost of *Libanâtës vulgârës*. Rays of umbel unequal in length. Leaves of involucels clothed with white down. Involucrum wanting, or of 2 or 3 entire or trifid or pinnatifid leaves.

2 L. *graveolëns*, plant clothed with hoary pubescence; stem branched; leaves pinnate; leaflets in fascicles, unequal, 2-3 times plicately pinnate; segments 2 or 3-parted; lobes linear, cuspidate; involucrum variable; involucels of many distinct leaves; fruit villously pubescent. 2. *H*. Native of Altaia, on rocks, but rare near the Fort called Ukstakenogorsck, but frequent beyond the river Irtysh. Séseli graveolëns, Led. fl. ross. alt. ill. t. 184. fl. alt. 1. p. 340. Involucrum wanting or of one bipinnate leaf; or of many lanceolate-linear reflexed hoary leaves. Leaves of involucel hoary, length of the umbelles. Petals pilose on the outside. The plant has a strong aromatic smell, and exudes a resinous gummy juice.

**Strong-scented** Stone-parsley. Fl. June, July. Pl. 1 to 2 ft.

3 L. *Patrinnâna* (D. C. prod. 4. p. 150.) stem terete, branched; leaves pinnate, canescent; leaflets multifid; lobes short, linear-subulate; umbelles 30-flowered; fruit rather compressed. 2. *H*. Native of Altaia, on a schistous arid hill at the river Irtysh, and at Ukstakenogorsck. The plant excludes a yellow aromatic juice. Mercarcips of fruit much compressed from the back, as in other species of *Séseli* and *Libanâtës*. Involucrum of a few multifid leaves. Leaves of involucels linear, connected together a little way at the base. Perhaps the same as *L. graveolëns*.

Pârin*’s* Stone-parsley. Pl. 1 to 2 feet.

Sect. II. *Eulibanâtës* (this section is supposed to contain the genuine species of the genus). D. C. l. c. Petals glabrous (f. 55. F. f.).

4 L. *vezuâres* (D. C. prod. 4. p. 150.) stem furrowed; leaves pinnate; leaflets deeply pinnatifid; lower ones decussate; segments lanceolate; fruit ovate-oblong, villous. 2. *H*. Native of the temperate parts of Europe and Asia, on mountains and in fields. In England on elevated chalky pastures, but rare; as on Gogmagog hills, Cambridgeshire; and between Albany and Stony Stratford. Athamânta Libanâtës, Lin. spec. p. 331. Schlütes, syst. 6. p. 488. Jacq. fl. austr. 4. t. 392. fl. dan. 754. Smith, engl. bot. 138. Séséli Libanâtës, Koch, umb. 111. L. daceoidès, Scop. carn. no. 317. L. montâna, All. pedem. 1368. t. 72. L. Diviniâna, Scop. carn. no. 316. Athamânta oreceseurnium, Huds. engl. 115. Ligústicum ferulaceum, Lapeyr. abr. p. 155. Libanâtës, Riv. pentap. irr. t. 37.—Bauh. hist. 3. p. 105. f. 1.—Plak. phyt. t. 173. f. 1. Radical leaves pinnate or tripinnate; leaflets opposite, deeply and sharply cut, smooth: the lowermost ones crowded, and often crossing each other. Flowers crowded, white or reddish. There are varieties of this plant with the fruit either pilose or nearly glabrous. The following varieties are probably so many species.

Var. ε, inciçâna (D. C. prod. 4. p. 150.) plant hoary from pubescence; leaves supra-decomposâ. leaflets very minute, wedge-shaped, 4-toothed; leaves of involucrum and involucels linear; umbels of many rays. 2. *H*. Native of Siberia.

5 L. *Sibiriça* (Meyer, verz. pfl. p. 123.) leaves pinnate; leaflets pinnatifid or bipinnatifid; segments lanceolate or oblong, cuspidate; involucra of many leaves or wanting; leaves of involucels shorter than the umbelles; fruit pubescent, having the furrows furnished with 2 vitre each. 2. *H*. Native of Siberia, very common; and of Caucasus, in the plains adjoining the mountains of Tauluseh. Athamânta Sibiërica, Lin. mant. p. 55. Atham. Libanâtës γ Sibiriça, Schlütes, syst. 6. p. 489. Séséli Libanâtës ĝ, Koch, et Mertens in deutsch. fl. 2. p. 412. Libanâtës vulgârës ĝ, Sibiriça, D. C. prod. 4. p. 150. Séséli athamânthoïdes, Led. fl. alt. 1. p. 342.—Gmel. sib. t. 186. t. 40. f. 2. exclusive of the synonyms. It differs from *L. vulgârës* not only in the leaves being simply pinnate, but in the involucra being usually wanting, in the involucels being shorter than the umbelles, and in the furrows of the fruit being furnished with 2 vitre, and the commissure with 4. Var. β, acëvâle (Led. fl. alt. 1. p. 342. under *Séséli*) leaves and umbels simple, rising in fascicles from the root.

6 L. *athamâنتهoïdes* (D. C. prod. 4. p. 150.) stem furrowed, angular, sparingly branched; leaves pinnate; radical ones petiolate: upper ones sessile, nearly opposite; leaflets pinnatifid; lobes simple or trifid, linear, short, acute; leaves of involucra many, linear, ciliated, rarely cut. 2. *H*. Native country unknown. Ligústicum athamânthoïdes, Spreng. umb. 126. exclusive of the synonyms. Fruit glabrous. It agrees in habit with Athamânta Pyrënaëcica, Jacq. hort. vindi. t. 197., the *Libanâtës vulgârës* var. γ daceifólia, but differs in the fruit being glabrous.

7 L. *verciëllëta* (D. C. prod. 4. p. 151.) stem terete, furrowed, naked at the apex; leaves pinnate; leaflets pinnate-partial, cut; lower ones decussate; involucra of few leaves; adult fruit naked. 2. *H*. Native of Mount Pannaruss. There is a plant very similar to this grows about Bayonne, at a place called Chambre d'Amour. Athamânta verticillâta, Smith, fl. græc. t. 275. prod. 1. p. 188. The plant is very different from *Pichôtës verticillâta*, to which it has been joined by Sprengel.

Whorled-leaved Stone-parsley. Pl. 1 to 2 feet.
3 L. tenuefölia (D. C. prod. 4. p. 151.) plant glabrous; stem terete; leaves supra-decompound; leaflets linear, divaricate; sheaths dilated; leaves of involucrum 5, about equal in length to the middle of the rays of the umbel; leaves of involucels with membranous ciliated edges, length of the umbellites; fruit glabrous. 2. H. Native of Altaia. Athamanta tenuefölia, Pall. ex Schultes, syst. 6. p. 495. Umbels lateral. Involucrum of few leaves; the outer leaf the largest. Calyxes glabrous. Mature fruit unknown.

Fine-leaved Stone-parsley. Pl. 1 to 2 feet.

9 L. Stephani naïa (D. C. prod. 4. p. 151.) stem simple, fleshy, glabrous, striated; leaves glabrous, pinnate; leaflets oblong or ovate, sessile, cut: uppermost leaflets rather trifid; petioles ending in a sheath at the base; lower cauline leaves larger than the radical ones, and on longer petioles; umbels dense, sheathed, sheathed, as well as the involucre and involucres, are membranous and villous; involucrum of many obovate-cuneated leaves; involucels of many linear leaves. 2. H. Native of Altaia, in the more humid parts of the Alps, especially at the springs of the river Tscharysch, and elsewhere. Athamanta compacta, Led. fl. Ross. alt. ill. t. 81. fl. alt. 1. p. 327. Athamanta cervaria? Pall. in. 2. p. 560. Athamanta monstrosea, Steph. ex Willd. rel. in Schultes, syst. 6. p. 495. Ligusticum athamanticum, Adans, miss. Petals erect, ovate-oblong, with an inflexed point. Styles equal in length or longer than the mericarps. Fruit nearly cylindrically, a little compressed from the sides, puffed, crowned by the permanent calyx and styles; mericarps with 5 filiform ribs: lateral ones margined; vitte 2 in each furrow, and 4 in the commissure. Var. β, pinnatifida; leaves pinnate; leaflets pinnatifid; segments linear, a little cut.

Stephan’s Stone-parsley. Pl. 1 to 1 ½ foot.

10 L. cachrayoide (D. C. prod. 4. p. 151.) plant glabrous, glaucous, stem terete; leaves pinnate; leaflets multifid; lobes linear, entire; superior petioles dilated; involucra and involucres of many elongated acuminate leaflets. 2. H. Native of Da-buria, near Nerstinski Sawod. Cachrys Sibirica, Steph. ex Fisch. in cat. sem. 1823. Spreng. syst. 1. p. 692. Trev. act. soc. nat. cur. 13. p. 168. This species will probably form a proper genus, from the fruit being very much compressed from the back, in the dorsal ribs being prominent, and in the marginating ones being dilated into narrow wings. Vitte 2 in the commissure, covered, and one in each furrow. Seed flat, not involute, as in Cachrys. Leaves of Sæsli; calyx involucral, and petals of Libanotis; fruit nearly of Peucedanum. Ovarium sometimes Villous when young. Fruit glabrous. Petals glabrous. Perhaps this, with Sæsli Patrinianæa, will form a new genus, nearly related to Agasæolis in tribe Selineæa.

LXII. CEENOLOPHUM (from κενος, kenos, empty, and λωφός, lophos, a crest; the ridges or ribs of the fruit are hollow inside). Koeh, umb. p. 103 in add. no. 34. b. diss. ined. in litt. 1828. D. C. coll. mem. 5. p. 48 t. 3. f. T. prod. 4. p. 151. —Cinthium species of Bebb.

Lin. syst. Pentandria, Digynia. Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point (f. 55 G. l. b. f.). Transverse section of fruit nearly terete; mericarps with 5 equal sharp rather winged ribs, which are hollow inside: lateral ones marginating; vitte one in each furrow, and 2 in the commissure. Seed semi-terete, inclosed in a dry pericarp, which is adnate to it when young (f. 55 G.).—Glabrous perennial herbs. Leaves bipinate or many times ternate; leaflets divate, rather flat; segments lanceolate, cuspidate, quite entire, nervled. Involucrum wanting or of one leaf; involucels of many leaves (f. 56 G. c.). Flowers white. This genus is nearly allied to Cnidium, but differs in the seed being inclosed in a dry loose pericarp when mature.

Fischer’s Cenolephum. Fl. June, Aug. Cult. 1820. Pl. 2 ft. Cult. This plant will grow in any common garden soil; and is easily increased by seeds.

Lin. syst. Pentandria, Digynia. Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point. Transverse section of fruit nearly terete; mericarps with 5 equal winged ribs; wings rather membranous; lateral ribs marginal; vitte one in each furrow, and 2 in the commissure. Seed semi-terete. Albumen flat on one side.—Herbs perennial, rarely suffruticosae. Leaves pinnate or ternate; leaflets multifid; lobes linear. Involucra variable; involucres of many leaves. Flowers white or rose-coloured. This genus is very nearly allied to Sèchil, but differs in the ribs of the fruit being winged, and in the margin of the calyx being obsolete.

UMBELLIFERÆ. LXXIII. Cnidium. LXXIV. Petitia.

Parsley-like Cnidium. Pl. 2 feet.
4 C. venosum (Koch, umb. p. 109.) stem terete, smooth, straight, hardy branched above; leaves pinnate; leaflets pinnatifid or bipinnatifid: segments linear, or oblong-linear, acutish, quite entire or trifid; involucra wanting or of few leaves; leaves of involucra setaceous, about equal in length to the umbellules.

5 C. anomaum (Led. fl. Ross. alt. t. 311. fl. alt. 1. p. 330.) stem furrowed, glabrous, twiggy; leaves pinnate; leaflets bipinnately cut: segments cut or nearly entire, acute; leaves of involucra oblong-linear, entire, pinnatifid, or bipinnatifid. H. Native of Altai, in fertile humid meadows, in the valleys of the rivers Tscheryshch and Kotsun, near Aleksandrovsk. Genet. fl. sib. 1. p. 190. t. 45. and 43. There is also a stemless variety found at the fountains of the river Tschegan. Root fusiform. Leaves pale green, glabrous. Involuta and involucres of many leaves; those of the involucro oblong, entire, and ciliated, and about equal in length to the umbellules. Petals white. Fruit beset with glaucous stones. Vitae in each furrow, and 2 in the commissure. Stylodium pusillius. Calyx 5-cleft.

Anomalous Cnidium. Pl. 1½ to 2 feet or more.
6 C. cuneatum (Led. fl. Ross. alt. t. 312. fl. alt. 1. p. 321.) stem furrowed, glabrous, branched; superior branches verticillate or opposite; leaves bipinnate: lower leaflets ternate: upper ones 2-5-parted, or cut, cuneated; leaves of involucro oblong-elliptic, a little toothed at the apex; leaves of involucres broad, elliptic, entire, mucronate. H. Native of Siberia, in meadows at the river Kerlyk, but rare. Root fusiform. Leaves pale green, glabrous. Rays of umbel 12-20. Calyx with 5 minute teeth.

7 C. fontanesii (Spreng. umb. spec. p. 41.) stem straited, dichotomous at the apex; leaves ternately compound; leaflets rather trifid: segments linear, blunthist; leaves of involucra and involucres many, linear, acuminate. H. Native of Algiers, in fields near Shibra. Laserpitium piceosancte, Desf. fl. alt. 1. p. 254. t. 71. Laserpitium Fontanesii, Pers. ene. 1. p. 313. Laserpitium Atlanticum, Poir. suppl. 3. p. 504. Ligusticum Fontanesii, Spreng. in Schultes, syst. 6. p. 565. Perhaps the furrows of the fruit are furnished with 1 or many vitae, and therefore may be either a species of Ligusticum or Cnidium; but the habit is that of Cnidium.

Desfontaines Cnidium. Pl. 1 to 2 feet.
8 C. suffruticosum (Cham. et Schlecht. in Linnaea. 1. p. 387.) stem shrubby, naked, decumbent; branches erect; leafy; leaves ternately compound; leaflets short, rather trifid; sheathes of leaves permanent. G. Native of the Cape of Good Hope, in sand by the sea-side. Cniatom suffruticosum, Berg. cap. p. 77. The habit of this plant is very different from all the other species.

Suffruticoso Cnidium. Shrub decumbent.

Diffuse Cnidium. Pl. 1 foot.

11 C. meliolium (Bieb. suppl. p. 212.) stem unknown; leaves pinnate; leaflets profundly pinnatifid: segments linear-subulate; involucra and involucres of many subulate, reflexed leaves. H. Native of the Alps of Caucasian. Involutum of 6-8 leaves. Involutare longer than the flowers. Flowers of a beautiful rose colour.

Meum-leaved Cnidium. Pl. 1 to 2 feet?
12 C. canadense (Spreng. in Schultes, syst. 6. p. 415. exclusive of many of the synonyms) stem angular, flexuous; leaves bipinnate, shining; leaflets many-parted: segments lanceolate; involucra and involucres of few leaves. H. Native of North America, at the mouths of large rivers from Canada to Carolina; at the mouth of the St. Lawrence, in Canada. Selinum canadense, Michx. fl. bor. amerc. 1. p. 153. A Cynium bipinnatum, Walt. carolin. p. 15. The fruit is unknown, and therefore it is a doubtful species of Cnidium. Flowers white.

Cult. See Sessilis, p. 311. for culture and propagation.

Lin. syst. Pentândria, Digynia. Calyx toothless. Petals lanceolate, entire, with an involute point. Fruit oblong, crowned by the reflexed styles; transverse section roundish-elliptic, furrowed on both sides, from the raphe being nearly central, not marginal; mericarps rather convex on the back, with 5 contiguous, thick, elevated, wingless, bluntly keeled ribs, therefore the transverse section is triangular, spongy inside; lateral ribs not broader than the rest, nor marginal. Vitae solitary in the furrows, which are narrow, and twin in the commissure. Seed adhering to the tegument, compressed, not angular.—A glabrous, green, biennial herb: with a very long, branched, thick root, which is spongy inside, and intercepted by transverse, membranous dissepiments. Stem short, nearly simple, thick, fissilare, leafy at the base, straited above, and scabrous at the stria. Leaves tripinnate; sheaths large; rachis smoothish; lobes linear, scabrous on the margins, and on the dorsal nerve, mucronate at the apex. Umbels terminal, of many rays: rays 14-20, very rough, and very unequal: central ones much the shortest. Involuta wanting, rarely of 2 leaves; involucres of from 4-12 linear-subulate, quite entire leaves, which are much shorter than the umbels. Flowers greenish. Stylodium large.
1 P. scabra (Gay. l. c.). H. Native of the Eastern Pyrenees, in the valley called d’Eynes, at a place called La Cueillette de Nouri, among the debris of schistous rocks, at the elevation of 7200 feet, a little below the limits of perpetual snow. Selinum scabrum, Lapeyr. abr. 1813. p. 147. Spreng.

Scabrous Petitia. Pl. ½ to 3½ foot.

Cult. Sow the seeds in a dry situation in spring, in light earth.

Lin. syst. Pentandria, Digynia. Teeth of calyx at first obscure, but increase in length as the fruit comes to maturity; they are at last erect and subulate, and longer than the stylodium. Petals without claws, quite entire, ovate-lanceolate, acuminate, and very acute, with an involute point. Fruit compressed a little from the sides, oblong-elliptic, crowned by the reflexed styles. Mericarps convex on the back; with 5 distant, equal, filiform ribs: lateral ribs marginating; funnels of fruit very broad; vitae 6 in the commissure, 4 in the lateral funnels, and 3 in the dorsal ones, all distinct. Seed adhering.—A perennial, smooth herb; with an oblique root, which is naked at the neck. Stem slender, quite simple, angularly striated, smooth, unless just under the umbel, where it is scabrous, a foot high, bearing 2 or 3 leaves. Leaves pinnate; leaflets sessile, decussate, palmately 3-parted; segments palmately 5-5-cleft; lobelets linear, cuspidate. Umbels terminal, small, dense, when in fruit nearly globose; with short, stiff, smooth rays. Involucrum wanting, very rarely of 3-4 leaves; involucres of 1-5 linear-subsulate leaves, which are about equal in length to umbellules, and sometimes much shorter. Petals white. Stylodium small. Carrophore bipartite.

Cult. See Cenolophium, p. 513. for culture and propagation.

LXXVI. THASP'UM (from the Isle of Thaspsia, which gave the name to the Thapsia of the ancients; in allusion to its affinity with that genus). Nutt. gen. amer. 1. p. 196. exclusive of some species. D. C. prod. 4. p. 153.

Lin. syst. Pentandria, Digynia. Margin of calyx 5-toothed. Petals elliptic, tapering into a long, inflexed point. Fruit not contracted from the sides, somewhat elliptic; mericarps convex, with 5 winged, nearly equal ribs; funnels striated, each furnished with 1 vitta: and the commissure with 2. Seed terete.—Perennial herbs, natives of North America. Involucra wanting; involucres unilateral, of 3 leaves. This is a very distinct genus from Smyrnis and Zizia; but it is evidently allied to Cnidium, from the fruit, but is distinguished from that genus in the calyx being 5-toothed, in the petals not being emarginate, in the involucres being 3-leaved, and in habit.

§ 1. Umbels opposite the leaves. Flowers dark purple.

§ 2. Umbels terminal. Flowers yellow.

3 T. acte'folium (Nutt. l. c.) leaves binate; leaflets oval, equally toothed; umbels somewhat verticillate; lateral ones sterile. 2. H. Native of Canada, on the banks of the St. Lawrence, near Tadoussac; and of Vîrginia. Ligústicum acte'folium, Michx. fl. bor. amer. 1. p. 166. Herb 3 feet high. Leaves of involucres setaceous. Fruit oblong-oval, with 10 rather winged ribs.

Actea-leaved Thaspium. Fl. Ju. Jul. Clt. 1810. Pl. 3 ft. Cult. The species of this genus will grow in any common garden soil, but best in peat; and are easily increased by dividing at the root, or by seed.

Lin. syst. Pentandria, Digynia. Margin of calyx 5-toothed. Petals on long claws, spathulate obovate, with a triangular inflexed point. Fruit a little compressed from the sides; mericarps with 5 sharp, rather winged, equal ribs: lateral ribs marginating; vitæ 3-4 in the funnels, which are broad, and 8 in the commissure. Carrophore bipartite. Seed rather semi-terete.—Glabrous, perennial herbs. Radical leaf binate; leaflets large, ovate-lanceolate, unequally serrated. Stem much branched, naked at the apex. Involucrum wanting, or of 1 leaf; involucres of 2-5 leaves. Flowers white, those in the disk of the umbel sterile.

Cult. See Thaspium above for culture and propagation.

Lin. syst. Pentandria, Digynia. Margin of calyx 5-toothed. Petals obovate, emarginate, or entire, with a very short unguliflexed point. Fruit attenuated at the neck; transverse section nearly terete, or a little compressed from the sides; mericarps with 5 filiform, wingless, equal ribs: lateral ribs marginating; vitae 2 or 3 in each funnel. Seed somewhat semi-terete. Carrophore unknown.—Perennial or biennial herbs, usually velvety from villi on the stem, leaves, and fruit.
Leaves trinerved or pinnate; leaflets cut or multifid. Involucra of 1 or few leaves; involucels of many leaves. Flowers white.

2 A. *Macedónia* (Spreng. in Schultes, syst. 6. p. 491.) stem panicked, clothed with soft, velvety villi; leaves almost glabrous; petioles twice trifid, decompound; leaflets ovate, somewhat 3-lobed, mucronate toothed; umbels very numerous, velvety. ʒ. F. Native of Macedonia, Atlas, and according to Allioni about Nice. *Bubon Macedonicum*, Linn. spec. p. 304. Desf. atl. 1. p. 256. Blackw. icon. 382. Plench. icon. t. 194. Daucus Macedonicus, Riv. pent. irrig. t. 48. A'pium Macedonicum, Moris. hist. sect. 9. t. 9. — Lob. icon. 706. Fruit bottle-shaped, hispid, covered by 10-12 vitiae, having the ribs very slender.—In some parts of the East they use this plant to scent their clothes; the smell is very strong, and rather disagreeable to Europeans. The plant, but especially the seed, is esteemed to be diuretic, emmenagogue, and carminative; the seeds are an ingredient in theriac.

*Macedonian Parsley, or Spigél.* Fl. June, Aug. Cit. 1596. Pl. 1 to 2 feet.

3 A. *Ramosissima* (Port. in Schultes, syst. 6. p. 496.) stem erect, scabrous, much branched; radical leaves and lower cauline ones supra-decompound; leaflets filiform, mucronulate, stellate, glabrous; upper ones ternate; involucrum of many leaves; petals hairy on the outside as well as the fruit. ʒ. H. Native of Dalmatia. Host fist. auct. 1. p. 364. Allied to *A. Cretensis*. Fruit ovate, not bottle-shaped, very hairy. Petals emarginate, very hairy on the outside. Involucra of 8-10 linear leaves. *Much-branched Spigél.* Pl. 1 foot.

4 A. *Cretensis* (Lin. spec. p. 352.) stem rather villous; leaves bipinnate; leaflets divided into linear, trifid lobes; lower ones hardly exceeding the rest; involucra of 1 or few leaves; petals hairy on the back. ʒ. H. Native of the south and midparts of Europe, in exposed situations. The leaves are said to be trinerved by many authors. The seeds have been occasionally employed as carminatives, and were supposed likewise to be diuretic and emmenagogue; lately they have been little used, except as ingredients in theriac and mithridate. Haller, however, judges it to be much superior to the common carrot in medicinal efficacy. It was celebrated anciantly as a specific in the stone.

*Cretan Spigél or Candy Carrot.* Fl. June, Jul. Cit. 1596. Pl. 1 foot.

5 A. *Mathioli* (Wulf. in Jacq. coll. 1. p. 211. icon. rar. 1. t. 57.) stems glabrous, flexuous; leaves glabrous; leaves 3-4 times ternate; leaflets linear-filiform, elongated, divaricate; involucra of 1 or few leaves; petals glabrous. ʒ. H. Native of the Alps of Carinthia, Camiola, and in fields about Nice. *Libanótis rupéstris*, Schop. carn. no. 315. t. 9. Mèum Mathiél, Bald. fl. p. 390. f. 1. Stem glabrous, except under the origin of the leaves, where they are rather puberulous. Perhaps *Sesel* Túrbith, Lin. is referrible to this plant, and probably a *A. annua*, Lin. spec. 353. Leaves very like fennel.

*Sicilian Spigél.* Fl. June, July. Cit. 1866. Pl. 2 to 3 ft.

7 A. *Canesceens* (D. C. prod. 4. p. 155.) plant glabrous at the bottom, and canescent at the top from short crowded down; leaves ternately decompound; leaflets cut; lobes linear; petals hairy; involucra and involucels of 5 leaves; petals smoothish; fruit ovate, beset with very long, white, spreading hairs, which are rather capillate at the apex. ʒ. H. Native of the Levant, between Aleppo and Bagdad. Herb half a foot high, sparingly branched. Leaves of involucra and involucels oval-oblong, apiculate. Petals some of them cleft at the apex, and others entire. Immature fruit unknown, and therefore the genus is rather doubtful.

*Canescent Spigél.* Pl. 3/4 foot.

† Species not sufficiently known, and will perhaps, when more fully examined, be removed from the genus altogether.

8 A. *Depressa* (D. Don, prod. fl. nep. p. 184.) leaves bipinnate, pubescent; leaflets very slender, many-parted; segments linear, mucronate; stipes filiform, assurgent, velvety, exceeding the leaves; umbels simple or compound; involucrum of 5 pinnatifid leaves. ʒ. H. Native of Nipaul, in the alpine region of Gosaingathan. Plant tufted. Root long, simple, fusiform, a finger in thickness. Scapes numerous, 8 inches high.

*Depressed Spigél.* Pl. 3/4 ft.

*Giant Spigél.* Pl. 3 to 4 feet.

10 A. *Tarres* (D. Don, prod. fl. nep. p. 185.) leaves bipinnate, glabrous; leaflets pinnatifid; segments linear, acute, furrowed above; involucra of 5 short leaves; involucels of many leaves, equal in length to the rays; stem straight, terete, smooth. ʒ. H. Native of Nipaul. Stem 2 feet high, simple.

*Terete-stemmed Spigél.* Pl. 2 feet.

11 A. *Carvifolia* (Steph. in Schultes, syst. 6. p. 496.) involucrum dimidiated; segments pinnatifid, linear, hoary. ʒ. H. Native of Siberia (ex Steph. in herb. Willd.). There are 3 specimens under this name in Willdenow’s herbarium, which are very distinct from each other; one of which is *Lasiopityum Daucicum*; the second is *Rúmica scelólidae*, and the third is *Rúmica athamanthóides*. The plant is therefore doubtful.

*Caraway-leaved Spigél.* Pl. 1 foot.

Cult. These plants will grow in any common garden soil; and are either increased by dividing at the root, or by seed.

L. scoticum (Linn. spec. p. 359.) stem slightly branched at the upper part, striated, smooth; leaves binate, opaque; leaflets rhomboid, broad, acute, smooth, serrated; involucra of unequal, partly leafy, entire leaves; leaves of involucral more numerous, lanceolate, rather unequal. 2. H. Native of Lapland, Norway, &c., North America, and Siberia; Kotzebue's Sound, and Kamtschatka; Scotland on the sea-coast about the Frith of Forth; also on the western coast; very abundant in rocky places; about Dunstanburgh Castle in Northumberland. Smith, engl. bot. t. 1207. Fl. dan. t. 297. Torrey, fl. un. st. 1. p. 313. Cham. et Schlecht. in Linnaea. 1. p. 390. Angelica scoticum, Lam. dict. 1. p. 173. Sesiellum Scoticum, Riv. pent. 1853. p. 59. A pium ternatum, Willd., herb. in Röm. et Schultes, syst. 6. p. 491. Flowers white, with a reddish tinge; anthers red. Fruit oblong, having the commissure furnished with 6 vittae. Root fusiform, warm, and pungent. The herb is eaten either crude or boiled by the natives of Scotland and its isles. The flavour is highly acid, and though aromatic, and perhaps not unwholesome, is very nauseous to those who are unaccustomed to such food. L. Scoticum, Lour. coch. p. 183. cultivated in China, belongs probably to a distinct genus, from the circumstance of the petals being entire.

2 l. carniolicum (Host, fl. aust. 1. p. 378.) stem erect, branched, striated; radical leaves trinate; leaflets deciduous, pinnae-pinnatifid, mucronate; involucra of many leaves, which are toothed at the apex. 2. H. Native of Carniola, on a mountain called Grosskahlenberg; and of Silesia. Fruit large, nearly 3 lines long, ovate-oblong, having the ribs short and a little winged, and with the furrows broad and furnished with 3 vittae each. Teeth of calyx very small.

Carniolian Lovage. Pl. 2 to 3 feet?

3 l. alatum (Spr cling, umb. spec. p. 125.) stem furrowed and winged; leaves supra-decompound; leaflets petiolate, ovate, dentant, pinnate-pinnatifid; segments deeply serrated, oblong; involucri of few leaves; leaves of involucres setaceous, about equal in length to the umbellules. 2. H. Native of Caucasus, in grassy places. Röm. et Schultes, syst. 6. p. 551. Athamantia alata, Biebr. fl. taur. 1. p. 214. Cnidium myrrhifolium, Biebr. suppl. p. 212. Flowers rose-coloured when young, but at length becoming white; anthers red. Margin of calyx short, 5-toothed. The commissure, according to Koch, is furnished with 4-6 vittae, and the furrows with as many, from which it differs from the genus Cnidium and especially from C. apifolium, which is very like.

4 l. fulvum (All. pedem. no. 1319. t. 60. f. 1.) stem branched, striated; leaves supra-decompound; segments rather remote, linear, cuspidate; leaves of involucrum pinnatifid at the apex. 2. H. Native of Dauphiny, Piedmont, and Jura, on the lower alps, in open places; and of Dauria, but not of the Pyrenees, because L. fulvum of Lapeyr. is Sesseli Libanotis, Laserpitium Daucicum, Jacq. hort. vind. 3. t. 58. Ligusticum Seguieri, Vill. dauph. 2. p. 615. exclusive of the synonyms. Furrows of fruit furnished with 3-4 vittae each, and the commissure with 8 vittae. ex Koch, umb. p. 105. Stems usually spotted.

5 l. cynapiifolium (Viv. in litt. 1820. ex D. C. prod. 4. p. 158.) stem terete, branched; leaves decumbent from the petiole being much branched; leaflets multifid: segments linear, acute; involucra and involucres of many leaves; umbel of many rays; umbellules nearly globose, many-flowered. 2. H. Native of Corsica, in the fissures of rocks. Habit almost of Cnidium apioideum or Ligusticum Seguieri, but is easily distinguished from them in the involucrum of many leaves; and from L. fulvum it is distinguished by the stem being hardly striated, in the leaves of involucres being undivided, and in the umbellules being more crowded with flowers. Mature fruit not seen.

Poodle's-parsley-leaved Lovage. Pl. 3 to 4 feet.

6 l. conifolium (D. C. prod. 4. p. 158.) stem terete, branched; leaves supra-decompound, glabrous; leaflets pinnatifid: lobes acutely toothed; involucra and involucres of many leaves, which are as well as the rays of the umbel and upper part of the stem pubeulent. 2. H. Native of Nipaul, on high mountains. Laserpitium conifolium, Wall. miss. Plant tall and very showy. Radical leaves 2 feet long, with trifid petioles. Mericarps with 5 wings, and having many vittae in the furrows.

Hemlock-leaved Lovage. Pl. 4 to 6 feet.

7 l. striatum (D. C. prod. 4. p. 158.) stem terete, branched; leaves binomial; lobes or leaflets entire, acute, rarely cut; involucra and involucres of 5-6 linear, spreadingly-deflexed leaves, which are glabrous as well as the stems and rays of the umbel. 2. H. Native of Nipaul, in the Great Valley, in rice-fields. Laserpitium striatum, Wall. miss., but is referable to the genus Ligusticum from the mericarps being furnished with 5 wings, and in the furrows being furnished with many vittae, &c.

Striated Lovage. Pl. 3 to 4 feet.

8 l. cuneifolium (Guss. pl. rar. p. 130. t. 26.) stem striated, branched; leaves having 3 leaflets; leaflets pinnatifid; segments short, cuneiform, trifid, obtuse, awned, approximate; involucra permanent, of many leaves; fruit ovate, glabrous. 2. H. Native of the kingdom of Naples, in Abbruzzo, in open places of valleys. Allied to L. Pyreneicum.

Wedge-leaffletted Lovage. Pl. 1 to 2 feet.

9 l. discolor (Ledeb. fl. Ross. alt. ill. t. 310. fl. alt. 1. p. 321.) lower leaves ternately binomial; lower leaflets petiolate, ternate: upper ones and segments of the lower ones, oblong, pinnatifid, or cut, deciduous; involucra of many lanceolate-linear, deciduous leaves; involucres of many linear, permanent leaves. 2. H. Native of Altaia, near Ridders, Alexandrowsk, and Belaja at the river Buchtorminsk. L. Peloponnesiacum, Pall. itin. 2. p. 528. Root fusiform, supose, perhaps biennial. Stem solitary, branched, furrowed, glabrous. Leaves pale green above, and pale glaucous beneath. Petioles of radical leaves half a foot long, ternate, and the divisions binomials. Rays of umbel variable in length. Calyx with 5 minute teeth. Petals white. Mericarps with 3 rather winged ribs; having the furrows furnished with 3 vittae, and the commissure with 4-6. It differs from L. cuneifolium of Aiton, in the involucrum being of many leaves.
Two-coloured-leaved Lovage. Pl. 4 to 5 feet.

10 L. Cañidians (Ait. hort. kew. 1. p. 348. ed. 2. vol. 2. p. 714.) leaves supra-decompound; leaflets cuneiform, cut, glabrous; involucre of 2 rather foliaceous leaves; ribs of fruit membranous, glabrous. 2. H. Native country and the rest unknown.

§3. Margin of calyx obsolete. Involuca wanting, or of few leaves.—Silaus species, Koch, in litt. 1828.

11 L. Pyrenæum (Gouan. ill. 14. t. 7. f. 2. exclusive of the syn. of Seguiri) stem branched, striated; leaves supra-decompound, shining; leaflets pinnatifid: segments linear, mucronate, short, divericate; involucrum of a few caducous leaves. 2. H. Native of the Pyrenees, in open places. D. C. fl. fr. 4. p. 309. 

L. Pyrenaicum, Koch, umb. p. 105. Séalel aristatum, Ait. hort. kew. 1. p. 359. This plant is generally confused with L. f. fulvum, but it is perfectly distinct. It is hardly to be distinguished from L. Seguiri, unless in the furrows of the fruit being furnished with many vitæ, and the commissure with 6 to 8 vitæ.

13 L. Corsicum (Gay, in ann. sc. nat. 26. p. 222.) stem nearly simple, few-leaved, striated; leaves tripartite; leaflets palmate-parted; lobules small, linear, cuspidate; involuca wanting; or of 1 leaf; rays of umbel muricatæ; involucels of many linear-subulate, serrulatæ leaves, which are about equal in length to the umbellæ; teeth of calyx obsolete; ribs of fruit scabrous from denticulations. 2. H. Native of Corsica, on the mountains, at the elevation of 5000 or 6000 feet. Vitæ in the lateral furrows 3, in the dorsal 4, also 4 in the commissure. Habit of Mèum mutellinum, from which it differs in the petals being emarginate, not entire.

Corsican Lovage. Pl. ½ to 1 foot.

14 L. Pucédakofèdes (Presl, in herb. Haenke, ex D. C. prod. 4. p. 158.) stem branched, furrowed; leaves decumbent; leaflets linear; umbel opposite the leaves; rays angularly winged; involuca wanting, or of few leaves, which are multifid at the apex; involucels wanting, or of few leaves. 2. H. Native of Chili. The specimen is very like the rest, but varies in the involucels and involucelles being sometimes wanting. Calyx oblong. Petals entire.

Var. β, tunifolium (Presl. l. c.) stem and branches thicker; leaves of involucella multifid; of the involucelles linear, and longer than the umbellæ; fruit ovatæ; mericarps with 5 ribs, furnished with many vitæ.

Var. γ, longifolium (Presl. l. c.) segments of leaves very long. 2. H. Native of Peru. Fruit wanting in the specimen, and therefore it is probably a proper species.

Pucédakofèdes-like Lovage. Pl. 7.

15 L. Fânsil (Bert. herb. ex D. C. prod. 4. p. 669.) plant glabrous, erect, branched; leaves pinnate; leaflets multifid; lobes linear, acute; umbels terminal, or rising from the forks of the branches; involuca wanting, or of 1 many parted leaf; involucelles nearly wanting. 2. H. Native of Chili, in woods and hedges, at Kancagua and Valparaíso, where it is called Pansil. Limb of calyx obsolete. Petals white, emarginate, with an inflexed point. Fruit with winged ribs. Perhaps a species of Pleurospermum.

Pansil Lovage. Pl. 1 to 2 feet?

+ Species not sufficiently known.

16 L. Multifidum (Smith, in Rees’ cyclo. bot. 21. no. 8.) stem branched, filament; leaves triplicate-pinnate; leaflets linear, channelled, acute, decurrent; leaves of involucel 7-8, lanceolate, with membranous margins; fruit ovate-roundish, with winged, curled ribs. 2. H. Native of Siberia. Perhaps a species of Caudium.

Multifid-leaved Lovage. Pl. 3 to 4 feet.

17 L. Divaricatum (Led. ed. hort. dorp. 1824. p. 5.) leaves 4-times pinnate; terminal leaflets 3-parted; lateral ones simple, or bipartite; segments linear, cuspidate; involuca of 1 leaf. 2. H. Native of the Island of Cyprus. Athamánà multifólia, Smith, fl. geoc. t. 247. prod. 1. p. 188. The vitæ being unknown, the species is therefore still obscure. It is probably a species of Caudium.

Cyprus Lovage. Pl. 1 ft.

19 L. obtusifolium (Horn. hort. laf. 1. p. 270.) stem unknown; leaves bipinnate; leaflets cordate, orbicular, sharply toothed; involucra and involucelles of many leaves.—Native of Tangiers. Wildl. enum. p. 312. Fruit unknown.

20 L. Nepalese (D. Don, prod. fl. nep. 185.) stem terete, striated, glabrous, erect, very simple; leaves septicomnate; leaflets ovate, acute, deeply serrated, nerved, cuneated at the base: lower ones tripartite; involucels of many leaves, one half shorter than the umbellæ. 2. H. Native of Nepal, in Gossangistan. Umbels terminal, solitary, of many rays. Calyx 5-toothed. Petals oval-oblong, cuspidate at the apex. Fruit undescribed. Probably a species of Hymenolepis.

Nepalese Lovage. Pl. ½ to 1 foot.

Chervil Lovage. Pl. 1 to 2 feet?

22 L. Aciphylla (Spreng. in Schultes, syst. 6. p. 554.) stem sheathed; leaves fan-shaped, multifid; leaflets linear, stiff, quite entire, nerved, pungent; mericarps with 3 ribs. 2. H. Native of New Zealand. Aciphylla squarrosa, Forst. gen. p. 136. t. 68. Laserpitium aciphylla, Lin. fil. suppl. 181. Probably a species of Caudium, or a proper genus.

Pointed-leaved Lovage. Pl. 1 foot.

23 L. ? Pusíum (H. B. et Kunth, nov. gen. amer. 5. p. 19.) stem branched, terete, striated, filiform; leaflets ternately decompound, rather hairy beneath; leaflets sessile, ovate-oblong, acute, sharply crenate-serrate, cuneated at the base. 2. H. Native of New Spain, in humid places. Flowers white. Fruit un-
UMBELLIFERÆ. LXXIX. LIGUSTICUM. LXXX. SILAUS.

319

known. According to Kunth, this is perhaps a species of Helicoleum.

doubtful Lovage. Pl. 1 foot.

24 L. Græcum (D. C. prod. 4. p. 159.) stem erect, branched; leaves all bipinnate. 2 H. Native of Greece. Ligusticum Græcum folio-api, Tourn. cor. p. 23. According to the fruit, which is preserved in the herbarium of the museum of Paris, it is a true species of Ligusticum. Sium Græcum, Lour, and S. Græcum, Lin. are very different plants from this.

Greek Lovage. Pl. 7.

25 L. Capeneæ (D. C. prod. 4. p. 159.) stem erect, branched; leaves bipinnate; leaflets short, thick; involucra and involucels of 3–5 leaves; fruit ovate; calyx obsolete. 2 H. Native of the Cape of Good Hope. Athamánæ Capenæis, Born. f. cap. p. 7. In Burmann's herbarium there are specimens of several plants fastened on the same sheet of paper, under the name of Athamánæ Capenæis, therefore the one which he meant to go under this name is doubtful.

Cape Lovage. Pl. 2 feet.

Cult. See Athamánæ, p. 316. for culture and propagation.

Lin. Syst. Pentádrâvia, Dígnânia. Margin of calyx obsolete. Petals obovate-oblong, narrowed into an inflexed point, entire, or rather emarginate, appendiculate at the base, or sessile and truncate. Transverse section of fruit nearly terete. Mericarps with 5 sharp, rather winged equal ribs: lateral ribs marginalizing; vitae many in each furrow, and so close together as to appear like a single broad one; and 4–6 in the commissure. Seed somewhat semi-terete.—Glabrous, perennial herbs. Leaves cut into many parts; leaflets linear. Involutâra wanting, or of few leaves; involucels of many leaves. Flowers cream-coloured or greenish. This genus is very nearly allied to Ligusticum.

I S. Frâtesis (Bess. enum. pl. vob. p. 43. no. 1367.) stem angular; leaves supra-decompound; leaflets pinnate-parted: segments rather remote, lanceolate, nerved, a little channeled, cuspidate; involucra obsolete, or of 1–2 leaves. 2 H. Native of humid meadows, from Europe to Tauria; and Siberia; in Britain, in rather moist meadows and pastures. Peucedánæs Silius, S. Linn. spec. 354. Smith, engl. bot. 2142. Mart. rust. t. 128. Jacq. auct. t. 15. Hayne, arz. gev. t. 5. t. 5. Cnidium Silius, Spreng. umb. prod. 40. Schultes, syst. 6. p. 416. Sium Silius, Roth, fl. germ. 1. p. 129. Sâseli pratânse, Riv. pent. 1. t. 58. Crantz, austr. 3. p. 209. t. 6. f. 1. Sâséli selinoïdes, Jacq. enum. vind. 227. Ligusticum Silius, Duby, in D. C. bot. gall. 1. p. 230.—Mor. hist. 3. sect. 9. t. 6. f. 10.—Lob. icon. 738. f. 5.—Petr. herb. brit. t. 28. f. 5. Root spindle-shaped. Herb smooth, dark green. Leaves bipinnate; leaflets elliptic-lanceolate, entire: either undivided or separated almost to the base into 2 or 3 segments of the same shape and magnitude. Umbels of several unequal rays. Involutâra of from 1-3 linear, white-edged leaves, but most frequently none at all. Involute of several linear leaves. Flowers yellow or greenish white. Fruit roundish-ovate. The whole plant, being fetid, when bruised, is supposed in some parts of Norfolk to give a bad flavour to milk and butter; but cattle certainly do not eat it; except accidentally, or in small quantities, sufficient perhaps to have the effect in question. Where this herb abounds in pastures, it may be found partially cropped, though generally left almost entire.

3 S. alpeâstri (Bess. enum. pl. vob. p. 43. no. 1405.) stem striated; leaves bipinnate or tripinnate, with the ramifications spreading; leaflets pinnate; lower segments 3 or 4-parted: upper ones entire: lobes all entire, linear, cuspidate; involucra almost wanting; leaves of involucels setaceous; fruit ovate-oblong. 2 H. Native of the south of Podolia, in open fields; and of Altai, near Schulbins, at the river Irtysh. Peucedánæs alpêstre, Spreng. umb. spec. p. 56. exclusive of the synonymes. Peuced. Silius, Biéb. fl. taur. 1. p. 215. Silius Besséri, D. C. prod. 4. p. 161. Flowers yellowish. Differ from S. tenueflórus in the fruit being shorter and thicker, nearly ovate, not cylindrical. Compare it with Peucedánæs alpêstre, Lin. which is not sufficiently known.

Alpine Pepper-saxifrage. Fl. Jul. Aug. Cite. 1739. Pl. 1 to 2 ft. 4 S. longiflórum (Led. fl. ross. alt. 1. p. 323.) leaves supra-decompound, with the ramifications rather divaricate; leaflets somewhat tripartite: segments lanceolate or linear, cuspidate; involucra almost wanting; leaves of involucels setaceous. 2 H. Native of Siberia, in meadows, about the rivers Irtysh and Buchtorminsk. Ligusticum longiflórum, Willd. spec. 1. p. 1428. Athamánæ denudâta, Fisch. Angélica Fischéri, Spreng. in Schultes, syst. 6. p. 605. Cithrimum Mediterâneum, Biéb. fl. taur. 3. p. 215. Ligusticum Fischéri, Link, enum. 1. p. 276. Cnidium Fischéri, Spreng. syst. 1. p. 888.—Gmel. sib. 1. p. 188. no. 4. t. 41. The Altaian plant differs from the one collected on the banks of the Volga, in the leaves being more profoundly divided, nearly ternate; in the segments being linear, not 3-5-parted; in the lobes being lanceolate; and in the involucre being usually of 1 leaf. Furrows of fruit furnished with 1 vitoe each, but sometimes the outer ones have 2.

As. ß. diâricâtum: segments of leaves longer. 2 H. Cnâdium divaricâtum, Led. ind. sem. hort. dorp.

5 S. carvâfoârus (Meyer, planz. t. 125.) root fusiform; stem furrowed and striated, branched; leaves bipinnate; leaflets of the radical leaves divaricate: of the cauline linear, divaricate; involucra and involucels composed of short setaceous leaves; rays of umbel very unequal. 2 H. Native of Caucasus, on the higher mountains. Bünium peucedanoides, Biéb. fl. taur. 1. p. 208. suppl. 211. D. C. prod. 4. p. 116. Sium peucedanoides, Spreng. umb. spec. 41. no. 5. Peucedânæs carvâfoâra, Biéb. Petals pale yellow. Vitae solitary in the furrows, according to Besser: but there are 2–3 vitae in nearly all the furrows, rarely solitary.

6 S. ? peucedânoâdes (D. C. prod. 4. p. 161.) root turripiniform; stem striated, fusiform, somewhat trichotomous at the apex; leaves nearly ternate; segments linear, acute, entire, with revolute margins; involucra of 1 leaf; involucels wanting; umbels of 4–5 rays; umbellules 8–10-flowered. ß. H. Native of South America, on temperate mountains about Popayan. Cnidiuem peucedanoides, H. B. et Kunth, nov. gen. amn. 5. p.
UMBELLIFERÆ. LXXXI. WALLROTHIA. LXXXII. MEUM. LXXXIII. GAYA.

15. Paeúcinum júncum, Wild. n. s. in Schultes, syst. 6. p. 576. From the yellow entire petals, it comes nearer Siláus than Cúdnám, but the involucre is wanting. Sulphur-wort-like Pepper-saxifrage. Pl. 2 feet.

Cult. See Athamánta, p. 116. for culture and propagation.

Lin. syst. Pentántida, Monogónia. Teeth of calyx 5, ovate-lanceolate, acute (f. 56. A. b.). Petals entire, elliptic, acute at the base and apex (f. 56. A. d.). Transverse section of fruit nearly terete; mericarps with 5 prominent, equal ribs: lateral ribs margining. Vitte in each furrow, and 2 in the commissure.—A smooth perennial herb. Radical leaves decompound; leaflets linear-lanceolate. Invocura of 5-6 unequal leaves; involucres of 5-6 linear-lanceolate leaves. Flowers white. This genus is intermediate between Ménum and Ligústicum; it differs from the first in the calyx being evidently 5-toothed, and from the last in the petals being entire.

Cult. See Athamánta, p. 116. for culture and propagation.

Lin. syst. Pentántida, Digýnia. Margin of calyx obsolete. Petals entire, elliptic, acute at the base and apex. Transverse section of fruit nearly terete. Mericarps with 5 prominent, acutely keeled, equal ribs: lateral ribs margining; vitte many in the furrows, and 6-8 in the commissure. Seed nearly semi-terete.—Glabrous, perennial herbs. Stems nearly simple, terete, striated. Leaves supra-decompound, or pinnate; leaflets multifid: segments slender, linear, acute. Invocura almost wanting; involucres of many leaves. Flowers white or purple. This genus is distinguished from Ligústicum in the calyx being without teeth and in the petals being entire.

1 M. Athamánticum (Jacq. fl. austr. t. 303.) leaves supra-decompound, divided into numerous, fine, setaceous leaflets or segments; stems leafy, not much branched; invocula of a few linear leaves, which are often 3-5-lobed at the apex, but often wanting altogether; involucres of more numerous, entire, or cut leaves, somewhat dimidiate. 2. H. Native of Europe, in mountain pastures; plentiful on the mountains in the north of England; and abundant in the Highlands of Scotland.

2 M. Wallróthia (Spreng. fl. fr. 4. p. 310. Crantz, auct. lsec. 3. p. 92. Hayne arz. gew. 7. t. 12. Athúsa Ménum, Lin. syst. veg. 287. Dáucus Créticus, Trag. hist. 445. f. 1.—Moris. hist. 3. p. 270. sect. 9. t. 2. f. 2. Roots tapering. Stems hollow. Petals sometimes slightly obcordate. The whole plant, but especially the root, is highly aromatic, with a hot biting flavour like lovage, which it communicates to milk and butter, from the cows feeding upon its herbage in spring. A strong infusion of this herb is said to give cheese the taste and odour of the Swiss chaszipage. The seeds, as well as the roots are recommended as carminatives and stomachics. The plant is called Spignel, Meu or Baud-money in England, and Highland-miken in Scotland.

Athamánta-like or Common Bald-money. Fl. May, June. Britain. Pl. 1 to 2 feet.

Mutellina or the Swiss Bald-money. Fl. June, Aug. Clt. 1774. Pl. 2 to 1 foot.

Cult. See Athamánta, p. 116. for culture and propagation.

Lin. syst. Pentántida, Digýnia. Margin of calyx obsolete. Petals obovate, more or less emarginate, with a broad inflexed point. Fruit oval, rather compressed; mericarps with 5-6, wing-formed ribs, which are contiguous at the base, obtuse: outer ones marginal. Vitte none. Carpophore bipartite. Seed nearly semi-terete, easily separated from the covering. —Perennial mountain herbs. Leaves all radical, pinnate; leaflets bipinnatifid: lobes linear. Stems naked, simple. Umbels compound. Invocula of few leaves. Flowers equal, fertile. This genus differs from Ménum in the petals being emarginate, not entire; in the furrows of the fruit being without vitte, and in the fruit being rather bladdery.

2 G. píreínea'ca (Gaudin, l. c. in a note) leaves of involucra 1-5, undivided. 2. H. Native of the higher Pyrenees. Pinéllína dioica, 3. Lapey. abr. p. 166. Séseli nánum, L. Dufour, in litt. Séseli montánnum, var. Benth. cat. It differs from the first in its more stiff, branched habit, in its glossy colour, in its 1-leafed stem, in the leaflets and segments being lanceolate, in the ribs of the mericarps being less elevated. Plant small, glabrous. Root thick.

Píreínea Gaya. Pl. 1. foot.

Cult. These plants should be grown in pots, in a mixture of peat and loam, and placed among other alpine plants. They are increased by seeds.
XXIV. CONIOSELENUM

(a name evidently composed of Conium and Selinum). Fisch. in Hoffm. umb. ed. 2. p. 185. 

rit. f. 5. Koch, diss. ined. D C. prod. 4, p. 163.

LIN. SYST. Pentändria. Digynia. Margin of calyx obsolete. Petals obcordate or obovate, with an inf lexed point. Styles at length diverging, reflexed. Fruit rather compressed from the back, or convex; mericarps with 5 winged ribs; the lateral ribs twice the breadth of the others, and marginal; vittae unequal, 3 in the lateral furrows, but usually 2 in the dorsal ones, and 4-8 in the commissure. Carophore bipartite. Seed flat on one side.—Glabrous, biennial herbs. Stems branched, fistular. Leaves bipinnate; leaflets pinnate-parted; segments oblong-linear. Umbels terminal, of many rays. Involuta wanting, or of few leaves. Involute and 5-7 linear-sululate leaves, which are about equal in length to the umbellules, or longer. This is an ambiguous genus, intermediate between the tribe Paeideneae and Sesiineae; with the first it agrees in the mericarps being winged, and with the last in the mericarps being convex on the back. Flowers white.

1 C. Fiscneri (Wimm. et Grab, ex fl. 1828. p. 215.). 

H. Native of Siberia, Tartary, Ingrina, Silesia, and Savoy, on the mountains: North America between the Coppermine and Mackenzie rivers; Labrador; Stratais of De Foes, on the northwest coast; Kotschubé's Sound. C. Tartaricum, Hoffm. l. c. Perhaps C. Ingricium or C. neglectum. Fischer in litt. is not distinct from this. Perhaps Ligusticum Gmelini, Cham. et Schlecht. in Linnaea, 1. p. 391. and Gmel. sb. 1. p. 195. t. 44. appertains also to this plant. Perhaps all these different names belong to different species, or probably to the same, but they are so much confused that it is impossible to extricate them.

Fischer's Conioselium. Pl. 1 to 2 feet.

Cult. This plant is only to be increased by seed, which should be sown in the open ground early in spring. A light soil suits it best.

LXXV. CRITTHUM

LIN. SYST. Pentändria. Digynia. Margin of calyx obsolete. Petals roundish, entire, involute, ending in an obovate segment. Transverse section of fruit nearly terete; mericarps with 5 elevated, sharp, rather winged ribs: lateral ribs a little broader than the rest, and marginating; pericarp spongy, with large cells. Seed semi-terete, constituting a free nucleus, which is covered with copious vitae in every part.—A suffruticose, glabrous, fleshy herb. Petioles sheathing at the base. Leaves bipinnate; leaflets oblong-linear. Umbels compound. Involuta and involucels of many leaves. Flowers white. This genus differs from all others in the present tribe as the genus Archangelica does from the rest of the genera in tribe Angelicina, in the seed being a free nucleus, covered with copious vitae.

1 C. MARITIMUM (Lin. spec. 354.). 2. H. Native of rocky sea-shores and cliffs; as along the Black Sea, in Tauria; and along the Mediterranean Sea; and of Europe along the shores of the Western Ocean from Spain to Britain; and of the Canary Islands; and in Britain, on the rocky sea-shore and cliffs. Smith, engl. bot. 819. Jacq. hort. vind. 2. t. 87. Câehrys maritima, Spreng. in Schultz, syst. 6. p. 442. Crêthamus, Cord. hist. 201. f. 1. Sâmpire, Petiv. hort. brit. t. 24. f. 8.—Lob. icon. 392. f. 1.—Bauh. hist. 3. p. 2. 194. f. 1. Moris. hist. 3. p. 289. sect. 9. t. 7. f. 1. Root branched, creeping extensively. Herb greenish-glaucous, salt, and pungently aromatic in flavour. Stems ascending. Leaves biternate; leaflets uniform, lanceolate, tapering at the base. Leaves of involucra and involucels ovate, acute, spreading, rather short. Flowers white, with yellowish anthers. Samphire is called Perce-pierre and Saint-pierre of which there English name apprises to be a corruption) in French: MeriFeue in German; and Finschh marino in Italian. The herb makes an old-fashioned English pickle, as those known who read Shakspeare's King Lear. It is sold in the London shops; but there are many plants preferred for the same purpose, as Salviaea herbaceae and Inula crithmifolius, c.e., and is a frequent addition in salads. In taste it is crisp and aromatic, and constitutes a light and wholesome condiment. It is generally gathered in places where it is found wild; and the allusion to the practice by Shakspeare, in his description of Dover Cliffs, is well known. The plant is also used medicinally.

Var. B. Canarívus (Cav. anal. scienc. nat. 1801. vol. 3. p. 569.) leaves more shewing (ex Cav.), but the difference between the Canary Island plant and the European is hardly discernible. Sea-side or Common Samphire. Fl. Aug. Brit. Pl. 1 ft. Cult. Samphire is propagated by parting the roots, or by sowing the seeds in April; but is rather difficult of cultivation. Marshall says it likes a cool situation; but yet prefers a sandy or a gravelly soil, and plenty of water. Some, he adds, have found it to do best in pots, set for the morning sun only.

J. Braddock placed it in a sheltered dry situation, screened from the morning sun, protected it by litter during winter, and in spring sprinkled the soil with a little powdered barilla. This I do, he says to furnish the plant with a supply of soda, since, in its native place of growth, it possesses the power of decomposing sea water, from which it takes the fossil alkalii, and rejects the muriatic acid. With this treatment it has continued to flourish at Thames Ditton for some years, producing an ample supply of shoots, which are cut twice in the season, for pickling or to be used in salads.

Tribe VI.

ANGELICÆÆ (this tribe contains plants agreeing in important characters with the genus Angelica) or Orthospermæ paucijugæae tetrâpetæ, Koch, umb. p. 98. D. C. prod. 4. p. 164. Fruit compressed from the back, girded by a double dilated winged margin, from the raphe being central or nearly so, hence the fruit is furnished with 2 wings on both sides. Mericarps with 5 ribs: dorsal 3 filiform or winged: lateral 2 always expanded into wings, and always broader than the dorsal ones, even if they also should be winged. Seeds rather convex on the back, and flattish in front.

odour of this plant is strong and peculiar; its taste is warm and aromatic. It abounds with a yellowish, gummy, resinous juice, very much resembling Opipanax. Its qualities are supposed to be similar to those of Angelica and Masterwort in expelling flatulences, and exciting perspiration; therefore chiefly used in hysterical disorders and uterine obstructions. The leaves, eaten as salad, are accounted as emmenagogue. The root, which is not so ungrateful as the leaves, is said to possess similar virtues, and may be employed in powder.Official or Common Lovage. Fl. June, July. Ct. 1596. Pl. 4 to 6 feet.

Cult. This plant will grow in any soil; and is easily increased by dividing at the root.

Lin. syst. Pentandra. Digynia. Calyx with 5 broad teeth. Petals unguiculate, obovate, marginate, with an inflexed point. Fruit compressed from the back, furnished with 2 wings on both sides from the raphae being central; mericarps with 5 membranous, winged ribs; wings of the lateral ribs twice the breadth of the others; vitta 1 in each furrow, but there are often 2 in the outer furrows, and always 2 in the commissure. Carphophore bipartite.—Glabrous perianal herbs. Leaves ternately decimundate or tripinnate; leaflets pinnatifid. Umbels compound. Involuta of few leaves; involucels of many leaves. Flowers white.

2 S. CANDOLLI (D. C. prod. 4. p. 165.) stem terete; rays of umbel pubescent; petals obcordate, having the middle nerve crested above. H. Native of Nipal, on the mountains at Kamaon. Angelica? Candollii, Wall. mas. Leaves ternately decimundate; leaflets slender, multifid. Umbels terminal, of many rays. Involuta of many or of few leaves, or wanting, or soon falling off. Petals nearly as in the genus Pycholéa. Fruit as in S. carvifolia, but larger, and more ovate. Seed furrowed on the back.

De Candolle's Milk-parsley. Pl. 2 feet.

3 S. terenthynnum (Hook. fl. bor. amer. 1. p. 366. t. 95.) plant glabrous in every part; leaves tripinnate, stiff, glaucous; segments pinnatifid : lobes short, linear, acute; peduncles elongated; involuca wanting; leaves of involucels linear, short; mericarps with 5 broad, undulating ribs. H. Native of the north-west coast of America, common on the sandy grounds of Wallawallah river. Root fusiform. Rays of umbel very unequal. Fruit rather large, ovate, compressed. The genus to which this plant belongs is truly doubtful. The fruit not corresponding well with any described genus. Turpentine Milk-parsley. Pl. 1ft foot.

4 S. STELLATUM (D. Don, prod. fl. nep. p. 185.) leaves pin-
UMBELLIFERÆ. LXXXIX. Angelica. XC. Archangelica.

3 A. *sylvestris* (Linn. spec. 361.) stem polished, striated, often purple, with wide spreading branches, pubescent at the apex, as well as the peduncles; leaves bipinnate or tripartite, rather glaucous; leaflets ovate or ovate-lanceolate, acute, unequally and sharply serrated, never decurrent at the base; involucre of 1-2 leaves. 2. H. Native of Europe, Siberia, and Caucasus, in watery places, alder carps, and along the banks of rivers, common; plentiful in like situations in Britain. Smith, engl. bot. t. 1128. Woodw. suppl. t. 265. Ger. encyc. 999. f. 1. Dodon. pemp. 318. f. 1. Camer. epity. 900. f. 1. Lob. icon. 699. Angelica palustris, Riv. pent. t. 17. Hayne, arz. gew. 7. t. 9. Water Angelica, Petiv. herb. brit. t. 24. t. 10. Imperatòria sylvéstris, D. C. fl. fr. 4. p. 286. Selinum sylvastre, Crantz, auct. 177. Selinum angelica, Roth. germ. 1. p. 133. Selinum pubescéns, Moench, meth. p. 80. Umbels convex, with numerous general and partial downy rays. Flowers white, but more generally flesh-coloured. Points of petals erect. Vittae in the commissure superficial. The flavour is more bitter, and less grateful than the *Archenangelica*, but the virtues of both are similar. The herb dyes a good yellow.

4 A. *lucida* (Linn. spec. 360.) stem terete, glabrous; leaves bipinnate; leaflets equal, ovate, deeply serrated; sheaths dilated; involucre and involucels of 3 leaves each. 2. H. Native of North America, from Canada to Pennsylvania, in moist shady places. Pursh, fl. amer. sept. 1. p. 193. Jaqc. hort. vind. 3. t. 24.—Moris, hist. sect. 9. t. 3. f. 8. Ang. lobata, Watt. car. p. 116. f. ex Torr. The petals are said to be elliptic, pale green, with an inflexed point. By Jaquelin the flowers are said to be whitish, or of a pale yellow-colour.

**Sect. II. Psedangélica** (this section is supposed to contain false species of the genus: hence the name). D. C. prod. 4. p. 168.—Angélica species, Spreng. Koch.—Selinum species, Guan. —Sélesi species, Lin. Petals elliptic, acuminated or mucronated. The fruit is like that of the last section, but differs in there being usually 4 vittae in the commissure. Rays of umbels very unequal, the central ones very short.

† *Species not sufficiently known.*

7 A. *integromilfolia* (Walt. car. p. 115.) leaflets entire, petiolate. 2. H. Native of Carolina. The rest unknown.

*Entire-leafflet* Angelica. Pl.? 8 A. *bracteata* ( Roxb. in Beats, trav. voy. append. p. 297.) stem fistular; leaves unequaly pinnate; leaflets rather cordate, 3-7-nerved, finely jagged, serrated; bracteas or sheaths broad, nearly orbiculate at the base of the petioles, and between the segments; involucre and involucels of 6-10 broad lanceolate leaves each. 2. H. Native of the Island of St. Helena, where it is called by the inhabitants *common angelica*. Petals white, oval-oblong, incurved. Umbelles glabrous. Fruit unknown. Perhaps a species of Archangelica.

Bracteate Angelica. Pl. 3 to 4 feet?

Cult. Any soil will suit the species of Archangelica, and they are easily increased by seeds.

**LIN. SYST. Pentândria, Digynia.** Margin of calyx with 5 short teeth. Petals elliptic, entire, acuminated, with an incurved point. Fruit rather compressed from the back, furnished with 2 wings on each side, from the raphe being nearly central. Mericarps with 5 thickish keeled ribs, the 5 dorsal ribs elevated, and the 2 lateral ones dilated into wings, which are twice the breadth of the others. Seed not adhering to its tegumen, but distinct from it, and covered by copious vittae all over. Carpophore bipartite.—Perennial or biennial herbs. Leaves pinnate; leaflets broadly ovate, acute, coarsely toothed: terminal one lobed. Petioles large, sheathing, and rather bladery, involucels wanting or nearly so; involucels dilate, of many leaves. Flowers white or greenish.

1 A. *officinalis* (Hoffm. and Koch, l. c.) stem polished, striated, a little glaucous, branched in the upper part; leaves ternate, then pinnate; leaflets ovate-lanceolate or subcordate, cut, and sharply serrated, partly decurrent: the odd one deeply 3-lobed; petioles dilated and tumid at the base; involucre of a very few linear leaves, or wanting altogether; leaves of involucre linear-lanceolate. 2. H. Native of Europe, on mountain sides, particularly in Lapland, Sweden, Norway, Germany, Carpathian mountains; and from Unalaschka to the Bay of Eschhydroz; and now cultivated everywhere for the sake of its stalks. In Britain in watery places, rare, apparently a naturalized plant: as about the Tower of London, and on the banks of ditches frequent; in marshes among reeds by the side of the
UMBELLIFERÆ. XC. ARCHANGELICA. XCI. OPOPANAX.

Thames, between Woolwich and Plumstead, very abundantly; in the county of Durham; and at Broadmere, about 7 miles north-west from Birmingham. Angélica Archangelica, Lin. spec. 360. Oed. fl. dan. t. 206. Nees, off. pl. 9. t. 14. Hayn. arz. gew. t. 8. Smith, engl. bot. 2561. Woodv. med. bot. t. 60. Angélica officinalis, Muench, mth. p. 81. Angel. sativa, Mill. dict. no. 1. Riv. pent. t. 15. Petiv. herb. brit. t. 24. f. 9. Camerae, epist. 899. f. 1.—Ger. emac. 1000. Flowers greenish. The garden angélica was formerly cultivated on account of its leaf-stalks, which were blanched, and eaten as celery; now they are used only when candied, being, when so prepared, acceptable to most people, and are not so powerfully aromatic; the young and tender stalks are for this purpose collected in May. Sometimes also the seeds and leaves are used in medicinal preparations. The root, which is the most efficacious part, is used in the aromatic tincture. Of the anti-pestential virtues of the root, those who wish to be informed will find amusement at least in old Gerarde, p. 1000.

The plant delights in moist situations, or the bank of running water; but will grow freely in any soil or exposure. The plants are raised from seed, and for a bed 4½ feet by 6, sown in drills a foot apart, to be transplanted; half an ounce of seed will be requisite. "Sow in August, or as soon as the seed is ripe, as the plants will come up earlier and stronger than from sowing in the spring. When the plants are advanced from 4 to 6 inches high, transplant them into rows 2 feet apart. They will soon strike root, and advance quickly in strong growth. In the second year these strong erect branchy stalks will be several feet high, producing large umbels of flowers and seed, ripening in autumn, which, as well as the leaves of the plant, are used in medicine. But for candying, the young shoots of the stem and stalks of the leaves are the useful parts; being cut while green and tender in May and June, they are made by the confectioners into the sweet-meat called angélica. In the second year, if seed is not wanted, cut the plants down in May, and the stock will send out side shoots; by repeating this practice every year, the same plant may be long continued."—Abercrombic.

Officinal or Garden-angelica. Fl. June, Sept. Britain. Pl. 4 to 6 feet.

2 A. ATROPURPUREA (Hoffm. umb. 169.) stem polished, purpl'e, with a glaucous bloom, branched at the top; leaves ternate, then pinnate; leaflets ovate, acute, deeply serrated, and somewhat lobed; the terminal ones confluent; petioles dilated, and tumid at the mid; branches and umbels pubescent; involucra wanting; the involucres of many narrow leaves. 3 H. Native from Canada to Virginia, in moist meadows. Angélica atropurpurea, Lin. spec. 360. Lam. dict. 1. p. 173. T orr. fl. un. st. 1. p. 316. Angélica triquinita, Bigel. fl. boust. p. 68. ex Torr. —Corn. can. 199. with a bad fig.—Moris, hist. sect. 9. t. 5. f. 9. bad. Petals rusty purplish or white. The plant may be used in the same way as the A. officinalis.

3 A. DECURRENS (Lc'd. fl. ross. alt. ill. t. 166. fl. alt. 1. p. 316.) stem striated, with a glaucous bloom, furnished with leaves and axillary branches as follows; leaves pinnate or bipinnate: lower leaflets pinnate, upper ones pinnatifid: segments oblone, or ovate-oblone, acuminated, recurved; odd one 3-lobed; involucra of many narrow leaves. 3 H. Native of Altai, everywhere on the margin of rivulets. Flowers like those of A. officinalis, but varying more to yellow. Habit of A. officinalis, but differs in the leaves being much acuminated, those on the secondary branches of the petiole running down a great way, and serrated their whole length. Fruit exhalent a heavy smell when rubbed.

Decurrent-leaved Archangelica. Fl. year. Pl. 6 to 8 ft.
awned; floriferous branches alternate; leaves of involucre and involucels ovate-lanceolate, short; fruit oblong-elliptic, with acute prominent ribs. 2. H. Native of Sicily and the kingdom of Naples, on dry calcareous hills. F. rigida, Tenore, fl. neap. append. 4. p. 15. exclusive of the synonyms. Bûbon rigidus, Ucria ex Guss.—Bocc. mus. 2. t. 76.

*Geniculate-leaved Giant-fennel.* Pl. 2 to 3 feet.

5 F. thyrsiflora (Sibth. and Smith, fl. græc. t. 280. prod. no. 664.) stem angular and furrowed at the top; floriferous branches terminal, aggregate, compound; leaves supra-decompound; leaflets linear, elongated, roughish; leaves of involucre 4-6, linear-lanceolate. 2. H. Native of Candia, on rocks. Ferulago thyrsiflora, Koch, umb. p. 98. Vitae above 30 in the commissure, according to Koch, but in a specimen examined there are only from 20 to 25.

6 F. sulcata (Desf. atl. 1. p. 352. t. 67.) stem angular and furrowed; leaves supra-decompound; leaflets pinnatifid: lobes linear, acuminate; leaves of involucre many, oblong-linear, reflexed. 2. H. Native of Naples, Sicily, Mauritania, and Portugal, on hills. F. nodiflora, Spreng. umb. spec. p. 84. but the figure of F. nodiflora in fl. græc. is destitute of involucre, and therefore does not belong to this plant; therefore the plant of Linneas is truly doubtful. F. Barrelieri, Tenore, in herb. Merat. Ferulago nodiflora, Koch, umb. p. 98. Ligusticum luteum, Poir. voy. barb. 2. p. 136. ex Poir. suppl. 3. p. 481. Peucedanum Lusitanicum and rupéstre, Wildl. herb. ex Spreng. syst. 1. p. 914. Vitae 60 in the commissure, ex Koch.

7 F. Stricata (Spreng. in Schultes, syst. 6. p. 592.) stem straight, stiff, furrowed; leaves ternately supra-decompound, straight; leaflets ternate, triquetrous, filiform, glabrous; leaves of involucre ovate-oblong. 2. G. Native of the Cape of Good Hope.

**Sect. II. Ferula KIA (an alteration from the generic name).** D. C. prod. 4. p. 172.—Ferula, Koch, umb. p. 96. Vitae 3 in each of the dorsal furrows, and 4 in the commissure. Involucre wanting. Stems terete.

* Stem leafy.

8 F. Communis (Lin. spec. p. 355.) stem terete, branched; leaves supra-decompound, green; leaflets linear-setaceous, filcid; central umbel nearly sessile; lateral ones male, pedunculate; involucre wanting; sheaths of upper leaves very large. 2. H. Native on hills in the region of the Mediterranean, from Portugal to Greece, and of Mauritania. D. C. fl. fr. 3. p. 343. F. nodiflora, Lin. spec. 356? Smith, fl. græc. t. 279.—Dodon. pempt. p. 321. f. 1. Lob. icon. t. 778. f. 2.—F. fémina, Plum. Tourn. Moris. umb. 35. t. 2. hist. 3. p. 309. sect. 9. t. 15. f. 3. Lateral umbels usually opposite, rising from the axils of the sheathing petioles under the central umbel. Fruit 5 lines long, and 3 lines broad. There issues from the stem when cut a yellowish fetid juice, which hardens on the surface of the wound. The dry dead stem is full of white pith, which easily takes fire, and the Sicilians use it for tinder. Hence the fable of Prometheus. In Apulia, where the plant grows in great plenty, it is grateful to buffaloes, which form the chief part of the subsistence of many farmers there.

*Common Giant-fennel.* Fl. June, July. Clt. 1597. Pl. 8 to 12 feet.
9 F. glauca (Lin. spec. p. 588.) stem terete, branched; leaves supra-decompound, glaucous beneath; leaflets linear, elongated, flat; involucro wanting; pétioles of upper leaves dilated; central umbel pedunculate; lateral ones male only, on longer peduncles. \( \frac{3}{2} \). H. Native of the south of France, at Merival, near Montpelier in the spot mentioned by Lobel; also of Provence, Italy, Sicily, Greece, &c. F. foliis glauco, Bauh. hist. 3. p. 2. p. 45. with a figure. 

\[ \text{Férula et Ferulágo}, \] 

Lob. adv. p. 348. F. communis, Goun. hort. monsp. p. 140. F. glauca, D. C. fl. fr. suppl. p. 514. Schultes, syst. 6. p. 588. Leaves of involucro many, linear-setaceous, caducous, ex Spreng. but in the plants examined there has been no involucro seen; therefore Sprengel's plant is probably distinct from this.

\[ \text{Glaucous Giant-fennel. Fl. June, July.} \] 

\[ \text{Clit. 15 to 16. P. 6 to 8 feet.} \]

10 F. rigidula (D. C. prod. 4. p. 172.) stem terete, branchged, and is, as well as the petioles, quite glabrous; leaves pinnate; leaflets pinnatifid: lobes short, few, acute, channelled, stiffish, hardly puberulous; umbels rather panicled, without any involucro. \( \frac{3}{2} \). H. Native of Persia, on rocks among the mountains about Seidkhodz. Very like F. Clapiace in the in- florescence and fruit, but differs in the primary pairs of leaves being an inch and a half distance from each other, and the secondary pairs are more elongate; leaflets fewer; lobes fewer, stiffer, and rather fleshy. Sheaths larger, and rather glaucous.

\[ \text{Stiffish Giant-fennel. Fl. 3 feet.} \]

11 F. Caßnica (Bieb. fl. taur. suppl. no. 551.) stem terete, branched; leaves triplicate pinnate; leaflets pinnatifid, soft, approximate; segments very short; umbels somewhat panicled; the peduncles of the lateral umbels furnish each with a subulate ligula at the base; involucro none. \( \frac{3}{2} \). H. Native of arid fields from Odessa to Sarepta; and of Caucasus, near Kislian. Spreng. umb. spec. p. 81. F. carchroides, Pisch. in litt. 1822. There are varieties of this with either glabrous or pubescent leaves, according to Bieb. The habit is like that of Cacchodes Odontálgaica. Sheaths cuscullate; upper ones almost destitute of leaves. Fruit oval, glabrous, 3 lines long, \( \frac{1}{2} \) line broad. Commissure furnished with 4 vitae. Umbel-bearing branches alternate; lower ones often opposite, and upper ones in whorles.

Perhaps a species of Pheuedanum, according to Besser.

\[ \text{Caspián Giant-fennel. Fl. June, July.} \] 

\[ \text{Clit. 1819. P. 2 to 3 feet.} \]

12 F. orientalis (Lin. spec. p. 356.) stem terete, branched; leaves 5 times pinnate; leaflets multifid, setaceous, apparently puberulous when examined by a lens; sheaths large, cucurbit: involucro wanting. \( \frac{3}{2} \). H. Native of Asia Minor, Greece, Caucasus on Mount Beschbrakm, and perhaps of Numidia. Lam. dict. 2. p. 455. Spreng. umb. spec. p. 89. Tourn. trav. 2. t. 379. Branches of root thick. Leaves a foot and a half long. Upper sheaths 3 inches long, and an inch broad. Sprengel refers to this the Fashook of Jackson's account of Morocco, t. 7. Stevens says it is the same as F. puecedanifólia, Willd. herb., but Pallas's figure, which is cited for it, is very different from our plant.

\[ \text{Eastern Giant-fennel. Fl. July, Aug.} \] 

\[ \text{Clit. 1759. P. 3 to 4 feet.} \]

13 F. Persica (Willd. spec. 1. p. 1413.) stem terete, glauco; leaves ternately supra-decompound; leaflets rather remote or decurrently pinnate; segments linear-lanceolate, dilated, and cut at the apex; stipular umbel sessile; involucro and involucres wanting. \( \frac{3}{2} \). H. Native of Persia; and of Caucasus, on hills near Baku. Andr. bot. reg. 528. Sims. bot. mag. 2096. F. assafoetida, Mart. in Mill. dict. no. 9. exclusive of the synonymy of Kørsø. Wood. med. bot. 22. t. 8. Planch. icon. t. 203. Assafetida, Hoppe, in phil. trans. 1785. p. 36. t. 3. and 4. The plant smells very strong of assafetida, and there is a yellow gummy juice very like the flows from the plant, which in all probability has the same virtues as that of the true assafetida, F. asafoetida. Plant of a yellowish hue.

\[ \text{Persian Assafetida. Fl. June, July.} \] 

\[ \text{Clit. 1783. P. 3 to 6 ft.} \]

14 F. Tingtona (Lin. spec. p. 355.) stem terete, branched; leaves supra-decompound, shining; leaflets or segments oblangeolate, deeply toothed; upper leaflets large, sheathing; terminal umbels on short peduncles: lateral umbels few, male, on longer peduncles; involucro none. \( \frac{3}{2} \). H. Native of Spain and Barbary, and in fields about Tangiers. Rivin. pentap. 3. t. 10. Herm. par. t. 165. Moris. ov. sect. 9. t. 15. last figure. 

\[ \text{Desf. fl. atl. 1. p. 251. Fruit 6 lines long, and 3 lines broad. This plant is easily distinguished from the rest, in the leaflets being broader, and shining.} \]

\[ \text{Tangier Giant-fennel. Fl. June, July.} \] 

\[ \text{Clit. 1680. P. 6 to 8 feet.} \]

15 F. nud'a (Spreng. umb. spec. 81. t. 7 f. 15.) stem terete, striated, branched; leaves ternately bipinnatifid, glaucous; segments obtuse, rather tridentate; involucro and involucres none. \( \frac{3}{2} \). H. Native of Siberia. Petioles sheathing at the base, glaucous. Branches spreading. Stem about the thickness of a goose quill, girded by fibres at the base, just at the neck.

\[ \text{Naked Giant-fennel. Fl. Ju. July.} \] 

\[ \text{Clit. 1821. P. 1 to 2 ft.} \]

16 F. Tessekocpete (H. B. et Kunt. nov. spec. 5. p. 12. t. 418.) stem terete, fistular; leaves quadrifidipinnate; leaflets or segments linear, acute, flat; involucrum of one leaf; involucres of 3-7 linear leaves, which exceed the fruit. \( \frac{3}{2} \). F. Native of Mexico, in cold places near the town of Tolucco. Herb glabrous, a foot high, a little more. Rays of umbel unequal. Leaf of involucrum linear, shorter than the rays of the umbels.

Leaves of involucres 5-6, very unequal, the longer ones exceeding the umbelles. Flowers many, abortive. Vitae 4 in the commissure, and 3 in the furrows.

\[ \text{Tolucco Giant-fennel. Fl. 1/4 ft.} \]

17 F. Petiolaris (D. C. prod. 4. p. 173.) plant quite glabrous; stems terete, branched, leafy at the base; petioles biterate, having the ultimate divisions very long, and cylindrically conical, acute, bearing no foliaceous segments; upper sheaths small, undivided, acuminate; involucro and involucres none. \( \frac{3}{2} \). H. Native of Persia, among stones on the tops of the mountains about Seidkhodz, where it was collected by Szwowits. The species is very remarkable in the absence of foliaceous leaflets, and therefore the leaves are reduced to the naked petioles.

\[ \text{Petiolar Giant-fennel. Fl. 2 to 4 feet.} \]

18 F. Seseloderes (Meyer, plannz. p. 126.) glabrous, glaucous- cent; stem rather angular, leafy, branched; lower leaves bipinnate: leaflets pinnatifid: lobes linear; sheaths narrow: upper sheaths leafless, acuminate; umbels all fertile, pedunculate; involucro almost wanting; leaves of involucro setaceous: vitae 1-3 in the furrows. \( \frac{3}{2} \). H. Native of Caucasus, on Mount Beschbrakm. Leaves of Seselí montanum; but the petals are yellow like other species of Pérula. Margin of calyx obsolete. 

Fruit nearly like Pheuedanum.

\[ \text{Seseli-like Giant-fennel. Fl. 2 to 3 feet.} \]

** Stems almost naked.**

19 F. A'ssa-fœ'tida (Lin. mat. med. 79.) stem terete, simple, furnished with leafless sheaths; radical leaves pinnate, having 1 or 2 pinnatifidly sinuated leaflets on each side; lobes oblong, obtuse; involucro wanting. \( \frac{3}{2} \). H. Native of Persia, in the provinces of Khorassan, Laq, and Fars. A'ssa-fœ'tida, Kømpf. amén. p. 333. and p. 336. with a figure. Stem
3-6 feet high. According to the testimony of Kämpfer, this is the plant from which the real assafetida is obtained. It is the concrete juice of the root, and is procured by the peasants who live in the neighbourhood of the mountains in the provinces of Khorassan and Laar in Persia. When the leaves begin to decay the oldest plants are selected, not less than 4 years' standing. The earth is partly cleared away, so as to expose the upper part of the root. The leaves and stem are twisted off, and used as a covering to screen it from the sun. In this state the root is left 40 days, when the covering being removed, the top of the root is cut off transversely. It is then screened again 48 hours, when the juice is scraped off, and exposed to the sun to harden. This done, a second section is made; the screen again employed, and the juice obtained a second time as before. Thus the assa-foetida is 8 times repeatedly collected from the same root; but after a third section it remains 8 days to recover a sufficient stock of juice.

Assafoetida is well known by its peculiar nauseous fetid smell, the strength of which is the surest test of its goodness. This odour is extremely volatile, and of course the drug loses much of its efficacy in keeping. It comes in large irregular masses, composed of various shining little lumps or grains, partly whitish, partly brownish or reddish, and partly of a violet hue; those are accounted the best which are clear, of a pale reddish-colour, and variegated with many fine white tears. It is a gummy resin, but has the gum in largest quantity. It is the most efficacious of the fettid gums, and is commonly used in hysteria hypochondriasis, some symptoms of dyspepsia, amenorrhoea and chlorosis, flatulent cholices, and most diseases termed nervous; it is thought to be the most powerful remedy we possess for those peculiar convulsive and spasmodic affections, which often recur in hysteresis. It is recommended as an emmenagogue, anesthetic, expectorant, antiasthmatic, and anodyne. Its action is quick and penetrating.

Assa-foetida. Fl. July, Aug. Pl. 6 to 7 feet.

20 F. Szowits'a (D. C. prod. 4. p. 173.) stem terete, nearly naked, branched, glabrous; leaves tripinnate, clothed with velvety pubescence; leaflets deeply toothed, obtuse; umbels somewhat panicked, without involucra; fruit ovate-obovate, flat, longer than the pedicels. 2. H. Native of Persia, at Seid-khodzi, in gravely and stony places, where it was collected by Szowits. Neck of root appearing hairy from numerous erect fibres. Petioles of leaves trifid. Umbels terminal, on short peduncles. Fruit the size of F. comminís.

Szowits’s Giant-fennel. Pl. 5 to 6 feet.

21 F. Pube'scens (Pall. ex Willd. rel. in Schultes, syst. 6. p. 598.) stem pubescent, pannicled, nearly leafless; radical leaves clothed with hoary pubescence, ternately tripinnate; leaflets jagged: lobes linear, tripartite, obtuse; sheaths opposite, small; involucra and involucules minute and caducous. 2. H. Native of Siberia.

22 F. Fúmi'la (Pall. ex Willd. rel. in Schultes, syst. 6. p. 598.) stem smooth, pannicled, leafless; radical leaves pinnate, ternately tripinnate; leaflets pinnatifid; lobes dentate, bluntns. 2. H. Native of Siberia.

Dwarf Giant-fennel. Pl. 1 foot.

23 F. Ar'me'n (D. C. prod. 4. p. 174.) glabrous; petioles ternate at the base, having the divisions bipinnate; leaflets short, divided into thick, oblong, obtuse, aggregate, somewhat whorled lobes; stem naked, terete; leaves of involucra and involucules short, oblong; fruit elliptic. 2. H. Native of Armenia.

Oroserineum Armènium Scelesos Massilisiensis folio, Tourn. herb. Upper leaves reduced to short leafless sheaths.

Armenian Giant-fennel. Pl. 2.

† Little known species.

24 F. Breviföllia (Link, in Schultes, syst. 6. p. 592.) stem terete, glabrous; leaves supra-decompound; leaflets linear, channelled, divaricate, flaccid, cupulidate, elongated; involucra wanting; primordial umbels sessile. 2. H. Native of Portugal.

Short-leaved Giant-fennel. Pl.

25 F. Capilla'res (Link, in Spreng, umb. spec. 85.) stem terete, glabrous; leaves trinervate; leaflets filiform, capillary, loose; sheaths of petals almost wanting; umbels axillary; involucre of a few sessate leaves. 2. H. Native of Portugal.

Narthécium. Dalech. ludp. p. 754. Fèrula tenuii-fòlió, Mor. ox. sect. 9. t. 15.

26 F. Peccadani'fölia (Willd. herb. in Schultes, syst. 6. p. 592.) stem knobbed, branched, leafy; leaves tri-nervate, stiff; leaflets trifidly pinnatifid, linear-subulate, elongated; involucra wanting; umbellules rather capitata. 2. H. Native of Siberia, at the Volga. F. nodifòra, Pall. itin. app. p. 39. t. N. ed. gall. t. 56. F. Sibírica, Willd. spec. 1. p. 1411. Leaflets very long, nearly terete. Fruit unknown. The herbarium of Wildenow is said not to contain this plant.

Sulphur-wort-leaved Giant-fennel. Pl. 5 to 6 feet.

27 F. Nudicau'lis (Spreng. neu endt. 2. p. 149. but not of Nutt.) stem naked, furrowed, glabrous; radical leaves bipinnate; leaflets deeply serrated, mucronate; sheaths of upper leaves abortive; leaves of involucrum linear-lanceolate. 2. H. Native of Sicily, on the Nebrodes, in the higher pastures.

Naked-stemmed Giant-fennel. Pl. 2 to 3 feet.

28 F. Fenicula'ce (Nutt. gen. amer. 1. p. 183.) plant pubescent; stem short, naked, furrowed, glabrous; radical leaves pubescent, supra-decompound; leaflets linear, very narrow, acute, short; ultimate ones trifid; involucra wanting; involucules unilateral, digitate, with linear segments. 2. H. Native of North America, on the plains of the Missouri; and on the northwest coast near Fort Vancouver, and barren sandy grounds on the Columbia river; low hills near the source of the Wallawalla river, and on the Saskatchewan at Carlton House. Pastinacum feniculae, Spreng. in Schultes, syst. 6. p. 587. Flowers yellow. Herb smelling of fennel. Fruit furnished with 5 stripes, 3 of which are conspicuous. Umbel solitary, terminal. Sprengel refers to this Lomárium villum, Rafin, in journ. phys. 1819. aug. 1. p. 101. and the flowers are said to be white by the author, but according to Nuttall they are yellow; and therefor also the Cogswellia villosa, Schultes, syst. 6. p. 588.

29 F. Cana'ensis (Lin. spec. p. 356.) segments of leaves branched, shining, linear.—Native of Canada. Lin. hort. ups. p. 61. Gron. vird. p. 147. This is a very obscure plant, and probably the same as Angelica lacida.

Canadian Giant-fennel. Pl. 2 feet.

30 F. Nutta'li (D. C. prod. 4. p. 174.) plant small, almost stemless, glabrous; leaves supra-decompound; leaflets linear, short, acute; sepalas red; rays of umbel elongated; involucra wanting; involucules unilateral, digitate, with short segments. 2. H. Native of North America, on the plains of the Columbia; banks of streams among stones at the Great Falls of the same river. F. nudiculátis, Nutt. gen. amer. 1. p. 183. but not of Spreng. Smýrium nudicaule, Pursh, fl. bor. amer. 1. p. 196.
Pasinica nudicaule, Spreng. in Schultes, syst. 6. p. 587. Root fusiform. Plant having the colour of fennel, but more aromatic. This plant differs from the genera Ferula, Pastinaca, and Smyrnium, in the flowers being white, not yellow, as in those genera.

31 F. Palmeilla (Hook. in fl. amer. bor. amer. 1. p. 268.) Plant glabrous, nearly stalkless; leaves bipinnatifid, on longish petioles, glaucous; leaflets linear, bluish; lower ones often again pinnatifid; peduncles rather shorter than the leaves; involucrum none; involucre unilabiate, dimidiate, palmate, with the disk florescent. 2. H. Native of North America, about Carlton House on the Saskatchewan. Root large, thick, rather fusiform. The involucres are very remarkable, truly palmate, gradually tapering into the broad petiole or ray, and bearing a small umbelule of white flowers on the disk.

Palmeilla Giant-fennel. Pl. ½ foot.

32 F. Affinis (Bess. cat. hort. crem. 1816. p. 57.) Native near Odessa. This species is not described.

Allied Giant-fennel. Pl. 2 to 3 feet.

Cult. Any common garden soil answers the species of Ferula; and they are only to be increased by seeds.

XCH. DOREMA (from ὁρμα, dorema, a gift or benefit; not that the plant is considered pre-eminentiely deserving that title, but that the name is also agreeable to the ear). D. Don, in Lin. trans. vol. 16. p. 601.

Lin. syst. Pentàndria, Digynia. Flowers sessile, immersed in wool. Margin of calyx 5-toothed. Petals ovate, with an inrolled point. Disk epigynous, cup-shaped, fleshy: with a pli- cate, rather lobulate margin. Style complanate, recurved at the apex. Stigmas truncate; Fruit elliptic, much compressed from the back, girded by a complanate broadish margin; raphe very narrow, usually closed. Mericarps 5-ribbed; the 3 intermediate ribs distinct, filiform, at equal distances: lateral 2 confluent with the margins; vitreous prominent, one in each furrow, and 4 in the commissure, which is flat. Carpophore bipartite, filiform. Seed flat.—A robust, greenish, glaucous, Persian herb, with a perennial root, and clothed with glandular down, almost with the habit of Opothetia Chironion. Leaves large, petiolate, somewhat bipinnate, 2 feet long; pinnae usually 3 pairs, each pair rather remote: lower leaflets distinct; superior ones confluent, deeply pinnatifid: segments oblong, mucronate, quite entire, or rarely a little lobed, coriaceous, veined beneath, 1-5 inches long, and half an inch to 2 inches broad. Petioles and rachis terete, ribbed, pubescent, very much dilated at the base, and sheathing a little, with the upper margin winged and stipulate. Umbels proliferous, racemose; umbellules globose, on short peduncles, usually disposed in a spicate manner. Peduncles terete, woody. Involucra and involucres wanting. Petals white. Stamens and styles yellow. Ovarium densely woolly. Fruit naked.

1. D. Ammoniacum (D. Don, l.c.) 2. H. Native of the south of Persia, in the vicinity of Jerzid Khat, a town of Irak El Ajam, the ancient Parthia, about 42 miles south of Isphahan. To discriminate and characterize those plants which more immediately administer to the wants and comforts of man, is one of the chief objects of practical botany; but it is a task replete with difficulties; the countries whence many of the substances are derived, particularly those belonging to the Materia Medica, being generally remote, and often inaccessible to travellers. Although the gum Ammoniacum has held a place in the Materia Medica from a very early period, yet the plant from which it is obtained has hitherto remained almost totally unknown; and the same may be said of the analogous gum Galbanum, and many other articles derived from the vegetable kingdom, enumerated in the Pharmacopoeia. It is true Dioscorides and Pliny mention the plant which yields the gum Ammoniacum, the former under the appellation of Agasylis, and the latter under that of Metopium, and give Libya as its native country; but if the gum was anciently imported thence, it must have been the produce of a different plant than ours; and probably identical with the species of Ferula, represented by Jackson in his account of Morocco, as the gum now comes to Europe by way of the Levant and India. Dioscorides, whose opinion is adopted by all subsequent writers, derives the name Ammoniacum from Ammon or Hammon, the Jupiter of the Lybians, whose temple was situated in the desert of Cyrene, near to which the plant was said to grow. But it appears that Dioscorides was altogether mistaken as to its native country; and that the name Ammoniacum or Ammoniacum, as it is indifferently written, is really a corruption of Armeniacum; for it is now ascertained beyond all doubt, that the plant is a native of Persia, and that the gum must have been anciently brought to Europe by way of Armenia; and we sometimes find the name of the apricot written Malum Arminiacum. Wildenow, having sown some seeds picked from the gum-Ammoniacum, a species of Heracleum came up, which he called Heracleum ammoniacum, but this appears to be identical with Heracleum Pyrenicum; but as the plant possesses no smell analogous to Ammoniacum, and affords no gummy substance whatever, it is probable it was only an accidental weed.

The materials from which the description was drawn were procured by Lieut.-Colonel Wright, of the royal engineers, in the district where the gum Ammoniacum was collected, which is given above, and presented by him along with other dried plants to the Linnean Society. Every part of the specimen is covered with drops of a gum possessing all the properties of Ammoniacum, and this circumstance alone, independent of any other evidence, would seem sufficient to remove all doubt on the subject; besides the specimen has been compared with the portions of inflorescence and fruit, which are found abundantly intermixed with the gum in the shops, and they are found to agree in every particular. The name applied to the plant by Dioscorides is already pre-occupied by another genus of Umbelliferae, and that of Pliny is scarcely unexceptionable, as originating in a mistake, Metopium having been used by some ancient authors to denote the Galbanum, and by others the gum-Arabic tree; but most writers seem to agree in considering it the appellation of an ointment, or some ologelous substance, rather than a plant. The name Dorema has been given to avoid confusion.

The first volume of the Dictionnaire Universel de Matière Médicale, by Merat and De Lens, published at Paris in 1829, contains some valuable notices on the Ammoniacum plant, from which it appears that the plant was already known to Mr. Brown, and had been determined by him to constitute a new genus. We also learn from the same work that M. Fantonier, a geologist sent into the Levant by the French government, had visited the district where the plant grows spontaneously, and transmitted a drawing, together with specimens of the herb and gum, to the museum of natural history at Paris. M. Fantonier was informed that the plant grows likewise in Khorsan.

In the appendix to the first volume of the transactions of the Medical Society of Calcutta, p. 369, is an extract of a letter addressed to Dr. Wallich by Lieut.-Colonel Kennett, accompanied by a rude figure of the plant, which yields the gum Ammoniacum, of which the following is a copy: “I have the pleasure to forward you a drawing and description of Oshae, a Persian plant that produces the gum Ammoniac. It was procured by Capt. Hart, of the 5th battalion Bombay native regiment, whilst on sick certificate in Persia; and understanding it was a desideratum in botany, he has requested me to send it to you in his name. It is to be regretted that Capt. Hart did not know enough of botany to give a particular description of the plant,
flower, and seed; but he brought away a root, with a piece of the stem, and some dry leaves attached; and which I have forwarded in a box to your address. You will observe the account of the plant is dated in July, 1822, though I only received it a short time ago.

"Description of the Oshac or gum-Ammoniac plant, by Capt. Hart.

"It having been intimate to me while at Bushire by the Resident, Capt. Bruce, that the plant which produces the gum-Ammoniac, called by the Persians Oshak, would be acceptable to botanists, as it was but imperfectly known, I procured the accompanying piece of stem, leaf, and flower, and took a drawing of one of the finest plants. Its height was 7 feet 2 inches, and the circumference of the lower part of the stem 4 inches. It grows principally on the plains between Yerdekaua and Kuminsha, in the province of Irak, without cultivation. The gum is so abundant, that upon the slightest puncture being made, it instantly oozes forth, even at the ends of the leaves. When the plant has attained perfection, innumerable beetles, armed with an anterior and posterior probe of half an inch in length, pierce it in all directions; it soon becomes dry, and is then picked off, and sent via Bushire to India and various parts of the world; and is of considerable export. I am of opinion it might be cultivated with success in many parts of Kattiywar, and the experiment might be worth the consideration of government. The gum might easily be procured by artificial means, which would answer the purpose equally well.

"From the part of the stem attached to the roots of the specimen I sent you, a considerable portion of the gum will be seen exuded, in which respect it resembles the Assafetida plant, which abounds in the mountains in the south of Persia, particularly in the province of Fars."

The gum is collected about the middle of June; a tenth is remitted as tribute to the government; the rest is sent to Bushire on the Persian Gulf. Part of that imported to this country comes from the Levant; but the largest quantity and the best comes by way of India.

According to Major Willock, who has visited the districts where the plant grows wild, the Ooshak or gum-Ammoniac plant grows in great abundance over the arid plains in the vicinity of the town of Zand Khast, on the borders of the provinces of Fars and Irak, a district appertaining to the government of Ispahan. The white juice which forms the gum pervades the whole plant, but exudes chiefly from the principal stems. It either remains on them in lumps, or, falling to the ground, is gathered by the villagers in the autumn, and is sold by them. The Ooshak plant is to be met with nowhere but in the province of Irak, growing in very dry plains, gravelly soils, and exposed to an ardent sun.

Ammoniac has a nauseous taste, followed by a bitter one; and a peculiar smell, somewhat like that of Galbanum, but more grateful; it softens in the mouth, and acquires a white colour upon being chewed. It softens by heat, but is not fusible; when thrown upon live coals it burns away in flame. Such tears as are large, dry, free from small stones, seeds or other impurities, should be picked out, and preferred for internal use; the coarser kind is purified in solution, colature, and careful insipitation; but unless this be artfully managed, the gum will lose a considerable deal of its more volatile parts. These are often vended in the shops under the name of stained gum-Ammoniacum, a composition of ingredients much inferior in virtue.

The general action of gum-Ammoniac is stimulant. On many occasions, in doses from 10-30 grains, it proves a valuable antispasmodic, deobstructive or expectorant. In large doses it purges gently, excites perspiration, and increases the flow of urine. It is used with advantage to promote expectoration in some pulmonary diseases, especially asthma and chronic catarrh; in dyspepsic affection to augment the flow of urine, and to support the salivation in small pox. In long and obstinate cholics, proceeding from viscid matter lodged in the intestines, this gummy resin has produced good effects, after purges and the common carminatives had been used in vain. Externally it is supposed to soften and ripen hard tumours, is often applied as discutient in white swellings of the knee, and other indolent tumours. A solution of it in vinegar has been recommended by some for resolving even ichorous swellings. It is exhibited internally combined with vinegar, vinegar of squills, assafoetida, &c. and in pills, with bitter extracts, myrrh, assafoetida; externally, dissolved in vinegar, combined with turpentine, common plaster, &c.

XCV. ERIOSYNAPHE (from ερός, erion, wool, and συνάψω, synaphé, connection; in reference to the commissure, which is the connection of the two mericarps that compose the fruit, and which is clothed with wool-like down in the hollows between the nerves). D. C. Coll. Mem. 5. p. 50. t. 1. f. 9. prod. 4. p. 175.—Férla species, Fisch.

Lin. syst. Pentandria, Dígyinia. Limb of calyx with 5 short blunt teeth. Petals ovate, entire, acuminated; points short, incurved. Fruit compressed from the back, girded by a thickish margin. Mericarps with 9 dorsal filiform ribs, but the 2 lateral ones are lost in the thickish margin, which is spongy inside; furrows between the ribs broad, and furnished with 2-3 striae, and bearing 2-3 small vitre; commissure without vitre, marked by a middle nerve and 2 marginal ones, tomentose, and rather concave between the nerves. Seed complanate.—A perennial glabrous herb, with the habit of Férla. Leaves decompound: leaflets long, linear. Involucra and involucels none. Flowers yellow. This genus is very nearly allied to Férla, but the singularity of the commissure of the fruit distinguishes it from all other umbelliferous genera.

Lin. syst. Pentandria, Dígyinia. Margin of calyx obsolete. Petals elliptic, with an inflapsed acute point. Fruit oblong or oval: the transverse section elliptic. Mericarps compressed from the back, having 5 filiform bluntish ribs: the 2 marginal ones rather the broadest; furrows between the ribs furnished with 3 vitre each; commissure bearing 2 broad marks. Seed oblong, with many stripes, free from the pericarp.—Glabrous perennial herbs. Leaves tripinnate; leaflets multifid. Stem terete, branched. Involucra of few leaves or wanting. Flowers cream-coloured. This genus differs from Peucédanum, in the furrows of the fruit being furnished with 3 vitre each, instead of one.

1 P. sal’a (Bess. enum. pl. vohl. 55. no. 1484.) stem terete, branched, naked; radical leaves tripinnate; leaflets many-

Salt-field Palumbia. Fl. June, July. Clt. 1804. Pl. 1 foot. 2 P. RAMOSISSIMA (D. C. prod. 4. p. 176.) stem terete, much branched, sparingly leafy; leaves alternate: leaflets few, oblong, acutely cut; involucrum wanting; involucels of few leaves; fruit oblong. 2. F. Native of the East Indies, on the Panduan mountains on the confines of the province of Silhet. Selimum? ramosissimum, Wall. mss. Root long, cylindrical, simple. Stem 2 feet high. Upper leaves reduced to the petioles. Fruit much flattened from the back; furrows furnished each with 2-3 obscure vittae; commissure covered with a pelticle, and therefore appearing without vittae at first sight.

Much-branched Palumbia. Pl. 2 to 3 feet?

XCVI. PEUCE/DANUM (pevee/danum) of Theophrastus and Dioscorides; said to be from πεύκη, peuje, a pine, and δανός, dannos, parched; the plant was so called on account of its small smell, which resembles resin). Koch, umb. 92. f. 28. and f. 29. D. C. prod. 4. p. 176.—Peucedanum, Selimum, and Férola, &c. of authors.—Oreo-selimnum and Thysselium, Hoffm. umb. p. 153. and 154.—Oreo-selimnum and Peucedanum, Lag. am. nat. 2. p. 90.

Lin. Syst. Pentandria, Diggynia. Margin of calyx 5-toothed. Petals obovate, emarginate or entire, with an inflexed point. Fruit flattened from the back or lenticularly compressed, girded by a dilated complanate margin. Mericarps having the ribs at equal distances, the 3 intermediate ones filiform, but the 2 lateral ones are more obsolete, and contiguous to the dilated margin, or lost in it. Vitiae one in each furrow, but sometimes 2, and usually 2 in the commissure. Carphophore bipartite. Seed flat in front.—Usually glabrous perennial herbs. Leaves simply pinnate, or many times pinnate, or ternately divided. Umbels compound, terminal. Involucra variable; involucels of many leaves. Flowers white or yellow or greenish yellow. According to Besser, the species with obcordate petals narrows at the base are distinguished from the species with ovate petals, which are broadest at the base, and entire or a little margined at the apex. The first constitutes Oreoselinum, and the second the true species of Peucedanum.

Sect. I. Eufue/cedanum (from eu, well, and Peucedanum; this section is supposed to contain the true species of the genus). D. C. prod. 4. p. 176.—Peucedanna legitima, Koch. 1. c.—Peucedanum, Gaertn. fr. 1. t. 21. Spreng. syst. 1. p. 1082. Margin of mericarps narrow. Vitiae 2-4 in the commissure. Dorsal ribs of mericarps 3, the outer 2 more remote than the rest. Involucra usually wanting or of few leaves, rarely of 5-8 leaves.

* Flowers yellow.

1 P. paniculatum (Lois. fl. gall. p. 722.) stem terete, striated, branched at the top; leaves 5 times ternate or trichotomous: segments linear; leaves of involucra 1-2, sectaeous, caducous; involucels of many leaves. 2. H. Native of Corsica. D. C. fl. fr. 5. p. 513. Schulth. syst. 6. p. 565. Umbels numerous, disposed in a panicle. Flowers yellow. Fruit unknown. This is a different plant from the Selimum paniculatum of Spreng.

2 P. officinalis (Lin. spec. p. 353.) stem terete, branched; leaves 5 times tripartite: segments linear, acute, flaccid; involucels of 3 sectaeous leaves, deciduous; pedicels much longer than the fruit. 2. H. Native of Europe, in humid meadows and shady places. In Britain in salt marshes, very rare; as in ditches near Shoreham, Sussex; and at Walton near Harwich, Essex. About a quarter of a mile below Faversham, by the river side. Smith, engl. bot. t. 1767. Hayne, arz. gew. 7. t. 4. P. altissimum, Desf. cat. hort. par. p. 119. P. Alsaticum, Poir. dict. 5. p. 227. Selimum Peucedanum, Sowerby, engl. bot. t. 1767. P. majus Italicum, Bauh. p. 149. Moris, oxon. sect. 9. t. 15. f. 1.—Bauh. hist. 3. p. 32. f. 1. Trag. hist. p. 889. p. 881. Hog's-fennel, Petiv. herb. brit. t. 24. f. 7. Herb smooth, with a resinous juice, and a strong sulphureous smell. In England, Gerard says, it is called Horestrang (or Horestrang (or Horestrang (or Horesrăng), from the German Harstrang), Sulfur-fennel or Hog's-fennel, Sulphur-wort, and Brimstone-wort. The root wounded in spring yields a considerable quantity of a yellow juice, which dries into a gummy resin, and retains the strong scent of the root. Many stimulating qualities have been attributed to the root, but it should seem to be rather dangerous for internal use.

Var. β, Italicum (Mill. dict. no. 2.) segments of leaves or leaflets very narrow, filiform. 2. H. Native of the south of Europe. Lob. icon. t. 781. Leaves of involucre 3-4, as in the species. Leaves almost like those of P. longifolium. Perhaps a proper species or a variety of P. longifolium or P. Morisoni, but very distinct from P. Parisiense. It grows on low mountains, and also in valleys by the sides of rivers in Italy. It is altogether a larger plant than the species.

3 P. ledeneou'ri; stem terete, branched; leaves 5 times tripartite; segments linear, with roughish cartilaginous serrated margins; involuca of few leaves, caducous; pedicels exceeding the fruit. 2. H. Native of Siberia, every where in open situ-
331 segments pedicels and P. leaflets pinnulae leaves in involucrem Native primordial involucrum pinnulae Vittae leaflets leaflets 105. H. p. leaves in leaves leaves leaves in involucels margins secondary triternately cars, to Rutlienica, 1 as 4 the the Var.fi; 567. Fl. 5 feet. 9. Var. Koch, unknown feet. fruit. 8 Var. Koch, Willd. 366. Fl. 5 feet. 11 P. dissem'tum (Led. fl. ross. alt. ill. t. 181. fl. alt. 1. p. 306.) stem terete, leafy; superior branches in whorles; sheaths spreading; leaves pubescent, 4 times pinnate; pinnulae opposite, petiolate, pinnate; leaflets pinnatifid or entire; segments oblong, rather bifid; primordial umbels nearly sessile; involucra and involucels very minute. 2. H. Native of Altaia, on hills at the river Talskowa, near Buchtorminsk. Involucrum of one or few minute setaceous leaves. Petals golden yellow, ovate, acute, inflexed. Ribs of fruit filiform. Vitta 1 in each furrow, and 2 in the commissure.

Dissected-leaved Sulphur-wort. Fl. June. Pl. 4 feet. 12 P. canesc'ens (Led. fl. ross. alt. ill. t. 105. fl. alt. 1. p. 307.) stem terete, leafy; intermediate branches opposite and tern; sheaths closely adpressed; leaves clothed with hoary pubescence, 3 times pinnate; pinnulae opposite, petiolate, pinnate; lower segments pinnatifid; upper ones confluent; lobes broad-ovate, tridentate or entire, acute; involucrum wanting or of one leaf; involucels of many short leaves. 2. H. Native of Alita, on rocks on Mount Arkauia. Leaves of involucels many, lanceolate, acute, with a yellow keel, and white margins. Flowers deep yellow. Petals ovate, acuminate, inflexed. Fruit not seen.

Canescint Sulphur-wort. Fl. May, June. Pl. 1 to 2 feet. 13 P. gracille (Ledeb. fl. ross. alt. ill. t. 306. fl. alt. 1. p. 308.) stem leafless, branched; branches scattered; radical leaves clothed with hoary pubescence, but at length becoming glabrous, bipinnate; pinnulae opposite, pinnate; leaflets nearly opposite, rather trifid; sheaths leafless, stem-clasping, chartaceous, permanent. 2. H. Native of Alita, in dry saltish open places in the Kirghisian-steppe, between Buchtorminsk and the lake called Noor-Saisan. Root thick. Involucra and involucels wanting, or of one or two leaves, which are formed from the pedicels becoming abortive and leaf-like. Flowers polygamous, those in the terminal umbels hermaphrodite and fertile; and those in the lateral umbels male. Vitta 1 in each furrow, and 4 in the commissure. Petals golden yellow, obovate, acute, inflexed. Habit of a species of Ferula, and probably the same as Ferula pinuma, Fall. ex Schultes, syst. 6. p. 598.

Var. β, microcarpum (D. C. prod. 4. p. 309.) seed one-half smaller than in the species.
**Slender Sulphur-wort.** Fl. May. Pl. 1 to 2 feet.
14 P. _debrum_ (Led. fl. alt. 1. p. 310.) stem leafless, branch- ed; branches scattered; upper branches nearly opposite; leaves unknown; sheaths leafless, stem-clasping, chartaceous, permanent; fruit orbicularly elliptic. _H._ Native of Altaiia, in exposed dry sterile places, at the river Tchuva. Habit more robust than that of the preceding species, and the stems more branched and more flexuous. Umbels polygamous. involucra and involucels wanting, unless they are caducous. Vitae 1 in each furrow, and 4 in the commissure.

**Doubtful Sulphur-wort.** Pl. 2 to 3 feet.

**Golden-flowered Sulphur-wort.** Fl. June. Cht. 1779. Pl. 3 to 4 feet.
17 P. _capillaceum_ (Thunb. prod. 50. fl. cap. 257.) stem terete, striated, naked, nearly simple; radical leaves 5 times trichotomous; segments subulate, furrowed, caducous. involu- cera and involucels of 5-6 lanceolate-subulate leaves. _F._ Native of the Cape of Good Hope, on the mountains. Siech. pl. exciss. no. 212. Flowers yellow, according to Thunberg. Fruit ovate, compressed, margined winged, having 3 elevated ribs on each side, ex Thunb.

**Copitated-flowered Sulphur-wort.** Pl. 1 foot.
18 P. _teutonicum_ (Thunb. prod. 50. fl. cap. 257. but not of Poir.) stem striated, terete, a little branched; leaves bipinnatifid; segments lanceolate and alternate, margined: sheaths broad, stipula-formed at the base of the petioles; involucre and involucels of 6 leaves. _F._ Native of the Cape of Good Hope, on the mountains. Spreng. _Fl._ 3. p. 59. Fruit ovate, margined, winged on the back, with 5 ribs, ex Thunb.

**Fine-leaved Sulphur-wort.** Pl. 2 to 3 feet.
19 P. _virgate_ (Cham. et Schlecht. in Linnaea. 1. p. 392.) stem terete, shrubby; leaves stiff, pinnate; leaflets lanceolate, quite entire, mucronate, with revolute margins; involucre and involucels of many short leaves. _F._ Native of the Cape of Good Hope, on the mountains. Borch. cat. pl. afr. austr. no. 2868. The whole plant is quite glabrous and coriaceous. Petals ovate, yellow, entire at the apex, or hardly emarginate. Fruit said to be elliptic, with 5 ribs on the back, having a complanate margin.

**Twiggy Sulphur-wort.** Shrub.

**Flowers cream-coloured.**
20 P. _Schoettii_ (Bess. in litt. ex D.C. prod. 4. p. 178.) stem terete, a little branched; leaves pinnate-parted: segments linear, acute, entire or divided; involucra and involucels none. _H._ Native of Volynia and Podolia. Imperatoria Chabarei, Bess. _Fl._ 3. p. 570. Very like _Palminia Chabarei_, but differs in the lobes of the leaves being more diverging, in the rays of the umbels being quite smooth, in the involucels being wanting, and in the furrows being furnished with one vitrea each.

**Schott's Sulphur-wort.** Pl. 2 to 3 feet.
21 P. _O. orientale_ (Led. fl. alt. 1. p. 310.) stem terete, branched, fistular; leaves pinnate; leaflets bipinnatifid; lobes linear-oblong, acute; involucrum wanting; involucels of a few leaves. _H._ Native of Nipaul, on the Himalaya at Gosaingthana. P. _sulfitum_ D. C. prod. 4. p. 178. but not of _Sclerina?_ dissection, Wall. _Fl._ 3. p. 598. Habit of _Ethusa_ or _Thyselium_. Fruit nearly orbicular, with a narrow margin. Vitae all evident, solitary in the furrows, and twin in the commissure. Flowers cream-coloured or greenish, according to the dried specimen.

**Eastern Sulphur-wort.** Pl. 1 to 2 feet.

**Flowers white.**

**Parsian Sulphur-wort.** Fl. May, July. _Fl._ 300. Pl. 4 to 5 feet.
23 P. _l. aureum_ (D.C. prod. 4. p. 179.) stem terete, branched; leaves binate; leaflets broad-linear, elongated, acuminate, with a few anned serratures; involucra and invo- lucels wanting; fruit with membraneous wings. _H._ Native of Nipaul, and at Deera-Dhoom. _Fl._ 3. p. 312. Sulphur-wort; Wall. _Fl._ 3. p. 598. Flowers white, but rose coloured in a dried state. The fruit is nearly like that of section 4, but the involucra are wanting. Commis- sure furnished with 2 curved vittae.

**Glacous Sulphur-wort.** Pl. 2 to 3 feet.
24 P. _vaginatum_ (Led. fl. oss. alt. ill. t. 608. fl. alt. 1. p. 512.) root creeping; stem simple; leaves pinnate, pinnae opposite, pinnae alternate, pinnae-parted, or tripartite, or entire; segments linear, acute; sheaths membraneous; in- volucrum wanting; leaves of involucels linear, length of umbel- lules. _H._ Native of Altaiia, in meadows at the rivers Irtysh, and Koksun. _Fl._ 3. p. 396. Flowers white; petals tapering into an inflexed point. Vitae 2 in each furrow, and 4 in the commis- sure. Stylodium and styles purple. Margin of mericarps broad.

_var. _F._ _P. pimilum_ (Led. fl. alt. 1. c.) differs from the species in the stems being only 3 inches high, furnished with leaves at the root; mericarps nearly one-half smaller.

**Sheathed Sulphur-wort.** Pl. ½ to 1 foot.

UMBELLIFERÆ.

25 P. synleularis (D. C. prod. 4. p. 179.) stem terete, furrowed; leaves bipinnate or tripinnate; leaflets pinnatifid; segments linear-lanceolate, bluish; involucre and involucels of many leaves; fruit lanceolate-elliptic.  

26 P. Bicaëlsse (Koch, umb. p. 94.) stem furrowed at the top, much branched; leaves bipinnate; leaflets pinnatifid; segments linear, acute; leaves of involucra many, rather toothed; leaves of involucels cohering at the base, exceeding the umbelules.  

27 P. Alsaticum (Lin. spec. 354. but not of Poir.) stem angularly furrowed; branched; leaves tripinnate; leaflets pinnatifid; segments oblance, mucronate, with serrately sebaceous margins; involucre and involucels of many lanceolate-linear leaves, which are subulate at the apex; fruit elliptic-oblong.  

29 P. Cervaria (Meyer, verz. pflanz. p. 126.) plant glabrous, glaucouscent; stem fistular, terete; leaves bipinnate and tripinnate; leaflets membranous, ovate, or a little cordate, cut, mucronated toothed; petioles nearly terete, fistular; sheaths narrow; leaves of both involucra and involucels setaceous; mericarps peltate, with narrow margins; the 3 dorsal ribs sharp.  

30 P. Cervaria-leaved Sulphur-wort. Pl. 3 to 5 feet.  

31 P. Austriacum (Koch, umb. p. 94.) stem sulcate; leaves tripinnate; leaflets ovate, cuneate at the base, coarsely toothed, pinnatifid; teeth bluntish, mucronate; leaves of involucra linear.  

32 P. montanum (F.L. fr. 3. p. 420.) Oreo selinum Austria, Hoff. umb. p. 155. Vitellæ usually 4 in the commissure, and often 2 in the outer furrows, ex Koch, in litt. P. montanum, involucræatum, et Rabilense, are probably only varieties of this species. Besser makes P. Austriacum and montanum one species and P. involucræatum et Rabilense another. The petioles of the radical leaves are divided into 3 branches.  

XCVI. PEUCEDANUM.

white, with a purplish outside. The plant is recommended in the gout; and in Styria they use it in intermittent fevers.  

Var. P. latifolium (Viv. ital. fragm. 1. p. 18. t. 22.) leaves broader and less glaucous.  

Var. g. disséctum (D. C. prod. 4. p. 180.) leaflets pinnatifid; lobes 3-5-cleft.  

30 P. Oreo selinum (Cusson, ex Lapeyr. a. p. 149.) stem terete, striated; leaves tripinnate; petioles bent back; leaflets remote, ovate, deeply pinnatifid, divaricate, shining; teeth rather mucous; fruit oval-orbicular.  

35 P. Alpestre (Lin. spec. 353.) stem terete, furrowed, branched; leaves thrice or 4-times ternate; leaflets linear, acute; involucre of many reflexed leaves; umbels of many rays; involucres of many acute, leaves rather shorter than the umbrellas. *4. H.* Native of the Alps. Selinum tenuifolium, Wall. Fl. alp. Desf. hort. par. cat. 119. Horn. hort. hafn. 1. p. 276. P. minus, Poir. suppl. 5. p. 228. but not of others. The leaves agree with those of *P. montanum.* Flowers yellow.

**Alp Sulphur-wort.** Fl. June, July. **Cht.** 1759. Fl. 2 to 3 ft.

34 P. Wallichianum (D. C. prod. 4. p. 181.) stem terete, branched; leaves supra-decompound; leaflets linear, cuspidate, smooth; involucra and involucres composed of cut leaves; ribs of fruit elevated; vittae in the commissure 4. *4. H.* Native of the East Indies, at Sirinagar; and of Nipaaul at Kamaon and Gosaingthang. Selinum tenuifolium, Wall. Fl. alp. Leaves, habit, and involucrum like those of *P. involucratum.* Ribs of fruit more elevated than in the rest of the species of the present genus, and nearly as in *Selinum* exsertum, but the commissure is broad, as in the other species of the genus.

Wallich’s Sulphur-wort. Fl. 2 to 3 feet.

**Involuterata Sulphur-wort.** Fl. July, Aug. **Cht.** 1810. Fl. 2 to 3 feet.

**Broad-leaved Sulphur-wort.** Fl. July, Aug. **Cht.** 1816. Fl. 2 feet.

**Selinum-like Sulphur-wort.** Fl. 2 to 3 feet.

39 P. Polyphyllum (Lede. fl. ross. alt. t. 309. fl. alt. 1. p. 314.) stem sulcate; leaves numerous, bipinnate; leaflets pinnatifid, trifid, or entire; segments oblong or linear, acute, with smooth margins; leaves of involucrum lanceolate, with membranous margins, deciduous. *4. H.* Native of dry rocks at the rivers Tscharysch and Kerlyk, near Riddersk, Lekwetis and elsewhere; on sandy hills, about Schulbinsk at the river Irtysch. Involucres of many leaves, like those of the involucrum. Flowers white; outer petals deeply emarginate, with an inflexed point. Mericarpers with rather prominent ribs, ridged by a broad margin. Vitae in the commissure, and 1 in each furrow: the outer ones as broad as the furrows.

Var. a. pubescens (Ledeb. fl. alt. 1. p. 315) segments of leaflets short, oblong, crowded, covered with fine down or thick short hairs; stem at most 2 feet high. *4. H.* Native on dry rocks, at the rivers Tscharysch and Kerlyk.

Var. b. glabrum (Led. 1. c.) segments of leaflets longer, oblong-linear, more remote, glabrous; stem 3 feet high, or more. *4. H.* Native in sandy places, near Schulbinsk and Lekwetis.

Var. c. lineare (Led. 1. c.) segments of leaflets elongated, linear, rather falcate, remote, glabrous; stem 2 feet high. *4. H.* On rocks about Riddersk.

**Many-leaved Sulphur-wort.** Fl. June. **Cht.** 2 to 3 feet.

**Whorled-branched Sulphur-wort.** Fl. July. **Cht.** 1653. Fl. 4 to 6 feet.

† Species not sufficiently known.

41 P. Isetense (Spreng. umb. spec. 57, and in Schultes, syst. 6. p. 569) stem angular, much branched; leaves terete; leaflets trifid and pinnatifid; segments lanceolate, cuspidate, veiny; umbels axillary; involucra and involucres of
many leaves. \( \mathcal{Y}. \) H. Native of Siberia, on the mountains.—
Gmel. sib. 1. p. 190. t. 42. Root thick, fusiiform. Habit of 
Trinia. Flowers cream-coloured. Fruit oval, a little 
winged. This species probably appertains to sect. 
Thyselium.

42 P. Créticum (Lin. spec. 354.?) stem terete, knobbed at
the origin of the leaves; leaves glaucous, pinnate; leaflets mul-
tifid: segments linear; umbel of 8-10 rays; involucrum of many
short, reflexed leaves; fruit oblong, glabrous. \( \mathcal{Y}. \) H. Native
of Canadia. Ligústico Créticæ, fœniculi folio, caulo nodosó,
57 and 58. f. 1. agrees well with this plant, but the figure of 
P. Alp. extt. p. 528. cited by Limnæus, is very different from it.

Cretan Sulphur-wort. Pl.?
43 P. microphyllum (Smith, in Rees’s cyclo. no. 11.) leaves 
tripinnate; leaflets 3-lobed, fleshy; involucrum hardly any.
\( \mathcal{Y}. \) H. Native of Siberia, in salt deserts about the Volga. 
Peucedanum salinum, Pall. in Spreng. syst. 1. p. 910. 
Athamânsia tenuifólia, Willd. herb. ex Spreng. Involution of 1
celeanous leaf, which is also sometimes absent. Fruit unknown.

A doubtful species.

Small-leaved Sulphur-wort. Pl. 2 to 3 feet?
44 P. japonicum (Thumb. fl. jap. p. 117.) stem terete, flex-
uous, branched; leaves 5-times 3-parted; leaflets cuneiform,
trifid; petioles broad, sheathing. \( \mathcal{Y}. \) H. Native of Japan, 
The whole plant is glabrous, and hardly a foot high. Mercicarps 
pressed, ovate, scarcely winged.

Japan Sulphur-wort. Pl. 1 foot.
45 P. Terna’tum (Nutt. gen. amer. 1. p. 182.) stem striated,
few-leaved; leaves on long petioles, ternate; leaflets long,
linear, acute, quite entire, attenuated at the base; involucrum 
almost wanting; involucels very short, 5-6-leaved; fruit oblong, 
elliptic, winged. \( \mathcal{Y}. \) H. Native of Carolina, in woods by the 
sides of marshes. Flowers unknown. Calyx entire. Margin
of calyx thick. Probably a species of Pastinaca.

Ternate-leaved Sulphur-wort. Pl. 3 feet.
46 P. verticillâta (Rafin. fl. lud. p. 81.) leaves decom-
pound; leaflets filiform: lower ones in whorls. \( \mathcal{Y}. \) H. 
Native of Louisiana, in humid places. Rob. trav. louis. 3. p. 461.

Whorled-leaved Sulphur-wort. Pl. 2 to 3 feet?
47 P. rupe’stre (Hoffmans. and Willd. in Schultes. syst. 6.
572.) leaves supra-decompound; leaflets linear, very narrow,
trifid; petioles and involucels of many leaves; umbellules 
usually 5-flowered. \( \mathcal{Y}. \) H. Native of Portugal. The rest
unknown.

48 P.? genicula’tum (Forst. fl. ins. auct. p. 136.) plant 
glabrous, branched, prostrate; stem terete, striated; leaves
alternate, cuneate at the base, quite entire, semi-ornicular at
the apex, and crenated; petioles shortly and bluntly auriculated
at the base; umbels pedunculate, of 2-3 rays; involucrum of
2-3 leaves; umbellules many-flowered; petals inflexedly cor-
date at the apex. \( \mathcal{Y}. \) H. Native of New Zealand. Bowsliésa 
geniculâta, Spreng. umb. spec. 14. t. 5. f. 11. But it certainly
is not a species of Bowsliésia, from the calyx being without teeth.

Kneed Sulphur-wort. Pl. prostrate.
49 P. Sprengelii (D. C. prod. 4. p. 182.) stem terete, 
branched; leaves bipinnate, lanceolate; leaflets pinnatifid, ses-
sile: segments lanceolate, mucronate, veiny, with serrately
scabrous margins; floriferous branches panicked. \( \mathcal{Y}. \) H. Na-
tive country unknown. Selinum paniculatum, Spreng. pug. 2.
p. 50. sist. 1. p. 909. Flowers yellow. Fruit with 3-winged
margins, having the ribs obsolete, and the furrows plano-
convex.

Sprengel’s Sulphur-wort. Pl. 2 to 3 feet?
plant has the appearance of a species of *Ligusticum*. Fruit winged, as in *Puccinellium*, sect. iv. but the calyx teeth are obsolete, and the involucrum is wanting, as in the other species of *Imperata*.

*Caucasian Masterwort*. Pl. 1 to 2 ft.

4 I. *MEXICANA* (Hort. Chelsea). 2 H. Native of Mexico. A broad-leaved species, received by Mr. Anderson, of the Chelsea Botanic Garden, from Mr. Otto, of the Botanic Garden at Berlin, in the year 1818, but it has not yet flowered. It may prove hereafter to belong to a distinct genus.

*Mexican Masterwort*. Clt. 1818. Pl. 3 to 4 ft.

*Cult*. Plants of easy culture; and may be either increased by dividing the roots or by seed.

**Lin. syst. Pentândria, Digynia.** Margin of calyx somewhat 5-toothed or nearly obsolete. Petals oval, acuminate, incurved. Fruit compressed on the back, winged on the margin, nearly orbicular, emarginate at the base. Mericarps with 3 blunt, dorsal, nerve-formed ribs; the 2 lateral ribs expanded into wings, which cover the whole surface of the fruit. Vitta 1 in each dorsal furrow, which are narrow, and 1 on each side of the commissure at the margins. Parts of carphophore adnate to the mericarps. Seed complanate.—A perennial herb, with the habit of *Angélica* or *Ostéricum*. Sheaths of leaves large: upper ones leafless. Umbels pubescent, of many rays. Involucra none, or of few leaves. Umbellules dense, many-flowered. Involution of many setaceous leaves. Flowers white. This is an intermediate genus between *Angélica* and *Imperatia*.

1 C. *Dahurica* (Fisch. in litt. D. C. prod. 4. p. 184). 2 H. Native of Dahuria, near Nertschinsky-Sawod. Thys-selium Dahuricum, Spreng. syst. 1. p. 894. Habit of *Ostéricum praticás*, but more branched, firmer, and thicker in the stem. Habit also of *Angélica Razočhóí*, but the leaves are more deeply serrated, the sheaths larger and inflated, and the involucrum composed of one or two leaves.

*Cult*. See Imperatia above for culture and propagation.

**XCIX. BUBON** (from βούβω, boubon, the groin, or a tumour in that part, or elsewhere, which this herb was supposed to cure). Koch, umb. 95. D. C. prod. 4. p. 184. but not of Spreng.—*Bubon* species, Spreng, in Schultes, syst. —*Agasyllis* species, Spreng. prodr. —Galbanophora, Neck. elem. no. 292.

**Lin. syst. Pentândria, Digynia.** Margin of calyx obsolete. Petals obovate, entire, with an acute involute point. Fruit lenticularly compressed from the back, girded by a dilated complanate margin. Mericarps with 5 ribs at equal distances: the 3 intermediate ones filiform; and the 2 lateral ones lost in the complanate margins. Vitta covering the whole seed, 4 on the back and 2 in the commissure. Carphophore bipartite. Seed rather convex, flattish in front.—Quite smooth shrubs, natives of the Cape of Good Hope, abounding in a gummy, resinous, sweet-scented juice. Stems terete. Leaves biternate, glaucous, stiltish; leaflets toothed or pinnatifid; petioles sheathing. Umbels compound, of many rays. Involucre and involucels of many linear leaves. Flowers greenish yellow.

1 B. *Galbanum* (Lin. spec. p. 364.) leaflets cuneate, rhomboid, deeply toothed at the apex; terminal ones 3-lobed. 2 H. G. Native of the Cape of Good Hope, on hills. Jacq. vind. 3. t. 36. Thumb. fl. cap. 253. Berg. cap. 77. Woodv. med. bot. 34. t. 12. Sims, bot. mag. 2489. Selium Galbanum, Spreng, in Schultes, syst. 6. p. 563. Agasyllis Galbanum, Spreng. prodr. 22. Pluk. alm. t. 12. f. 2. Herm. par. 163. with a figure. Dorsal vittae of fruit under a thick pericarp. Stem with purplish bark, covered with whitish powder. This was formerly supposed to be the plant which yielded the drug called gum galbanum; but it has lately been discovered to be the produce of quite a different plant, a native of Persia, now called *Galbanum officinale*.

2 B. *Dùmmiferum* (Lin. spec. 364.) leaflets cuneate at the base, pinnatifid: segments lanceolate, acute. 2 H. G. Native of the south of Africa. Selinium gummiferum, Spreng, in Schultes, syst. 6. p. 564.—Comm. Hort. amst. 2. p. 115. t. 58. Like the preceding, but differs in the leaves being more finely divided. Dorsal vittae of fruit superficial.

*Cult*. A mixture of loam, peat, and sand is a good soil for these shrubs; but they can only be propagated by seed.

**Lin. syst. Pentândria, Digynia.** Margin of calyx obsolete. Petals roundish, entire, involute, with a somewhat quadrately reduced point. Fruit lenticularly compressed from the back, girded by a complanate margin. Ribs of mericarps filiform, at equal distances: the 3 intermediate ones acutely keeled: and the 2 lateral ones more obsolete, and running into the flattened margin. Vitta broad, solitary in the furrows, and filling them, but twin in the commissure. Seed rather convex, flattish in front.

—Annual erect, glabrous herbs. Leaves decompound, with linear-setaceous lobes. Involucre and involucels wanting. Flowers yellow, nearly like those of *Pastináca*.

1 A. *ségetum* (Lin. mant. 219.) fruit oval, nearly destitute of the membranous margins. 2 H. Native of France, Portugal, Sardínia, Greece, Persia, &c. Jacq. hort. vind. t. 192. D’Urv. nemum. p. 33. Broth. fl. hirs. 1. p. 465. Münn. ségetum. Guss. prod. fl. sic. 1. p. 346. Anéthum grávuléns, Ucria, ex Guss. A. pusillium, Hortul. Perhaps only a variety of the following, according to Brotero; but it differs from it in the mericarps being almost without a margin, and in being rather more convex on the back, and therefore holds an intermediate station between *Anéthum* and *Funiculium*.

*Corn-field Dill*. Fl. June. Fl. 1796. Pl. 2 to 1 foot.

but smaller and more glaucous; it has finely divided leaves, and a slender single stem. The whole plant is powerfully aromatic. The leaves are used to heighten the relish of some vegetable pickles, particularly cucumbers; and also occasionally in soups and sauces. The whole herb is also used in medicinal preparations. Dill is raised from seed, of which half an ounce is sufficient for a bed 3 feet by 4 feet. Sow annually in February, March, or April, or occasionally in autumn, as soon as the seed is ripe, to come up stronger in the spring, in any open compartment, either in drills, 6 or 12 inches apart, or broad-cast thinly, and raked in evenly. The plants should remain where raised, and may be thinned moderately, should they rise too thick. They will shoot up in stalks, with leaves and seed umbels in summer and autumn, for use in proper season. Leave some plants when raised for seed; they will furnish plenty in the autumn. The bruised herb is anodyne and resolvent. The seeds are aromatic, and contain an ethereal oil, and useful, therefore, in flatulencies; the essential oil is also good in the colic. A distilled water, drawn off to the quantity of a gallon to a pound of seeds, was ordered in the London Pharmacopoeia, and occasionally made the basis of carminative draughts, and juleps; its flavour is more agreeable than that of the seeds in substance. Along with the water arises a considerable quantity of essential oil, which is given from 1 to 3 or 4 drops, or more, as a carminative. This, however, is now altogether disused.

3 A. So'wa (Roxb. hort. beng. p. 22.) fruit oblong, nearly destitute of a membranous margin. O. H. Native of the East Indies, where it is called So'wa, and where it is cultivated for its use in medicine. Fleming. ind. med. in soc. asiat. 11. p. 156. ex Schultes, syst. 6. p. 628. Herb very like the preceding. Rays of umbel 5-16. Fruit flat, 5-ribbed, almost wingless.

† Species not sufficiently known.

4 A. cymbo-ca'rum (D. C. prod. 4. p. 186.) fruit elliptic, puberulous on the outside, when examined by a lens, with a very narrow margin. O. H. Native of Persia, about Seidkhdzi, where it was collected by Szowits. Plant small, glabrous. Root slender, simple. Leaves many-parted: lobes linear. Umbels pedunculate, opposite the leaves, 3-6-rayed, without involucre. Umbellule 6-7-flowered, surrounded by an involucre. Flowers unknown, but probably yellow, as the other species. Fruit appearing turgid at first sight, ellipsoid, but empty inside, from the mericarps being thin and concave. Carpophore filiform, bipartite. Mericarps of the same structure as the other species of the genus.

Boat-fruited Dill. Pl. 1 foot.

Red-stemmed Dill. Pl. 1 foot.

Cult. All the species grow very well in the open border, where the seeds should be sown.

VOL. III.

CI. CO'RTIA (in honour of Bonav. Corti, who was the first to discover the motion of molecules in the cells of plants). D. C. prod. 4. p. 186.—Schultzia species, Wall.

Lin. syst. Pentßndria, Digînîa. Teeth of calyx elongated, acute. Petals lanceolate, acuminated, entire. Stylodium conical; styles diverging. Fruit elliptic, rather retuse at both ends; mericarps flattish, 5-ribbed: ribs winged: lateral ribs the broadest; vitte 1 in each furrow, and 2 in the commissure, which is broad and flat. Seed flattish.—A nearly stemless herb. Leaves petiolate, pinnate; leaflets divided into short, capillary segments. Scapes, some of them thick and stem-formed, bearing an involucrum, composed of 2-3 multifid leaves; others are elongated, and bearing an umbel, which is usually of few rays. Involute of 5-7 linear, entire, or 2-3-elef acute leaves. This genus differs from Schultzia in the calyx being 5-toothed, and in the fruit being compressed from the back, not from the sides, evidently 5-winged.

Lindley's Cortia. Pl. 1 foot?

Cult. Sow the seeds in the open border in spring, in a warm sheltered situation.

CII. CAPNOPHYLLUM (from κανάω, kanos, the Greek name for fumitory, and φύλλον, phyllon, a leaf; resemblance in leaves to those of fumitory). Gaertn. fruct. 2. p. 32. t. 85. Koch, umb. p. 95. no. 24. in add.—Cônum species, Auct.—Rûnia, Link. but not of Gaertn.

Lin. syst. Pentßndria, Digînîa. Margin of calyx obsolete. Petals oblong, somewhat emargiante, tapering into an indented point. Fruit lenticellate compressed, girded by a complanate, dilated margin. Mericarps having the 3 intermediate ribs thickish, keeled, rather flexuous or tubercled: the lateral ribs lost in the dilated margins. Vitte solitary in the furrows, and twin in the commissure. Seed rather convex, but flat in front.—Annual herbs, natives of the Cape of Good Hope, with leaves almost like those of fumitory, whence the name. Leaves hoary, multifidly decumbent, with linear, cuneate segments. Umbels opposite the leaves, or nearly terminal. Involucra and involucels composed of 3-6 leaves, with membranous edges. Flowers white.

African Capnophyllium. Pl. 1 foot.

Cult. Sow the seeds in a warm sheltered situation in spring.

Lin. syst. Pentßndria, Digînîa. Margin of calyx 5-toothed (f. 64. a.). Petals acumination, reflexed (Ell.); anthers erect, adnate to the sides of the filaments (Ell.). Fruit flaky com-

X x
pressed (f. 64. c.) from the back. Mericarps with 5 filiform, rather keeled ribs, at equal distances, approximate; lateral ribs dilated into a membranous margin (f. 64. c.), broader than the fruit. Vitae solitary in the furrows, and filling them, and twin in the commissure. Carpophore bipartite. Seed flat.—Glabrous herbs, natives of North America, in marshes. Stems terete. Leaves reduced to petioles, which are terete, acute, fistulare, and jointed, without any leaflets. Involutae and involucres of 4-5 subulate leaves. Flowers white.—Habit of Sium, Čánáh, and Otoía, but the fruit is that of Anékthum, and the anthers are very different from those of all other umbelliferous plants.

Terete-leaved Tiedemanniæ. Pl. 1 foot.

Cult. Sow the seeds of this plant in a pot filled with peat, and place a pan of water under it.

CIV. ARCHEMÓRÁ (from Archemorus, in mythology, son of Lycurgus, slain by an adder; in reference to the poisonous quality of the plants). D. C. coll. diss. 5. p. 52. prod. 4. p. 188.

LIN. SYST. Pentándria, Digynia. Margin of calyx 5-toothed. Petals obcordate, with an inflexed point. Fruit compressed from the back, flat, oval, or obovate. Mericarps with 5 filiform, rather keeled ribs at equal distances, approximate; lateral ones dilated into a membranous margin, which is almost broader than the seeds. Vitae solitary in the furrows, and filling them; but twin in the commissure. Carpophore bipartite. Seed flat.—Marsh herbs, natives of North America. Leaves pinnate. Involute wanting, or of few leaves; involucres of many leaves. Flowers white. Habit of Čánáh or Sium. Fruit of Pastináca.

1 A. ambigüa (D. C. prod. 4. p. 188.) stem smooth; leaves pinnate; with 3-5 pairs of linear, sessile, undivided, acute leaves; involucrum wanting; involucres of 3-5 subulate leaves; fruit oval. 2. B. H. Native of New Jersey, and about Philadelphia, in marshes. Čánáh ambiguus, Nutt. gen. amer. 1. p. 189. Pastináca ambiguus, Torr. fl. un. st. 1. p. 315. Sium longifólium, Pursh, fl. amer. sept. 1. p. 194. Habit almost of Čánáh peucedanifólia, ex Nutt. Hardly distinct from the following. This is a truly poisonous herb.

Ambiguous Archemora. Pl. 6 to 10 feet.

3 A. tricuspidáta (D. C. prod. 4. p. 188.) leaves pinnate; lower leaflets lanceolate; upper ones obovate, tridentate; involucrum caducous. 2. B. H. Native of Carolina, in humid places. Sium tricuspidatam, Ell. sketch. 1. p. 354. Sium rigidus, Walt. cit. 114. According to Elliot, this is very like the preceding species.

Tricuspidate-leafletted Archemora. Pl. 2 feet?

4 A. denticuláta (D. C. prod. 4. p. 188.) leaves pinnate; with usually 3 pairs of oval, denticulated, acute leaflets; involucres of 2 leaves, rarely wanting. 2. B. H. Native of Georgia, in humid places, and along the sides of water. Stem 3-4 feet high.

Denticulate-leaved Archemora. Pl. 3 to 4 feet.

Cult. The species of Archemóra grow best in peat earth, in a moist situation; and they will be easily increased by dividing at the root.

LIN. SYST. Pentándria, Digynia. Margin of calyx obsolete, or minutely denticulated. Petals roundish, entire; involute: with a broad, retuse point. Fruit compressed from the back, girdled by a dilated, complanate margin. Ribs of mericarps very slender: the 3 dorsal ones at equal distances: and the 2 lateral ones contiguous to the dilated margin. Vitae linear, acute, hardly shorter than the ribs, solitary in the furrows, but twin or more in the commissure. Carpophore bipartite. Seed flat.—Herbs with fusiform, usually fleshy roots. Leaves pinnate; leaflets toothed, cut, or lobed. Umbels compound. Involute and involucres none, or of very few leaves. Flowers yellow.

The garden parsnip, is called Panaís, in French, Pastinake in German, and Pastinaca in Italian. It has smooth leaves, of a light yellowish green colour, in which it differs from the wild plant, the leaves of which are downy and dark green; the roots also are thick and fleshy, and have a milder taste; it does not differ so much from the native plant, as the cultivated does from the native carrot.

Use.—The parsnip has long been an inmate of the garden, and was formerly much used. In Catholic times it was a famous
The leaves are long; roots generally from 20-30 inches long, and from 3 to 4 in diameter.

2. The leaves are somewhat stronger and taller than those of the common sort. The roots are oblong, about 18 inches long, more swollen at the top, and not tapering gradually, but ending rather abruptly, about 4 inches in diameter at the shoulder.

4. The leaves of this sort are few, and do not exceed 12 or 13 inches; the roots are from 4 to 6 inches in diameter, funnel-shaped, tapering very abruptly, with a strong tap-root, the whole being from 15 to 15 inches long. The shoulder is broad, and grows above the surface of the soil. The flavour of this parsnip is superior, and when dressed is of a yellow colour than the other varieties.

Soil.—The soil most proper for the parsnip should be light, free from stones, and deep. It should be dug or trenched before sowing, at least 2 spits deep; and the manure should either be perfectly decomposed, or if recent, deposited at the bottom of the trench.

Seed estimate and sowing.—Sow in the end of February, or in March, but not later than April, and for a seed-bed 5 feet by 20, the plants to remain thinned to 8 inches' distance, half an ounce of seed is the usual proportion. Having prepared either beds 4 or 5 feet wide, or one continued plot, sow broadcast, moderately thin, and rake the seed well into the ground.

Culture.—When the plants are about 1-2 or 3 inches high, in May or June, let them be thinned and cleared from weeds, either by hand or by small hoeing, thinning them from 8 to 12 inches' distance. Keep them afterwards clean from weeds, till the leaves cover the ground, after which no further culture will be required. The roots will be pretty large by the end of September, from which time a few may be drawn for present use: but the parsnip is far best at full maturity, about the close of October, indicated by the decay of the leaf. The root will remain good for use till April and May following.

Preserving during winter.—The parsnip is not so liable as the carrot to be hurt by frost if left in the ground. But it would be proper in the beginning of November, when the leaves decay, to dig up a portion of the roots, and to cut the tops off close, laying them in sand, under cover, ready for use in hard frosty weather. The rest will keep good in the ground till they begin to shoot in the spring; then in February or March dig them up; cut the tops off; and, preserved in sand, the roots will remain sound till about the end of April.

To save seed.—Transplant some of the best roots in February, 2 feet asunder, inserted over the crowns; they will shoot up in strong stalks, and produce large umbels of seeds, ripening in autumn.

Field culture of the parsnip.—The parsnip has been partially introduced of late years as a field plant, and is nearly equal to the carrot in its product of nutritive and saccharine matter. Its culture as a field plant has been chiefly confined to the island of Jersey, where it attains a large size, and is much esteemed for fattening cattle and pigs. It is considered rather more hardy than the carrot, and its produce is said to be greater. It may be sown either in autumn or spring, and its seeds admit of drilling by machinery. The plants, when they come up, are more easily recognised than carrots, and therefore their culture is on the whole more simple, less dependent on manual labour, and therefore more suited to farming. For the rest their culture is the same as that of the carrot. The variety best suited for the field is the Large Jersey, the seed of which should be procured from the island, as that of the garden parsnip sold by seedsmen never attains the same size. The quantity of seed required for sowing in drills is from 3 to 5 lbs. per acre, and for broad-cast 6 or 8 lbs. It must always be new, as two year old seed does not come up freely. It may or may not be prepared by steeping, but it requires no earth or sand intermixed with it, as it passes freely through the same drill that will sow tares or pease. The time of sowing is generally about the middle of February; but some sow in September, in which case the seed does not vegetate till early in spring. This last method is obviously against the culture of the soil, which must thus remain a year in a consolidated state. The manner of sowing is generally in drills 15 or 18 inches distant; but some sow broad-cast and harrow in the seed; and in Jersey, parsnips and beans are generally cultivated together. The beans are first dibbled in, and afterwards the parsnip seed scattered over the surface and harrowed. It is acknowledged that a good crop of both plants is never obtained; and therefore, though this mode may be found to answer in the mild climate of Jersey, it is not to be imitated in other places. Drills or broadcast, without any intermixture of plants, are the only advisable modes. The after culture of the parsnip is the same as that for the carrot, with this difference, that the parsnip, when sown broad-cast, is generally thinned out to 12 inches at an average, plant from plant, and when in rows 18 inches apart, to 9 inches in the row. The produce of the parsnip is said to be greater than that of the carrot, and the economical application the same. In the fattening of cattle it is found equal if not superior, performing the business with as much expedition, and affording meat of exquisite flavour, and a highly juicy quality. The animals eat it with much greediness. It is reckoned that thirty perches, where the crop is good, will be sufficient to fatten an ox 3 or 4 years old, when perfectly lean, in the course of 3 months. They are given in the proportion of about 30 pounds weight morning, noon, and night; the large ones being split in 3 or 4 pieces, and a little hay supplied in the intervals of those periods. And when given to milch cows with a little hay in the winter season, the butter is found to be of as fine a colour and as excellent a flavour as when feeding in the best pastures. Indeed, the result of experiment has shown that not only in neat cattle, but in the fattening of hogs and poultry, the animals become fat much sooner, and are more bulky than when fed with any other root or vegetable; and that, besides, the meat is more sweet and delicious. The parsnip leaves being more bulky than those of carrots may be mown off before taking up the roots, and given to cows, oxen, or horses, by whom they will be greedily eaten. Their produce in nutritive matter is 99 parts in 1000, of which 9 are mucilage and 90 sugar. Gerarde says, that a very good bread was made from them in his time. They afford as much spirit as the carrot. The parsnip being more hardy and luxuriant than the carrot, is less liable to the mildew and worms; but equally so to become forked if the soil be not deep and well pulverised, and if the manure be not minutely divided and equally distributed.
Cultivated or Garden Parsnip. Fl. Jul. Brit. Pl. 3 to 4 ft. 2 P. latifolia (D. C. mem. soc. vol. 4, prod. 4. p. 189.) stem terete, striated, pubescent, as well as the petioles and leaves on the under surface; leaves pinnate; leaflets of the lower leaves large, and dilated at the base, and rather cut; of the cauline leaves ovate; involucra and involucres wanting; teeth of calyx obsolete; fruit oval: having the commissure furnished with 2 vittae. 2. H. Native of Corsica, where it was gathered by Soleiro. It differs from P. sativa in the stem being terete, not furrowed; and from P. divaricata in the fruit being oval, not orbicular, in the commissure being furnished with 2 vittae, not with 4-6; and from the other species in the leaflets of the radicles being large.

Var. b, glabrata (D. C. prod. 4. p. 189.) leaves glabrous above, hardly pubescent beneath. 2. H. Native country unknown, but cultivated in the botanic garden at Geneva.

Broad-leaved Parsnip. Fl. Ju. Jul. Clt. 1830. Sh. 3 to 4 ft. 3 P. divaricata (Desf. cat. hor. par. 1815. p. 189.) stem terete, striated; leaves pinnate, clothed with short pubescence on both surfaces; radical leaves with 0-11 leaflets; cauline ones with 3-5; leaflets ovate, cuneate at the base, or cordate, undivided, sharply serrated: teeth mucronate; terminal leaflet longest and somewhat 3-folded; involucra and involucres wanting; fruit nearly orbicular. 2. H. Native of Corsica, at Bastia. P. graveolens, Salzm. exsic. Koch, umb. 91. but not of Bieb. P. sativa, Thom. exsic. P. velutina, Koch, in litt. P. Kóchí, var. Duby, in bot. gall. 1. p. 230. Vitta 4-6 in the commissure, usually interrupted, 2 of which are generally larger than the rest.

Divaricata Parsnip. Pl. 3 to 4 feet. 4 P. lu'cida (Linn. nat. 58.) stem furrowed, much branched; leaves glabrous, stiff, crenated, reticulated beneath; radical ones cordate, usually lobed; cauline leaves ternate or quinate; leaflets attenuated at the base: upper ones ovate-rhomboid; umbels numerous; rather panicked; involucra of 1 leaf; fruit orbicular. 2. H. Native of Balearic Islands. Gounan. ill. 19. t. 11, 12. Jacq. hor. vind. t. 199. Root thick, milky. Stem when cut yielding a whitish, fetid, rue-like, tanecous gum. Yellow flowers.

Shiny Parsnip. Fl. June, Jul. Clt. 1771. Pl. 3 to 4 ft. 5 P. umbrosa (Stev. in litt. ex D. C. prod. 4. p. 189.) stem furrowed, angular; leaves pinnate, pubescent on the nerves and petioles; leaflets oval-oblong, serrate-toothed: terminal leaflet somewhat 3-folded; umbels numerous, rather panicked; involucres dimidiate; fruit oval. 2. H. Native of Tauria. This species was formerly confused with P. graveolens, but is truly distinct from it.

Shady Parsnip. Pl. 2 to 3 feet. 6 P. stenoca'ra (D. C. prod. 4. p. 189.) stem striated, glabrous; leaves smoothish, pinnate; leaflets decurrent, oblóng-linear, cut, and toothed; involucre wanting; involucres of few leaves; fruit oblong.—Native of Siberia. Umbels and umbellules of many rays. Fruit 3 lines long and a line broad, quite glabrous; lateral ribs not expanded into wings, but all filiform, as well as the vittae. Vitta twin in the commissure, solitary in the dorsal furrows, and often wanting in the lateral furrows.

Strong-scented Parsnip. Fl. Jul. Aug. Clt. 1817. Pl. 2 ft. 8 P. s'ekakul (Russ. besch. aep. l. p. 157.) stem terete, downy, branched; leaves pinnate, puberulous; leaflets pinnatifid, cut, bluntly and unequally toothed; peduncles villous; involucre none; involucres of 1-2 leaves; fruit ovate-ornicular. 2. H. Native of Syria, about Aleppo; and of Egypt, near Alexandria. Héracleum púllum, Viv. in litt. Tordylium suavéolens, Delille, ill. fl. aepyt. no. 323. Pastinaca dissécta, Vent. celt. t. 78. Scealáu, Rauw. reis. 1. p. 746. ex Vent. J. Bauh. hist. 3. p. 66, with a figure.—Moris, exoon. sect. 9. t. 4. ultimate figure, and therefore Tordylium Scealakul, Mill. dict. no. 5. Root grey on the outside and white inside, edible. According to Olivier this species of parsnip is cultivated in the Levant under the name of Sceakul.

Sceakul Parsnip. Pl. 1 to 2 feet. 9 P. pimpinelli'o'des (Bieb. fl. taur. 1. p. 237. suppl. 247.) stem angular, branched; leaves pinnate, pubescent; leaflets rather trifid, cut: segments cuneate, deeply serrated: lower ones reflexed: upper ones linear-lanceolate; involucra of 1-3 leaves; involucres of 4-5 leaves, dimidiate, deciduous; fruit orbicular. 2. H. Native of Caucasus and Iberia, in grassy places; and of Persia, near Seichkhozi, in sandy places. Buxb. cent. 3. t. 27. Mill. fig. t. 266. Malabanía pimpinellifolia, Hoffm. umb. 126. and 209. t. 1. f. 6. a. b. Héracleum pimpinellifolium, Spreng. tent. 12.

Cult. The species are only to be increased by seed, which should be sown in spring in the open ground.

CIV. Leiotulus (from λειός, leios, smooth, and νος, nos, an ear; in allusion to the smooth dilated margin of the fruit). Ehrenb. in Linnæa. 1829. p. 399. D. C. prod. 4. p. 699.

Lin. syst. Pentándria, Digynia. Teeth of calyx obsolete. Petals roundish, entire, involute, with a broad retuse segment. Fruit flattened compressed, having a smooth thickened dilated margin: and 3 intermediate approximate ribs, and 2 very remote lateral ones; vittæ filiform, solitary in the furrows, and distant in the commissure.—Herb a span high. Leaves bipinnatifid. Involucre wanting. Involucres of a few very fine entire leaves, but often wanting altogether. Flowers yellow.

1 L. Alexander'nes (Ehrenb. l. c.)—Native of Egypt, near Alexandria, on hills towards Rosetta.

Alexanderian Leiotulus. Pl. 1 to 1/2 foot.

Cult. Sow the seeds in a warm sheltered situation in the open ground.

CIVII. Astyda'mia (a mythological name, daughter of Oceanus; the plant grows on the borders of the ocean, in the Canary Islands). D. C. coll. diss. 5. p. 53. t. 1. f. D. prod. 4. p. 190.

the 2 lateral ribs lost in the margin. Dorsal vittae very few, and the commissural ones are either wanting or covered. Seed unknown.—A smooth, fleshy subshrub. Leaves pinnae; leaflets cuneate, deeply toothed at the apex: ultimate ones confluent. Umbels compound. Involuta and involucres of many leaves. Flowers yellow. It differs from *Crichtum* and *Bupleurum* in the flower being compressed from the back, and in the calyx being 5-toothed; and from *Heracleum* in the vittae not being club-shaped, and in the petals being entire; and from *Laserpitium* in the ribs being hardly elevated, and in the petals being entire; and from *Pastinaca*, to which it is most nearly allied, in the fruit rather being fusingly and a little crested, with the margins hardly flattened.

*Canary-island* Astydemia. Fl. Jul. Clt. 1780. Sh. 1½ ft. Cult. This plant will require the same treatment as is recommended for *Crichtum*, p. 321; but it will require shelter in winter.

**CXLV. SYMPHYLOMA** (from σύμφυος, συμφυκον, to glue together, and λωμα, loma, a fringe; the margins of the mericarps are closely joined together). Meyer, verz. pflanz. p. 127.

Lin. syst. Pentándria Dígnia. Margin of calyx obsolete. Petals equal, emarginate, with an inflexed point. Stylodium without a margin. Styles reflexed. Fruit elliptic, compressed from the back, flat, with rounded margins; mericarps closely joined together at the margins; with 5 filiform ribs; the 3 dorsal ones at equal distances; and the lateral ones more remote and almost marginal. Vittae wanting or obsolete. Seed complanate. Carpophore wanting.—A humble herb. Leaves with 3-5, nearly orbicular leaflets. Involuta none. Petals red. Fruit very singular in its structure, by the mericarps being closely joined at the margins.

Lin. syst. Pentándria, Dígnia. Calyx 5-toothed. Petals obovate, emarginate, with an inflexed point: outer ones usually radiating and bifid. Fruit flatly compressed from the back, girdled by a flat, dilated margin. Mericarps with slender ribs: the 3 dorsal ones at equal distances: and the 2 lateral ones remote from the others, contiguous to the dilated margin. Vitellate solitary in the furrows, and usually twin in the commissure, all flat: dorsal ones 4.—Strong, coarse, robust herbs, with broad, pinnate, ternate, or lobed leaves; petioles large and sheathing. Umbels of many rays. Involuta caducous, usually of few leaves; involucres of many leaves. The species are extremely intricate, and difficult to define.

**CXXI. SYMPHYLOMA**. CIX. HERACLEUM. 341

1 H. *Nepálensis* (D. Don, prod. fl. nep. p. 185.) stem furrowed, rather hairy; lower leaves having the petals twice trifid, binate: with triradiate leaflets; upper leaves ternate: with rather 3 lobed leaflets; leaflets all ovate, acute, and equally serrated, rather hairy above, and pubescent along the nerves beneath: fruit elliptic; commissure furnished with 4 vittae. 7 H. Native of Nipaul. Flowers equal, yellowish. Knees of stems bearded with white wool.

*Nipaul* Cow-parsnip. Pl. 3 to 4 feet.

2 H. *Obtusifolium* (Wall. mss. ex D. C. prod. 4. p. 191.) stem striated, pubescent; leaves ternate or 5-lobed, roundish-cordate; leaflets or lobes obtuse, with a few coarse teeth, rather hairy above, and beset with whitish pubescence beneath; umbels of many rays; fruit ovobovate; commissure furnished with 4 vittae. 7 H. Native of Nipaul. Dorsal vittae linear. Flowers not radiating, cream-coloured. *Obtuse-leaved* Cow-parsnip. Pl. 3 to 4 feet.

3 H. *mu'gens* (Wall. mss. ex D. C. prod. 4. p. 191.) stem striated, pubescent; leaves ternate, with the petals rather hairy; leaflets petiolate, orbicular, rather cordate at the base, toothed, seaborous from hairs above, pubescent beneath; upper leaves bluntly trifid; fruit ovobovate-elliptic; commissure furnished with 4 vittae. 7 H. Native of the East Indies. *Cómium rigens*, Heyne, ex Wall. Leaves of involucres lanceolate, striated, puberulous on the outside. Flowers not radiating, cream-coloured. Dorsal vittae of fruit linear.

*Stiff* Cow-parsnip. Pl. 2 to 4 feet.

4 H. *Flaves'cens* (Baumg. fl. trans. 1. p. 214.) leaves pinate, rough from hairs; leaflets ovate or oblong; flowers yellowish, not radiating; commissure furnished with 2 vittae. 7 H. Native from Dauphiny to Siberia, in the grassy parts of mountains. Jacq. aust. 2. t. 173.

Var. a, *latifolium* (D. C. prod. 4. p. 191.) leaflets lobed or palmately parted, unequally crenate-serrate; flowers uniform, not radiating; fruit orbicular-oval, glabrous, emarginate at the apex. 7 H. Native of Tauria, Caucasus, Siberia, Dachuria, and many other parts of Russia, in rather humid meadows. H. *Sibíricum*, Lin. mant. 354. Beib. fl. taurn. and suppl. no. 556. Hoffm. umb. 143. t. 1. B. f. 1. Schult. syst. 6. p. 475. H. *Austriacum*, Pall. ind. taurn. Spondylyum confórneum, Mrench, mth. p. 83.—Gmel. sib. 1. t. 50. From this plant a spirit is made at Kantschatka, called raka, as related in Cook’s voy. 3. p. 337, where the process of making the spirit is described. It is used also as food.

Var. β, *angustifolium* (D. C. prod. 4. p. 191.) leaflets oblong, lanceolate, or linear, sinuately toothed, ultimate ones confluent. 7 H. Native of Dauphiny, Vallais, Austria, Russia, &c. in waste, grassy fields. H. *angustifolium*, Lin. mant. 56. Jacq. fl. aust. t. 173. H. *Sibíricum* of Lin. has been raised from the seeds of *H. angustifolium*.

*Yellowish* Cow-parsnip. Fl. Ju. Jul. Clt. 1789. Pl. 4 to 6 ft. 5 H. *Osa'nt' (Guss. pl. rar. p. 133. t. 57.) stem furrowed, muricate, almost simple; leaves simple, cordinate, glabrous on both surfaces, rather coriaceous, obscurely lobed, and triplicate.
crenate-serrate; lobes acuminate; flowers rather radiating; involucra almost wanting; leaves of involucres linear; fruit obovate. 2. H. Native of Abruzzo, in gravelly parts of mountains. Habitat of *H. alpinum*, but the flowers are greenish.

Commisssure of fruit furnished with 2 vitte.

*Oryin* Cow-parsnip. Pl. 2 to 3 feet.

6 H. alpinum (Sibth. and Smith, fl. grcc. t. 282, prod. 1. p. 192.) stem much branched; leaves pinnate; leaflets lobed, cut, pubescent: of the radical ones roundish; umbels usually of 3 rays; flowers radiating; fruit orbicular; involucra and involucres almost wanting; vitte semi-circular. 2. H. Native on Mount Parnassus. Habitat of *Pastinaca sativa*; but the petals are obsolete, with an inflexed mucrone. Flowers golden yellow. Vitte linear.

Golden-flowered Cow-parsnip. Pl. 1 to 2 feet.

7 H. longifolium (Jacq. austr. t. 174.) leaves scabrous, pinnate, or pinnatifid from the coalition of the leaflets; leaflets or lobes elongated, deeply crenated; leaves of involucres linear-setaceous; fruit glabrous, cuneiform. 2. H. Native of Austria, in alpine meadows. Host. fl. austr. 1. p. 374. An intermediate species between *H. flavescens* and *Spondylium*. Petals at first green, but at length becoming white, obcordate; outer ones radiating a little. Fruit larger and more much cuneated than in the above-mentioned species.

8 H. palmatifolium (D. C. prod. 4. p. 192.) upper cauline leaves 5-parted from the top of the sheath, or 3-parted; outer lobes bipartite, all elongated, coarsely toothed, glabrous above, but roughish beneath; leaves of involucres linear-setaceous; fruit glabrous in all states, obovate. 2. H. Native country unknown. Flowers white, radiating a little. It differs from *H. Spondylium* in the leaves being palmate-parted, not pinnate-parted, less rough, and in the fruit being more obovate. Probably *H. elegans* of many authors is the same as this species.

Palmate-lobed Cow-parsnip. Pl. 4 to 5 feet.

9 H. Spondylium (Lin. spec. 1. p. 556.) leaves ternate, pinnate, or pinnatifid from the coalition of the leaflets, scabrous; leaflets pinnatifid, cut, and serrated; leaves of involucres lanceolate, membranous, finely fringed, with long taper points; fruit orbicular, glabrous. 2. H. Native of Europe, and probably of Siberia, in hedges, the borders of fields, and rather moist meadows, very common; plentiful in some parts of Britain. Smith, engl. bot. t. 999. Hayn. arz. gew. 7. t. 10. H. protetorius, Crantz, austr. 5. p. 11. H. bráncia usrins, All. pedem. no. 1291. *Spondylium* Rall, syn. 256. Ger. emac. 1009. with a figure. Camer. epat. 546. with a figure. Riv. pent. irr. t. 4. and of many other old authors. Spondylium brácea, Stev. law. no. 355. *Spondylium* brácea usrins, Hoffm. umbb. 192. t. 1. f. 11.—Acánthus Germánica, Fuchs, hist. 53. with a figure. Cow-parsnip. Petiv. herb. brit. t. 24. f. 1. Root taper-shaped, whitish, aromatic, sweetish, and rather mucilaginous. Stem rough, with white hairs. Flowers more or less radiant, white or reddish. The whole plant is wholesome and nourishing food for cattle; and it is gathered in Sussex for fattening hogs, being known by the name of hogseed. The seeds are strong-scented, and are accounted diuretic and stomachich. Linneus says the plant is used in Scania against dysentery. Gmelin says that the inhabitants of Kamtschatka, about the beginning of July, collect the footstalks of the radical leaves, and after peeling off the rind (which is very acid) dry them separately in the sun, and then tying them in bundles, lay them up carefully in the shade

in bags; in this state they are covered with a yellow saccharine efflorescence, tasting like liquorice; this being shaken off is eaten as a great delicacy. The Russians distil an ardent spirit from the stalks thus prepared, by first fermenting them in water, with the greater bilberries (*Vaccinium uliginosum*), which Gmelin says is more agreeable to the taste than spirits made from corn.

*Var. angustifolium* (Smith, fl. brit. 307.) leaves deeply pinnatifid; the 2 lowest lobes elongated, and spreading in a radiating manner. 2. H. Native of Yorkshire. Mr. Woodward has found this variety growing on the same root with the common kind.

*Var. g. elegans* (Jacq. austr. t. 175.) leaflets decussate, narrow, toothed. 2. H. Native of Austria, Piedmont, &c.

*Var. g. laciniatum* (Desf. hort. par. ex D. C. prod. 4. p. 192.) leaflets cutinate, ovate, coarsely and deeply serrated. 2. H. Native country unknown.

*Var. g. subcannascentis* (D. C. prod. 4. p. 192.) leaves canescent beneath. 2. H. Native of France. This variety differs from *H. Pyrenaeica* in the ovaries being glabrous.

10 H. Cashpicum (Hortul. ex D. C. prod. 4. p. 192.) leaves pinnate, scabrous; leaflets elongated, cut, and toothed, acuminate; leaves of involucres linear, broadest at the base; leaves of involucres setaceous, ciliated on both sides with long villi; fruit obovate, glabrous in all stages. 2. H. Native about the Caspian sea. This species is sufficiently distinct from any of the varieties of *H. Spondylium*.

11 H. Canadiens (Wall. mss. ex D. C. prod. 4. p. 192.) leaves ternate, clothed with hoary tumenuntum beneath, as well as on the stems and petioles, but smoothish above; leaflets petiolate, cuneated at the base, trifid or pinnatifid; lobes irregularly toothed; leaves of involucres linear, acuminate, about equal in length to the rays; fruit obovate-oblong; vitte linear.

Whitened Cow-parsnip. Pl. 4 to 5 feet.

12 H. Lanatum (Michx. fl. bor. Amer. 1. p. 166.) leaves ternate, petioloate, tomentose beneath: upper ones 3-lobed; leaflets petiolate, broad-ovate, roundish-cordate, lobed; leaves of involucres small, subulate; fruit broadly obovate, oval. 2. H. Native of Virginia, Pennsylvania, and Canada, as far as the Mackenzie river; moist banks of streams in north-west America, in humid pastures. Pursh, fl. Amer. sept. 1. p. 181. Begel. fl. bot. p. 67. Torr. fl. bor. Amer. 1. p. 313. H. Spondylium, Cham. et Schlecht. in Linnaea. 1. p. 39. Petals said to be oblum. The plant is said to be very nearly allied to *H. Spondylium*, but very distinct. The roots and stems of this plant are eaten by the Chenook Indians; and by the Cree Indians, under the name of Penpoo antico; i.e. flute stem; and the young stems are used by them as a pot-herb.

13 H. Cordatum (Presl, del. prag. p. 138.) leaves ternate; leaflets cordate-ovate, petioloate, lobately pinnatifid, mucronately toothed, hispid beneath, as well as the petioles and stem, which is furrowed; leaves of involucres linear; involucra wanting; fruit glabrous, obovate, somewhat emarginate at the apex. 2. H. Native of Sicily, in humid groves on the Nebrodi. Root black, sweet-scented, and is called *Angélica* by the Sicilians, and is used for the same purposes by them. H. Spondylium and H. Pinnaces Ucrina, ex Guss. prod. fl. sic. 1. p. 364.

*Cordate*-leafletted Cow-parsnip. Pl. 4 to 6 feet?

14 H. Pyrenaicum (Lam. dict. 1. p. 403.) leaves very large, palmatifid, hoary from tumenuntum beneath; leaflets lanceolate, toothed or ternate; involucre of few leaves; young fruit covered with long hairs: adult ones glabrous, nearly orbicular.

Pyrenean Cow-parsnip. Fl. June, July. CIt. 1798. Pl. 4 to 6 feet.

15 H. Panaceae (Lin. spec. p. 358.) leaves pinnate, canescent beneath; leaflets on long petioles, cordate, usually 3-lobed, toothed; leaves of involucres linear-setaceous; young fruit bearing a few scattered hairs. H. H. Native of the southern Alps of Europe. Lob. icon. t. 701. f. 2. Mor. ox. sect. 9. t. 17. f. 3. H. setosum, Laperey. abr. p. 153?

True Cow-parsnip. Fl. July; Aug. CIt. 1796. Pl. 6 feet.

16 H. astraenum (Bieb. fl. taur. suppl. p. 224.) stem rough from strigae; leaves deeply lobed, serrated, acute, scabrous above, pubescent beneath; umbels of 40 rays; leaves of involucres linear-setaceous; fruit orbicular-elliptic, when dry orbicular-scabrous. H. H. Native of the north of Caucasus, on Mount Beschtan; and according to Koch also of the Alps of Bavaria and Tyrol. Spondylum â€˜asperum, Hoffm. umb. p. 134. Dorsal vitice 2 longer than the lateral ones; all filiform; those in the commissure evidently clavate. In the cultivated plant the fruit is nearly glabrous even when young.

Rough Cow-parsnip. Fl. June, July. CIt. 1818. Pl. 6 to 8 ft.

17 H. villus (Fisch. in Schultes, syst. 6. p. 579.) leaves sinuately pinnatifid, sharply serrated, acuminated, clothed with hoary tomentum beneath; leaves of involucra and involucres setaceous, deflexed; umbels sparingly radiant; fruit elliptic, ciliated, woolly on the back. H. H. Native of Caucasus, in gravelly places on the margins of rivulets. Stev. obs. 1828. p. 72. H. Pyrenacium, Bieb. fl. et suppl. no. 559, but not of Lam. H. decipiens and H. marginatum, Hoffm. umb. p. 134 and 135. and probably H. giganteum, Horn. hort. hain. ex Prescott. Leaves as in H. Pyrenacium hoary beneath, but differs in the young fruit being tomentose, and in the adult ones being roughly ciliated. Vitice broad; the dorsal ones drawn out beyond the middle, and filling the furrows; the commissural ones short, rarely somewhat branched. There are varieties with larger and smaller fruit.

Var. B, subellusium (Hoffm. umb. gen.) fruit covered by scattered rather loose hairs; leaves less canescent beneath.

Villosum Cow-parsnip. Fl. July. CIt. 1856. Pl. 4 to 6 feet.

18 H. rubescens (Bieb. suppl. p. 225.) leaves pubescent beneath; cauleine leaves ternate; leaflets somewhat palmately pin natifid, toothed; segments and recesses acute; umbels of many rays; involucra of 1-2 leaves; involucres short, caducous, of few leaves; fruit elliptic, having the disk rather villous. H. H. Native of the south of Tauria, in shady places; and of Eastern Caucasus, in alpine places. Spondylum rubescens, Hoffm. umb. p. 134. H. speciosum, Ledeb. hort. dorp. p. 77. H. Pana ces, Steven. mem. misc. 3. p. 259? To this species is probably referrible the H. gummiferum, Willd. enum. p. 321. Hort. berol. 1. p. 53. t. 53. and t. 54. It differs, however, from H. Pyrenacium and H. Panaces, in the young fruit being clothed with short down, not with long spreading down. Fruit glabrous in the adult state; having the dorsal vitice slender, and drawn out and the middle, and being suddenly dilated into a club-shaped form at the apex. The young shoots are filled with a sweet aromatic juice, which is called Baldargan by the natives of Caucasus, and is eaten by them in a crude state.

Pubescent Cow-parsnip. Fl. July. CIt. 1823. Pl. 4 to 5 feet.

19 H. barbatum (Ledeb. fl. ross. alt. ill. t. 303.) leaves pinnate, with 2 pairs of leaflets; lower leaflets and terminal one sinuately pinnat-parted, petiolate; lobes acuminate, serrated; serratures ovate, acuminated; umbels radiant: fruit elliptic, beset with a few pili, somewhat emarginate at the apex; vitice in the commissure parallel. H. H. Native of Altai, in mountain meadows. Stem furrowed like the rest, beset with rigid pili, which rise from a callous or blackish point, and which are usually retrograde on the lower part of the stem; bearded with numerous pili at the knees. Petioles hispid, bearded at the insertion of the petioles. Leaves pubescent beneath, but green and furnished with a few stiff hairs beneath at the veins. Involucrum of one or few leaves, caducous; involucres of a few linear permanent leaves. To this plant may be referred the one in Gmel. fl. sib. 1. p. 213. no. 29. which Linnaeus has cited for his H. Panaces. It is called Sladkajatrawa, i.e. a sweet herb, by the natives of Siberia, a name given by them to many other plants, as to Liquorice and Milk-vetch, &c.

Bearded Cow-parsnip. Pl. 4 feet.

20 H. dissectum (Ledebe. fl. ross. alt. ill. t. 304. fl. alt. 1. p. 301.) leaves ternate; leaflets petiolulate; lateral leaflets pinnate-parted; terminal one pinnate-parted; segments cut or pinnatifid, oblone, acuminated, serrated; umbels radiant; mericarps orbicularly elliptic, at length glabrous; commissural vitice diverging. H. H. Native of Altai, in meadows, near Tschetschulicha, and the metal mines at Riddersak; and elsewhere. H. laciniatum, Fisch. in litt.? Stem deeply furrowed, sparingly pilose, hispid at the joints, villous towards the top. Leaves hispid above from a few thick hairs, but paler and pubescent beneath. Involucra wanting; involucres of a few linear leaves, which are variable in length. Flowers white.

Dissected-leaved Cow-parsnip. Fl. July. Pl. 3 feet.

21 H. douglasii (D. C. prod. 4. p. 193.) leaves scabrous beneath, and on the petioles, glabrous above, and ternate; leaflets petiolulate, corolate, 3-5-lobed, acuminated, toothed; leaves of involucra numerous, subulate at the apex; fruit obovate, glabrous; dorsal vitice elongated, rather club-shaped; commissural vitice 2, short, rather club-shaped, and 2 other small, nearly abortive ones. H. H. Native of the north-west coast of America. This may prove nothing but a variety of H. lanatum.

Douglas’s Cow-parsnip. Pl. 3 to 4 feet.

22 H. cuciniforme (D. C. prod. 4. p. 194.) leaves hispid beneath, as well as the petioles, glabrous above, pinnate; leaflets 3-5, petiolulate, corolate, lobed; lobes toothed, hardly acuminated; leaves of involucra many subulate; fruit obovate-cuneate, glabrous; dorsal vitice filiform; commissural vitice 2, rather clavate. H. H. Native country unknown, but probably of Siberia.

Cuciniform-fruit Cow-parsnip. Pl. 4 feet?

23 H. lucustifolium (Bieb. fl. et suppl. no. 560.) leaves decumbent, ternate or quiniminate pinnate, smoothish; leaflets cuneated, obtuse, deeply serrated; fruit villous; vitice filiform, acute. H. H. Native of Tauria, on stony hills; and of Caucasus, in subalpine places above Nikita, ex Stev. obs. 1828. p. 71. H. montanum, Georgi in Willd. herb. ex Stev. Stem angular, pubescent, as well as the young leaves. Flowers white, radiant. Commisual vitice equal in length to the dorsal ones.

Lovage-leaved Cow-parsnip. Fl. June, July. CIt. 1816. Pl. 2 feet.

24 H. Caucasiœ (Stev. mem. soc. hist. nat. misc. 3. p. 259.) leaves ternate; leaflets on long petioles, toothed, glabrous above, pubescently scabrous beneath: intermediate one 3-lobed. H. H. Native of Caucasus, on the mountains, at the river Jucharibasch. Flowers white, rather radiant. A plant like this from Iberia has the upper leaves ovate and 3-lobed, on long petioles, and the young fruit bristly.

Caucasian Cow-parsnip. Fl. June, July. CIt. 1818. Pl. 4 ft.
25 H. himile (Sibth. et Smith, fl. gracc. prod. 1. p. 198.) leaves rather bipinnate, cut, pubescent; stem nearly simple; umbels 4-7-rayed; fruit orbicular, smoothish. 3 H. Native of Greece, on Mount Olympus. Umbels large. Stems hardly a hand high. Vitae of fruit 4, red, oblong : the dorsal ones attaining the length of the middle.

**Humble Cow-parsnip.** Pl. ½ to ¾ foot.

Sect. IV. **Carmelina** (from Mount Carmelo, the habitation of the species). D. C. prod. 4. p. 194. Fruit ornamented with thick adpressed stiff bristles. Vitae not sufficiently known, but there are probably 4 dorsal ones, and 2 filiform hardly clavate commissural ones. Petals hispid; exterior ones radiant. Perhaps a proper genus, or perhaps only a species of **Zozimia** or Pastinacea.

26 H. Carmelina (Labill. syr. dec. 5. p. 3. t. 1.) leaves pinnate, scabrous from adpressed down beneath; leaflets ovate-oblong, deeply toothed: extreme one rather cordate, 3-lobed; rays of umbel 5, very unequal, contracted after flowering. 3 H. Native of Syria, on Mount Carmel. Involucra and involucels composed of erect permanent setaceous leaves. Bristles on the stem and branches retrograde.

**Carmelo Cow-parsnip.** Pl. 2 to 3 feet?

27 H. alpinum (Lin. spec. p. 359.) leaves cordate-roundish, smooth, palmately 5-crenate; lobes bluntish, crenately toothed, rarely cut; leaves of involucels setaceous; fruit obovate-orbicular. 3 H. Native of the Alps of Jura, in pastures, and at the borders of woods; as well as of the Alps of Dauphiny, Provence, and the Pyrenees. D. C. fl. fr. 4. p. 316. H. testiculatum. Lapeyr. suppl. p. 43.—C. Bauh. prod. 83. with a figure.—Barrel. icon. t. 55.

28 H. austriacum (Jacq. austr. t. 61.) leaves pinnate, with 2-3 pairs of leaflets, scabrous from scattered hairs on both surfaces; leaflets ovate-lanceolate, doubly serrated: terminal one somewhat 3-lobed. 3 H. Native of Austria, Carniola, and Transylvania, in alpine meadows. Crantz, austr. 153. t. 1. Spondylium Austriacum, Scop. carn. ed. 2. vol. 1. p. 204. t. 1. To this Sprengel refers Tordylum silifolium, Scop. carn. no. 318. t. 8. but it differs in the petals being red, and in the fruit being hispid from villi.

29 H. chorobanum (D. C. prod. 4. p. 194.) lower leaves ovate, somewhat lobed, serrated: superior ones cruciately pinnate; leaflets linear, all rather canescent beneath from down. 3 H. Native of Caucasus, about Nartzana and Kobi, among grass on the mountains. Said not to be distinct from H. Austriacum by Stev. obs. 1828. p. 70. Heraclæum longifolium, Bieb. fl. taur. 1. p. 223. exclusive of the synonymes. Wédnia Chorodanum, Hoffm. umb. 139. t. 1. β, and in lit. f. 12, 13. Fruit obovate. Commis sur vitæ wanting; but there are 4 dorsal ones which are clavate, and hardly attaining a third part of the length of the fruit. There is also a variety of this with rose-coloured flowers (H. rosœum, Stev. in mem. soc. mosc. 3. p. 260.) and more humble stem.

**Chorodanum Cow-parsnip.** Pl. 2 to 3 feet?

30 H. Minimus (Lam. dict. 1. p. 403.) plant dwarf, glabrous; leaves nearly all radical, bipinnate: leaflets lanceolate-linear, cut a little; involucra usually of one leaf; involucels wanting. 3 H. Native of the Alps of Dauphiny, but rare.

D. C. fr. 4. p. 316. H. bipinnatum, Cuss. H. pumilum, Vill. daubh. 2. p. 640. t. 14. Peucedanum Vochtorinum, Spreng. umb. spec. 51. Schultes, syst. 6. p. 571. It differs from Peucedanum in the petals being deeply emarginate; in the fruit being oval and flattened; in the vitæ extending nearly to the middle of the fruit, filiform, not saccate. It may hereafter prove also to be generically distinct from **Heraclæum**.

**Small Cow-parsnip.** Fl. May, July. Clt. 1810. Pl. 1 foot.

Sect. VI. **Trichochnnum** (from θριχος, thrichos, a hair, and γωνια, gonia, an angle; in reference to the stems being bearded at the joints or knees). D. C. prod. 4. p. 195. Commis sure without any vitæ. Umbels not radiant. Petals yellowish. Stems woolly or bearded at the joints.

31 H. wallchii (D. C. prod. 4. p. 195.) stem terete, hairy at the base, glabrous except at the knees or joints; leaves terinate, having a few scattered pilis above, and bearing a few small ones at the nerves beneath; leaflets lanceolate, acuminate, serrated, undivided, or the larger leaflets of the lower leaves are 2-lobed, and the terminal one 3-lobed. Involucra of 1-2 decidual leaves.—Native of Nipaul. Fruit obovate, nearly orbicular, with 5 slender ribs. Vitæ 4, linear, drawn out a little beyond the middle of the mericarps.

**Wallich's Cow-parsnip.** Pl. 2 to 4 feet?

† Species hardly known, but of most them may prove to be synonymous with those described above.

32 H. tuberosum (Molin, chil. ed. germ. p. 115. ex Willd. spec. 1. p. 1423.) leaves pinnate: with 7 leaflets; flowers radiant; root yellow, composed of tubers. 3 F. Native of Chili. The rest unknown.

**Tuberos-rooted Cow-parsnip.** Pl. 2 to 3 feet?

33 H. Tauricum (Fisch. in litt. ex Loud. hort. brit. p. 109.) 3 H. Native of Siberia. Perhaps the same as H. villósum.

34 H. verrucosum (Stev. in litt. ex Loud. hort. brit. p. 109.) 3 H. Native of Tauria. Perhaps the same as H. asperum.

**Warted-stemmed Cow-parsnip.** Fl. June, July. Clt. 1820. Pl. 7 to 8 feet.

Cult. All the species grow well in any soil, and are all easily increased by seed; and some of the perennial ones by dividing at the root.

Lin. syst. Pentáudria, Digynia. Calyx 5-toothed. Petals obovate, emarginate, with an indented point. Fruit flatly compressed from the back, and rather convex in the middle, more or less hairy, girded by a smooth thickened dilated margin. Mericarps with very slender ribs, the 3 dorsal ones at equal distances, and the 2 lateral ones more remote, and contiguous to the dilated margin. Vitae covering the whole seed, the dorsal ones solitary between the ribs, 4 on the back of each mericarp, and so large as to fill the furrows; but having 2 broad ones in the commissure. Carpophore bipartite. Seed flat.—Herbs, natives of the Levant, with decomposed leaves, compound umbels, many leaved involucra and involucels, and white flowers, which are not radiant. This is an intermediate genus between **Heraclæum** and Tordylum; but differs from the first of these in the margin of the fruit being thickened, not flat; and from the last in the margin of the fruit being smooth, not tubercular; and from both in the form and disposition of the vitæ.
1 Z. absinthifolium (D. C. prod. 4. p. 195.) stem furrowed; leaves supra-decompound, hoary and pilose; leaflets lanceolate, rather remote, and somewhat trifid, cuneate at the base, short.

2 Z. anethifolia (D. C. prod. 4. p. 196.) stem terete; leaves supra-decompound, glabrous, glaucous; leaflets linear, acute.

ζ. H. Native of Persia, between Teheran and Isphan. Habit of the first species. Involucela small, glabrous. Fruit more of an orbicular form than in H. absinthifolium, and beset with scattered down over the whole disk, but when young rather pilose.

Fennel-leaved Zozimia. Pl. 2 feet.

Cult. The seeds of these plants should be sown in the open ground in spring. A light soil suits them best.

CXI. POLYTÉNIA (from πολυς, many, and τενας, tanās, viita; the mericaps are furnished with many viitas). D. C. coll. mem. v. p. 53. t. 13. prod. 4. p. 197.

Lin. syst. Pentandria, Digynia. Calyx 5-toothed. Petals oval, emarginate, with an inflexed point. Fruit oval, compressed from the back, which is lenticular, quite glabrous, with a smooth margin, and a depressed dorsal area. Mericaps with very slender distinctly long ribs. Vittae twin between the ribs on the back, and 6 in the commissure. Carpophore indistinct. Seed complanate. An American glabrous herb. Upper leaves tripartite, opposite. Lateral flowering branches opposite. Umbels terminal. Involucera none. Leaves of involucels setaceous. Flowers yellowish in the dried state. This genus is allied on the one hand to Zozimia, and on the other to Tordylium.

1 P. Nuttāllii (D. C. l. c.) Native of North America, in the Arkansas territory. Tordylium Americānimum, Nutt. mas. Stem nearly terete. Leaflet trifid, cuneate at the base; lobes lanceolate, toothed at the apex.

Nuttall’s Polytienia. Pl. 1 foot.

Cult. See Zozimia above for culture and propagation.

CXII. JOHRENA (in honour of Mart. Dan. Johreni, who was the first to introduce the dichotomous method in botany). D. C. coll. mem. v. p. 54. t. 1. f. C. prod. 4. p. 196.

Lin. syst. Pentandria, Digynia. Teeth of calyx obsolete, very blunt. Petals unknown. Stylodium short, conical, a little furrowed; styles short, diverging, at length deciduous. Fruit oval, lenticularly compressed from the back, quite glabrous, rather spongy and suberosa, with a thin and smooth margin, and a flat rather coloured dorsal area. Mericaps with 3 dorsal filiform ribs, which at length become brownish, and therefore probably contain vitae; the 2 lateral ribs usually indistinct in the dilated margin: but sometimes rufous, and of the form of vitae. Commisură spongy, without any vitae, but furnished with 2 lines. Carpophore bipartite. Seed complanate. A quite glabrous herb, native of the Levant. Stem terete, dichotomous. Lower leaves bipinnate; leaflets opposite, 2 pairs and an odd one, distant, divided into 5 to 5 linear acute lobes, which are confluent at the base; superior leaves parted into 3 linear elongated, quite entire lobes; upper ones reduced to a narrow elongated sheath. Umbels of 8 to 2 rays. Involucera wanting or of one leaf; involucels of 4 to 5 linear setaceous leaves.

1 J. dichotoma (D. C. l. c.)—Native of the East, at Mount Lebanon. Hippomorathrum crithmi folio flore luteo, Vaill. herb. Dichotomous Johrenia. Pl. 1 to 2 feet?

Cult. See Zozimia above for culture and propagation.

Tribe VIII.

TORDYLIUM (plants agreeing with Tordylium in important characters), or Orthospérmæ paucijugata annulatæ, Koch, umb. p. 55. D. C. prod. 4. p. 196. Fruit lenticularly or flatly compressed from the back, girded by a thick dilated thickened knobbed or plicate margin. Mericaps with 5 very slender or obsolete ribs; lateral ribs contiguous to the dilated margin, or forming the same. Seed flat. This tribe differs from tribe Peucedanées, in the margin of the fruit being ribbed or plicate, not smooth, and quite entire.

Lin. syst. Pentandria, Digynia. Margin of calyx 5-toothed. Petals ovate, emarginate, with an inflexed point; outer ones radiant, bifid. Fruit round the rays of the umbels flatly compressed, with a somewhat thickened accessary wing margin, which is hardly tubercularly wrinkled; those of the disk dissimilar, having one of the mericaps contracted into a hemispherical urceolus around the other, which is abortive. Mericaps with very slender ribs, the 3 dorsal ones at equal distances, and the 2 lateral ones contiguous to the thickened margin, or covered by it. Vittae filiform, one in each furrow, and 2 in the commissure. Carpophore bipartite. Seed flattened. This genus hardly differs from Tordylium unless in the unequal mericaps of the fruit, and in their margins being hardly wrinkled, and quite smooth in the disk on both sides, as in Heracleum.

1 H. Àgyptiaca (Lin. amen. 4. p. 270. exclusive of the synonyms,) stem hispid; leaves scabrous, pinnate; leaflets pinnatifid; segments bluntly lobed; involucera and involucels small, setaceous. Ω. H. Native of Egypt and of Syria, on the sea shore. Jacq. hort. vind. t. 87. Tordylium Àgyptiacum, Lam. ill. t. 193. f. 2. Poir. dict. 7. p. 711. Flowers white. In this species the flowers sometimes have 5 to 4 styles. Carphophore green. Styles white, erect.

Cordate-leaved Hasselquistia. Fl. July. Cult. 1787. Pl. 2 ft. Cult. The species being natives of warm climates, the plants are difficult to preserve through the winter. The surest way to procure good seed is to sow in autumn, and preserve the plants in a frame or greenhouse till spring, when they should be planted out in a warm sheltered situation.

CXIV. TORDYLIUM (τορδύλιον of Dioscorides; said to Yy

Vol. III.

LIN. SYST. *Pentandria Digynia*. Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point; outer ones radiating and bifid. Fruit drupe compressed from the back, girdled by a rugged tubercular thick accessory margin. Mericarps with very slender ribs; the 3 dorsal ribs at equal distances, and the 2 lateral ones contiguous to the thickened margin, or covered by it. Vitae filiform, one or more in the furrows, and 2 or more in the commissure. Carpophore bipartite. Seed complanate.—Herbs, with pinnate leaves; leaflets ovate, deeply toothed. Involuta of many leaves. Flowers white.

The two sections differ from each other in the number of vitae.

SECT. I. *Eutordylium* (from eu, well, and *tordylium*; this section is supposed to contain the true species of the genus). D. C. prod. 4. p. 197.—Tordylium, Hoffm. umb. 1. p. 198. t. 3. f. 3-4. A. Koch, umb. 87. f. 24, 25. Vitae solitary in the furrows, and twin in the commissure.

1 T. SYRIAUM (Lin. spec. p. 345.) plant pubescent; leaves pinnate; leaflets roundish, repandly toothed: terminal one ovate; involucra and involucrals longer than the umbels. O. H. Native of Syria, Asia Minor, and Greece. Jacq. Hort. vindi. t. 54. Riv. pent. t. 3. Barbel. icon. t. 340.—Mor. ox. sect. 9. t. 16. f. 7. There is a variety of this with a simple erect stem; and another with diffuse procumbent stems.

2 T. MAXIMUM (Lin. spec. 345.) stem scabrous or hispid from retrograde bristles; leaves pinnate; leaflets lanceolate, deeply serrated and notched: terminal one elongated; leaves of involucra and involucrals linear, shorter than the umbels. O. H. Native of middle and south Europe, Caucasus, and the Levant, in cornfields. In England on banks and waste ground, but rare; about London; under a hedge on the north side of the parks, Oxford; in a hedge about half a mile from Eton. Smith, engl. bot. 1173. Jacq. austr. t. 142.—Mor. ox. 3. p. 516. sect. 9. t. 16. f. 1.—Rivin. pent. 1. t. 1.—Lob. icon. 737. Heracleum Tordylium, Spreng. spec. umb. 49. T. magnus, Broth. and T. Lusitanicum, Wield. does not differ from this species according to Link. Stem erect, branched, hollow. Leaves densely clothed with fine close bristly hairs, all directed towards the point; leaflets oblong-lanceolate, the lower ones umbel. Umbels dense, bristly. Flowers reddish, the outermost petal with equal lobes, the two next with extremely unequal ones.

SECT. II. *Condylacarpus* (from *co*ndylas, *kondylas*, a finger joint, and *kapros*, *karpas*, a fruit). Hoffm. umb. 1. p. 202. Koch, umb. p. 86, but not of Desf. D. C. prod. 4. p. 198. Vitae numerous both in the furrows and commissure. In the commissure there are 4 in *T. Hasselquatioe*, and therefore it is an intermediate plant between the two sections, as there are 8-10 in the commissure of the other species.

3 T. HASSELQUISTII (D. C. prod. 4. p. 198.) plant pubescent; leaves pinnate; leaflets roundish, repandly toothed: the terminal one in the lower leaves is reniformly cordate; leaves of involucra setaceous, shorter than the umbels: of the involucrals similar, but longer than the umbelles. O. H. Native of the Levant. Like *Hasselquatioe cordata*, but the character of the fruit is the same as that of *Tordylium*. Habit of *T. officinale*. Vitae in the commissure 4, 2 curved and 2 straight.

Hasselquist's Hart-wort. Pl. 1 foot.

4 T. OFFICINALE (Lin. spec. p. 346.) stem generally branch-ed, furrowed, clothed with soft deflexed hairs; leaves pinnate, rough; hair; leaflets ovate, cut, crenate, the odd one the largest, leaves of involucra and involucrals lanceolate, acute; those of the latter about equal in length to the umbelles; radiate petals in pairs, with very unequal lobes. O. H. Native of Portugal, south of France, Italy, Dalmatia, and Greece, in cultivated fields; possibly never seen at all in England, the *T. maximum* having been conformed with it; however, it is said to have been found by Mr. Doody about Isleworth, Ray, and about London. Petiver. Smith, engl. bot. 3440. fl. græc. 3. t. 267. —Colum. ecphr. t. 124. f. 1.—Mor. ox. 3. p. 316. sect. 9. t. 16. f. 6.—Dord. pemp. t. 313. f. 314. Lob. icon. 736.—Bauh. hist. 3. p. 84. f. 2. Small Hart-wort, Petiv. herb. brit. t. 24. f. 6. T. microspernum, Ten. add. 1827. Condylacarpus officinalis, Koch, l. c. Leaflets roundish or ovate, crenate, and variously cut. The radius of the umbelles formed of the very unequal outer petals of the flowers of the circumference, the large lobes of 2 flowers coming together, and resembling a single petal. These lobes are sometimes reddish. Fruit hairy on the disk, brown, with scarcely any ribs or veins; the border greatly elevated, tumid, neatly crenate transversely. *T. Aplanum* is readily distinguished from this species by having in each marginal flower only one radiant petal, with 2 equal lobes.

5 T. APLANUM (Riv. pent. t. 2.) plant erect, villous below; leaves pinnate; leaflets of the lower leaves roundish, cuneated at the base, lobately crenated; of the upper ones pinna-tid, linear, acute; leaves of involucra and involucrals setaceous; those of the latter shorter than the umbelles. O. H. Native of Apulia and Greece, in cultivated fields. Lin. spec. 345. exclusive of the synonyms.—Jacq. hort. vindi. t. 55. T. grandiflorum, Moench, meth. p. 78. Condylacarpus Aplanum, Hoffm. umb. p. 203. T. insole, Clark in Spreng. neue entd. 3. p. 165. There is a variety of this which is almost glabrous below. Stem hairy at the joints.

*Apulian* Hart-wort. Fl. June, July. Cl. 1739. Pl. 1 to 1 ½ foot.

*Cult.* The seeds only require to be sown in the open border in spring. A light soil will suit the species best.

CXV. TORDYLOPSIS (from *Tordylium* and *opsi*, *opsis*, appearance; plant resembling *Tordylium*). D. C. prod. 4. p. 199.—Tordyloides, Wall. mss.

LIN. SYST. *Pentandria Digynia*. Margin of calyx 5-toothed: teeth acute: outer teeth the largest, dilated at the base, and cuspidate at the apex. Outer petals of umbels large and obcordately 2-lobed: the rest smaller, ovate, and cuspidate, entire, rarely a little 2-lobed. Stylodium conical; styles 2, erect, elongated. Fruit hairy when young. The rest unknown.—Herb a foot high, more or less hairy. Stem terete, striated, erect, nearly simple. Petioles sheathing at the base. Leaves with 1-2 pairs of ovate cut toothed leaflets, and an odd one. Umbels terminal, 6-8-rayed. Involute of 5-6 lanceolate linear acuminate leaves, which are almost longer than the rays. Umbelles crowded, 15-18-flowered. Leaves of involucrals conforming to the leaves of the involucra, exceeding the flowers.—Habit almost of *Heracleum*, but the involucra are of many leaves. It agrees also with *Tordylium* in the hairiness, and in the corol-las. The genus is very doubtful, the perfect fruit being unknown.
UMBELLIFERÆ. CXVI. Kruberæ. CXVII. Pachypleurum. CXVIII. Agasyllis. CXIX. Stenocelium, &c.

1 T. BRUSSONI (Wall. mes. ex D. C. prod. 4. p. 199.) 1. F. Native of Niapai, in Kamon, towards Emôdi.

BROWN’S Tordylophus. Pl. 1 foot.

Cult. This plant should be grown in a pot, so that it may be placed under shelter in winter.

Tribe IX.

SILERINEÆ (this section contains plants agreeing with Siler in important characters, or Orthospermeae multijugatae, Koch, umb. 84. D. C. prod. 4. p. 199. Fruit longitudinally compressed from the back. Mericarps with 5 primary ribs, having the lateral ones of these marginating; and 4 secondary less prominent ones, these last are rarely wanting; all filiform and wingless. Seed flatish in front.

Cult. See Tordylium above for culture and propagation.

CXVII. PACHYPLEURUM (from παχυς, pachys, thick, and πλεύρων, pleuron, a rib; the ribs of the fruit are thick and coryled). Led. fl. ross. alt. ill. and fl. alt. 1. p. 296.

LIN. SYST. Pentándria, Digynia. Margin of calyx 5-toothed. Petals obovate-orbicular, somewhat emarginate, with an inflexed point. Fruit compressed from the back. Mericarps with 5 elevated roundish thick equal ribs; the lateral ribs marginating. Vitellae one in each furrow, and 2 in the commissure. Seed flat in front. Involucra and involucres of many lanceolate-linear leaves, with membranous margins.—A perennial herb, having a fuscescent root, nearly a foot long. Stem solitary, 2-3 inches high, leafy at top; but with numerous auxiliary elongated branches, which are furnished with leaves beneath the middle. Petals dilated into sheaths. Leaves pinnate; leaflets pinnatifid. Cauline leaves tripinnate; leaflets oblong, acute, entire or bifid. Umbels of many rays. Umbellules when bearing the fruit nearly globose. Flowers white. The whole plant is pubescent, and powdery towards the apex. Stems, petioles, peduncles, and rays of umbels violaceous.

LIN. SYST. Pentándria, Digynia. Margin of calyx obsolete. Petals lanceolate, incurved. Fruit oval, compressed from the back; mericarps with 5 primary obtuse ribs: the 2 lateral ones of these more humble than the rest, and placed in front of the short accessory margin: the secondary ones sometimes absent. Seed a free nucleus, which is flat on one side, and rather convex on the other, covered with many vitæ, 8-10 on the back, and 5-6 in the commissure.—A perennial herb, with the habit of Cachrys. Stem succulent. Leaves pubescent, ternately decomposed; leaflets decurrent, lanceolate, serrated, a little lobed. Involucra wanting. Umbels of many rays. Leaves of involucres numerous, setaceous. Flowers white.

CXIX. STENOCELIUM (from στένος, stenos, narrow, and κοίλος, koilos, hollow; in reference to the narrow furrows of the fruit). Ledebr. fl. ross. alt. ill. t. 175. fl. alt. 1. p. 298.

LIN. SYST. Pentándria, Digynia. Margin of calyx 5-toothed. Petals obovate-orbicular, somewhat emarginate, with an inflexed point. Fruit compressed from the back. Mericarps with 5 elevated roundish thick equal ribs; the lateral ribs marginating. Vitellae one in each furrow, and 2 in the commissure. Seed flat in front. Involucra and involucres of many lanceolate-linear leaves, with membranous margins.—A perennial herb, having a fuscescent root, nearly a foot long. Stem solitary, 2-3 inches high, leafy at top; but with numerous auxiliary elongated branches, which are furnished with leaves beneath the middle. Petals dilated into sheaths. Leaves pinnate; leaflets pinnatifid. Cauline leaves tripinnate; leaflets oblong, acute, entire or bifid. Umbels of many rays. Umbellules when bearing the fruit nearly globose. Flowers white. The whole plant is pubescent, and powdery towards the apex. Stems, petioles, peduncles, and rays of umbels violaceous.

UMBELLIFERÆ. CXX. Siler. CXXXI. Galbanum. CXXII. Cuminum. CXXXIII. Trepocarpus.

lentically compressed from the back; mericarps with elevated obtuse filiform ribs, having 5 primary ones: the lateral ones of these margination; and 4 less prominent secondary ones. Vitae one in each furrow, under the secondary ribs. Seed flatish in front.—Perennial glabrous herbs. Leaves triternate; petals trifid, sheathing at the base; branches of petals bearing 3 roundish, coarsely and bluntly crenated, or bluntly 3-lobed leaflets. Umbels large, of many rays. Involuta wanting or of few leaves, caducous. Flowers white.

Cult. See Laserpitium, p. 351. for culture and propagation.

CXXI. GALBANUM (galb or galban, in Celtic, means fat, oily; in reference to the gum). D. Don, in Lin. trans. 16. p. 605.

Lin. syst. Pentantria, Digynia. Fruit compressed from the back, elliptic, ungulcular; raphe narrow, open, not closed. Mericarps with 5 elevated compressed bluntly keeled ribs, not winged: lateral ones distinct, marginal; furrows broadish, concave, without any vitae. Commisurine flat, dilated, furnished with 2 vitae; vitae broad, a little arched. The seeds from which the foregoing description has been drawn were picked from the gum. The rest of the plant remains unknown.

1 G. Officinale (Don, l. c.) 2 H. The plant, according to Dioscorides, is a native of Syria; but it must be in some remote inaccessible part of it, as it has not been observed by any of the numerous travellers who have visited that country. As the gum-galbanum is partly imported from Syria and partly from India, it is very probable that the plant is also a native of Persia. The Bûbon Galbanum of Linneus possesses neither the smell nor the taste of Galbanum, but in these particulars agrees best with Fennel, and the fruit has no resemblance whatever to that found in the gum. How a plant differing so essentially from Galbanum should yet have been retained so long in the Pharmacopoeia may well be subject of surprise, especially as the Bûbon Galbanum, being so frequent in gardens, afforded abundant opportunities of settling the question.

Galbanum agrees in virtue with gum-ammoniac, but is generally accounted less proper in asthma, and more so in hysterical complaints. It is exhibited in the form of pills or emulsions, to the extent of about a drachm. Applied externally, it is supposed to resolve and digest tumours, and to promote suppuration. The best sort of galbanum consists of pale coloured pieces, about the size of a hazel nut, which, on being broken, appear to be composed of clear white tears, of a bitterish acid taste, and a strong peculiar smell. But it most commonly occurs in agglutinated masses, composed of yellowish or reddish, and clear white tears, which may be easily torn asunder, of the consistence of firm wax, softening by heat, and becoming brittle by cold, mixed with seeds and leaves. Galbanum is generally obtained by cutting the plant across some inches above the root. The juice which flows from the wound soon hardens, and is the galbanum brought to us from Syria and the Levant.

Officinal Galbanum. Pl. 4 to 5 feet.

Cult. See Théopistes, p. 350. for culture and propagation.

Tribe X.

CUMINÆ (this tribe contains plants agreeing with Cuminum in important characters), or Orthosperme multijugateae contractae, Koch, umb. 81. D. C. prod. 4. p. 200. Fruit contracted from the sides. Mericarps with 5 primary filiform ribs: the lateral ones of these margination, and 4 secondary more prominent ones. Seed straight, flatish in front.

Lin. syst. Pentantria, Digynia. Teeth of calyx 5, lanceolate, setaceous, unequal, permanent. Petals oblong, emarginate, with an inflexed point, erectly spreading. Fruit contracted from the sides. Mericarps with 5 wingless ribs; the 5 primary ones filiform, and minutely muricate, the lateral ones of these margination: the 4 secondary ones more prominent and prickly. Vitae one in each furrow, under the secondary ribs. Carpophore biform. Seed rather concave in front and convex on the back.—Herbs, with multifid leaves; linear setaceous leaflets. Involuta of 2-4 simple or divided leaves; involucres dimidiate, of 2-4 leaves, which are at length reflexed. Flowers white or reddish.

1 C. HISPA'NICUM (Merat, herb. D. C. prod. 4. p. 201.) segments of leaves linear-setaeose, acute; umbels bifid; umbels bearing 3-4 fruit; involucres about equal in length to the fruit, which are bearded by bristles. 2 H. Native of Spain, in corn-fields in Valia de la Manca. Habit of C. Cuminum, but differs in the fruit not being glabrous or puberulous, but bearded by long stiff spreading pili. Flowers reddish.

Spanish Cumin. Pl. 1 foot.

2 C. MIN'ICUM (D'Urville. enum. 39. t. 279.) segments of leaves linear, obtuse; involucres about equal in length to the fruit, which is glabrous. 3 H. Native of the island of Cos, in shady places frequent. Stem slender, branched, hardly 2-3 inches high. Every part of the plant is smaller than in the other species. In the specimens received from D'Urville, the segments of the leaves are acute, and the involucres are rather shorter than the fruit.

Minute Cumin. Pl. 2 to 3 inches.

3 C. CYM'IUM (Lin. spec. p. 365.) segments of leaves linear-setaceous, acute; umbels 3-5-cleft; involucres exceeding the fruit, which is pubescent. 4 H. Native of Upper Egypt, and Ethiopia. Cuminum, Riv. pent. t. 40. Cam. eppt. 518. Schkuhr, handb. no. 714. t. 80. Woodv. med. bot. t. 190. Nees. off. pln. 13. t. 7. Hayn. arz. gew. t. 11. Planch. icon. 192. Cav. icon. 4. t. 360.—Mor. hist. p. 271. sect. 9. t. 2. There are varieties of Cuminum with white, red, or purple flowers. Coat of fruit aromatic; albumen insipid. The plant is cultivated in the south of Europe and all Lesser Asia. In the islands of Malta and Sicily, where it is much cultivated for sale, it is called Cuminum aegro or hot cumin, to distinguish it from Cuminum dolcic, sweet cumin. Cumin seeds have a bitterish warm taste, accompanied with an aromatic flavour, not of the most agreeable kind, residing in a volatile oil.

Var. a, secardium (D. C. prod. 4. p. 201.) fruit clothed with short down; but roughish on the ribs. 5 H. C. Egyptian, Cimum, Merat, in herb. This is the wild plant.

Var. β, glabratum (D. C. l. c.) fruit glabrous. 6 H. C. Cuminum, Merat, in herb. This is the cultivated plant.

Cult. The seed should be sown in spring in a warm sheltered situation, where the plants will flower in summer, and produce seed in autumn.

CXXIII. TREP'OCARPUS (from τρέοντα, trepo, to turn, and

Lin. syst. Pentändria, Dígyínia. Calyx 5-toothed; teeth subulate, falling off but slowly after flowering. Petals obcordate, inflexedly emarginate. Fruit pyramidal or nearly terete, contracted from the sides. Mericarps convex on the back, with 5 primary, filiform, hardly prominent ribs, margined each by a brown vittaeform line on both sides; and 4 secondary elevated ribs, bearing one vittae at the lower part of each. Commissure thick, furrowed in the middle, and furnished with vittae inside. Seed somewhat compressed on the back, straight.

- Glabrous branched herbs, with the habit of *Ethisia*. Leaves multifid, with linear segments. Umbels opposite the leaves, of 5 rays. Involucra linear, of 1-3 leaves. Umbellules 5-8-flowered; involucres linear, unequal, 4-5-leaved, dimidiate. Flowers white. This genus is nearly all allied to *Cuminum* instead of *Ethisia*; it differs from the first in the commissure being spongy, and in the mericarps having accessory margins.

1 T. *Ethisia* (Nutt. l.c. ex D. C. l.c.) umbels of 5 rays; fruit 5 times longer than its breadth. @ H. Native of North America, in the Arkansa territory, ex Nutt. The primordial leaves are nearly as in *Cynapium*, with short acutish lobes; cauline leaves with long linear acute lobes. Involucra of 2-3 leaves; involucres of 4-5 leaves.

*Ethisia*-like *Trepocarpus*. Pl. 1 foot.

2 T. *Brachycahres* (D. C. prod. 4. p. 202.) umbelles of 2-3 rays; fruit 3 times longer than its breadth. @ H. Native of Louisiana. Perhaps only a variety of the first. It differs from it in the involucra and involucres being of fewer leaves; in the lower umbels being on shorter peduncles; and in the fruit being thicker, and less angular.

Short-fruited *Trepocarpus*. Pl. 1 foot.

Cult. See *Cuminum* above for culture and propagation.

**Tribe XI.**

**THAPSIEÆ** (this section contains plants agreeing with *Thapsia* in important characters), or Orthosperme multijugata alata, Koch, umb. p. 75. D. C. prod. 4. p. 202. Fruit compressed from the back, or the transverse section is nearly terete. Mericarps with 5 filiform bristly primary ribs: the lateral ones of these placed in the commissure, which is flat; and 4 secondary ones: interior ones of these filiform, and the exterior ones or all are winged; wings undivided; hence the fruit has 8 wings, or only 2 wings on each side. Seed somewhat complanate or teretely convex, but flat in front.

Lin. syst. Pentándria, Dígyínia. Margin of calyx 5-toothed. Petals elliptic, entire, with an inflexed or involute point. Fruit compressed from the back. Mericarps with 5 primary filiform ribs, 3 of which are dorsal, and the 2 lateral ones are placed in the commissure, which is flat and 4 secondary ones, the 2 dorsal ones are filiform, and the 2 lateral ones are membranous and winged; wings entire. Vittae one in each furrow, under the secondary ribs. Carpophore bipartite. Seed complanate.- Perennial herbs. Leaves pinnate, bipinnate, or tritipinate, or decumbent; petioles sheathing; the upper leaves usually reduced to the petioles. Umbels large, compound, of many rays. Involucra and involucres wanting, or of a few deciduous leaves. Flowers yellow. This genus differs from *Laserripitum*, in the wings of the mericarps being only 2, not 4; and from *Melanoselium* and *Artédia*, in the wings being entire; and from *Lepiodocidium*, in the backs of the mericarps not being scaly.

*Involucra wanting or of 1-2 leaves.*

1 T. *Garga'rnica* (Lin. mant. 57.) stem terete, glabrous; leaves bi-tripinnate, shining; segments linear, acute, elongated, quite entire along the margins, decurrent or confluent; involucra of few leaves; fruit cordate at the base, with a very open recess. @ H. Native of Calabria, Mauritania, Greece, Sicily, Sardinia, Spain, &c. in open places and on hills. Magn. bot. monsp. p. 286. with a bad figure.—Goun. obs. p. 18. t. 10. Desf. alt. p. 262. Sibth. et Smith, fl. græc. t. 387. There are varieties of this with glabrous or hairy petioles. To this the Férula Neapolitana, Ten. med. fl. p. 316. append. 4th. p. 12. is referred by Sprengel, which is said by the author to be nearly allied to *F. glauca*. The bruised root is said to be good for resolving tumours.

2 T. *Silphium* (Viv. fl. lyb. p. 17.) stem terete, furrowed, glabrous; leaves pinnate; leaflets many-parten; segments simple or trifid, all linear, elongated, hairy on both surfaces, with revolute margins; fruit cordate at the base, having the recess constructed. @ H. Native of the north of Africa, on the mountains of Cyrenaica. This is supposed to be the plant which yielded the juice called *silphium*, a medicine held in such high estimation among the ancients, as to have imparted to it the name which it gave (the vicinity of Cyrene, now included in the pashallic of Tripoli), the appellation of "Silphífera!"

3 T. *Villidès* (Lin. spec. p. 375.) stem terete, glabrous; leaves tripinnate, and are, as well as the petioles, villous: leaflets oblong, sinuately pinnatifid: lower ones deflexed; involucra and involucres almost wanting. @ H. Native of Portugal, Spain, south of France, and Mauritania, on hills and in bushy places. Lam. ill. t. 206. D. C. fl. fr. 4. p. 342.—Moris. ox. sect. 9. t. 18. f. 3. Plench. icon. 219. Parkins. 878. t. 877. f. 2. Ger. emac. 1030. Flowers yellow, as in the rest of the species. Aspect of plant hoary. Root carrot-shaped, black on the outside.

4 T. *Asclepiéum* (Lin. spec. p. 375.) stem terete, glabrous; leaves tripinnate; leaflets digitately multifid, capillary, short; petioles glabrous; involucra and involucres wanting. @ H. Native of Apulia, Sicily, Rhodes, and about Constantinople. Sibth. fl. græc. t. 286. ex Smith, prod. 1. p. 201. Guss. prod. fl. sic. 1. p. 370. T. Apulia, Mill. dict. no. 4.—Col. exsp. 1. t. 86. Mor. hist. 3. p. 319. sect. 9. t. 18. f. 9. Fruit one-half smaller than those of *T. Gargaríum*, having the wings rather truncate at both ends. Habit of *Eleconesetum mendiesii*. The root is about the thickness of a man's thumb; the bark is yellow and wrinkled; the inside white, abounding in a bitter milky juice.

5 T. *ex-tída* (Lin. spec. p. 375.) stem and petioles villous; leaves tripinnate; leaflets much spreading, pinnatifid, attenuated at the base: segments short, lanceolate, toothed; involucra wanting. @ H. Native of Spain, Zante, Cyprus, &c. Blackw. t. 459. Lob. icon. t. 780. ex Smith. Moris. hist. sect. 9. t. 18. f. 7. ex Lin. Lobel's figure is more probably referrible to *Laserripitum gemmiferum*. T. tenifolia, Lag. gen. et spec. 12. is referrible to the figure of Morison, but differs in the stem being glabrous. It is probably only a variety of this species. The leaves are rough and hairy.

UMBELLIFERÆ. CXXIV. Thapsia. CXXV. Cymopterus. CXXVI. Laserpitium.

**Involuca of 5-7 leaves.**

6 T. polygama (Desf, fl. Atl. 1. p. 261. t. 75.) stem terete, glabrous, sparingly branched; leaves glabrous, bipinnate; leaflets multifid; lobes linear, acute, divaricately trilobed; involuca of 5-7 leaves; central flowers male. 2. H. Native of Mauritania, about Bone, Lacalle, and Tangiers. Spreng. in Schultes, syst. 6. p. 614. exclusive of the synonym of Lam. and therefore the description. Flowers pale yellow. Stylodium thick. Styles diverging, at length reflexed.—Barrel. icon. 356. appears to be intended for this plant, but the flowers are said to be white.

*Polygamous Deadly-carrot.* Pl. 1 to 2 feet.

† *Species not sufficiently known.*

7 T. praëlata (D'Urv. enum. p. 32.) stem branched above; radical leaves quadrifidly decomposed, shining; leaflets oblong, cut, almost pinnatifid; umbels numerous; central one much the shortest; lateral ones on peduncles, which are terminated each with a lanceolate twin bracteate at the base. 2. H. Native of the island of Cos, among broken rocks at the height of 900 feet. Stem 6-8 feet high. Fruit unknown.

*Tart Deadly-carrot.* Pl. 6 to 8 feet.

8 T. Transagana (Broth. fl. Lus. 1. p. 468.) leaves bipinnate; leaflets pinnatifid; segments linear-lanceolate, hairy. 2. H. Native of Portugal, near Montemor and Serpa. Habit of T. Gargarica, but more hairy.

*Transagana Deadly-carrot.* Pl. 2 to 4 feet.

9 T. maxima (Mill. dict. no. 2.) leaves pinnate; leaflets very broad, pinnatifid, villous beneath; petioles decurrent. 2. H. Native of Spain, all over Old Castile quite to the Pyrenees. Perhaps not different from T. villosa. Root said to be of a dark colour on the outside, and the leaves very thick.

*Largest Deadly-carrot.* Fl. June, July. Cit. ? Pl. 4 to 5 ft. 10 T. altissima (Mill. dict. no. 6.) leaves decomposed; leaflets large, shining; umbels large. 2. H. Native of Apulia. Perhaps the same as T. praëlata.

*Tulles Deadly-carrot.* Pl. 8 feet.

*Cult.* The species of Thapsia will grow in any common garden soil. They are only to be increased by seeds, which should be sown in autumn as soon as ripe.

CXXV. CYMOPTERUS (from κυμα, κυμα, a wave, and πτερόν, pteron, a wing; in allusion to the undulated wings of the mericarps). Rafin. journ. phys. 1819. aug. p. 100. but not of Schultes, syst. 6. p. 34.—Thapsia, Nutt. gen. amer. 1. p. 184.

Lin. syst. Pentandria, Digynia. Cymax minutely 5-toothed. Petals roundish-oval, with an inflexed point. Fruit nearly elliptic, compressed, 7-8-winged: the perfect mericarps are therefore 4-winged, and the imperfect ones 5-winged; wings undulate; furrows of fruit flat, 1-nerved; cinnamomeous naked, but with 3 stripes. Carpophore not separable from the mericarps.—A smooth humble herb, with tuberous roots, rather decumbent, nearly naked stems; binate leaves: with short obtuse decussate lobes, and long petioles. Umbels 4-6-rayed; involucra wanting; involucels 5-7-parted, disseminated. Flowers polygnamous: female ones nearly sessile and white; central ones male, pedicellate.—This genus is truly distinct from Thapsia, but perhaps may be joined with Laserpitium.

Glomerate-flowered Cymopterus. Pl. decumbent.

*Cult.* See Thapsia above for culture and propagation.

Lin. syst. Pentandria, Digynia. Margin of calyx 5-toothed. Petals obovate, emarginate, with an inlaxed point. Fruit compressed from the back, or nearly terete, 8-winged: the 5 primary nerves of the mericarps being filiform: and the 4 secondary ones being winged. Vittae 1 in each furrow, under the secondary ribs. Carpophore free, bipartite. —Herbs with bipinnate or tripinnate leaves; leaflets entire, toothed or cut. Umbels showy, of many rays. Involua and involucels of many leaves. Flowers white, rarely yellow. This genus is easily distinguished from the others by the 8 wings to the fruit.

*Fruit glabrous, or the primary ribs are clothed with adpressed, very short down.*

*Rough Laserwort.* Pl. 1 to 2 feet.

2 L. alabrum (Cranz, austr. 3. p. 54.) leaves bipinnate, quite glabrous in every part, and shining; leaflets obliquely cordate, mucronately toothed: but those of the superior leaves are quite entire; leaves of involuca setaceous; wings of fruit equal, rather curved. 2. H. Native of Europe, on the mountains, in dry and stony places. D. C. fl. fr. suppl. p. 509. L. latifolium, Lin. spec. 156. Jacq. fl. aust. t. 146. Schkuhr, handb. t. 10. Fl. dan. t. 1513. L. Libánótis, Lam. dict. 3. p. 423.—Dod. pempt. 312. f. 2. Chus. hist. 2. p. 194. f. 2.—Riv. pent. t. 21.—Planch. icon. 179.—Mor. hist. sect. 9. t. 17.—Mor. hist. 3. p. 202. t. 19. f. 1-6. Stem and under side of leaves rather glaucous. Flowers white. In the Alps this plant is only a foot or 2 feet in height, while in cultivation it grows much larger. The plant is acid and aromatic, with something of bitterness, and seems to merit a place amongst the aromatic stimulants, emmenagogues, and aperient sudorifics. It is used by the peasants for themselves, and by forgers for horses, in some countries. The root is the hottest part of the plant.

Var. B. crispus (Turra, fl. Ital. prod. p. 65. no. 14.) wings of fruit very much curved. 2. H. Native of Mount Baldo.

*Glabrous Laserwort.* Fl. June, July. Cit. 1640. Pl. 2 to 4 ft.

3 L. aquilegifo'lium (Murr. syst. p. 228.) leaves bipinnate or trinervate; leaflets ovate, rather cordate at the base, slightly lobed, glabrous, but puberulous on the nerves beneath; involucra and involucels deciduous, of few leaves; wings of fruit equal, flat. 2. H. Native of France, Austria, Hungary, &c. on the mountains. D. C. fl. fr. 5. p. 510. Jacq. aust. 22. t. 147. L. trifolium, Jacq. vind. 48. Cranz, austr. 187. but not of Lin. L. alpinum, Waldst. et Kt. pl. hung. t. 253. Bess. prim. 2. p. 393. Stem glabrous, glaucous, green. This plant is usually confused with Siler trifolium, from the shape of the leaves; but it is easily distinguished from that plant in the 8-winged fruit.

*Columbine-leaved Laserwort.* Fl. May, July. Cit. 1640. Pl. 4 to 6 feet.

4 L. garganii (Moretti, in Com. 1824.) fl. com. no. 344. and in bot. Ital. 1825. no. 3. p. 33. leaves somewhat tripinnate: leaflets roundly 2-3-lobed, acutely and deeply serrated: 1
upper cauleine ones tripartite; lobes linear-lanceolate; involucra and involucroles of few leaves: wings of fruit flat, unequal: the dorsal ones a little smaller than the lateral ones. 2. H. Native of Switzerland and Italy, in subalpine places. L. lutelöüm, Gaudin, fl. helv. 2. (1828.) p. 348. L. trilobum, Sut. fl. helv. but not of Lin.—Hall. hist. no. 352. exclusive of the synonym. Allied to L. aquilegiföllum and L. glabrum, but differs from them in the flowers being yellow.

Gaudin's Laserwort. Pl. 3 to 4 feet. 5 L. margina tum (Waldst. et Kît. pl. rar. hang. 2. p. 210. t. 192.) leaves bierrate, shining, and are as well as the stems glabrous; petioles and nerves of leaves rather pilose beneath; leaflets ovate, sessile, somewhat 3-lobed, serrated; upper stem leaves reduced to the petioles; involucra and involucroles of 2-5 linear-lanceolate leaves; wings of fruit unequal: the 2 lateral ones the broadest. 2. H. Native of Carniola, in woods. Petals incurvly obcordate at the apex, greenish yellow, margined with purple.

Sicilian Laserwort. Pl. 3 to 4 feet. 7 L. Siler (Linc. spec. 357.) leaves bipinnate, quite glabrous; leaflets lanceolate or oval, quite entire, mucronate, sometimes confluent and 3-lobed; leaves of involucra and involucroles linear-lanceolate, awnily acuminate; wings of fruit narrow. 2. H. Native of middle and south Europe, on the mountains. Jaq. fl. aust. 2. t. 145. D. C. fl. fr. 4. p. 315. Hayne, arz. gew. 7. t. 7. Plench. icon. 178. Blackw. 426. Ligusticum Gargânicum, Till. pisi. t. 30. Ten. in herb. Balb. and Mor. Siler lanciföllum, Moench. L. montanum, Lam. fl. fr. L. trifoliatum, Sieb. and Schlus. syst. 6. p. 619. Siler montanum, Mor. oxi. sect. 9. t. 3. f. 1. Plant quite glabrous, growing from 1-2 feet high in subalpine places. Stem green or pinnatifid. Flowers white. The root is extremely bitter, and might be useful in fevers, loss of appetite, &c. An infusion of it in wine has been given with success in disorders of the breast. It yields an aromatic resinous oil on being wounded, and being made into a syrup, is recommended in disorders of the breast. Vill. dauph. 2. p. 637. Allon. pedem. no. 1316.

Wild or Mountain Laserwort. Fl. May. July. Clt. 1640. Pl. 1 to 6 feet. 8 L. Galliicum (C. Bahn. pin. p. 156. Linc. spec. p. 357.) leaves supra-decompound, glabrous, shining; leaflets cuneate, 5-3-cleft, mucronate; leaves of involucra linear-lanceolate, acuminate; wings of fruit equal, flat. 2. H. Native of the south of France; and of Upper Italy. D. C. fl. fr. 4. p. 312. Spreng. in Schultes, syst. 6. p. 624. Gaud. aix. t. 58. Paris. theat. 938. f. 1. L. trifurcatum, Lam. fl. fr. 3. p. 415. L. cuneatum, Moench. meth. 79. There is a variety with broader segments (in Mor. hist. sect. 9. t. 19. f. 8.) and with the lobes very much disdegree and short (Pluk. alm. t. 199. f. 1. L. fumosum, Wildl. spec. 1. p. 1518.) segments of leaves oblong-linear (Mor. hist. sect. 9. t. 19. f. 9. and therefore L. angustiföllum, Linc. spec. p. 357.) segments of leaves very narrow (J. Bahn. hist. 3. p. 137. and therefore L. angustiföllum, Wildl. l. c.) segments of leaves cut into many lobes (L. Galliicum laciniatum, Hortul., &c.). The most of the varieties have glabrous stems; very few have them hispid from scattered bristles. L. tenuiföllum, Riv. pent. irr. 22. is also a variety of this species. Flowers white.

French Laserwort. Fl. Ju. Jul. Clt. 1686. Pl. 1 to 2 ft. 9 L. Peucédanodis (Linc. spec. p. 358.) leaves trinerved, quite glabrous; leaflets quite entire, oblong, mucronate; leaves of involucra, and involucroles setaceous; pistils elongated; wings of fruit unequal, flatish. 2. H. Native of Carniola, Croatia, and Upper Italy, in mountain woods. There are varieties of this with oval-oblong leaflets (Hoppe, pl. exsic.). oblong leaves (Jacq. icon. rar. 2. t. 250.) oblong-linear leaflets (Seg. ver. 3. p. 227. t. 7.) and linear leaflets (Pluk. alm. t. 198. f. 4.) but all these varieties differ from any of those of L. Galliicum in the segments of the leaves not being cuneate nor lobed. Flowers white.

Sulphur-wort-like Laserwort. Fl. June. Clt. 1816. Pl. 1 to 3 feet. 10 L. Gummi'ferum (Desf. fl. atl. 1. p. 254. t. 72.) leaves ternately decomposed, glabrous; leaflets pinnatifid; lobes lanceolate, short, acute, stiffish; involucra and involucroles of few leaves. 2. H. Native of Portugal, Spain, and Mauritania, in sandy and barren fields. L. thapsiaförmis, Brot. phly. lus. p. 77. t. 35. L. polygamum, Lam. dict. 3. p. 425. Thapsia gummifera, Spreng. umb. spec. p. 31. Flowers white. Petals indentedly margined. Fruit 8-winged (ex Brot.); and therefore this plant if irreferrable to Laserpitium and not to Thapsia. Lobes of leaves, when dry, usually channelled. Petioles sometimes pilose, usually glabrous as well as the lobes.

Gum-bearing Laserwort. Pl. 2 to 3 feet. 11 L. Hieris'tum (Lam. fl. fr. 3. p. 648.) leaves supra-decompound, hairy; leaflets narrow, pinnatifid; lobes short, linear, cuspidate; leaves of involucra and involucroles membranous, rather trifid at the apex, ciliate; wings of fruit thin, flat. 2. H. Native of France, Switzerland, Piedmont, on the Alps, in meadows; and of Kotzebue's Sound. D. C. fl. fr. 4. p. 313. L. Pânex, Gouan. ill. 13. L. Halléris, All. pedem. no. 1315. —Hull. helv. no. 795. t. 19. exclusive of the synonym of Gmel. and Seg.—Mor. hist. sect. 9. t. 15. f. 16. Flowers white.

Hairy Laserwort. Fl. June. Clt. 1759. Pl. 1 to 2 feet. 12 L. Scab'rum (Cav. icon. 2. p. 72. t. 190.) leaves bipinnate, scabrous; leaflets oblong, cut, acute, and are as well as the stems glaucous; leaves of involucra and involucroles lanceolate, tapering into a bristle; fruit tomentose while young: adult ones 8-winged. 2. H. Native of Spain, near Catì and Valfleams, on dry exposed hills. Referrible to L. hirsutum, but truly distinct. Petals white, with a violaceous border, villous beneath. Stem scabrous.

Nitid-leaved Laserwort. Pl. 2 to 3 feet?

14 L. Arcangelica (Jacq. icon. rar. 1. t. 58. Wulf. in Jacq. coll. 1. p. 214.) leaves ternately divided; stem and petioles hispid; leaflets ovate, cuneate at the base, serrated, extreme one 3-lobed; and the lateral ones 2-lobed; leaves of involucra and involucroles linear-lanceolate, hairy, 2-3-cleft at the apex; wings of fruit flat, broader than the mericarps. 2. H. Native of Carniola, Croatia, Silesia, Carpathian mountains, among rocks. L. Chironium, Scop. carn. no. 324. Archangelica,
Clus. hist. 2. p. 195. Lob. icon. 701. Petioles large, saccate, very villous. Stem 5 feet high, furrowed. Flowers white, pubescent when young. Fruit glabrous, or clothed with adpressed pubescence according to Koch.

* Primary ribs of fruit hispid from spreading bristles.

Far. fl. glabratum (D. C. prod. p. 206.) leaves and stems glabrous. 3. H. Native of Piedmont, Pyrenees, &c. L. daucoides, Dufour, in litt. L. Pruteicium, Lapeyr. suppl. p. 48. Balb. fl. taur. 49. Fruit pilose on the primary ribs, as in var. a. The wings of the fruit are very unequal: the 2 lateral ones are large: and the 2 dorsal ones very small, or nearly wanting, hence this species falls in almost to Thapsia, but differs in the petals being emarginate.

17 L. Athamanxete (Spreng. in Schultes. syst. 6. p. 624.) plant hispid; stem furrowed, much branched; leaves ternately decompound, rough on both surfaces, stiffish; leaflets oblong, pinnatifid; segments broadly lanceolate, mucronate; leaves of involucra and involucres oblong, reflexed. 3. H. Native of Siberia. Perhaps the same as L. hispidum or a variety of L. Pruteicium.

† Species not sufficiently known.

18 L. Capeense (Thum. prod. p. 50. fl. cap. 2. p. 201.) stem terete, glabrous; leaves bipinnate; leaflets oval, mucronate, margined, quite entire; sheaths large, petiolar.—Native of the Cape of Good Hope. Fruit ovate, striated, and therefore the genus is doubtful.

Cape Laserwort. Pl. 1 to 1 1/2 foot.

19 L. Aureum (Willd. spec. 1416.) stem terete, nearly simple; leaves ternately decompound; leaflets ovate-lanceolate, pinnatifid: segments lanceolate, bluntish, mucronate; leaves of involucra and involucres filiform. 2. H. Native of the Levant. Spreng. in Schultes. syst. 6. p. 626.—Buxb. cent. 1. t. 43. ex Spreng. but the description hardly agrees with it. L. élegans, Clark, in Spreng. neu. entd. 3. p. 160. is related to it according to Spreng. syst. 1. p. 918. Flowers golden yellow. Fruit unknown. Perhaps a species of Thapsia.

20 L. Peruclaceum (Lapeyr. abr. pyr. p. 152. but not of Lin.) stem naked, simple, furrowed; leaves decompound: leaflets capillary, simple in the lower part, and more decompound at the apex; mericarps of fruit 4-winged. 2. H. Native of the Pyrenees, in a place called Pic du Gard. This is a very obscure species.

Fennel-like Laserwort. Pl. 2 to 3 feet.

Cult. All the species grow well in common soil, but it must be rather dry. They are only to be increased by seed, which should be sown in the autumn or spring.

CXXVII. LOPHOSCIADUM (άλοθρος, lophos, a crest; and σκίδαω, skidion, an umbel; in reference to the crested wings of the mericarps). D. C. coll. mem. 5. p. 57. t. 3. f. 6. prod. 4. p. 207.

Lin. syst. Penétanodia, Digynia. Margin of calyx 5-toothed. Petals elliptic, entire, acuminate, somewhat involute at the apex. Fruit compressed from the back. The primary ribs of the mericarps are unknown: but the 4 secondary ones are winged: the 2 lateral of which are expanded into a somewhat serrated wing each: and the 2 dorsal ones are expanded into interrupted wings, which at first sight appear like retrograde scales. Seed unknown.—Herb glabrous. Stem terete, erect. Lower leaves like those of Achillea millefolium, pinnate; leaflets short, innumerable, divided into linear-subulate lobes; upper leaves sessile, pinnate from the base, usually rising from the axes of the sheaths. Umbels compound, sometimes proliferous. Leaves of involucra 5-7, ovate-lanceolate, cuspidate; of the involucres 5-7, but narrower, and about equal in length to the umbellules. Flowers yellow. Allied to Thapsia, but differs in the ribs of the fruit being scaly; but the fruit examined being immature and incomplete, it is therefore doubtful in what part of the order the genus should be placed. Perhaps it should have been placed near Cachrys.

Cult. See Laserpitium above for culture and propagation.

Lin. syst. Penétanodia, Digynia. Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point. Fruit flatly compressed from the back. Mericarps with 5 filiform, primary ribs: the 3 intermediate ones on the back: and the 2 lateral ones placed in the commissure, which is flat: and 4 secondary ones: the inner ones of these filiform and very slender, but the outer 2 are expanded into membranous serrated wings; under all the ribs there are oleiferous canals. Carphophore bipartite. Seed flat.—A shrub with a terete simple stem, which is naked below. Leaves tripinnate; leaflets ovate, acuminate, serrated: ultimate ones usually confluent; petioles sheathing. Umbels composed of many rays. Involucra of many cut leaves; and the involucres of many entire leaves. Flowers white.

plant is called by gardeners Bûbôn Gâlânâmum, to which it is very similar in habit, hence it has the name of decipens.

*Deceiving* Black-parsley. Fl. Ju. Jul. Clt. 1785. Shrub. *Cult.* Any light soil will suit this plant; and it is only to be increased by seed.

**Tribe XII.**

**DAUCI'NEÆ** (this section contains plants agreeing with *Daucus* in important characters) or ORTHOSPOR'ÆME MULTIO-CÂTE ARMAÎTE. Koch, umb. p. 76. D. C. prod. 4. p. 208. Fruit lentically compressed from the back, or the transverse section is nearly terete. Mericarps with 5 primary, filiform, bristly ribs: the lateral ones placed in the commissure, which is flat, as in *Thapsiça*; and with 4 secondary ones, which are more prominent and prickly than the primary ones: the prickles free, or joined into a wing. Seed complanate or somewhat semi-teretely convex, flattish in front.

**LIN. SYST.** *Pentândria, Digînia.* Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point; those in the outer ray of the umbels with unequal lobes: the outer lobe very large. Fruit compressed from the back. Mericarps with 5 primary, filiform ribs: the 3 intermediate dorsal, and the 2 lateral ones placed in the commissure; and 4 secondary ribs: the 2 inner ones of these filiform: and the 2 outer ones winged: the wings deeply and sinuately lobed. Carpophore bipartite. Vittea none. Seed flat.—An annual, glabrous herb. Leaves, as well as those of the involucre and involucels divided into linear lobes. Umbels compound. Flowers white. Herb with the habit of *Nigella Domasiçìna*; and the florescence like that of *Orlaza grandiflora*.

1 A *SQUAMMA* (Lin. spec. p. 347). **O. H.** Native of the Levant, on Mount Lebanon (Lin.): between Bagdad and Kermanshah (Olivier), on the banks of the Euphrates (C. Ros- tan); in Syria and Asia Minor (Schr.); in the Morea, and Lycia (Smith); Cyprus (Sibth.). Gingidium Rauwofíia, Cam. hort. 16, but not of Dioscorides, ex Sibth. and Smith, fl. gréc. 208. Thápsia orientális, Tourn. cor. 22. 1. Mor. ox. sect. 9. t. 18. f. 11. Flowers white. There is a pencil-like brown brush in the centre of the umbels. Cotyledons long, linear. Compare D. C. mem. umb. t. 19. t. 7.

**Cult.** The seeds should be sown as soon as they are ripe, in warm border, as if sown in spring, the plant rarely produces seed.

**LIN. SYST.** *Pentândria, Digînia.* Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point: those in the outer rays of the umbel radiant and profoundly bifid. Fruit lenticularly compressed from the back. Mericarps with 5, filiform, primary, setiferous ribs: the 3 intermediate ones dorsal: and the 2 lateral ones placed in the commissure, which is flat: and with 4 secondary ones, bearing 2-3 series of prickles each: the outer ones more prominent, or a little winged; prickles hooked, or rayed at the apex. Vittea 1 in each furrow, under the secondary ribs. Carpophore bifid or undivided. Seed flat, convex behind.—Annual herbs. Leaves multifid; lobes linear. Involuta variable; involucels of many leaves. Flowers white; those in the rays of the umbels hermaphroditic, with short styles: those in the disk male: the rest female, and fertile, with long styles.

1 O. GRANDI'PÔRA (Hoffin. umb. 1. p. 58.) plant erect, dichotomous, glabrous; leaves bipinnate; leaflets pinnatifid; segments linear, short; leaves of involucra 5, with scarious margins; prickles of fruit hooked at the apex. **O. H.** Native of south and middle Europe, and of Tauria, in fields. Echinóphora, Col. echp. 1. 91. t. 94. f. 1. Rivin. pent. t. 25. Caécalis grandiflóra, Lin. spec. p. 346. Lam. ill. t. 192. f. 1. Jacq. aust. 1. t. 54. Daucus grandiflóris, Scop. carn. 1. p. 189.—Lob. icon. 728. f. 1.—Mor. hist. sect. 9. t. 14. f. 3. There is a variety of this with smaller flowers, a native of the south of France.

**LIN. SYST.** *Pentândria, Digînia.* Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point: outer ones usually radiating, and profusely bifid. Fruit somewhat compressed from the back, ovate or oblong. Mericarps with 5 primary, filiform, bristly ribs: the 3 intermediate ones dorsal: and the 2 lateral ones placed in the commissure, which is flat: and with 4 more secondary, prominent, equal, winged ribs, which are divided into a simple series of prickles. Vittea 1 in each furrow, under the secondary ribs. Seed flatish in front.—Herbs, usually biennial. Leaves bipinnate. Leaves of involucra many, trifid, or pinnatifid; involucelles of many entire or trifid leaves. Flowers white or yellow; the central ones usually fleshy, dark purple, and sterile. The species of this genus are badly known, and are extremely difficult to extricate from confusion.

**Sect. 1. PLATYP'ERÖUM** (from πλατύς, platys, broad, and σφυρί, sperma, a seed; seeds broad). Hoffin. umb. 1. p. 64.

1 D. MURICATUS (Lin. mant. p. 392.) plant hispid; leaves tripartite; leaflets multifidly cut; leaves of involucrum 3-5, many of which, or all, are trifid or pinnatifid; prickles of fruit longer than the breadth of the seed, peltately glochidiate at the apex. $\odot$. H. Native of Maurtania, Numidia, Cambod, and China, in fields.—Mor. hist. sect. 9. t. 14. f. 4. Herm. par. 111. Artédia muriçata, Lin. spec. ed. 1. p. 242. D. mucrìcatus, Desf. atl. 1. p. 243. Spreng. in Schultes, syst. 6. p. 477. exclusive of the synonymy of Poir. Platyürspernum mucrìcátum, Hoffm. and Koch, l. c. and perhaps Caücalis Maurtánica is referrible to this. The hairs on the lower part of the stem are bent back.—Col. ceplhr. 1. p. 95 t. 94. Flowers pink.

Muricuted-fruited Carrot. Fl. Ju. Jul. Clt. 1683. Pl. 1 fl. 2 D. LITTORALIS (Sibth. and Smith, fl. grece. t. 272. prod. 1. p. 185.) stem decumbent, hispid from deflexed hairs; leaves bipinnate, hispid; leaflets short, multifid, cuneiform; leaves of involucrum 3-cleft, shorter than the umbel; fruit ovate, obeset with glochidiate prickles. $\odot$. H. Native of the island of Cyprus, by the sea-side; and of Spain. Leaves of the involucrum usually 5; of the involucels membranous. Flowers white. Fruit angular, beset with strong prickles.

Most-beautiful Carrot. Fl. Ju. Jul. Clt. 1816. Pl. 2 to 4 fl. 4 D. BESARRABECUS (D. C. prod. 4. p. 210.) glabrous; leaves ternately supra-decomposer; segments linear-setaceous; umbels of many rays; involucrum wanting; prickles of fruit length of seeds, when young scabrous. $\odot$. H. Native on the shores of the Black Sea, about Odessa; and of the south of Bessarabia. Caücalis littorális, Biebr. fl. taur. 1. p. 208. Caücalis littorális, Biebr. umb. prod. 20. no. 5. Platyürspernum littorális, Koch, l. c. This is very different from Daüucus littorális of Sibth., but it nearly agrees with D. pulcherrimus, especially in the leaves of the involucels being ciliate, but differs from it in the segments of the leaves being fewer and longer; in the rays of the umbels and umbellages being fewer; and in the prickles of the fruit being shorter. Flowers white.

Laserwort-like Carrot. Pl. 2 to 3 fl. 6 D. EUNIFILES (Koch, umb. p. 77.) stem rough, branched; leaves pinnate, rather hispid; leaflets pinnatifid, with linear or trifid segments; leaves of involucrum usually trifid or undivided; prickles glochidiate at the apex, longer than the breadth of the fruit, which is oblong. $\odot$. H. Native of Egypt, at Alexandria. Caücalis glâbra, Forsk. descript. p. 206. Delile, fl. agypt. 64. t. 23. f. 2 and 3.

Var. a; smaller, sea-side plant; stems humble, diffuse. Delile, l. c. f. 2.

Var. β; a larger plant, native of sandy places, with taller, erect stems, and more slender and more acutely divided leaves.

Sect. II. Caro'ta (from car, celt. red; colour of root). D. C. prod. 4. p. 211. Prickles of secondary ribs slender, separate, even to the base. Rays of umbel nearly equal, or gradually shorter to the centre.

Small-flowered Carrot. Fl. June. Jul. Clt. 1824. Pl. 3 fl. 9 D. INVOLUCRATUS (Sibth. and Smith, fl. grece. t. 271. Smith, prod. 1. p. 184.) stem hispid from spreading hairs; leaves bipinnate; leaflets pinnatifid; leaves of involucrum pinnatifid, longer than the umbel; umbellules few-flowered, uniform; leaves of involucels narrow. $\odot$. H. Native of Cyprus, by the sea-side. Perhaps the same as D. Cri'ticus, Mill. dict. no. 5. Fruit small, scabrous from silvery prickles, which are hooked and glochidiate at the apex.

Involuterated Carrot. Fl. June. July. Clt. ? Pl. 2 to 4 fl. 10 D. CAROB'TA (Lin. spec. 348.) stem hispid; leaves bipinnate, and trinipate; leaflets pinnatifid, with linear-lanceolate acute segments; umbels with a solitary, coloured, abrotive flower; when in seed concave; bristles of fruit slender; leaves of involucrum pinnatifid, not so long as the umbels; umbellules few-flowered, equal; leaves of involucels undivided or trifid. $\odot$. H. Native of Europe, Tauria, Caucasus, and now introduced to South America, China, Cochín-china, &c. in pastures and the borders of fields, in a gravelly soil; common in Britain, in like situations. Smith, engl. bot. 1174. Mart. rust. t. 82. Fl. dan. 725. Planch. off. t. 176. Hayn. arz. gew. t. 7. t. 2. D. vul'garis, Neck. D. polygamus, Jacq. vind. 3. p. 43. t. 78. Caücalis Carótâ, Crantz. Huls. ang. p. 114. Staphylinus, Riv. pentap. ir. t. 26. Pastinæa sylvestris, Math. valgr. vol. 2. p. 157. f. 1.—Gen. emac. 1028.—Fuchs. hist. p. 684. Root slender, aromatic, and sweetish, resembling the garden carrot, which is only a cultivated variety. Leaves rather hairy. Umbels white, except the one central neutral flower, which is blood red. Seeds small, protected by the incurvation of all the flower-stalks, by which the umbels are rendered hollow, like a bird's nest. There are several varieties of the wild carrot, besides the cultivated kinds.

Var. β, sativa (D. C. prod. 4. p. 211.) root spindle-shaped, thick, succulent. This is the cultivated carrot, of which there are varieties with white, red, but usually yellow or copper-coloured roots.

The root of the plant, in its wild state, is small, dry, sticky, of a white colour, and strong flavoured; but the root of the 7
cultivated variety is large, succulent, and of a red, yellow, or pale straw colour.

Use.—It is used in soups and stews, and as a vegetable dish. Parkinson informs us that, in his day, ladies wore carrot leaves instead of feathers. In winter, an elegant chimney ornament is sometimes formed by cutting off a section from the head or thick end of a carrot, containing the bud, and placing it in a shallow vessel with water. Young and delicate leaves unfold themselves, forming a radiated tuft, of a very handsome appearance, and heightened by contrast with the season of the year.

Varieties.—Those in common cultivation are:
1. Large red or field carrot, grows to a large size, and is chiefly cultivated in fields, and in farmers’ gardens, for colouring butter.
2. Orange carrot. The root is long and large, of an orange colour, and is the best sort for the main crop.
3. Early horn. Root short, smaller. It is the best kind for a small, early crop; also for shallow soils.
4. Late horn. With the same characteristics as the preceding, but suited for a late crop.

William Christie enumerates the following sorts of horn carrots:
—Early red, common early, long horn. Of long carrots:
—White, yellow, long yellow, long orange, long red, and the Altham, or superb, originally from Cheshire.

Soil.—The carrot requires a light mellow soil, mixed with sand, which should be dug or trenched one or two spades deep, breaking well all the lumpy parts, so as to form a porous bed, and an even surface. The orange and red sorts, on account of their longer roots, require a soil proportionally deeper than the horns.

Seed estimate and sowing.—The seeds have numerous forked hairs on their ribs, by which they adhere together, and therefore should, previously to sowing, be rubbed between the hands, and mixed with dry sand, in order to separate them as much as possible. They are also very light, and therefore a calm day must be chosen for sowing; and the seeds should be disseminated equally, and trod in before raking. Previously to sowing, if convenient, the seed should be proven, by sowing a few in a pot, and placing it in a hot-bed, or hot-house, as it is more frequently bad than most garden seeds. For a bed 45 feet by 30, one ounce will be requisite, and the same for 150 feet of drill rows.

Times of sowing.—To have early summer carrots, sow on a warm border in the beginning of February, or, to have them still more forward, sow in a moderate hot-bed, giving copious admission of air. In the open garden, begin with the early horn, in the last fortnight of February, or first week of March, as dry, fine, and open weather may occur. The first sown beds should be assigned a favourable situation, and covered for a time with haulm. Follow with the orange, in the first fortnight of March, and make successive sowings thence to the 20th of April for main crops. Add smaller sowings twice in May, for plants to draw young late in summer; also sow a few at the commencement of July, for a later succession of young carrots in summer and autumn. Lastly, in the beginning of August, two separate small sowings may be made for plants to stand the winter, and afford young roots early in spring, March and April.

Insects.—Carrots, when they come up, are apt to be attacked by insects, like the turnip; the most approved remedies for which are thick sowing, in order to afford both a supply for the insects and the crop; and late sowing, especially in light soils, thus permitting the grubs to attain their fly state before the seed comes up.

Culture.—When the plants are up 2 or 3 inches in growth, in May and June, they will require thinning and clearing from weeds, either by hand or small hoeing. Thin from 3 to 5 inches’ distance, such as are designed for drawing in young and middling growth. But the main crop, intended for larger and full-sized roots, thin to 6 or 8 inches’ distance. Keep the whole clean from weeds in their advancing young growth. Some of small and middling growth will be fit for drawing in June and July; large sizeable roots, in August and September; and those of full growth, by the end of October.

Preserving in winter.—Carrots are taken up at the approach of winter, cleaned, and stored among sand. They may be built very firm, by laying them heads and tails alternately, and packing with sand. In this way, if frost be excluded from the storehouse, they keep perfectly well till March or April of the following year. Some persons insist that the tops should be entirely cut off at the time of storing, so as effectually to prevent their growing; while others wish to preserve the capability of vegetation, though certainly not to encourage the tendency to grow.

To save seed.—Plant some of the largest best roots in October, November, or the last fortnight of February, 2 feet apart; insert them a few inches over the crowns. They will yield ripe seed in autumn, of which gather only from the principal umbel, which is likely not only to afford the ripest and largest seed, but the most vigorous plants. A considerable quantity of carrot seed, for the supply of the London seedsmen, is raised near Weatherfield in Essex; and much is imported from Holland.

Field culture of the carrot.—It is observed, by a judicious writer, that the carrot has been too much neglected on lands, where it would have yielded a more valuable product in agriculture perhaps than any bulbous or tap-rooted plant whatever. Several contradictory experiments in its culture have been detailed in a number of publications, from which the practical husbandman will be at a loss to draw any definite conclusion. But in a communication to the board of agriculture from Robert Burrows, an intelligent Norfolk farmer, who has cultivated carrots on a large scale, and with great success, for several years, so accurate an account is presented of the culture, application, and extraordinary value of this root, that carrots will probably soon enter more largely into the rotation of crops on suitable soils.

Varieties.—The only sort adapted for field culture is the long red or field carrot. New seed is most essential, as it will not vegetate the second year.

The best soil for the carrot is a deep rich sandy loam; such a soil ought at least to be a foot deep, and all equally good from top to bottom; on any other the field culture of the carrot will not answer.

In preparing the soil for the carrot, it is essential to plough it before winter, that it may be pulverized by frost, and to work it well in the spring to at least the depth of a foot. This deep tillage may be perfectly accomplished by means of the trench plough, following the common one, or even by the common one alone with a good strength of team; but the former method is to be preferred, wherever the lands are inclined to be stiff or heavy. Three ploughings are mostly found sufficient where the land has been previously in a state of tillage, but more may in other cases be necessary. As soon as the last ploughing has been made in March, the land should be harrowed, and the surface made as fine as possible. In Suffolk the farmers sow carrots after turnips, barley, and peas, set upon a rye-grass ley; the crops upon the first have generally been most productive; next to that they prefer the latter. In the first place, they feed off the turnips by the beginning of February, and then lay the land up in small bulks or furrows, in which state it remains till the second week in March, when it is harrowed down, double furrowed to the depth of about a foot, and the seed sown.

The climate most suitable to the carrot is the same as for the turnip; but they will thrive better than the turnip in a dry and windy situation.
warm climate, and are consequently of better growth in the south of England and France, in proportion to their size in moist climates, as Holland and Ireland, than the turnip.

Manure, according to some, should not be given to carrots the year they are sown, as it is alleged when the roots meet with it they become forked and wormy. This, however, is only applicable to cases in which recent unfermented manure has been given, or where other manure has not been properly broken in pieces, and spread over the soil, or in the drills. The Suffolk and Norfolk farmers, who are the best carrot growers, always use dung; a suitable proportion of well-rotted farm-yard dung being constantly turned into the soil at the last ploughing in March, as it has been fully shown by various trials detailed in the Annals of Agriculture, and other books on husbandry, that though good crops of carrots may be occasionally grown without the aid of manure, it is only by the liberal application of that substance that the greatest produce possibly can be obtained, as they are in general found to bear a relative proportion to the quantity that may have been employed. Mr. Burrows prepares the land with a good dressing of about 16 cart loads per acre of rotten farm-yard manure, or cottagers’ ashes,—the load about as much as three horses can draw. He usually sows wheat stubbles after clover, ploughing the first time in autumn, and once more in the early part of the month of February, if the weather permits; setting on the manure at the time of sowing, which is about the last week in March, or sometimes as late as the second week in April. In Suffolk, when carrots are intended to be sown after peas, they usually plough the stubble as soon as the harvest is over, in order that the land may clear itself of weeds; in December, it is laid up in small balks to receive the benefit of the frosts; in February, it is harrowed down, and manured at the rate of 15 loads per acre; the manure ploughed in to the depth of about 4 inches, and in the month of March the land is double-furrowed, and the seed sown. By pursuing this method, they say, the manure lies in the centre of the soil, and not only affords nourishment and support to the carrot in its perpendicular progress, but renders it easy to be turned up by a single ploughing, and greatly promotes the growth of the succeeding crop of barley. In Norfolk, it is the practice to sow carrots after a crop of turnips. The manure, after being put on the land in the beginning of March, is first ploughed in with a common plough, and afterwards trench ploughed about 14 or 15 inches deep; it is then harrowed very fine, and the seed sown about the beginning of March.

The season for sowing the carrot, preferred by Mr. Burrows, is the last week in March or first of April; but he prefers the first period, having generally found early crops the most productive. The usual preparation of the seed for sowing, is by mixing it with earth or sand, to cause it to separate more freely; but Burrows adds water, turns over the mixture of seeds and moist earth several times, and thus brings it to a point of vegetation before he sows it. "Having then weighed the quantity of seed to be sown, and collected sand or fine mould in the proportion of 2 bushels to an acre, I mix the seed with the sand or mould 8 or 10 pounds to every 2 bushels, and this is done about a fortnight or 3 weeks before the time I intend sowing; taking care to have the heaps turned over every day, sprinkling the outside of them with water each time of turning over, that every part of the sand heaps may be equally moist, and that vegetation may take place alike throughout. I have great advantage in preparing the seed so long beforehand; it is by this means in a state of forward vegetation, therefore lies but a short time in the ground, and by quickly appearing above ground, is more able to contend with those numerous tribes of weeds in the soil, whose seeds are of quicker vegetation." Suppl. &c.

The quantity of seed, when carrots are sown in rows, is 2 pounds per acre, and for broad-cast sowing 5 pounds. Burrows sows 10 pounds per acre in the broad-cast manner.

The usual mode of sowing the carrot is broad-cast, but perhaps the better mode would be to sow them in rows at 12 or 14 inches asunder; drawing the drills, and hoeing the intervals by any suitable hoe. The most common practice, however, where carrots are best cultivated, is the hand or broad-cast method, the seed being dispersed as evenly as possible over the land, after the surface has been reduced to a very fine state of pulverization by harrowing, in order to provide a suitable bed for it to vegetate in, being then covered in by means of a light harrow. As the seed is not of a nature to be deposited with much regularity by the drill, and as the young plants can be easily set out to proper distances in the operation of hoeing, this is probably the most appropriate method of putting such sort of seed into the ground. And an additional proof of it is indeed found in its being that which is almost universally adopted in those districts where carrot-husbandry is practised to the greatest extent. The drill method, however, would save much hand labour. The seed may either be deposited by the drill-machine, or by furrows made with a hoe or other implements, burying the seed about an inch in depth, and harrowing once.

The after culture given to the carrot consists entirely of hoeing and weeding. In Suffolk they are hoed generally 3 times in the season. The first time, as soon as the plants can be distinguished from the weeds, which should be done with a 3-inch hoe. It is an operation that requires to be performed with great attention, as it is extremely difficult to distinguish the young carrots from the weeds. The second hoeing should be given in 3 or 4 weeks afterwards, according to the forwardness of the crop; it may be performed with common hoes, care being taken to set out the plants at proper distances. From 8 to 15 inches each way is the common distance, at which they are allowed to stand; and it has been proved by experience, that carrots which grow at such distances always prove a more abundant crop than when the plants are allowed to stand closer together. The third hoeing is commonly made about the middle or end of June, and in this, besides destroying the weeds, another material circumstance to be attended to, is to set the carrots at proper distances, and also wherever any have been left double at the former hoeings, to take the worst of the two plants away.

Carrots sown according to the plan of Burrows, are ready to hoe within about 5 or 6 weeks. He hoes 3, and sometimes 4 times, or until the crop is perfectly clean. The first hoeing is with hoes 4 inches long, and 2½ inches wide. The second hoeing invariably takes place as soon as the furrows are made, and is performed with 6-inch hoes, by 2½ inches wide. By this time the plants are set; the first time of hoeing nothing was cut but the weeds. He leaves the plants 9 inches apart from each other, sometimes they will be a foot or even farther asunder.

Carrots are generally taken up in the last week of October. The operation is performed by 3-pronged forks. "I take up in autumn a sufficient quantity to have a store to last me out any considerable frost or snow that may happen in the winter months. The rest of the crop I leave in the ground, preferring them fresh out of the earth for both horses and bullocks. The carrots keep best in the ground, nor can the severest frosts do them any material injury; the first week in March it is necessary to have the remaining part of the crop taken up, and the land cleared for barley; the carrots can either be laid in a heap, with a small quantity of straw covered over them, or they may be laid into some empty outhouse or barn, in heaps of many hundred bushels, provided they are put together dry. This latter circumstance it is indispensable to attend to; for if laid together in large heaps when wet, they will certainly sustain
The storing of the whole crop of carrots, may be a desirable practice when winter wheat is to follow them, in which case the same mode may be adopted as for turnips or potatoes, but with fewer precautions against the frost, as the carrot if perfectly dry is very little injured by that description of weather.

The produce of an acre of carrots in Suffolk, according to Arthur Young, is at an average 350 bushels; but Burrows' crop averaged upwards of 800 bushels per acre, which considerably exceeds the largest crop of potatoes.

The use to which the carrot is applied in Suffolk are various. Large quantities are sent to the London markets, and also used as food to different kinds of live stock. Horses are remarkably fond of carrots, and it is even said when oats and carrots are given together, the horses leave the oats and eat the carrots. The ordinary allowance is about 40 or 50 pounds a day to each horse. Carrots, when mixed with chaff, that is, cut straw, and a little hay, keep horses in excellent condition for performing all kinds of ordinary labour. The farmers begin to feed their horses with carrots in December, and continue to give them chiefly that kind of provender till the beginning or middle of May; to which period, with proper care, carrots may be preserved. As many of the farmers in that country are of opinion, that carrots are not so good for horses in winter as in spring, they give only half the above allowance of carrots at first, and add a little corn for a few weeks after they begin to use carrots.

The application of the carrot to the feeding of working cattle and hogs, is thus detailed by Burrows: "I begin to take up the carrot crop in the last week of October, as at that time I generally finish soiling my horses with lucern, and now solely depend upon my carrots, with a proper allowance of hay, as winter food for my horses, until about the first week of June following, when the lucern is again ready for soiling. By reducing this practice to a system, I have been enabled to feed 10 cart horses throughout the winter months for these last 6 years, without giving them any corn whatever, and have at the same time effected a considerable saving in hay. I give them to my cart-horses in the proportion of 70 pounds weight of carrots a horse per day, upon an average, not allowing them quite so many in the very short days, and sometimes more than that quantity in the spring months, or to the amount I withheld in the short winter days. The men who tend the horses slice some of the carrots in the cut chaff of hay, and barn door refuse; the rest of the carrots they give whole to the horses at night, with a small quantity of hay in their racks, and with this food my horses generally enjoy uninterrupted health. I mention this, as I believe that some persons think that carrots only, given as food to horses, are injurious to their constitutions; but most of the prejudices of mankind have no better foundation, and are taken up at random, or inherited from their forefathers. So successful have I been with carrots, as a winter food for horses, that with the assistance of lucern for soiling in summer, I have been enabled to prove by experiments, conducted under my own personal inspection, that an able Norfolk team-horse, fully worked two journeys a day, winter and summer, may be kept the entire year round upon the produce of one statute acre of land. I have likewise applied carrots with great profit to the feeding of hogs in winter, and by that means have made my straw into a most excellent manure, without the aid of neat cattle. The hogs so fed are sold on Norfolk hill to the London dealers as porkers." The profits of carrots so applied, he shows in a subsequent statement, together with an experiment of feeding four Galloway bullocks with carrots, against four others fed in the common way with turnips and hay.—Burrows' Communications, &c.

In comparing the carrot with the potato, an additional circumstance greatly in favour of the former is, that it does not require to be steamed or boiled, and it is not more difficult to wash than the potato. These, and other circumstances considered, it appears to be the most valuable of all roots for working horses.

The use of the carrot in domestic economy is well known. Their produce of nutritive matter, as ascertained by Sir H. Davy, is 98 parts in 1000, of which 3 are starch, and 95 sugar. They are used in the dairy in winter and spring to give colour and flavour to butter. In the distillery, owing to the great proportion of sugar in their composition, they yield more spirit than the potato; the usual quantity is 12 gallons per ton. They are excellent in soups, stews, and haricots, and boiled whole with salt beef.

Medical qualities.—The seeds, especially of the wild variety, have a moderately warm pungent taste, and an agreeable smell. They are carminative, and are said to be diuretic. The roots, especially of the cultivated variety, contain much mucilaginous and succulare matter, and are therefore highly nutritious and emollient. When beaten to a pulp, they form an excellent application to carminomatus and ill-conditioned ulcers, allaying the pain, checking the suppuration and fetid smell, and softening the cullos edges.

11 D. maritimus (Lam. dict. 1. p. 634. but not of Wh.) stem elongated, smooth, and glabrous at the base, but scabrous from tubercules above; leaves glabrous: lower ones bipinnate; leaflets jagged: segments linear, acuminated; leaves of involucra pinnafitid, linear, acute; of the involucres undivided; prickles about equal in length to the diameter of the fruit, which is ovate. g. H. Native of France, in sand, along the sea-shore; as well as along the shores of the Mediterranean Sea, where it is generally mixed with D. Carota, but from which it is easily distinguished. D. C. fl. fr. 4. p. 329. bot. gall. 1. p. 215.

12 D. glaberrimus (Desf. fl. ad. 1. p. 244. t. 64.) stem glabrous, or rather scabrous from small down; leaves pinnate; leaflets cuneate, bluntly 3-5-lobed, glabrous; leaves of involucra pinnafitid, acute, one half shorter than the umbels; involucres trifid or simple; prickles about equal in length to the breadth of the fruit, which is ovate. g. H. Native of the north of Africa, near Tazor, in woods of palm trees. Flowers small, white.

Quite-glabrous Carrot. Pl. 1 to 2 feet.

13 D. Gingidiom (Lin. spec. 348.) stem petioles scabrous from scattered bristles; leaves bipinnate; leaflets deeply toothed, ovate: segments obtuse, mucronate; leaves of involucra striated, pinnafitid, about equal in length to the umbels; prickles bristle-formed, equal in length to the breadth of the fruit, capitably glochidiate at the apex. g. H. Native of Corsica, on rocks by the sea-side, and probably of Sicily. D. Mauritianicus, Salzm. exsic.—Gingidium, Math. ed. Valgr. 373. f. 1. D. lucidus, Lin. fil. suppl. 179. ex Smith, in Lin. trans. 9. p. 133.—Bocc. mus. t. 20. Habit of D. Hispianicus, but differs in the fruit. Trzydaw, is a name employed by Dioscorides for an umbelliferous plant, but what plant is now unknown.

Chervil-like or Shining-leaved Carrot. Fl. June, July. Clt. 1722. Pl. 2 to 3 feet.

Spanish Carrot. Fl. Ju. Aug. England. Pl. 1 to 2 feet. 15 D. pectinatus (D. C. prod. 4. p. 212.) stem smoothish, striated, rather scabrous at the apex; leaves bipinnate, glabrous; leaflets ovate-lanceolate, pinnatifid: segments ovate-lanceolate, acute; leaves of involucra pinnatifid, about equal in length to the umbels, which are many-rayed; prickles simple, regularly pinnated, shorter than the breadth of the fruit, which is ovate. ʃ. H. Native country unknown. This species differs from all the rest in the fruit.

Pectinated-fruited Carrot. Fl. Ju. Jul. Clit.? Pl. 2 to 3 ft. 16 D. Mauritius (All. pedem. no. 1381. t. 61. f. 1.) stem scabrous from retrograde bristles; leaves bipinnate, glabrous; leaflets of the lower leaves lanceolate, deeply toothed: of the superior leaves linear, acute; leaves of involucra straited, pinnatifid, shorter than the umbels; prickles simple, acute, exceeding the breadth of the fruit, which is ovate. ʃ. H. Native in fields about Nice, and in the south of France, and of Mauritania. D. C. fl. fr. 5. p. 512. and probably of Lin. spec. 348. V. ʃ. pterocleatus (D. C. prod. 4. p. 212.) leaves of the involucres variable, some of them undivided; and some, as the outer ones, pinnatifid. ʃ. H. Native of Tauria, on the banks of rivers.

Mauritian Carrot. Fl. Ju. July. Clit. 1768. Pl. 3 ft. 17 D. maximus (Desf. fl. atl. 1. p. 241.) stem scabrous, striated; leaves bipinnate or tripinnate; leaflets of the lower leaves ovate, equally cut, with obtuse mucronate segments: of the upper leaves linear, acute; leaves of involucra pinnatifid, about equal in length to the umbels; prickles gladiolate at the apex, equal in length to the breadth of the fruit, which is ovate. ʃ. H. Native of Mauritania, Sardinia, south of France, on the borders of fields. Umbels large, radiating; having the central flower abortive.

Largest Carrot. Pl. 2 to 4 feet. 18 D. uttayus (Sibth. et Smith, fl. grece. t. 269. Smith, prod. 1. p. 184.) stem hairy from spreading pili; leaves bipinnate; lower leaflets cuneate, pinnatifid, mucronate: superior ones lanceolate, finely serrullated; involucra shorter than the umbels; leaves of involucres membranous; central flowers of umbels abortive, and of a different colour from the rest. ʃ. H. Native of the Grecian islands, and of Asia Minor.

Spotted Carrot. Pl. 1 foot. 19 D. Polygamus (Gouan. ill. p. 9.) stem terete, nearly scabrous; leaves bipinnate, smoothish, but pilose beneath on the nerves, as well as on the petioles; leaflets pinnatifid: segments lanceolate-linear, acute; leaves of involucra trifid or pinnatifid; outer flowers of umbel abortive; prickles acute, about equal in length to the fruit, which is ovate. ʃ. H. Native of Spain, and probably of Sicily, if the figure in Bocc. sic. t. 40. f. 3. appertain to this species. D. Carota β, Pers. exch. exclusive of the synonyme of Jaq. Fruit larger than those of D. Carota, and the prickles are twice the length. Perhaps sufficiently distinct from D. Carota.

Hispid Carrot. Fl. June. July. Clit. 1804. Pl. 1 to 2 feet. 21 D. grandiflorus (Desf. fl. atl. 1. p. 240. t. 59.) stem pilose; leaves tripinnate and quadruplicate; leaflets trichid, linear, cuspidate; leaves of involucra pinnatifid, with subulate segments, about equal in length to the radiating umbles; prickles peltately gladiolate at the apex, exceeding the breadth of the fruit, which is ovate. ʃ. H. Native of Algiers, among corn. Flowers like those of Orlaya grandiflora, and the leaves like those of D. Mauritius, but differs in the prickles of the fruit being gladiolate at the apex.

Great-flowered Carrot. Pl. 2 to 3 feet. 22 D. pusillus (Michx. fl. bor. amer. 1. p. 164.) stem hispid from retrograde pili at the base, and rather scabrous at top; leaves bipinnate, rather scabrous; leaflets cut into linear segments; leaves of involucra pinnatifid, about equal in length to the umbels, which are small; prickles distinctly gladiolate at the apex, about equal in length to the breadth of the fruit, which is ovate. ʃ. H. Native of Carolina, at St. John's and Savannah, in dry places (Ell. sketch. 1. p. 349.); at the Red River (Nutt. in litt.); in Pennsylvania, at Reading (Herb. Koch.). Truly distinct from D. Carota.

Small Carrot. Pl. 1 foot. 23 D. microphyllus (Presl. in herb. Haeke, ex D. C. prod. 4. p. 213.) stem villous from soft retrograde hairs, especially at the bottom; leaves bipinnate, villous; leaflets cut into linear segments; leaves of involucra pinnatifid, about equal in length to the umbels, which are small and crowded; prickles distinctly gladiolate at the apex, about equal in length to the breadth of the fruit, which is ovate. ? ʃ. H. Native of the north-west coast of America, at Nootka Sound; Straits of De Fuca; Rocky places of the Grand Rapids of the Columbia; and on the plains of the Multnomah River. Very nearly allied to D. pusillus, but the hairs on the stem are more numerous, longer, soft, and not tubercular at the base; and the fruit is a little larger.

Small-leaved Carrot. Pl. 1 foot. 24 D. setiviolatus (Desf. fl. atl. 1. p. 244. t. 65.) stem smooth, erect; leaves decumbent, pubescent; leaflets many-parted, opposite, somewhat verticillate: segments elongated, filiform, very narrow; leaves of involucra multifid; fruit cylindrical, pubescent, ciliately echinated at the angles; prickles short. ʃ. H. Native of Mauritania, near Mascar, on uncultivated hills. Central flowers abortive. Perhaps the same as D. verticillatus, Horn. hort, hafn. 1. p. 272.

Bristle-leaved Carrot. Pl. 3 feet. 25 D. aureus (Desf. fl. atl. 1. p. 242. t. 61.) stem hispid from spreading pili; leaves glabrous, supra-decompost; leaflets multifid: segments linear-lanceolate, acute, with rather revolute edges; leaves of involucra and involucres decomposed, reflexed; prickles stiff, peltately gladiolate at the apex, longer than the diameter of the fruit, which is oblong. ʃ. H. Native of Mauritania, in corn-fields near Mascar; and of Sicily and Calabria, in argillaceous soil; and of Lycia. Flowers white,
but becoming yellowish on drying. Umbels of many rays. Fruit yellow.

26 _D. crenatus_ (Desf. fl. atl. 1. p. 242. t. 62.) stem rather roughish from small, retrograde down; leaves glabrous, pinnate; leaflets multifid, somewhat verticillate: segments setaceous, stiffish; leaves of involucre many-parted at the apex; prickles bristle-formed, acute, and a little cleft at the apex, double the length of the diameter of the fruit. 2. H. Native of Mauritania, near Tangiers, Mascar, Tlemsen, and on Mount Atlas. Bristles of fruit purplish in Desfontaine's specimens, but yellowish in those of Salzmann. Torilis crenata, Spreng. umb. spec. 141. D. meifolius, Broth. phyt. t. 36. is not distinct from the present species.

_Long-haired Carrot._ Fl. June, Jul. Clt. 1804. Pl. 2 to 2 ft. 27 _D. hispidus_ (Sibth. and Smith, fl. grac. t. 269. prod. 1. p. 184.) stem hairy from spreading pli; leaves bipinnate; leaflets lanceolate, finely serrulat: leaves of involucre entire, trifid, or pinnatifid, shorter than the umbels; prickles of fruit elongated, glochidiate, and coloured. 2. H. Native in the islands of the Archipelago and Asia Minor, frequent. Spreng. umb. 143. Leaves of involucres membranous. Flowers white: central ones abortive. Prickles of fruit golden yellow.

_Hairy Carrot._ Pl. 2 feet.

29 _D. hilaris_ (Sibth. et Smith, fl. grac. t. 270. prod. 1. p. 184.) stem beset with spreading hairs; leaves puberulous, bipinnate; leaflets multifid, with linear lobes; leaves of involucre trifid, longer than the umbels; involucres membranous, on one side; central flower discolorious. 2. H. Native of Asia Minor.

_Two-coloured-flowered Carrot._ Pl. 1 to 1½ foot.

**Sect. III. _Anisacanthus_ (from _anisos, unequal, and _aktin, a ray; in allusion to the unequal rays of umbels)._ D. C. prod. 4. p. 214. Carphophore undivided, or hardly bifidly emarginate at the very top. Rays of umbels very unequal.

29 _D. brachyanthus_ (Sieb. exsic. nov. holl. no. 115.) stem glabrous; leaves bipinnate, smoothish; leaflets divided into linear lobes; leaves of involucre multifid, much shorter than the rays of the umbel, which are unequal; leaves of involucres simple, much shorter than the pedicels; prickles glochidiate at the apex, about equal in length to the breadth of the fruit, which is oblong. 2. H. Native of New Holland. Stem 2 or 3 from the same root, about a foot high. Rays of umbels diverging much.

**Brachiate-umbellled Carrot._ Pl. 1 foot.

30 _D. toriloides_ (D. C. prod. 4. p. 214.) stem hispid from deflexed hairs; leaves bipinnate, scabrous; leaflets divided into linear lobes; leaves of involucre multifid, much shorter than the rays of the umbels, which are unequal and scabrous from bristles; leaves of involucre simple, much shorter than the pedicels; prickles stalkily hooked at the apex, about equal in length to the breadth of the fruit, which is ovate-oblong. — Native of Peru, on the mountains; and of Mexico at Toluco, and the Cordil-eras de Guichilaque; and probably of Chili and Caraccas. D. montanus, Willd. rel. in Schultes, syst. 6. p. 482. Torilis Peruviana, Presl. in herb. Hanke. Habit of _Torilis_; but differs from that genus in the albumen not being involute. Rays of umbels shorter and less diverging than in the preceding species.

**_Torilis-like Carrot._ Pl. 1 foot.

31 _D. montevideensis_ (Hort. berol. ex Berth. in herb. Balb. D. C. prod. 4. p. 214.) stem, petioles, and under side of leaves hispid from long, soft villi; leaves bipinnatifid; segments divided into linear-subulate lobes; terminal umbels 5-7-rayed: axillary ones 3-5-rayed; rays unequal; prickles of fruit glochidiate at the apex. 2. H. Native of Monte Video. Leaves of involucre multifid, about equal in length to the umbel. Petals obovate,

32 _D. austriacus_ (Poppl. exsic. no. 97. diat. no. 303.) stem simple, hispid; hairs on the lower part of the stem deflexed; leaves bipinnate, hispid; leaflets multifid, with short acute lobes; leaves of involucre multifid, almost exceeding the umbels, which are crowded, and composed of few rays; prickles of fruit glochidiate at the apex. 2. H. Native of Chili. Flowers small, golden yellow in the dried state. The whole herb yellowish.

**Southern Carrot._ Pl. 1 to 2 feet?

† _Species not sufficiently known._

33 _D.? cumingii_ (Lam. ill. t. 192. f. 2. Poir. suppl. 2. p. 118.) stem glabrous, flexuous; leaves tripartite; segments linear, very long, glabrous; leaves of involucre ternate, shorter than the umbel, which is composed of few rays; prickles shorter than the breadth of the fruit, which is oblong. — Native country unknown. Perhaps a species of _Anthiscus._

_Cuinn-like Carrot._ Pl. ½ foot.

34 _D. cuinnii_ (Tineo. pug. spec. 1. p. 6.) stem erect, striated, hispid; leaves pinnate; leaflets ovate, deeply toothed; teeth obtuse, puberl.; petioles hairy; leaves of involucrum pinnatifid, larger than the umbel. 2. H. Native of Sicily. Schultes, syst. 6. p. 628. Schrank, in Fl. 1819. p. 383. Outer flowers of umbels yellow; inner ones reddish. Fruit unknown.

_Sicilian Carrot._ Pl. 1 to 2 feet.

35 _D. proliiferus_ (Presl. del. prag. 130.) stem erect, rather dichotomous, furrowed, covered with retrograde hairs; leaves bipinnate; leaflets cordate, pinnatifid, toothed; leaves of involucre entire, or deeply toothed; primary umbel proliferous; pedicels and fruit very hairy. 2. H. Native country unknown, according to Gussone, prod. fl. sic. 1. p. 324.; but according to Presl, it is a native of Sicily, between Syracuse and Catana, in sand by the sea-side. Perhaps the same as _D.siculus._

_Proliferous-umbelled Carrot._ Pl. 1 to 2 feet.

36 _D.? alatus_ (Poir. suppl. 2. p. 118.) stem erect, furrowed, hairy; leaves glabrous, somewhat pinnate; leaflets broadly cut: segments bluntish; petioles plicate; leaves of involucre pinnatifid at the apex, with linear segments; rays of umbel crowded, hispid; ribs of fruit membranously winged, spinous-toothed. 2. H. Native of Barbary, in uncultivated stony places by the sea-side,

_Winged-fruited Carrot._ Pl. 2 feet.

_Fetid Carrot._ Pl. ?

38 _D. nigridus_ (Hort. par.) _These 2 species have not been described._

_Coll._ All the species grow well in any common garden soil. The seeds of them should be sown in spring.

**Suborder II. _Camyllophyllum_ (from _camyllos, kamyplos, curved, and _spirous, spetum, a seed)._ D. C. prod. 4. p. 215. Albumen involute, or marked by a longitudinal furrow or channel on the inner side.

_Tribe XIII._

_ELÆOSELINÆ._ (This tribe contains plants agreeing with the genus _Elæoselium_ in important characters) or _Camyllophyllum multifidum_ ala'te. Koch, in litt. D. C. prod. 4. p. 215. Fruit cylindrical, more compressed from the back than from the sides. Mericarps with 5 filiform, primary ribs; and 4 secondary ribs: the 2 dorsal ones of these last nerve-formed:
and the 2 lateral ones expanded into wings: having the margins nerve or vein-formcd. Seed involute, semi-lunar.

Lin. syst. Pentandria, Diggynia. Margin of calyx hardly 5-toothed. Petals obovate, entire, with an inflexed point. Fruit somewhat compressed from the back, nearly terete, 4-winged. Mericarps with 5 filiform primary ribs: the 3 intermediate ones dorsal, and the 2 lateral ones placed within the wings and the nerve-formed margins: and 4 secondary ribs, the inner ones of those last obtuse, and the 2 outer ones expanded into membranous wings. Vittae under all the ribs abounding in oil, those under the primary ribs slenderer and narrower than those under the secondary ones; and 4 in the commissure. Seed involute.

2 H. thaspoides (D. C. prod. 4. p. 215.) leaves pinnate, hardly velvety on the petioles and nerves; leaflets pinnate-parted, cuneate at the base; lobes oblong-ovate, toothed; ultimate one trifid. 2 H. Native of Mexico, about St. Angel. Herb 6-7 feet high, with the habit of Thapsia Gargnica. Teeth of calyx nearly obsolete. Fruit a little smaller than in E. meodes, but the rest of the plant is similar.

Cult. The plants will grow in any common garden soil; and are only to be increased by seed.

Tribe XIV.

CAUCALISNEAE (this tribe contains plants agreeing with Caucalis in important characters), or Campylospérie multiflora armata, Koch, umb. p. 79. D. C. prod. 4. p. 216. Fruit contracted from the sides or nearly terete. Mericarps with 5 filiform primary bristles or prickly ribs: the lateral ones placed in the commissure, which is flat: and 4 secondary more prominent, prickly ribs, or they are obliterated from the copious prickles covering the whole furrows. Seed involute or inflexed on the margin. Caucalisneae is allied on one hand to Daucineae, and on the other to Scandiceae.

Lin. syst. Pentandria, Diggynia. Teeth of calyx 5, ovate-lanceolate. Petals obovate, emarginate, with an inflexed point: outer ones radiating, profoundly bifid. Fruit somewhat compressed from the sides. Mericarps with 5 filiform primary bristles or prickly ribs: the 3 intermediate ones on the back and the 2 lateral ones placed in the commissure, which is flat; and 4 secondary more prominent ones, which are deeply cleft into a simple series of prickles. Vittae one in each furrow, under the secondary ribs, and 2 in the commissure, which is flat. Carpo-
leaves multifid, narrow; involucra and involucels hispid, as well as the fruit. — Native of Arabia, at Hadie.

**Narrow-leaved** Bur-parsley. Pl. 7.

*Cult.* The seeds may be sown either in autumn or spring.

*Lin. syst. Pentändria, Dígyinia.* Teeth of calyx 5, setaceous. Petals obovate, emarginate, with an inflexed point: outer ones of the umbelles larger than the central ones and bifid. Fruit contracted from the sides. Mericarps with 5 bristly primary ribs; the 2 intermediate ones on the back, and the 2 lateral ones placed in the commissure, which is flat; the secondary ribs beset with copious prickles, which occupy the whole furrows, having one vitta under each secondary rib below the prickles. Carpophore setaceous, bifid. Seed with an inflexed margin. — Herbs, with multifid leaves, beset with short adpressed hairs, which are retrograde on the stems, and erect on the rays of the umbels. Umbels opposite the leaves. Involuca of 1-5 leaves; involucels of 5-8 lanceolate ciliate leaves. Flowers white, those in the disk of the umbelles male and sterile. Prickles of fruit hair-formed, usually hooked at the apex.

**Sect. I. Euctorilis** (*Hornet, eu, well, and Törilis; this section is considered to contain the true species of the genus*). D. C. prod. 4. p. 218. Fruit covered with stiff prickles, which are usually hooked at the apex.

1 T. microcerá (Bess. cont. enum. no. 1362.) stem branched; leaves linear-cut, outer ones not elongated; umbels on long peduncles, 7-10-rayed; leaves of involuca and involucels setaceous; fruit ovate; prickles much shorter than the fruit, incurved. — O. H. Native of the Ukraine and the south of Podolia. Törilis Ukránika, Spreng. in Schulz. syst. 6. p. 485. Involucels as in *T. Anthriscum*, equal in length to the umbelles.

**Small-fruited** Hedge-parsley. Pl. 2 to 3 feet.

2 T. Anthriscus (Gmel. fl. bad. 1. p. 615.) umbels on long peduncles of from 5 to 10 close rays; leaves of involuca and involucels several, awl-shaped; fruit covered with incurved prickles. — O. H. Native of Europe and Caucasus, in hedges and on the borders of fields, very common; plentiful in Britain in like situations. Caicalis Anthriscus, Scop. fl. carm. no. 311. Huds. angl. p. 114. Smith, engl. bot. t. 987. Fl. dan. t. 919. Curt. lund. fasc. 6. t. 22. Tordylum Anthriscus, Lin. spec. 346. Curt. fl. austr. t. 261. Torilis rubèlla, Moench, meth. p. 103. Caicalis aspéra a, Lam.duct. 1. p. 656.—Riv. pent. irr. t. 32. —Baul. pin. 153. prod. 80. with a figure. Stem rough from deflexed hairs. Leaves bipinnate, pinnatifid, and sharply cut, rather soft than harsh to the touch; the lowermost one much more compound than the others. Flowers small, either white or flesh-coloured; the exterior ones only a little irregular or radiant.

**Anthriscus** or Upright Hedge-parsley. Pl. July, Aug. Brit.-

3 T. neglečétta (Schultes, syst. 6. p. 484.) stem and branches erect; leaves ovate-lanceolate, cut; the terminal one hardly longer than the rest; umbels on long peduncles of from 7 to 10 rays; involucre wanting. — O. H. Native of Sardinia, Germany, &c. in fields and on the margins of woods. Scandix infèsta, Jacq. fl. austr. 1. 46. Caicalis infèsta, Vest. ench. p. 493. ex Schultes. Peduncles longer and the fruit larger than in *T. infèsta*. Flowers white.

4 T. infèsta (Hoffm. umb. p. 89. Spreng. prod. 24.) stem erect, much branched; leaves pinnatifid, deeply cut, and sometimes almost bipinnate: the terminal leaflets elongated; umbels 3 A
UMBELLIFERÆ.

CXXXV. Torilis.

Var. β, anthriscoides (D. C. prod. 4. p. 219.) stem sparingly branched, or almost simple, tall; branches erect. O. H. This appears to be a variety intermediate between T. infestum and T. anthriscus, and is probably the T. Anthriscus, Spreng. exclusive of the synonyms.

Var. β, purpurea (D. C. 1. c.) leaflets hardly elongated. O. H. Native of the south of Europe. Torilis purpurea, Ten. append. 4. p. 12. Guss. prod. fl. sic. 1. p. 325. In the specimens examined of this variety, the flowers are white, and the prickles of the fruit are more or less coloured. Perhaps a proper species.

Troublesome or Spreading Hedge-parsley. Fl. July. Britain. Pl. 3 to 1½ foot.

5 T. heterophylla (Guss. prod. fl. sic. 1. p. 326.) stem erect, sparingly branched; segments of leaves linear-lanceolate, cut; outer or terminal one not elongated; upper ones linear, entire; umbels on long peduncles of 2-3 rays; involucra almost wanting; prickles equal in length to the breadth of the fruit. O. H. Native of Sicily, Corsica, and south of France. Caúcalis lineifolia, Requien, in litt. 1815. The fruit in this species is very variable in form and size, as in T. nodosa.

African Hedge-parsley. Pl. 1½ foot.

7 T. chloroca râpra (Spreng. syst. 1. p. 898.) stem branched, rather puberulous; leaves bipinnate; leaflets or segments lanceolate, pinnatifidly serrated; umbels on long peduncles, 7-8-rayed; involucra usually only one leaf; bristles coloured, rather soft, scabrous, glabellate at the apex, rather longer than the diameter of the fruit. O. H. Native of the Canary Islands.

Green-fruited Hedge-parsley. Pl. 1 to 2 feet.

8 T. nodosa (Garrn. fruct. 1. p. 82. t. 20. f. 6.) umbels nearly sessile, gloomerate, lateral, simple; stems prostrate; involucra of several linear hairy leaves; the outer, as well as the interior fruits covered with dense, whitish, shining, tubercular granulations. O. H. Native of Europe and the Levant, on banks, and about the borders of fields; most plentiful in a gravelly or chalky soil; plentiful in Britain. The plant is also to be met with in Chili and Peru, but has probably been transported thither. Caúcalis nodosa, Huds. angl. 114. Smith, engl. bot. t. 199. but not of All. Tordýlmum nodósum, Lin. spec. 346. Jaqc. aust. append. t. 24. Caúcalis nodifóra, Lam. dict. 1. p. 656.—Riv. pent. irr. t. 36.—Mor. oxon. sect. 9. t. 14. f. 10. Stem rough from reflexed bristles. Leaves a deep glaucous green, hairy, bipinnate, and sharply cut, with very narrow tolerably uniform segments. Petals white or reddish, hardly at all radiating or unequal. This plant is very different from Cheironium nodosum, of which it is said to be a synonym by Sprengel in Schultes, syst. 6. p. 485. The Caúcalis Hispánica, Lam. 1. p. 658, appears to be referrible to this from the description; and Caúcalis lapúlaca, Popp. diar. no. 356. pl. exsic. p. 96. does not differ from this.

9 T. japonica (D. C. prod. 4. p. 219.) stem smoothish, terete, branched; leaves pubescent, bipinnate; leaflets oblong, pinnatifid; umbels pedunculate, axillary, and terminal, 5-7-rayed; involucra and involucres of a few short subulate leaves; mericarps oblong; bristles of fruit stiff, hooked at the apex. O. H. Native of Japan. Caúcalis Japónica, Houtt. plf. syst. 8. p. 42. t. 45. f. 1. Upper branches and rays of umbel angular, beset with upright hairs.

Japan Hedge-parsley. Pl. 1 to 2 feet.

10 T. scabra (D. C. prod. 4. p. 219.) stem smoothish, terete, branched; leaves pubescent, pinnate; leaflets oblong, pinnatifid, much acuminate; umbels terminal, and opposite the leaves, 5-7-rayed, sometimes without an involucrum; leaves of involucres subulate; mericarps oblong, covered with stiff bristles, which are hooked at the apex.—Native of Japan. Cheironium scabrus, Thumb. fl. jap. 119.

Scabrous Hedge-parsley. Pl. 1 to 2 feet.

11 T. tuberculata (Spreng. in Schultes, syst. 6. p. 486.) plant glabrous, branches twiggy; leaves pinnate; leaflets linear, quite entire; involucra and involucres wanting; hairs of fruit hardly hooked.—Native of Syria. Caúcalis tuberculata, Poir. suppl. 2. p. 137. Styles tubercular at the base; hence the name. Fruit the size of that of T. microcarya.

12 T. élata (Hisp. ex Spreng. in Schultes, 1. p. 685.) plant glabrous; leaves pinnate, leaflets linear, alternate; involucrum wanting; hairs of fruit stiffer; leaves supradecomposed; leaflets lanceolate, deeply pinnatifid; outer ones elongated. O. H. Native of Nipaul, on the mountains. Caúcalis élata, D. Don. prod. fl. nep. p. 183. Caúcalis conifólia, Wall. cat. mss. Umbels of 8-10 rays. Involucrum of 5-8 linear subulate leaves.

Tall Hedge-parsley. Pl. 2 to 3 feet.

SECT. II. Trichocarpæ (from thρίς, thrix, thrix, a hair, and καρπός, karpos, a fruit; in allusion to the fruit being covered with long soft hairs). D. C. prod. 4. p. 220. Fruit covered with very long, soft, setaceous, crowded, spreading, coloured hairs, which are not hooked at the apex.

13 T. trichosperma (Spreng. umb. spec. 142.) stem nearly erect; branches smoothish; leaves bipinnate, rough from adpressed hairs; leaflets pinnatifid, acute; umbels on long peduncles, 3-5-rayed; involucrum wanting; involucres of 2-3-subulate leaves. O. H. Native of Egypt, ex Lin.; and of Syria, at Tripoli. Scándix trichosperma, Lin. mant. 57. Cheironium trichospermus, Lam. dict. 1. p. 685. but not of Schultes. Anthriscus trichospermus, Pers. ench. 1. p. 685. but not of Schultes. Bristles of fruit painted with rufous or violet colour.

Cult. Sow the seeds in the open ground.

Tribe XV.

SCANDICINÆ.E (this tribe contains plants agreeing with
Scândix in many important characters, or Campylotropemus pacificus, elongate, Koch, umb. p. 130. Sprengel in Schultes, syst. 6. p. 42. D. C. prod. 4. p. 220. Fruit evidently compressed or contracted from the sides, usually beaked. Mericarps with 5 filiform ribs, now and then winged: lateral ones margination; all equal; and sometimes all are obliterated at the base, and only evident at the tops. Seed tetately convex, having a profound furrow in front, or with the margins somewhat involute.

Lin. syst. Pentádría, Digyia. Margin of calyx obsolete, or somewhat 5-toothed. Petals obovate, truncate or emarginate, usually furnished with an inflexed point. Fruit somewhat compressed from the sides, having a very long beak; mericarps with 5 blunt equal ribs: lateral ribs margination; furrows without vittae, or with obsolete ones. Carpophore undivided, or forked at the apex. Seed tetately convex, with a deep furrow in front. —Annual herbs, with terete, rather striated stems, and bi-pinnate leaves, having the leaflets divided into linear lobes. Umbels of few rays. Involuca wanting, or of one leaf. Umbellules of few rays; involucels of 5-7 leaves. Flowers white.

3 S. Brachyc'epa (Guss. ind. sem. 1825. prod. sic. 1. p. 350.) involuca wanting; leaves of involucels entire; umbels of few rays; fruit glabrous in the semiannual part; beak hardly twice the length of the seed. H. Native of Sicily, on the Nebrodes; and of Syria. This is an intermediate plant between the two sections of the genus from habit: but the beak of the fruit is compressed from the back, not from the sides. Leaves ternately decomposed, glabrous: lobes short. Stem hardly a hand high. Fruit 10 lines long.

Short-fruited Shepherd's-needle. Pl. ½ to ⅔ foot.

5 S. falca'ta (Lond. journ. 1. p. 87. t. 5. ex Hoffm.) leaves of involucels obovate, bluntly bidentate, ciliated, with membranous margins; radiant petals obovate, somewhat emarginate; fruit rather falcate, scabrous from bristles; stem and petals pilose; umbels glabrous. H. Native of Tauria, frequent. S. australis ß, Bibb. suppl. 424. Wýlia râdians, Schultes, syst. 6. p. 504.

6 S. Apicu'lata (D. C. prod. 4. p. 221.) leaves of involucels ovate, acuminate or bidentate, with membranous ciliated margins; radiant petals oblong-ovate, entire or bidual, with an acute recess; fruit scabrous from bristles; stem and petals pilose; umbels glabrous. H. Native of the Levant. Very like S. falca'ta, but differs in the involucels being acuminate and acute; in the styles being long, and at length diverging; in the lower leaves being on longer petioles, and in the plant being smaller.

7 S. gran'diflóra (Lin. spec. 369.) leaves of involucels ovate, obtuse, somewhat denticulated, with membranous ciliated margins; radiant petals somewhat obcordate, with an obtuse recess; fruit bristly; stem and leaves hairy. H. Native of Greece, Tauria, and Iberia, in fields; also of Dalmatia, if S. hirsuta of Biasioletto, collected at Lossin-Piccolo, be the same. Scândix orientalis flore maximó, Tourn. cor. p. 23. Carpothyllum grandiflorum, Lam. dict. 1. p. 686. Wýlia grandiflora, Hoffm. umb. 1. p. 15. t. 2. f. 3.

Par. ß, glabráta (D. C. prod. 4. p. 222.) stem and leaves glabrous. H. Native of the Levant, about Bagdad. Rays of umbel forming almost a straight line: lateral ones bearing 12-15 fruit, and the terminal ones 5-6, the rest abortive. Involucels spreadingly deflexed, rather ciliated. Perhaps a proper species, or a variety of S. falca'ta.

8 S. Ibe'rîca (Bieb. fl. taur. 1. p. 230.) leaves of involucels ovate, somewhat bidentate, with rather membranous ciliated margins; radiant petals obcordate, with an acute recess; fruit
sebaceous from bristles; stem furnished with one row of hairs; umbels glabrous. O. H. Native of Iberia, in corn fields, and in gravelly places; and of Persia, in the province of Aderbicdjan, at Seikhodzdi and Badalan. Wylić Ibérica, Hoffm. umb. 1 p. 19. t. 2. f. 4. Fruit nearly 2 inches long, sebaceous in the semieremic part, having the bead compressed and sebaceous at the angles; the rest smooth. Iberian Shepherd's-needle. Fl. June, Jul. Clit. 1823. Pl. 1 ft. 

† Species not sufficiently known.

9 S. GILÁNICA (S. G. Gmel. ill. p. 3. t. 21. f. 2.) stems branched, striated; fruit smooth.—Native of the north of Persia. Gmel. syst. veg. 486.

Gilan Shepherd's-needle. Pl. 1 foot.

Cult. —Sow the seeds in the open ground.

Linn. syst. Pententatoria, Dizygina. Margin of calyx obsolete. Petals ovate, truncate or emarginate, with an inflexed point, which is usually very short. Fruit contracted from the sides, beak'd; the bead shorter than the seed. Mericarps nearly terete, without any ribs, the bead alone 5-ribbed. Carpophore bifid at the apex. Seed teretely convexe, having a deep furrow in front.—Perennial, biennial or annual herbs. Stems terete, striated or furrowed. Leaves decompound, with usually linear slender segments. Umbels opposite the leaves or terminal. Involutioner wanting. Involutees of many leaves. Flowers white. The fruit varying in many of the species, either naked or furnished with a whorl of hairs at the base, resembling a collar. (Koeh, in litt.)

* Perennial species.

1 A. torquata (Duby, in D. C. bot. gall. 1 p. 239.) glabrous; stem rather striated; leaves bipinnate; leaflets ovate-lanceolate, eacerously and deeply toothed; leaves of involucres deflexed, lanceolate, acuminated, ciliated; umbels terminal; rays glabrous; outer petals radiant; fruit shining, girded by a series of small bristles at the base. O. H. Native of the Alps of the south of Provence and Piedmont. Cherophyllum torquatum, D. C. fl. fr. suppl. 505. My'iriris bulbós, All. pedem. no. 1375. exclusive of the synonyms. My'thiris torquata, Schultes. syst. 6. p. 514.

2 A. Sicula (D. C. prod. 4. p. 223.) stem glabrous, striated; leaves ternately decompound; sheaths and involucra ciliated; leaflets ovate, pinnatifid; lobes oblong, deeply toothed, bluish; fruit oblong, glabrous, smooth, girded by a series of bristles or hairs at the base. O. H. Native of Sicily, in woods and shady groves. Cherophyllum Siculum, Guss. prod. 1 p. 352.

Var. β, scabra (D. C. l.c.) fruit sebaceous from tubereles, particularly on one side. O. H. Native of Sicily.

Siciliana Rough Cherivil. Pl. 2 to 3 feet.

3 A. Cicutaria (Duby, in D. C. bot. gall. 1 p. 239.) plant smoothshist; leaves ternate, then pinnate; leaflets pinnatifid, unequal at the base; segments lanceolate, bluntly toothed; umbels opposite the leaves and terminal; rays numerous, glabrous, petals hardly emarginate, outer ones radiata; fruit ovate-oblong, smooth, naked at the base. O. H. Native of the Alps of Dauphiny and Switzerland, &c. in humid places; also of Vollynia and Podolia, in woods. Cherophyllum cicutaria, Vill. dauph. 2. p. 614. D. C. fl. fr. suppl. p. 506. Anthricus hú-

milis, Bess. enum. p. 13. no. 358. Cherophyllum daucifolium, Desf. cat. hort. par. 1828. Leaves membranous, glabrous; leaflets broad. Involutees of 5 deflexed leaves with ciliated margins. Flowers either white or red.

4 A. Sylvéstris (Hoffm. umb. 40-46. t. 1. f. 19. p. 210. t. 1. b. f. 17.) stem branched, striated, the lower part downy; leaves triply pinnate; leaflets ovate, pinnatifid, rough edged; extreme ones elongated; umbels smooth, terminal; involucres of 5 ovate fringed deflexed leaves; styles short, hardly diverging; fruit lanceolate, with a deep channel on each side, smooth. O. H. Native throughout the whole of Europe, even to Cae-

Riv. pent. irrit. t. 44. Hayn. arz. gew. 1. t. 33. Cherophyllum, no. 748. Hall. helv. 1. p. 328.—Moris. hist. 3. p. 303. sect. 9. t. 11. f. 5. Cicutària vnlgárís, Ráil. syn. p. 207. My'irris, Fuch's hist. 524. t. 525. Flowers white. Petals unequal in the marginal flowers, which alone are prolific. Perhaps A. prócerus, Bess. enum. pl. volb. 13. no. 359. is referrible to this species. The whole herb having the flavour of carrets, is eaten by domestic cattle, and is reported to be very grateful to rabbits. The snow white flowers, some of the earliest of their tribe, plentifully adorn the hedges and bushy margins of fields in spring, and announce the approach of summer. J. B. N. mentions instances of two families being poisoned by eating small quantities of the root.

Var. γ, pilosa (D. C. mem. soc. gen. vol. 4.) petioles and nerves of leaves hispid from hairs beneath. O. H. Native country unknown, but grown in gardens under the name of Cherophyllum angustárum.

Var. ε, scabrida (Spreng. prod. 4. p. 223.) fruit rather sebaceous. O. H. Native of Germany and Italy. Cherophyllum Magellénse var. a, Tenore, prod. fl. neap. append. 4. p. 15. exclusive of variety β, which is a synonyme of A. nemórosa, according to Koch.

Wild Cherivil or Smooth Cow-parsley. Fl. April, May. Brit.

Pl. 3 feet.

5 A. nemórosa (Spreng. umb. prod. 4. p. 223.) stem striated, branched, glabrous; leaves triply pinnate: leaflets pinnatifid; segments broad-lanceolate, acute; petioles pilose; umbels terminal; and opposite the leaves; leaves of involucel ciliated; fruit ovate, short, muricate, and girdled by a circle of hairs at the base. O. H. Native of Caucasus and Kantschatcha. Cherophyllum nemorósus, Hoffm. umb. 45 and 210. t. 1. f. 19. Cham. et Schlecht. in Linneá. 2. p. 390. The whole herb is very like A. syléstris, but the fruit is more ovate and shorter, and always more or less echinat.

Var. β, lucida (D. C. prod. 4. p. 223.) fruit somewhat muricate on one side; lobes of lower leaves blunt. O. H. Chere-

ropyllum lúcium, Desf. cat. hort. par. 1828.

** Annual species.

6 A. ceréfolium (Hoffm. umb. 41. 47. t. 1. f. 21. p. 210. t. 1. β, f. 26.) herb pale green, shining, delicate, and tender; stem a little hairy at the joints, only striated; leaves twice pinate, cut, with channeled footstalks; umbels either axillary or opposite the leaves, sessile, of 5-3 pubescent rays; fruit somewhat furrowed, not ribbed, oblong-linear, smooth. O. H. Native of the south of Europe. In Britain, near Woroester; in great

Var. β, trichospéra (Koch, in litt. ex D. C. prod. 4. p. 224.) stem weak, glabrous; leaves ternately decimated or triply pinnate; leaflets coarsely 5-7-toothed; segments bluntish; umbels opposite the leaves, pedunculate; rays few, glabrous; fruit oblong-linear, marinated from short down; styles short, erect. O. H. Native of Pannonia. Chaerophyllum trichospérmum, Schulter, exstr. fl. 2. t. 504. but not of Lam. Anthriscus trichospérmum, Schulter, t. 6. p. 555. but not of Pers. Chaerophyllum trichospérmum, Bess. in litt. Allied to A. cefrolium, but very different from Torilis trichospéra. Perhaps a variety of Scândix cefrolium, with scabrous fruit, ex Jacq. and Bieb, and therefore Chaerophyllum nemorosum, Jacq. appertains to this plant.

Common Beaked-parsley. Fl. May. Britain. Pl. 2 to 3 ft. Cult. All the species are of the most easy culture, and will grow in any soil and situation.

Var. β, Bóssei (D. C. prod. 4. p. 225.) stem rather hairy, erectish; leaves tripinnate; leaflets pinnatifid; segments short, bluntish; umbels of 2-3 rays. O. H. Native of Carolina. Stem a foot or a foot and a half high, contracted at the nodi in the dried state. Involuca of 1 or 2 multifid leaves; involucels of 5 ovate entire leaves. Fruit 3 lines long, without any beak. Mericarps with 5 ribs, and one vitta in each furrow. Styles 2, very short. Chaerophyllum articulátum, Bose, in herb. Vent. Procumbent Cicely. Pl. procumbent.

3 C. villósrum (Wall. cat. no. 558.) stem erect, the base beset
with retrograde hairs, and the top with spreading ones; leaves rather pilose, pinnate; leaflets bipinnatifid; lobules short, acute; umbels of 3–4 rays, without any involucre. Q. H. Native of Nepaul, on the mountain called Chandaghyri. Herb 2 feet high, branched, very hispid at the base. Involucels of 3-4 linear acute leaves. Fruit a little shorter than the pedicels. Styles short, straight.

Villous Cicely. Pl. 2 feet.

Sect. III. *Eucharophyllum* (from ev, ev, well, and chero-
phyllum; this section is supposed to contain the true species of the genus). D. C. prod. 4. p. 255. Fruit glabrous, evidently ribbed. Styles more or less diverging.—Perennial or biennial plants.

* Biennial plants.

4 C. coloratum (Lin. munt. p. 57.) root simple, fusiform; stem terete, and is as well as the petioles pilose; leaves termi-

5 C. prosenith (D. C. prod. 4. p. 225.) root unknown; stem beset with retrograde hairs below, but glabrous above; leaves supra-decomposed, the lower ones pilose at the petioles: superi-
or ones glabrous: leaflets multifid: lobes linear; leaves of involucels cuspitate and glabrous; styles nearly diverging; fruit cylindrical.—Native of Altai. Very like *C. bulbosum*, but the styles are hardly diverging, and erect on the fruit, which is much slenderer and longer.

Prescott’s Cicely. Pl. 1½ foot.

6 C. bulbosum (Lin. spec. p. 370.) root turbinate; stem beset with retrograde hairs at the bottom, and glabrous at the top; leaves supra-decomposed; lower ones pilose at the petioles: superior ones glabrous; segments multifid, linear; leaves of involucels cuspitate and glabrous; styles nearly diverging; fruit cylindrical.—Native of Altai. Very like *C. bulbosum*, but the styles are nearly diverging, and erect on the fruit, which is much slenderer and longer.

Prescott’s Cicely. Pl. 1½ foot.

7 C. temuletum (Lin. spec. p. 570.) root spindle shaped, sub-
divided; stem solid, striated, rough with short deflexed hairs, and spotted with dark purple, swelled under each leaf like most of the other species; leaves dark green, hairy, twice pinnate; leaflets pinnatifid or lobed; umbels of many unequal hairy seeds; involucre wanting, of one leaf, rarely of several; involucels of several ovate pointed leaves, which are finely fringed at the margins and keel, occasionally confluent at the base; seeds fur-

Intoxicating or Rough Cicely, or Rough Cow-parsley. Pl. June, July, Britain. Pl. 3 feet.

* Perennial species.

8 C. mosquorum (Kit. ex Link, enum. 1. p. 281.) stem quite glabrous; leaves decomposed; leaflets lanceolate, deeply serrated, having the middle nerve and margins hairy; leaves of involucre and involucels ciliolate. Q. H. Native of Hungary. C. angulatum, Kit. According to Link and Koch, this is a very distinct plant from *Anthriscus sylvestris*, although it has been joined to it by Sprengel. Perhaps *C. ciliatum*, Kit. in Schultes, syst. is the same, and probably *C. nütum*, Wt. fl. carp. p. 85. It is perhaps only a variety of *C. aëreum*.

9 C. aëreum (Lin. spec. p. 370. but not of his munt.) stem solid, branched, angular, striated, downy, with copious short def-
exed hairs, intermixed with more or less numerous coarse bristles; leaflets decomposed: the stem ones remarkable for their tapering leaflets, with numerous fine sharp parallel segments, their surfaces hairy or smooth; fruit in the early state club-shaped, when ripe linear, crowned with the lengthened spreading styles; seeds linear, of a tawny yellow, each with 9 prominent obuse permanent ribs, which are often roughish up-
wards, as well as the furrows; involucre wanting, or of very few leaves; leaves of involucels ovate-lanceolate, pointed, reflexed, coloured. Q. H. Native of Middle Europe, among the moun-
tains. In Scotland between Arbroath and Montrose; and at Corstorphine near Edinburgh, on the borders of fields. Smith, engl. bot. 2103. Jacq. austr. t. 64. Mirrhis aëreum, Spreng. prod. 29. and in Schultes, syst. 6. p. 511. Smith, engl. fl. 1. p. 52. exclusive of the synonyms of Wild. Scändix aëreum, Roth, germ. 1. p. 123.—Loh. icon. t. 754. Ger. emac. 1029.—Moris, oxon. hist. 9. p. 391. sect. 9. t. 10. f. 2.—Rupp, gen. ed. Hall. 282. t. 5. Joists of stem more densely hairy than the other parts, and a little swollen, crowned by the narrow annular base of each petiole. Flowers cream coloured, slightly irregular, the barren ones numerous, with only glbose rudiments of styles. Stylodia somewhat depressed, and considerably wrinkled.

10 C. maculatum (Willd. enum. suppl. 15.) stems smoothish, angular, spotted; leaves supra-decomposed, pilose; leaflets lanceolate, deeply serrated, attenuated at the apex; fruit mutic, coloured, 6 times longer than broad. Q. H. Native of the south of Europe, but the particular places are not known. It differs from *C. aëreum*, to which it has been joined by Sprengel, in the stem being spotted and smooth, and in the fruit being twice the length.

11 C. millifolium (D. C. prod. 4. p. 226.) stem and petioles hispid from pili; leaves many-parted; leaflets linear-lil-
iform, glabrous, distant; involucre of one leaf; leaves of invo-
Involucels leaflets petals styles lobes petals C. Native PI. leaves segments H. to leaves segments H. leaves foot. leaflets leaflets Native leaves. many, numerous, 364. as leaflets above, mate smooth. veins ciliated in involucels, as leaflets of 1 or 2 leaves; involucels usually of 5 leaves, which are ciliated and margined with white. 2. H. Native of Iberia, at the river Ksani. Myrrhis hulims, Schultes, syst. 6. p. 519. Flowers white.

14 C. hybridae (Ten. fl. neap. prod. 66.) stem glabrous, striated, rather scabrous; leaves tripinnate; leaflets lanceolate-oblong, deeply serrated; segments acuminate above, rather hispid beneath; leaves of involucra and involucels ovate, acuminate, ciliated with long hairs; petals glabrous; styles divaricate. 2. H. Native of the kingdom of Naples, in the woods of Magella. Flowers white.

15 C. hirsutum (Lin. spec. 371.) stem fistulous, beset with deflexed hairs; leaves ternately decomposed, nearly naked; leaflets ovate-cordate, acute, pubescent; segments deep serrated; petals usually ciliated; styles stiff, diverging, straight, permanent. 2. H. Native of the temperate parts of Europe, as in Switzerland, Germany, Austria, Carniola, in mountain groves. Jaec. fl. austr. t. 148. Scändix hirsuts, Scop. carn. no. 359. Myrrhis hirsuta, Spreng, in Schultes, syst. 6. p. 510. — Riv. pent. iunt. t. 53. — Boc. mss. 19. 9. 19. Herb when bruised somewhat aromatic; but the seeds, according to Jaquin, have scarcely any flavour. Seopoli says, they stain the fingers when rubbed with a brownish red. Flowers numerous, white, the external ones fertile.

Species not sufficiently known.

20 C. Arborascens (Lin. spec. 1. p. 371.) stem frutescens; leaves supra-decomposed, smooth; involucels present only; flowers all fertile. 2b. H. Native of Virginia. This species is very doubtful.

Arborescent Cicely. Shrub.

21 C. Capepense (Thunb. prod. 51. fl. cap. 2. p. 204.) stem terete, glabrous; leaves trinerved, rather hairy; leaflets rather remote, linear-lanceolate, somewhat trifid, cuspitate; involucels glabrous; fruit obversely pyramidal, a little beaked, acutely 5-ribbed; styles permanent, reflexed.—Native of the Cape of Good Hope. Myrrhis Capeensis, Spreng. umb. spec. p. 152. Schultes, syst. 6. p. 513.

22 C. ? Aristatum (Thunb. fl. jap. 119.) stem terete, gla-
brous; leaves ternately decomposed, rather hispid on both surfaces; leaflets ovate, acuminate, pinnatifidly cut; fruit rather trigose; styles permanent, divaricate.—Native of Japan. Myrhris aristata, Spreng. umb. spec. 138. Schultes, syst. 6. p. 512. Said to be allied to *Uropsorum dalcce*, and probably a species of that genus.

*Annew Cicely.* Pl. 2 to 3 feet.

23 C. minima (Vand. in Roem. script. p. 56.) stems numerous, hairy; radical leaves flat on the ground, biternate, hairy; leaflets somewhat 3-lobed, cut; involucre wanting; involucres usually of about 7 leaves.—On the mountains about Milan. Vittm. suppl. p. 360. Schultes, syst. 6. p. 524. Moretti suspects this to be not alig with *C. hirsutum*.

*Least Cicely.* Pl. 3/4 foot.

24 C. tenifolium (Poir. suppl. p. 342. but not of Stev.) plant glabrous; leaves decomposed; leaflets finely cut, acute; fruit nearly glabrous, prominently ribbed.—Native of the kingdom of Morocco. Myrhris tenifolia, Schultes, syst. 6. p. 520.

*Fine-leaved Cicely.* Pl. 1 to 2 feet?

* Cult. All the species are of the most easy culture, and will grow in any soil.

*Lin. syst.* Pentandria, Digynia. Margin of calyx obsolete. Petals ovate, with an entire subinvolucre point, pilose on the outside. Fruit somewhat compressed from the sides, ovate-oblong, crowned by the short diverging styles. Mericarps with 5 obtuse prominent ribs, 3 dorsal, and 2 marginating; vitre one in each furrow, which are broad, flat, and striated. CommisurBuffused in the middle. Carophoroph Bipartite. Seed ternately convex, somewhat convolute at the commissure.—Puberulous or hairy tufted herbs, not above 2 or 4 inches high. Leaves tri-ternately multifid; segments lanceolate-linear, acute. Scapes erect, pubescent. Umbels simple, containing about 20 flowers, surrounded by involucre composed of about 20 leaves each, which are oblong-lanceolate. Flowers white, some male, and others female.—This genus, from the seed and fruit, is allied to *Scandix*; but differs from *Chironphylum* in the umbels being simple, in the ribs of the mericarps being distant, and in the furrows being broad.

1 C. Andicolae (Lag. in litt. D. C. coll. mem. 5. t. 2. f. j. 1–3.) the plant is either wholly glabrous or puberulous; pedicels smoothish, a little longer than the involucre. *2 F.* Native of South America, in grassy plains at Antisana, at the height of 6000 to 7000 feet. Myrhris Andicola, H. B. et Kunth, nov. gen. amer. 5. p. 13. t. 419. Plant dwarf, tufted, deep green, but becoming blackish on drying. Umbels 10–12-flowered. Scapes hardly twice the length of the leaves. Kunth’s specimen is less than that of Domesey’s, and more glabrous; but the hairs of the scapes in both are deflexed. Pedicels glabrous.

*Andes Caldasia.* Pl. 2 to 5 inches.

2 C. erioida (D. C. 1. c. f. j. 4–5.) the whole plant is clothed with hairy pubescence; pedicels tormentose or hairy, much longer than the involucre. *2 F.* Native of New Holland, where it was collected by D’Urville. Scapes 5 times longer than the leaves. Leaves of involucre ovato-oblong. Fruit quite glabrous, seated on very hairy pedicels.

*Woolly-pedicelled Caldasia.* Pl. 2 to 3 inches.

† Species not sufficiently known.

3 C. chirophyllum (Lag. am. nat. 2. p. 98, and in litt. ined.) stems covered with retrograde hairs; segments of involucre entire, or cut, about equal in length to the flowering umbel. *2 F.* Native of Peru. *Var. a*, glabrescens (D. C. prod. 4. p. 229.) leaves puberulous, especially above, as well as the outside of the involucre; petals almost glabrous; peduncles dichotomous, twin. *2 F.* Native of Peru, at the town of Chinchin, in the province of Chancay, where it was collected by Ruiz et Pav.

*Var. b., hirsuta* (D. C. 1. c.) leaves pubescently hairy on both surfaces, as well as the outside of the involucres and petals; forks of umbels 3–4-rayed.

*Charvet-like Caldasia.* Pl. 2 to 3 inches.

4 C. lasiopeetala (Lag. in litt. ex D. C. prod. 4. p. 229.) stems and leaves rather tomentose, greyish; segments of involucres cut and pinnatifid, longer than the umbels; petals pubescent on the outside. *2 F.* Native on the Andes, in the tract called Cordillera del Peru.

*Hairy-pedalled Caldasia.* Pl. 2 to 3 inches.

* Cult. See *Fragosa*, p. 259. for culture and propagation.

CXL. SPALLEROCARPUS (σφαλλος, sphaalo, to deceive, and κφρος, karpos, fruit; from the fruit being liable to be mistaken for cumin seed). Bess. in litt. 1828. D. C. coll. mem. 5. p. 64. t. 2. f. N. prod. 4. p. 230.

* Cult. The seeds of this plant may only be required to be sown in the open border.

CXL. MOLOPOSpermum (from μωλυψ, molops, a stripe, and σπέρμα, sperma, a seed; the fruit is yellowish, and the vitue chestnut coloured, giving the fruit the appearance of being striped). Koch, umb. p. 108. diss. ined. in litt. 1828. D. C. prod. 4. p. 230.—Ligusticiucum species, Lin. and Spreng.

*Lin. syst.* Pentandria, Digynia. Calyx 5-toothed, foliaceous. Petals lanceolate, entire, ending in a long ascending acumen each. Fruit contracted from the sides; mericarps with 5 branched wings, the 2 lateral ones margingating, and one-half shorter than the rest, and the 3 dorsal ones very sharp. Seed bluntly tetragonal or angular; angle of commissure opposite, engraved by a profound furrow; the canals empty between the seed and commissure of the pericarp. Vitre toothed brown, solitary in the furrows; but none in the commissure, which is very narrow. Carpophore bipartite.—A perennial glabrous herb. Leaves ternately decomposed; leaflets lanceo-
late, elongated, shining, or decurrenty pinaire-parted; segments sharply pinnatifid. Leaves of involucrum numerous, elongated, rather membranous, sometimes multifid. Involucels of many leaves. Flowers white, on short pedicels. Terminal umbels, large, fertile: lateral ones smaller, male. Fruit often deformed, having the lateral ribs almost wanting, and the vitre of the lateral furrows. Perhaps this genus comes nearer to Pleuro- 
spérmum and Hymenola na than to Velea.

póspérmum Polopónesacum, Koch. 1. c. Sésél Polópenose, Dios. lib. 3. cap. 62. is Angélica syléstris, which grows fre-
quently in the Morea, ex Smith, prod. fl. greec. 1. p. 193.

Cicuta-like Molopóspérmum. Fl. May, July. Ct. 1596. Pl. 3 to 5 feet.

Cult. This plant will grow in any soil, and is easily increased either by dividing at the root or by seed.

CXLII. VELE'A (named after Seb. Eug. Vela, who illus-
trated unombofilius plants under the auspices of Lagascas). D. C. coll. mem. v. p. 61. t. 2. f. H. prod. 4. p. 230.—Ligústici,
species of H. B. et Kunth.

LIN. SYST. Pentándria, Digýnia. Margin of calyx obliterated. Petals unknown. Stylopódon conically deformed, short. Styles erect, filiform. Fruit ovate, without a beak; mericarps somewhat compressed from the sides, having the transverse sec-
tion nearly terete; ribs 5, the 2 lateral ones marginating, and nearly filiform, the 3 dorsal ones winged; vittae usually 3 in the furrows, but sometimes only 2, probably from 2 of them being joined in one; and 4 in the commissure. Involucre more numerous. Carpophore bipartite from the base.—A branched glabrous herb. Stem succulently striated. Leaves ternately decoupled; leaflets nearly sessile, trifid, or pinnatifid, serrated, cuneate at the base. Umbels terminal, of about 20 rays. Involucra and involucres none. Fruit almost like that of Cúdnid, but differs in the involucrum being involute; of Molo- 
póspérmum, but the calyx is toothless, the commissure less contracted, and the furrows marked with many stripes; of Myrrhísa, but the vittae are more numerous, and the carpophore is bipartite to the base.

1 V. Tolúcce'ssis (D. C. prod. 4. p. 231.) Vél. H. Native of Mexico, in the mountains near Tolucuca. Ligústicum Tolu-
cénsè, H. B. et Kunth, nov. gen. amer. 5. p. 19. t. 424. Cú-
nidum Tolucénsè, Spreng. syst. 1. p. 388.

Toluca Velea, Pl. 2 feet.

Cult. This plant will require some shelter in severe winters. It will be easily increased by seed or by dividing at the root.

LIN. SYST. Pentándria, Digýnia. Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point. Fruit compressed from the sides. Seed involute, covered by a double membrane; the outer membrane acutely keeled by 5 equal sharp ribs, which are hollow inside: the inner membrane closely adnate to the seed. Vittae wanting. Carphophore cleft at the apex.—Perennial villous herbs, having a strong scent of anise. Roots fusiform. Leaves ternately decompound; leaflets pinnati-

1 M. Odo-ra'ta (Scop. l. c.) leaves rather villous beneath.

Vol. III.
Long-styled Osmorhiza. Fl. July, Aug. Clr. 1806. Pl. 1 foot. 2 O. brevistylis (D. C. prod. 4. p. 232.) styles short, conical, tapering at the base and apex, one-half shorter than the breadth of the fruit. 2. H. Native of North America, in the United States and Canada, and in woody places on the west side of the Rocky Mountains; and from the mouth of the Columbia to Observatory Inlet, in lat. 55° on the north-west coast. Hook. fl. amer. bor. 1. p. 272. t. 97. Myrrhis Clatoni, Torr. fl. un. st. 1. p. 310. exclusive of many synonyms. Urspernum hirsutum, Bigl. fl. bost. ed. 2. p. 112. Umbels usually of 3-4 rays. Leaves of involucra linear-lanceolate, deciduous. The root, according to Bigelow, has an ungrateful scent, similar to that of Aralia nudicaulis; but according to Torrey it has a sweet anise scent.

Short-styled Osmorhiza. Pl. 2 feet.

§ 2. Involucra and involucels wanting.

Bertero’s Osmorhiza. Pl. 2 feet.

Cult. See Myrrhis, p. 592. for culture and propagation.

Lin. syst. Pentandra, Digynia. Teeth of calyx 5, stiff, permanent. Petals obcordate, with an inflected point. Styles short, conical, diverging, permanent, stiff. Fruit cylindrical, without a beak; mericarps with 5 primary flatish white ribs; furrows flat, having one vitre in each; and the commissure having 2. Seed unknown.—Quite glabrous herbs, natives of the Levant. Stems branched. Leaves pinnate; leaflets multifold: lobes linear-setaceous. Umbels compound, of from 5 to 16 rays. Leaves of involucra 5-7, multifold; of the involucels linear-subulate, rarely cut. Pedicels stiff, thickening after flowering. This is a very distinct genus, but from the structure of the seed being unknown, the place which it should occupy in the order is doubtful.

G. baueri (D. C. l. c. t. 3. f. K.) leaves of involucra multifold; most of the involucels are fertile; fruit terete, crowned by the calycine teeth, which are conical and elongated.—Native of Armenia, ex herb. Tourn. about Amadan in Persia, ex herb. Oliv. et Brug. Myrrhis Armenia folius Mei seu focioili semini brevi. Tourn. herb. Herb quite glabrous, erect. Root terete, nearly simple. Stem furrowed, a foot high. Leaves nearly like those of Daucus setisfolius, having the petioles dilated at the base. Central umbel of 15-16 rays, lateral ones of 10-12.

Carrot-like Grammosciadium. Pl. 1 foot.

Cult. The species will grow in any common soil, and will be easily increased by seed.

Tribe XVI.

Smyrneae (this tribe contains plants agreeing with the genus Smyrnium in character), or Cumin, hosepermum paucijugae turgide, Koch, umb. 133. D. C. prod. 4. p. 232. Fruit turgid, usually compressed or contracted from the sides; mericarps with 5 ribs: the lateral ribs marginating, or situated in the front of the margin; the ribs sometimes nearly obliterated. Seed involute, or with a furrow inside, semilunar or compound. —Habit of plants and inflorescence variable; the genus Exco- cantha and Echinophora agree in habit with Eryngium, in consequence of having spinose leaves; Lagace agrees with Actii- nutes in the one-seeded fruit; Pleurosporum with Astrantia in the utricular fruit.

CXLVI. LAGECIA (from λαγός, lagos, a hare, and οικός, oikos, a house; the place where a hare lies; the seeds enveloped in the hairy involucrum have been likened to young leverets in a hare’s form). Lin. gen. no. 285. Gertr. fruit. 1. p. 103. t. 23. f. 3. Lag. am. nat. 2. p. 106. D. C. prod. 4. p. 233.—Cuminoides, Tourn. inst. t. 155.

Lin. syst. Pentandra, Digynia. Lobes of calyx large, pectinated. Petals obcordate, bifid, shorter than the calyx; lobes anned. Ovarium bilocular, one of the cells abortive; the fruit is therefore ovate, and crowned by the calyx, hence there is a furrow on one side indicating the place of the abortive cell. Seed marked with a furrow on one side, and therefore appearing involute.—An annual erect herb. Leaves pinnate; leaflets ovate, uniform, alternate, coarsely toothed; teeth anned. Peduncles opposite the leaves. Umbels compound, of many rays. Umbellules 1-flowered. Leaves of involucrum 8-10, pectinated, of the involucels 4, also pectinated. Flowers pedicelate, within the involucel, white. Fruit downy.

1 L. cuminoides (Lin. spec. 294.) O. H. Native of Galatia, Persia, Greece, Candia, Lyibia, Spain, &c. in corn fields and vineyards. Smith, fl. grc. t. 245. prod. 1. p. 160. Schkuhr, handb. 1. t. 45. Linn. ill. t. 142. Sabb. hort. 4. t. 55. Planch. icon. t. 135.—Mor. hist. 3. sect. 9. t. 13. umb. t. 1. f. 13. Umbels nodding before flowering, but at length becoming nearly globose. The seeds are mostly all abortive in the plants cultivated in gardens.

Cult. The seeds should be sown in autumn, soon after they are ripe; otherwise if this is deferred till spring, they commonly remain a year, and sometimes two or three years before they grow.

Lin. syst. Pentandra, Digynia. Margin of calyx 5-toothed. Petals profoundly obcordate, nearly bipartite; lobes involute on the margin at the base, and excavated on the side, undulated and reflexed above. Fruit obovate-ovate, hairy; mericarps nearly terete, bluntly 5-ribbed. Carpophore bifid at the apex. Seed marked with a furrow on the inside, therefore the albumen is probably involute.—A branched herb, native of the Levant. Stems erect, white. Leaves pinnate, having the scent of thyme when bruised; leaflets many-parted; segments trifid, acute. Umbels of 3-4 rays. Umbellules dense, many-flowered. Leaves of involucrum 3-4, trifid; lobes usually tridentate. Leaves of
involucres numerous, cuneiform, trifid. Flowers equal, hermaprodotic, white.

1 O. orientalis (D. C. prod. 4. p. 234.) O. H. Native about Bagdad, on the banks of the Euphrates, where it was detected by Olivier and Bruguier. Oliviera decumbens, Vent. Hort. cels. t. 21. Stems white, decumbent in Ventenat's figure, but stiff and erect in the spontaneous specimens. Lower and floral leaves clothed with soft velvety villi.

Eastern Oliviera. Fl. May, July. CIt. 1816. Pl. 1 foot.

Cult. The seeds of this plant only require to be sown in the open border in spring or autumn, in a warm sheltered situation.

CXLVIII. ANISOSCIA'DIUM (from anisos, anisos, unequal, and sicadion, sicadion, an umbel; in reference to the lobes of the calyx and petals being unequal in the outer and inner flowers of the umbel). D. C. Coll. mem. v. p. 63. t. 15. Propr. 4. p. 234.

Lin. syst. Pentándria, Digynia. Lobes of calyx in the outer flowers of the umbels, large, ovate, and foliaceous; in the central flowers stiff, hooked, and mucronate-formed; in the inner ones all wanting or tooth-formed. Petals very unequal, outer ones large, obcordate bifid; inner ones small. Fruit rather pubescent, oblong-cylindrical, crowned by the calyx, and 2 stiff conical erect styles. Mericarps semi-terete, one of which is usually abortive; ribs 5, very blunt; vittae one in each furrow, brown, but none in the commissure. Albumen involute.—An herb, native of the Levant. Root simple. Stems diffuse, stiff, dichotomously branched, puberulous when examined by a lens. Leaves petiolate, pinnate; leaflets deeply pinnatifid; lobules short, hardly acute. Branches opposite the leaves. Involucra of 4-5 leaves, which are unequal, oblong, acute, and at length rather spinaceous. Rays of umbel 4-5, stiff, a little longer than the involucres. Leaves of involucres 4-5, oval, spreading, permanent, unequal. Flowers white, 7-10, sessile, stiff.

1 A. orientale (D. C. l. e. t. 15.) O. H. Native of the Levant, between Bagdad and Aleppo, where it was collected by Olivier and Bruguier.

Eastern Anisosciadium. Pl. spreading.

Lin. syst. Pentándria, Digynia. Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point; or the outer ones are larger and bifid. Styles in the female flowers elongated (f. 65. h.), filiform, 2, rarely 3. Fruit ovate, nearly terete (f. 65. h.), enclosed in a hollow receptacle, furnished with a short emersed beak. Mericarps with 5 depressed equal undulated ribs. Vittae one in each furrow, covered by a cobbled membrane. Albumen deeply involute (f. 65. j.)—Perennial herbs. Leaves bipinnatifid; segments cut. Umbels terminal; the flowers of the ray male, and joined together at the base before flowering, having the receptacle glanding them; the female flowers solitary and central. Involucra and involucres constantly of many leaves.

Sect. I. LEUCO'PHORA (from leu'cos, leucos, white, and φερει, pherei, to bear; in reference to the white flowers of the species). D. C. prod. 4. p. 235. Flowers white. Petals obcordate, glabrous, nearly equal. Lobes of leaves pungent, terete or conical.

1 E. spinosa (Lin. spec. 314.) Plant glaucous, finely downy; leaves pinnate; leaflets subulate, trifid, stiff; leaves of involucres and involucres spinose. 2 H. Native along the Mediterranean, in the sand by the sea side. Said to have been found by Ray on the sea coast of Lancashire, and by Mr. Blackstone between Faversham and Sea Salter; between Whitstable and the Isle of Thanet, by Sandwich, and near Westchester by Gerard; but it has been since searched for without success; it was therefore nothing but the common samphire that was found in the above mentioned habitats. Cav. icon. 2. t. 127. Smith, fl. gree. t. 265. eng. bot. 2413. D. C. Coll. memb. v. t. 16.—Mor. ox. sect. 9. t. f. 1. Root fusiform, edible. Flowers white. (f. 65.)

Var. β, pubescens (Guss. prod. fl. sic. 1. p. 309.) Stem pubescent, deeply furrowed; leaves scabrous; rays of umbels pilosely pubescent. 2 H. Native of the Levant.

2 E. platy'loba (D. C. prod. 4. p. 235.) Plant smoothish or pubescent in the upper part; leaves petiolate, pinnate; leaflets 3-4-cleft; lobes lanceolate, flattish, divaricate, spinose; leaves of involucres lanceolate, spinous. 2 H. Native of Persia, about Teheran. Stems angular, flexuous. Umbels small, when young, pubescent. Flowers white.

Broad-lobed Sea-parsnip. Pl. 3/1 to 1 foot.

3 S. trichophyll'a (Smith, in Rees' cyc. vol. 12. no. 3.) leaves biternate; segments filiform, channelled, acute, unarmed. 2 H. Native of the Levant, in stony places at the foot of Mount Ararat; and of Persia, in the province of Aderbeydjan, where it was gathered by Szovits. Umbels turbidly mucrous, about the size of those of E. spinos'a, of a deep purple while young; petals white. Perhaps this plant is the same as E. orientalis piceanifolium, Vaill. herb. The plant has a strong smell of galbanum according to Szovits.

Sect. II. CHRYSOPHORA (from χρυ'sos, chrysoe, gold, and φερει, pherei, to bear; in reference to the yellow flowers). D. C. prod. 4. p. 235. Flowers yellow. Petals ovate, barbately ciliated; the outer ones of the umbel rather radiant. Lobes of leaves flat, foliaceous, toothed at the apex. According to Fischer it is probably a distinct genus.

4 E. tenufolia (Lin. spec. 344.) Plant pubescent; leaves bipinnate; leaflets pinnatifid or cut, cuneate, unarmed at the apex. 2 H. Native of Apulia, Sicily, Greece, Tauria, and about Smyrna and Constantinople, in fields; and of Persia, in the province of Erivan, in dry saltish places. Sibth. and Smith, fl. gree. 266. prod. 1. p. 175. Stev. mem. soc. mosc. 3. p. 249 and 258. D'Ur'v. enum. 29.—Moris. oxon. sect. 9. t. 1. f. 2. Pluk. am. t. 11. f. 1. The fruit is similar to the rest of the species. A much branched glaucous plant.

Cult. These plants not producing seeds in this country are increased by cuttings of the roots or stems. Place them in a warm situation and a dry soil, or else cover them in winter, to prevent the frost from destroying them.

CL. EXOACANTHA (from exo, eko, without, and ak'anta, akanta, a spine; in allusion to the leaves of the involucres being spinose, and situated on the outside of the umbellules). Labill. Fl. syr. dec. 1. p. 10. t. 2. Lag. am. nat. 2. p. 106. D. C. prod. 4. p. 295.
LIN. SYST. PENTANDRIA, DIGYNIA. Flowers polygamous, central ones fertile, the rest sterile. Calyx in the sterile flowers, with obsolete margins. Petals obcordate, indented, equal. Young fruit of the sterile flowers obovate, and striated; those of the central flowers much larger, ovate, and somewhat papillose, crowned by 15 elongated stiff bristles. Seed unknown.—An herb, native of the Levant. Leaves pinnate: leaflets of the radical leaves ovate, toothed, rather cut; of the cauline leaves lanceolate-linear, acute. Umbels terminal, compound; umbel-lules on short peduncles. Leaves of involucre 10-12, large, channelled, spinose, longer than the rays, spreading; leaves of involucels 7-11, spinose, situated on the outer side of the umbel-lules, and longer than them, very unequal, 1 of which is very long, 2-4 are middle-sized, and 2-4 are bristle-formed. Flowers white.—This very singular genus is allied to Echinophora and Arctopus from the inflorescence, but the fruit is scarcely known. Perhaps the fruit is said to be crowned by 15 bristles, because the calyx is 5-parted, and each of these parts again trifid.

I. HETEROPHYLLA (Labill. l. c.). F. Native of the Levant, at Nazareth.

Variable-leaved Exoacantha. Pl. 2 feet.

 Cult. The seed of this plant ought to be sown in a pot, and the plants when of sufficient size to be potted separately; and in the second year, about the month of May, they may be planted out into the open border, where they will flower and seed freely.

CLI. ARCTOPUS (from apcoros, arkos, a bear, and pous, pous, a foot; this singular plant is beset with spines, which have been compared to the claws of a bear). Lin. hort. clif. 495. gen. no. 1165. Lam. ill. t. 865. Gaertn. fil. carp. 3. p. 14. 182. f. 4. D. C. prod. 4. p. 236.—Aprádus, Adans, fam. 2. p. 182.

LIN. SYST. PENTANDRIA, DIGYNIA. Flowers polygamo-dieicose. Margin of calyx 3-toothed. Petals lanceolate, with an incurved acute entire acumens. Stamens in the male flowers twice the length of the corolla, antheriferous. Stylopodium flat. Styles 2, very short, deciduous. Ovarium abortive. Stamens in the female flowers none. Styles 2, thickened at the base, and divaricate at the apex. Fruit ovate, beaked, crowned by the calyx, and con-fermumated with it from the base to the middle, having one side depressed and naked, with a furrow, not separable into two parts, but bilocular, with one of the cells abortive; the fruit is therefore 1-seeded from abortion, roundish, convex on one side, and concave with a furrow on the other.—A perennial herb, native of the Cape of Good Hope. Radical leaves pressed close to the ground in a stellate manner, with flat petioles, and roundish trifid limbs; the lobes toothed and spiny-ciliate. Male umbels compound, pedunculate, sterile, but mixed with a few female flowers; umbel-lules nearly globose; involucres usually of 5 leaves, which are joined together after flowering. Female umbels sessile, fertile, surrounded by the 4 or 5 concrete leaves of the involucrums, which are coriaceous, reticulated, and spiny toothed, girding the fruit. Petals white.

1 A. ECHINATUS (Lin. spec. ed. 2. vol. 2. p. 1513.) G. Native of the Cape of Good Hope, on hills about Cape Town, &c. Thunb. fil. cap. 255. Ker, bot. reg. t. 705.—Burman. afr. 1. t. 1. —Pluk. mant. t. 271. f. 5. The roots are used with success at the Cape in cases of siphils; but upon trial here some years since they were found to be less efficient than sarsaparilla.

Rough Arctopus. Fl. May, June. CIt. 1774. Pl. 1 foot.

 Cult. This plant should be grown in a mixture of peat, sand, and loam; and it may either be increased by dividing the plant or by seed.

CLI. CACHRYS (one of the names given by the Romans to the Rosemary. According to Morison, the name was derived from καθρίς, καθαίρειν, to burn, on account of the carminative qualities of the plants). Tourn. inst. t. 172. Lin. gen. no. 394. D. C. coll. mem. v. p. 65. prod. 4. p. 236.—Cachrys and Hippomátrárum, Lin. hort. herol. 1. p. 271. Koch, umb. 156. f. 36, 37.—Cachrys species, Spreng.

LIN. SYST. PENTANDRIA, DIGYNIA. Margin of calyx 5-toothed, or rarely obsolete. Petals ovate, entire, involute or inflexed at the apex. Stylopodium depressed, short, hardly distinct in the mature fruit. Fruit turritg, the transverse section nearly terete, or somewhat didymous; mericarps with 5 thick ribs, variable in the different sections. Commisure nearly equal to the breadth of the mericarps. Seed constituting a free nucleus, covered with copious vitre, deeply involute. Cotyledons of embryo diverging.—Perennial herbs. Leaves decussate. Umbels numerous. Involucra and involucres of many leaves. Flowers yellow.

SECT. I. EUCACHRYS (from eu, well, and cachrys; this section contains what are supposed to be the true species of the genus). D. C. prod. 4. p. 236. Cachrys, Koch. umb. 1. c. Margin of calyx obsolete. Ribs of fruit broad, thick, obtuse, sometimes so very broad at the base as hardly to be distinct. Prickles, bristles, or tubercles none.

1 C. MACROCARPA (Lam. crass. 1. (1783) 256.) plant glabrous; leaves decompound; leaflets multifid, linear-setaceous, divaricate; leaves of involucral and involucres few, entire; fruit globose, with very blunt, hardly distinct, smooth ribs.

2 C. MACROCARPA (Ledebe. fl. ross. alt. ill. t. 313. fl. alt. 1. p. 365.) radical leaves ternate: leaflets bipinnate or tripinnate: pinnula ternate or palmate: segments entire or 3-parted: lobes linear or oblong; involucral and involucres of many leaves; fruit oval; mericarps glabrous, 11-angled.

2. H. Native of Siberia, on hills in the Kirghisian steppe, at Uskamengogors, and between Bucktorninsk and Lake Noor-Saisen. Root rather woody, supini. Stems many from the same root, striated furrowed, pubescent, branched at top. Leaves a foot long and more than a foot broad. Umbels of 5-10 rays, but usually of 8. Leaves of involucral ovate or lanceolate, short membranous; of the involucres of unequal sizes. Flowers yellow, all hermaphro- dite in the primordial umbels; but in the lateral ones they are polygamous, the outer ones fertile, and the inner ones for the most part sterile. Calyx very minute. Petals yellow, oblong, connate, reflexed, hardly keeled on the inside. Stylopodium pulvinulate. Fruit large, compressed from the sides; mericarps with 5 thick keeled ribs. Carphophore bipartite, free.

Large-fruitd Cachrys. Pl. 1 to 2 feet.

3 C. ODONTÁLOCA (Pall. itin. 3. p. 720. t. g. f. 1, 2, 3. ed. gern. 3. append. no. 75. t. 9. ed. gall. in 5to. append. no. 309. t. 78. f. 1.) leaves decompound, clothed with hoary pubescence; leaflets linear, short, rather trifid; stem naked; leaves of involucral and involucres few, undivided; fruit oblong, having the mericarps somewhat compressed from the back, and hardly furrowed.

2. H. Native of Siberia, Tauria, and Caucasus, in very arid muddy places. Biebr. fl. turc. 1. p. 217. suppl. 216. Hoffm, umb. 1. p. 176. t. 3. f. 2. and f. 4. d. e. f. Cachrys calceolus, Pall. itin. 3. p. 663. 3. Cachrys unornamentatum, Hoffm. 1-leaved, ex vet.; few-leaved, ex Pall. Fruit oblong, smooth, and ribless on the outside, as in C. levisiata, but cylindrical, not
nearly globose. The Cossacks of the Jail chew the seeds for pain in the teeth, and obtain relief by the copious salivation which follows their use.

Tooth-ache Cachrys. Pl. 1 foot.

4 C. Peucedanoides (Desf. fl. alt. 1. p. 250.) leaves decomposed; leaflets filiform, stiffish, rather pubescent; leaves of involucra pinnatifid; of the involucres undivided; fruit oval, with smooth obsolete ribs. 4. H. Native of Algiers, in corn fields. This species differs from C. levi-gaûta in the leaves of the involucra being multifid, and in the leaves being pubescent.

Peucedanum-like Cachrys. Pl. 1 foot.

5 C. VAGINATA (Led. fl. ross. alt. ill. t. 9. fl. alt. 1. p. 366.) radical leaves bipinnate; leaflets pinnate-parted: segments oblong-linear, acute; lower leaflets and segments approximating the rachis; sheaths of cauleine leaves, ventricose; involucrum almost wanting; involucres of many leaves; fruit didymous; mericarps nearly globose. 4. H. Native of Siberia, on the mountains of Dolenkara, in the Kirghisian steppe. Stems rather flexuous, unequally stripped. Umbels of 10-20, unequal, spreading rays. Leaves of involucres linear-lanceolate, with membranous margins. Margin of calyx obsolete denticulated. Petals whitish, nearly orbicular, emarginate, with an flexed acumcn, keeled inside.

Sheathed-petioled Cachrys. Pl. 1½ foot.

6 C. ALPINA (Bieb. fl. tur. 1. p. 217. suppl. 216.) plant glabrous; leaves decomposed; leaflets linear, elongated; leaves of involucra and involucres very short, undivided; fruit oval, having the mericarps a little furrowed and striate, the strie crenulated. 4. H. Native of Tauria, on the tops of mountains. Hoffm. umb. 1. p. 176. C. Libanotis, Pall. ind. tur. Allied to C. Libanotis and C. levi-gaûta, but differs in the fruit not being perfectly smooth in C. levi-gaûta, nor deeply furrowed as in C. Libanotis. Perhaps this and the two preceding plants belong to the following section.

Sect. II. EGOMÀ RATHRUM (from aîa aîgos, a goat, and μαραθόν, marathron, fennel; goats' fennel). D. C. Prod. 4. p. 297. - Hippomârathrum, Link, 1. c. and Koch, diss. but not of Riv. - Hippomârathrum, Koch, in litt. Margin of calyx 3-toothed. Ribs of fruit very thick, obtuse, almost filling the furrows, more or less tubercular, papillos, wrinkled, or tomentose, rarely smooth.

7 C. LIBANOTIS (Link spec. p. 335.) plant glabrous; leaves decomposed; leaflets trifid, linear, rather pungent: superior ones opposite: upper ones trifid; leaves of involucra and involucres numerous, undivided; fruit ovate; mericarps very bluntly 5-ribbed. 4. H. Native of Mauritania, Sicily, but not in France. Schkuhr, handb. t. 65. good. Hippomârathrum Libanotis, Koch, in litt. Hippom. Siculam, Bocc. sic. t. 18. - Mor. ox. sect. 9. t. 1. f. 6. umb. t. 3. lower figure. C. vêrro, Lob. icon. t. 783. f. 2. C. Sicula γ, Guss. prod. 1. p. 359. and perhaps C. phaesesphêma, Ten. prod. xix. syn. 120. is also referable to this plant.

8 C. PTEROCHLENA (D. C. Prod. 4. p. 237.) plant glabrous; leaves decomposed: leaflets trifid, keeled, stiff, divericate, with the margins and keel scabrous; central umbels furnished with divided leaves of involucra, and the lateral ones with undivided leaves of involucra; leaves of involucres all undivided; fruit nearly globose; mericarps with 5 thick blunt ribs, which are granularly mucrinated on every side, having the furrows between the ribs deep and very narrow. 4. H. Native of Barbary, Italy, and Greece, ex Vâhl. Salzen; of Sicily, Spain, and the island of Cyprus, ex Sibthorp. C. Sicula, Lin. spec. p. 335. exclusive of Bocc. syn. Desf. fl. atl. 1. p. 240. Sibth. et Smith, fl. grac. t. 278. Hippomârathrum Siculam, Link. enum. 1. p. 271. Koch, l. c. Flowers yellow, as in the rest of the species.

9 C. caîsà (Pers. ench. 1. p. 311.) plant glabrous, or nearly so; leaves multifid, trichotomous: ultimate segments short, nearly conical; leaves of involucra and involucres linear, very short; fruit nearly globose, granular from papillae; ribs of fruit thick, almost closing the furrows. 4. H. Native of Palestine and of Eastern Caucasus. C. crispa, Spreng. in Schultes, syst. 6. p. 443. Hippomârathrum crispum, Koch, umb. 136. C. microcârpa, Stev. in litt. 1819. but not of Bieb. C. nudicâtulis, Godet, in litt. 1829. Perhaps the Caucasian plant and the Palestine one are distinct. Flowers yellow.

10 C. ASPIELLÔLIA; leaves scabrous; petioles 6 times divided, furrowed; leaflets tripartite: segments stiff, subulate, trigonal, or somewhat pentagonal, channelled above; involucra and involucres of 5 short lanceolate leaves; mericarps granular, with rather prominent ribs, and distinct furrows. 4. H. Native of Caucasus, by the sea, in the province of Baku, near Kaljari. Hippomârathrum aspillerium, Ledeb. in litt. Meyer, verz. pl. p. 131. Echinophora? Caspin, D. C. Prod. 4. p. 235. Segments of leaves short, hardly 2 lines long, thick, and stiff, by which it is easily distinguished from C. crispa.

Ample-leaved Goat's-fennel. Fl. 2 to 3 feet.

11 C. LONGILÔBA (D. C. Prod. 4. p. 237.) plant smoothish; leaves multifid, trichotomous; leaflets linear, stiffish, elongated; leaves of involucra and involucres linear, short; fruit nearly globose, granular from papillae: with thick ribs: which almost close the furrows. 4. H. Native of Persia, among rocks on the mountains about Seidkhodzi, where it was collected by Szowits. Flowers and fruit like the Caucasian variety of C. crispa, but the ultimate lobes of the leaves are very slender, about 2 inches long, not 2 lines as in that plant.

12 C. INVLVUCRA'TA (Pall. in Willd. herb. ex Schultes, syst. 6. p. 447.) plant glabrous; leaves ternately tripartite: leaflets cuneiform, jagged, acute; leaves of involucra and involucres lanceolate, membranous; fruit spongy, tubercular from papillae all over. 4. H. Native of Persia. This species is hardly known, but from the character given it is nearly allied to the preceding species. Stem branched at the base. Leaves three times tripartite.

Involucrated Goat's-fennel. Pl. 2 feet.

13 C. ERİNHSTHA (D. C. Prod. 4. p. 238.) leaves multifid, and are, as well as the stems, quite glabrous; lobes or leaflets trichotomous: segments linear-subulate, stiffish; rays of umbel puberulous; umbellules crowded with flowers; calyx and fruit tomentose. 4. H. Native of Persia, in gravelly places at Badalan. This is a very distinct species, from the fruit being nearly an inch long, and tomentose, with thick obtuse ribs, and very narrow furrows.

14 C. ACA'ULIS (D. C. Prod. 4. p. 238.) radical leaves bipinnate; petioles and scapes clothed with short white hairs; leaflets multifid, smoothish: lobes linear, soft, short; rays of umbel 4-5, puberulous, sometimes proliferous; leaves of involucra and involucres linear, with membranous margins; umbellules crowded with flowers; calyces glabrous. 4. H. Native of Persia, on arid hills at the Lake Ormiah, in the province of Aderbeidjan, where it was collected by Szowits. Herb small, with a fibrous neck. This is a very distinct species, allied to the preceding, but the fruit is unknown.

Stemless Goat's-fennel. Pl. ½ foot.
UMBELLIFIERÆ. CLII. CACHrys. CLIII. PRangos.

15 C. HUMILIS (Schousb. maroc. p. 118.) plant glabrous; leaves supra-decompound, fleshy; leaflets linear, trifid, mucronate; leaves of involucre and involucre's numerous, lanceolate, undivided; fruit furrowed, smoothish. 2. H. Native of Barbary, near Cape Spartel, mixed with Crithmum maritimum. Perhaps belonging to a different section. "Humble Goat's-fennel. Pl. ½ foot.

17 C. PUNGENS (Jan. pl. excis. Guss. prod. 1. append. p. 7.) plant glabrous; leaves decomposed; segments or leaflets filiform, linear, acute, somewhat pungent, elongated; leaves of involucre and involucre's linear; fruit ovate, with distant somewhat winged crested ribs, and broad concave furrows. 2. H. Native of Calabria and Sicily, in the sand on the sea shore. C. Sicula, longifolia, Guss. prod. fl. sic. 1. p. 360. Segments of the leaves elongated, 1-3 inches long.

Var. b. echinocephala (D. C. prod. 4. p. 283.) leaves decomposed; leaflets trifid, lanceolate-linear, acute, rather scabrous from short scattered down, especially on the margins; leaves of involucre and involucre's lanceolate-linear, acuminate, entire, of the involucre deflexed, of the involucre's equal in length to the umbellules; fruit obscurely ribbed; ribs tubercular, somewhat echinately crested. 2. H. Native of Sicily, and in fields about Naples, and probably of Greece and Spain. C. Sicula, Ten. fl. neap. prod. 19. C. Sicula var. a, Guss. prod. fl. sic. 1. p. 359. There is sometimes a one branched leaf at the base of the rays of the umbel, which may be taken for an involucre. It is perfectly distinct from C. petrochoilea; the upper leaves are opposite as in it, but the segments are broader, and striated beneath by elevated nerves. Leaves of involucre broadest at the base. Pungent Goat's-fennel. Pl. 1 to 3 feet.

 Cult. The species of Cachrys are only to be increased by seeds, which should be sown in autumn. A deep light soil suits them best.

Lin. Syst. Pentandria, Digynia. Margin of calyx 5-toothed. Petals ovate, entire, involute at the apex. Stylodipodium depressed, hardly prominent in the fruit. Transverse section of fruit nearly terete; commissure broad. Mericarps compressed from the back, with 5 smooth ribs, which are thick at the base, and ending each in a vertical membranous wing on the back. Seed girdled by copious vittae. Albumen involute.—Perennial herbs, with terete stems. Leaves decomposed; leaflets or segments linear. Umbels numerous. Flowers yellow.

1 P. PABULARIA (Lindl. 1. c. Wall. pl. rar. asiat. 3. t. 212.) plant glabrous; leaves supra-decompound; segments linear; leaves of involucrum and involucrums simple; fruit corky; mericarps with 5 ribs, which are expanded into crested wings. 2. H. Native of the temperate parts of the East Indies, about Imfal and Droz. This plant is called prangos at Imfal and Droz. It is employed in the form of hay as winter fodder for sheep and goats, and frequently for neat cattle, but its seed, when eaten by horses, is said to produce inflammation in the eyes, and temporary blindness. The properties of prangos, as a food, appear to be heating, producing fatness in a space of time singularly short, and also destructive to the Fuscio hepatica, or liver flake, which in Britain, after a wet autumn, destroys some thousands of sheep by the rot, a disease which has hitherto proved incurable. The last-mentioned properties of the plant, if they be retained in Britain, would render it especially valuable to our country. But this, taken along with its highly nutritious qualities, its vast yield, its easy culture, its great duration, its capability of flourishing on lands of the most inferior quality and wholly unadapted to tillage, impart to it a general utility of probable utility, unrivalled in the history of agricultural productions. When once in possession of the ground, for which the preparation is easy, it requires no subsequent culture, save that of cutting and converting the foliage into hay. Of the duration of the plant there are several facts. Seeds having been transported westward along with those of yellow lucern above 40 years ago, and sown on the eastern frontier of Kashmir, where they vegetated, and of which the plants of the first growth still remain in a flourishing condition. In another instance, the seeds were transported eastward, and sown upon rocks near Molbee, where the plants flourished for about 40 years, but in consequence of a long period of drought the prangos perished along with the crops of that district in general. From various facts it is conceived not unreasonable to presume, that by the cultivation of this plant moors and wastes, hitherto uncultivated, and a source of disgrace to British agriculture, may be made to produce large quantities of winter fodder, and that the yield of the highlands, and of downs enjoying a considerable depth of soil, may be trebled. As the prangos has hitherto been of spontaneous growth alone, practices a greater addition to the acreage of probable utility of the country may be adopted at a future time; but from a view of its habits, Mr. Moorcroft ventures to suggest that the seeds should be dibbled into holes singly, at an inch deep and a foot apart. Yellow lucern, which is also a spontaneous production of the country of the prangos, is of a constitution more hardy than that of the lucern of Europe, and requires no other culture than that necessary for sowing it, and lasts in vigour for a long series of years. It is submitted that, as it naturally grows along with the prangos, it would be well to imitate this habitue. The joint yield is vastly greater than that of the richest meadow land, and is produced on a surface of the most sterile nature, in regard to other herbage.

Fodder Prangos. Pl. 2 to 3 feet.

fruit than the Asiatic ones, but they are probably hardly varities. Flowers yellow, as in the rest of the species.

**Giant-fennel-like Prangos.** Clt. 1752. Pl. 1 to 2 feet.

3 C. Cylindracea (D. C. prod. 4. p. 238) leaves supra-decompound, rather hairy; segments or leaflets linear, divaricate; leaves of involucre as involucels umbilidior, linear; fruit cylindrical, expanded into membranous, entire, subulbulated wings; mericarps 5 times longer than their diameter. \( \checkmark \). H. Native of Calabria. Cachrys cylindrica, Guss. in litt. 1829. Fruit an inch long; the section of the mericarps are not semicircular, as in *P. ferulacea*, but somewhat depressed on the back.

**Cylindrical-fruited Prangos.** Pl. 1 to 2 feet.

4 U. Uloptera (D. C. prod. 4. p. 239) leaves decumponent, glabrous, with the petioles trichotomous; segments or leaflets linear; leaves of involucre and involucels spreading; fruit ovate, with very curved membranous wings. \( \checkmark \). H. Native of Persia, on rocks at Seidhodzi, in the province of Aderbeidjan, where it was collected by Szovits. Allied to *P. ferulacea*, but evidently distinct from it in the fruit being one-half smaller; in the wings being much more curled and white, and in the umbelles being more dense.

**Curled-winged-fruited Prangos.** Pl. 1 to 2 feet.

5 Thapsioides (D. C. prod. 4. p. 340) leaves supra-decompound, glabrous; leaflets or segments subulate, stiffish, shining; leaves of involucre and involucels subjacent, undivided; fruit ovate; having the ribs expanded into thick wings. \( \checkmark \). H. Native of Mount Atlas. Thapsioides thyrsoides, Desf. fl. alt. 1. p. 252. t. 68. Thapsioides Atlanticaeum, Poir. suppl. 3. p. 304. Thapsia Laspii, Spreng. in Schultes. syst. 6. p. 613. It differs from *Thapsioides* in the petals being yellow, not white, oblong, not margined. Ribb of fruit few.

**Thapsia-formed Prangos.** Pl. 2 to 3 feet.

6 Anisopetala (D. C. prod. 4. p. 240) plant glabrous; leaves decumponent; lobes or segments linear, short; stem nearly naked; leaves of involucre and involucels lanceolate, acute, entire; mericarps of fruit compressed from the back, oblong: with the ribs expanded into wings, the 3 dorsal ribs attenuated at the base, and somewhat concrete, the 2 lateral ones marginating and broader than the rest. \( \checkmark \). H. Native of Syria, near Nazareth. It is allied to *Cachrys odontalgica*, but differs in being glabrous, and in the fruit being winged. Calyx with 5 short teeth.

**Unequal-petalled Prangos.** Pl. 2 to 3 feet.

7 E. Eucululacea (Meyer, verz. pflanz. p. 131) plant quite glabrous; leaves supra-decompound; segments setaceous; leaves of involucre and involucels lanceolate; wings of mericarps flat: furrows naked. \( \checkmark \). H. Native of Caucasus, among rocks or in stony places, on the higher mountains of Talsuch, at the elevation of 2000 or 3000 feet.

**Fennel-like Prangos.** Pl. 2 to 3 feet.

**Cult.** The species of *Prangos* are of easy culture, but grow best in a dry soil. They are only to be increased by seeds, which should be sown in the autumn.

---

**Lin. syst. Pentandria, Digi'nia.** Margin of calyx oblate. Petals orbiculate, with an inflexed point. Fruit ovate, villously tomentose; mericarps with 5 thick, very blunt ribs, and narrow furrows. Seed covered over all with numerous very fine vitex, convex on the outside, and with a deep involute furrow on the inside. — Perennial herbs, hoary from villous tomentum in every part; referrible to *Hermas* or Heracleum in habit. Leaves pinnate; leaflets lobed; leaves ovate, toothed, dentate. Umbels and umbelles many-flowered, involucrata. Flowers white. This genus is easily distinguished at once from *Cachrys*, in the petals being white and obcordate.

1 M. Tomentosa (Koch, in litt. 1828. D. C. prod. 4. p. 241) leaves pinnate, with 3-5 large, broadly ovate, toothed, cut leaflets: ultimate leaflets confluent; all tomentose beneath, and nearly glabrous above; leaves of involucre and involucels numerous, elongated, linear, undivided; fruit ovate; mericarps bluntly 5-ribbed, tomentose all over. \( \checkmark \). H. Native of Barbary and Sicily. Cachrys tomentosa, Desf. atl. 1. p. 249.
UMBELLIFERÆ.  CLVI. MAGYDARIS.  CLVII. HERMAS.  CLVIII. CONIUM.

Tomentose Magydaris. Fl. June, July. Clt. 1823. Pl. 3 ft. 2 M. ambigua (D. C. prod. 4. p. 241.) leaves pinnate, with 5 oval-oblong crenulated leaflets, which are glabrous above, and scabrous on the nerves beneath, as well as on the petioles: ultimate ones distinct; leaves of involucre and involucels numerous, lanceolate-linear, undivided; fruit ovate, woolly. 2. H. Native of Mauritania, near Tangiers. Cächrys ambigua, Salzm. pl. exsic. 1825. This species is intermediate between the preceding and following; and to find the first, and to find the last in the analog of the leaves.  

Ambigous Magydaris. Pl. 3 feet. 3 M. panacina (D. C. prod. 4. p. 241.) leaves on long petioles, some of them undivided, oval-oblong, and toothed: others are pinnate, with the ultimate segments confluent, all scabrous beneath on the nerves, and on the petioles; leaves of involucre and involucels numerous, deflexed, undivided; fruit oblong, beset with spreading villi, hardly furrowed. 2. H. Native of Spain. Cächrys panacifölia, Vahl, symb. 1. p. 25. Brot. fl. lus. 1. p. 43. Athamánta panaciföia, Spreng. umb. spec. 1. p. 140.—Tüero, Gius, hist. 2. p. 93.  

Cult. See Perángos, p. 375. for culture and propagation.  

LIN. Syst. Pentândria, Digýnia. Margin of calyx 5-parted, foliaceous, permanent. Petals oval-oblong, acute, keeled, entire, equal. Fruit ovate; mericarps rather inflated, compressed from the back, 5-ribbed, the dorsal rib exerted, the two middle ones larger, and the 2 marginating ones small, and placed under the commissure; vitreous many in the furrows, which are broad. Seed elliptic, somewhat concave on the inside, and probably revolute, not adnate to the tegument.—Cape herbs, having the leaves clothed with white tomentum. Leaves undivided, hardly toothed. Umbels compound, nearly globose, of many rays. Involucels numerous, of many leaves; involucels of 3 leaves. Rays of umbellules many; outer ones bearing sterile male flowers: the inner one or three bearing hermaphrodite flowers; the pedicels of the sterile or abortive flowers setaceous and permanent after the inflorescence, forming as it were an involucre to the fertile flowers. Lateral umbels sterile, male. Flowers white or purple.  

1 H. gigantea (Lin. fili suppl. 435.) radical leaves on long petioles, oval or oblong, somewhat serrated, clothed with dense soft tomentum on both surfaces. 2. H. Native of the Cape of Good Hope. Thunb. nov. act. petrop. 14. p. 529. t. 11. fl. cap. 249. Bupleürum gigántium, Thunb. prod. 50. Leaves from the dense tomentum usually entire. The upper part of the plant and umbels glabrous. Leaves purple, ex Thunb. The wool scraped from the leaves is used for tinder at the Cape of Good Hope, as that from Artemisia is in China and Japan.  

2 H. villósa (Thunb. nov. act. petrop. 14. p. 531. fl. cap. 249.) leaves ovate-oblong, acute, somewhat cordinate at the base, stem-clasping, toothed, glabrous above, and clothed with white tomentum beneath. 2. G. Native of the Cape of Good Hope, on the Table Mountain. Burn. afr. t. 71. f. 2. Bupleürum villósum, Lin. spec. 343. Burn. fl. cap. p. 7. H. depauverata, Lam. dict. 3. p. 121. ill. t. 351. f. 1. Stem tomentose between the leaves, and glabrous above. There is also tomentum under the bracteas and involucre. Stems purple.  

Varr. β, depauvera (D. C. prod. 4. p. 242.) leaves on short petioles, velvety beneath from short rubrifulent tomentum; involucre and bracteas glabrous at the base. 2. G. Native of the Cape of Good Hope. Hermas depauverata, Lin. mant. 299. Perhaps a proper species.
